2. In a galvanic battery, a combination of a trough divided into cells by transverse partitions, handles secured to the cells to facilitate transportation, a cover common to all the cells, positive and negative electrodes secured to the cover and the cells, respectively, and contacts on the cover and the trough adapted to throw all of the cells into series when the cover is applied.

3. In a galvanic battery, a combination of a trough divided into cells by transverse partitions, electrodes secured to the sides of the trough, contacts in circuit with the electrodes, a cover common to all of the cells, electrodes attached thereto, and electric connections between the electrodes carried by the cover and the side of the cover, whereby the mere placing of the cover in position will throw all of the electrodes into series relation.

4. In a galvanic battery, a containing-vessel lined with lead and having carbon electrodes secured to the side walls by lead-covered bolts, whereby an extensive negative surface is secured and the fastening devices are protected from corrosion.

397,116

5. A trough-battery having its cells grouped in the discharging-circuit by electrical connections on the outside of the trough, said connections being covered by a protective casing, as and for the purpose set forth.

6. The combination, with a vehicle, of a frame or casing on the under side thereof, a battery within the casing, and adjusting devices for locking the battery against movement in the casing.

7. The combination, with a vehicle, of a frame or casing on the under side thereof, a battery within the casing, a packing between the battery and its cover, and adjusting-screws in the bottom of the casing to press the battery against the bottom of the vehicle and prevent displacement of the battery or spilling of its contents.

8. A depolarizing-liquid for a galvanic battery, consisting of an acid solution to which is added a previously-prepared compound of nitrate of potash and sulphuric acid.

9. A depolarizing-liquid for a galvanic battery, consisting of a mixture of chromic acid, sulphuric acid, and water, and containing granules or lumps of a previously-prepared compound of nitrate of potash and sulphuric acid.

10. A depolarizing-liquid for a galvanic battery, containing a compound formed by the action of sulphuric acid on the granules or lumps of nitrate of potash.

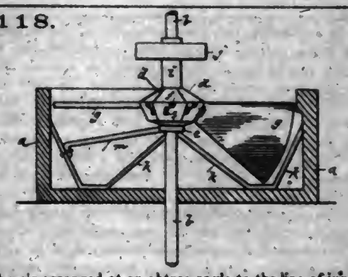
397,117. HAT-BLOCK.

JOHN C. FISHER, Reading, Pa. Filed Oct. 19, 1888. Serial No. 288,582. (No model.)

Claim.—1. A hat-forming ring, substantially as described, having a V-shaped circumferential groove with lining-band C, substantially as and for the purpose set forth.

2. A hat-forming ring, substantially as described, having strengthening-bands around the top and bottom rims, and an intermediate V-shaped groove with lining-band C, substantially as and for the purpose set forth.

3. A hat-forming ring, substantially as described, having a V-shaped groove, E, metallic bands B and C, and metallic binding-strips M, substantially as and for the purpose set forth.



397,118. MEANS FOR OPERATING MOTIVE POWER FROM WATER AND AIR CURRENTS.

JOSIAH B. FOX, Emlenton, Pa. Filed Jan. 14, 1888. Serial No. 260,773. (No model.)

Claim.—1. The combination consisting of the frame *a*, the vertical shaft *b*, the sleeve *i*, and hub *d*, attached thereto, the double paddles *g*, arranged securely about the hub *d*, and the turning device *m*, substantially as set forth.

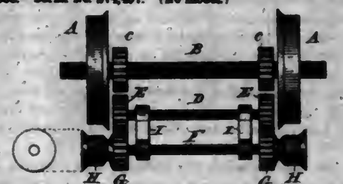
2. The combination of a fixed central shaft, a sleeve loosely fitted thereon and carrying a hub, the paddles *g*, arranged in pairs and at right angles to one another on opposite ends of horizontal shafts *f*, which are loosely journaled in said hub, each shaft having an oblique

397,118.

bend, *l*, therein arranged at an obtuse angle to the line of juncture of the pair of right-angled blades, whereby the shaft and paddles can make a quarter-turn without obstruction from the fixed central shaft, and a fixed turning piece arranged in the path of the paddles, substantially as and for the purpose described.

397,119. CUFF-FASTENER.

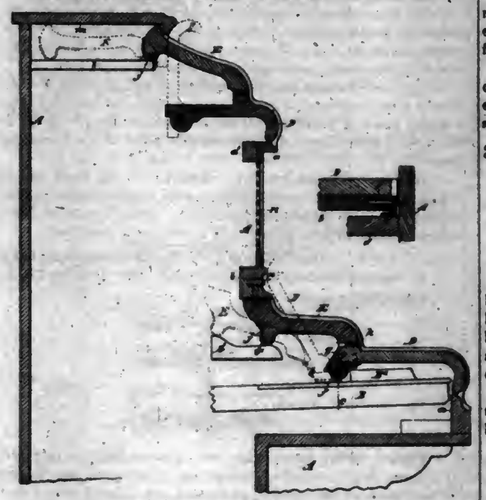
HENRY C. FRANK, New York, N. Y. Filed Nov. 16, 1888. Serial No. 290,991. (No model.)



Claim.—1. In a cuff-fastener, the hinged hook D D' D^2 D^3 and shank E, in combination with each other and with the spring M and clasp G, arranged for joint operation as herein specified.

2. In a cuff-fastener, the swivel E', formed on a rigid extension of the shank E, in combination with the hook D D' D^2 D^3 and with the spring-clasp G, the fastener being adapted to serve right or left as will, while holding itself rigid longitudinally as herein specified.

397,120. BRAKE.



OSCAR L. GILBERT, St. Paul, Minn. Filed May 19, 1888. Serial No. 274,457. (No model.)

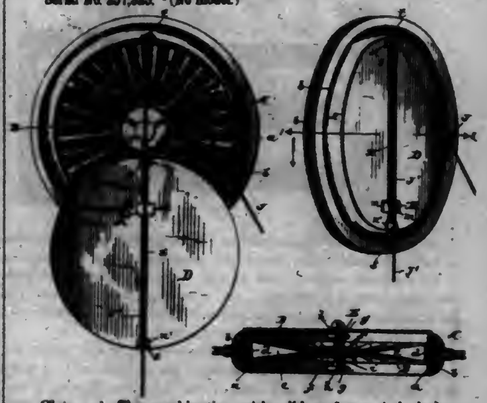
Claim.—In a car-brake, the combination of the hanger provided with axle F, having gear-wheels and brake-wheels, and axle D, having gear-wheels, and the car-axle, provided also with gear-wheels, whereby the brake-wheels are made to move in a direction the reverse of that of the car-wheels.

397,121. PIANO-CASE.

PAUL GRENELIN, New York, N. Y. Filed Oct. 4, 1888. Serial No. 287,171. (No model.)

Claim.—1. The front fall, D, having fixed pivots *f f*, combined with the back fall, E, hinged to the front fall, and with a support for the back fall, substantially as described.

2. In a piano, the front fall, D, and key-blocks *d*, having pivot-pins *f*, to which the front fall is attached, combined with the back fall, E, that is hinged to the front fall, and with a support for the inner end of the back fall, substantially as described.



3. The combination, with a front fall that is pivoted so as to lie close to the keys, with a back fall hinged to the front fall and adapted to be pushed inward by said front fall, of a support for the inner end of the back fall, and with a rail, *l*, extending across the front of the piano, and a lock on the rail *l*, for engaging the back fall to lock the piano, substantially as described.

4. The combination of the jointed fall D E and its fixed pivots *f* with the front rail or slip, *a*, and with the upper rail, *l*, having lock *l*, the front edge of the fall being adapted to rest on the highest part of the slip *a*, substantially as described.

5. The front frame, *a*, having the grooved rail *a*, and the extra slip a^4, glued to the inner side thereof, combined with the front fall, D, pivoted at the upper part of the piano and resting at one end upon the slip *a*, and with the back fall, E, hinged to the front fall, and a support for the inner end of the back fall, E, said back fall being pushed under the top of the piano when the front fall is raised, substantially as described.

397,122. VENTILATOR.

BETA A. GOODELL, Chicago, Ill., assignor to the Consolidated Patents Company, same place. Filed Dec. 6, 1887. Serial No. 257,395. (No model.)

Claim.—1. The combination, with a lid or frame, A, inclosing a ventilator-opening, of a cover, D, arranged to slide in a plane parallel to said frame and provided with a transverse slot, *x*, receiving a guiding-stud, E, upon the frame, serving as the sole means of guiding and retaining the cover in permanent sliding connection with the frame, substantially as set forth.

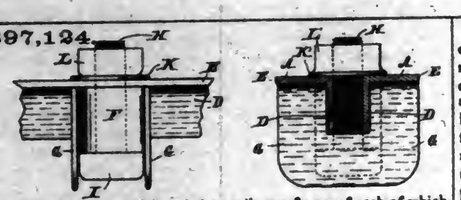
2. The combination of the frame A, guided slide D, eye *t*, arranged above the slide, and operating-cord J, extending through the eye *t* and downward and connected to the slide, substantially as set forth.

3. The combination of the frame A and slide D, having a vertical opening, *x*, guiding-stud E on the frame, extending into said opening, eyes *u u'* upon the slide, eye *t* upon the frame, and operating-cord J, substantially as set forth.

397,123. FOUNTAIN-PEN.

OSCAR F. GRANT, Pittsburg, Pa. Filed July 2, 1888. Serial No. 278,790. (No model.)

Claim.—1. A combined finger-hold and ink-reservoir adapted to be applied to an ordinary pen-holder and consisting of an elastic tube having a hole at one end for the reception of the lower end of a holder, an opening at the opposite end for the passage of the pen, and a bulbous intermediate body forming a reservoir, substantially as described.



2. A combined reservoir and finger-hold for pens, consisting of a tubular section of elastic material reduced at one end to closely embrace the pen, substantially as described.

397,124. HAY-CARRIER TRACK.

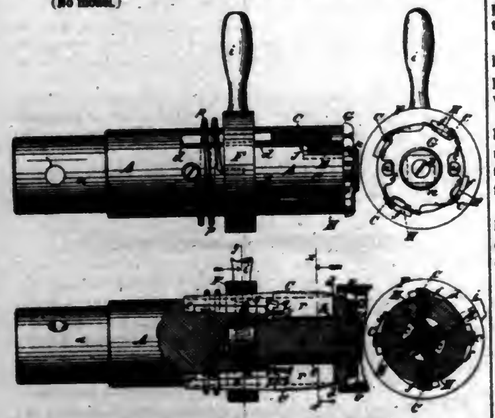
MARIAS G. GRONOUP, Milwaukee, Wis. Filed Oct. 30, 1888. Serial No. 289,526. (No model.)

Claim.—1. The combination of a clamping and supporting block consisting of a U-shaped band having two wings, one at each end, each of which wings projects outwardly laterally from the body of the band as great a distance as the lateral width of the flange of the rail resting

397,124.

thereon, with two parallel angle-iron rails, one flange of each of which rails is within and the other upon the end of such band and the wings projecting therefrom, and a bolt and nut whereby the angle-iron rails are secured rigidly to the block, substantially as described.

2. The combination of two angle-iron rails located at a distance apart but parallel to each other, with a U-shaped block within which the two downwardly-projecting flanges of the angle-irons are received, and a bolt and nut whereby the block is clamped to the angle-irons, the bolt being inserted through the band and between the angle-irons, substantially as described.



397,125. VALVE FOR FLUID-PRESSURE BRAKES. HERMAN GUHLS, St. Louis, Mo., assignor to the American Brake Company, same place. Filed Aug. 21, 1888. Serial No. 283,332. (No model.)

Claim.—1. The combination, in a valve for fluid-pressure brakes, of a double-seating valve having an exhaust-port, and ports leading to the auxiliary reservoir and cylinder, an air-chamber which communicates with the train-pipe, and a diaphragm arranged in said chamber, having a constant leak and connected with the double valve, substantially as and for the purposes specified.

2. In a fluid-pressure valve, the combination of the bottom section, the plug-valve section and its valve, the shell-section C, forming an air-chamber around the stem of the valve, the diaphragm connected to the valve-stem and having a constant leak, and the cap-section having a port, substantially as and for the purposes specified.

397,126. EXPANSIBLE AND COLLAPSIBLE TAP. THORVALD F. HANNER, Branford, Conn. Filed Sept. 7, 1888. Serial No. 284,317. (No model.)

Claim.—1. In a collapsing tap, the combination, with the sustaining stock or body and radiating movable tapping blades or cutters mounted thereon, and an internal rotary cam-spindle having cams to bear against and project the cutters, of a reamer or reaming-head attached to the end of the cam-spindle in advance of the stock and its cutters, whereby the retardation of the advancing reamer in entering the work will cause the cam-spindle to be arrested while the stock and its blades revolve thereon, and thereby automatically expand the tapping-cutters, with a retracting device to retract the cutters when the revolution is reversed, substantially as herein set forth.

2. In a collapsing tap, the combination of the sustaining stock or body having radially-movable cutters mounted therein, an internal rotary cam-spindle bearing on the cutters, an external cam-ring encircling the stock, connected rotatively with the inner cam-spindle and having inclines bearing externally on the cutters reverse to the inclines of the internal cam-spindle, with a reaming disk or head fixed to the end of the cam-spindle, said cam mechanism having a rotative engagement with the stock, with a limited play in the connection equal to the action of the cams, substantially as and for the purpose set forth.

3. The combination of the stock or body having radially-movable tapping-cutters, the internal cam-spindle acting to diverge the same, the external cam-ring acting to contract the same, and a retracting-spring tending to turn the ring in its contrary or retracting direction, with a reaming disk or head fixed on the end of the spindle, substantially as and for the purpose set forth.

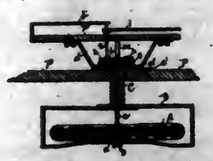
4. The combination of the stock or body having radially-movable tapping-cutters, the internal cam-spindle acting to diverge the same, and an external retracing device acting to converge the same, with a reaming disk or head fixed on the end of the cam-spindle in advance of the stock and its cutters, and a positive rotative stop or engagement between said stock and reamer having a loose rotative play between the two equal to the action of the cams, substantially as and for the purpose set forth.

5. In a collapsing tap, the combination, with a stock or body having radial slots, of movable blades or cutters mounted in said slots and fulcrumed therein by having one extremity abutting directly against and superposed upon the body of the stock at the end of the slots, substantially as set forth.

6. In a collapsing tap, the combination of the slotted stock or body and a series of radially-movable blades or cutters mounted therein, having rocking fulcrum-tips abutting directly upon a fulcrum seat or bearing in the body of the stock at the ends of the slots, an internal cam or diverging device bearing on the swinging ends of the blades to diverge the same, and an external retracting device bearing on the middle portion of the lever-blades between the fulcrum and the swinging or threaded ends, substantially as and for the purpose set forth.

7. In a collapsing tap substantially such as set forth, the combination, with the tap-body, of the lever-like threading blades or cutters C, having the fulcrum projection or rocking tip *c* on the extremity opposite to the threaded end, substantially as and for the purpose set forth.

8. The combination of the slotted stock or body A, having the slots *d* made deeply or entirely through the stock at the front end and partly through the stock at the rear end, leaving a solid base, *m*, with the lever-like blades C, fitting said slots and fulcrumed therein by having their extremities resting or abutting directly upon the solid base *m* at the end of said slots, substantially as set forth.

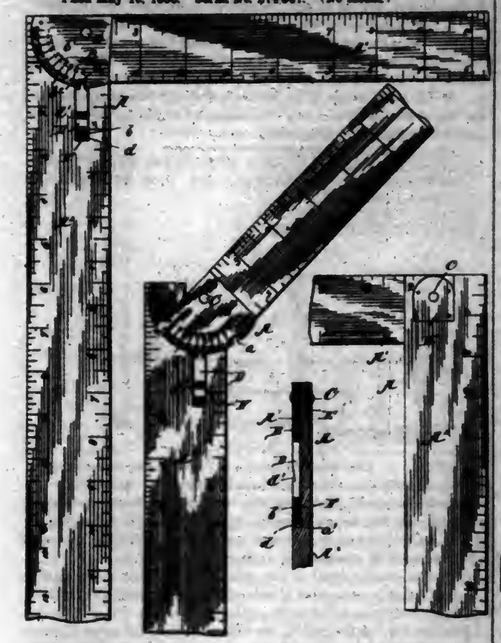


9. In a collapsing tap, in combination with the tap-body, the lever-like threading-blades C, made in two parts, with the threaded parts attachable to and detachable from the fulcrum part, substantially as set forth.

10. In a collapsing tap, in combination with the tap-body, the lever-like threading-blades C, made in two separate parts, *r s*, with a projection on one part to fit a recess on the other, and a fastening device to hold the two parts together, substantially as set forth.

11. In a collapsing tap, the combination, with the stock or body having a series of slots and movable cutters set in said slots, of a chip-resisting guard or shield set into the stock at the edge of the slot in the cutting side of the cutters, substantially as and for the purpose set forth.

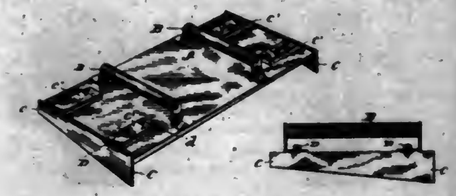
12. In a collapsing tap, the combination of the stock having longitudinal dovetailed sockets adjoining the tapping-blades on their cutting side, with the hardened blocks H, having dovetailed edges driven into said sockets, substantially as shown and described.



397,127. OVEN-THERMOMETER. HOMER HENDERSON and FRANK H. JOHNSTON, Columbus, Ohio. Filed Apr. 30, 1888. Serial No. 272,376. (No model.)

Claim.—1. The combination, with the air-chamber A, supported in a frame, B, of the spring-actuated pin *c*, bearing against the face of said chamber, and having guide-head *g* and slotted strip *h*, dial-plate F, and twisted hand-post *k*, carrying hand *l* and pivotally supported in the frame of said dial, substantially as and for the purpose specified.

2. The combination, with the air-chamber A, supported within a frame, B, and the hollow screw C, secured to said frame, of a dial-plate, F, having figures and letters thereon, as described, and having its supporting-frame detachably connected with the screw C, pin *c*, passing through screw C and frames *d* and B and having guide-head *g* and slotted strip *h*, and twisted hand-post *k*, carrying indicator-hand *l*, substantially as and for the purpose specified.

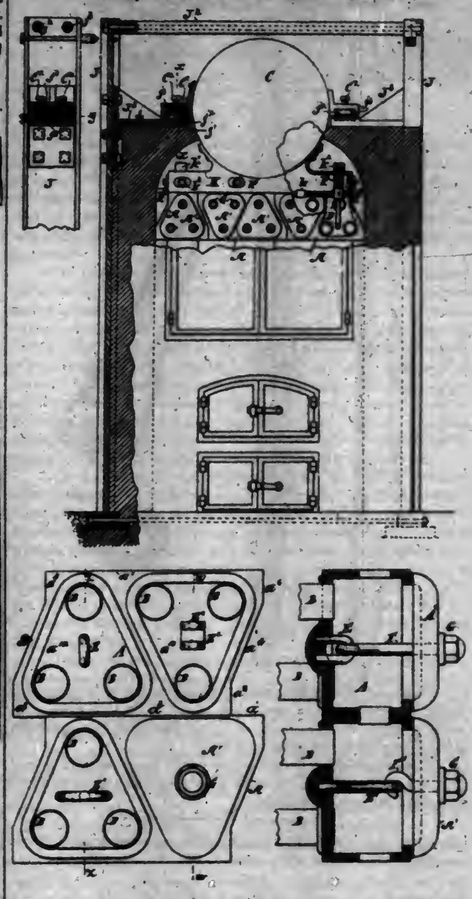


397,128. SCALE-MEASURE. STEPHEN J. HESTER, Fulton, Ky. Filed May 19, 1888. Serial No. 274,267. (No model.)

Claim.—1. A measuring-instrument for marking off the angles at which to cut rafters, consisting of two legs, pivoted together and designed to be provided with suitable scales, one of the legs having a spring-actuated pawl and the other provided with a sector-plate having a recess adapted to be engaged by the pawl to hold the legs perpendicular to each other, and a series of notches to be engaged by said pawl, substantially as described.

2. A measuring-instrument for marking off the angles at which to cut rafters, consisting of two legs pivoted together, one of said legs having a slot terminating in a cylindrical hole and provided with a pawl sliding within the slot and having an extension and a spring coiled around the extension to hold the pawl in an extended position, and the other one of said legs having a sector-plate provided with a recess and a series of notches, substantially as and for the purpose described.

397,129. PLASTERING-TROWEL. ALEXANDER HILL, Kansas City, Mo. Filed June 26, 1888. Serial No. 278,493. (No model.)



Claim.—1. The herein-described trowel, consisting of the flat-faced body portion provided with end guides secured thereto to regulate the thickness of the coat of plaster, substantially as set forth.

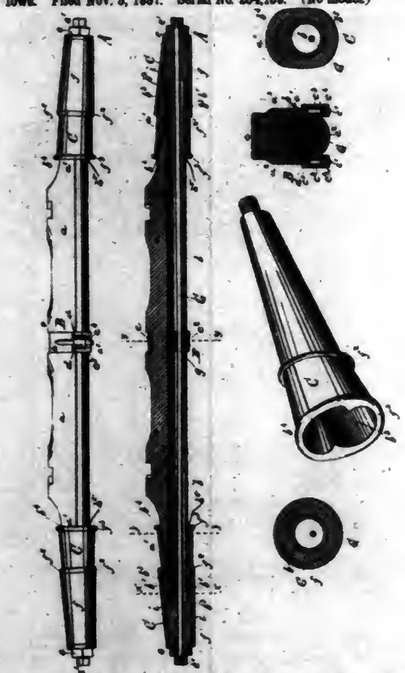
2. In a trowel, the combination, with a flat body provided with a pair of handles secured to its back, of end guides secured to the body and adjustable at right angles thereto, substantially as set forth.

3. In a trowel, the combination, with the body portion provided with a pair of handles secured to its back, of end guides secured to the body and adjustable at right angles thereto, the said end guides being narrower at one end than at the other, substantially as set forth.

397,130. STEAM-BOILER. WILLIAM R. KELLY, New Brunswick, N. J. Filed Sept. 22, 1888. Serial No. 286,101. (No model.)

Claim.—1. In a header, the combination, with the back of the header, of a connection for a removable bolt, said connection being of wrought-iron or similar material fastened to the back of the header by having the metal of the back of the header cast around it, substantially as specified.

2. In a boiler, the combination, with the back of a header, of an eye-connection for a bolt provided with a shank having an enlarged end, said eye being secured to the back of the header by having the metal of the back of the header cast around the shank, substantially as specified.

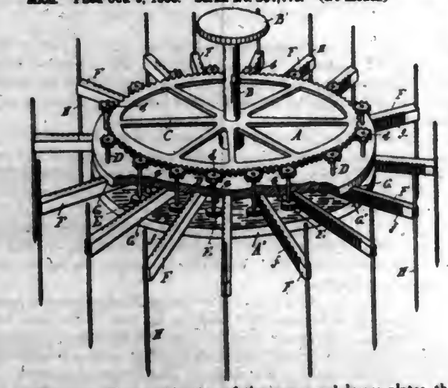


3. In a boiler, the combination, with a header having a detachable cover, of a bolt for securing the cover, an eye at the rear end of the bolt, and crossed hooks secured to the back of the header, substantially as specified.

4. In a boiler, the combination of a longitudinally-extending drum or shell, water-tubes, series of headers at the ends of the tubes, and a transverse saddle arranged between a series of headers and the drum or shell, and provided with openings opposite the headers immediately below and turrets above such openings, substantially as specified.

5. In a boiler, the combination of a longitudinally-extending drum or shell, water-tubes, series of headers at the ends of the tubes, and a transverse saddle arranged between a series of headers and the drum or shell, and provided with openings opposite the headers immediately below, turrets above such openings, hand-holes in the front in line with the turrets, and hand-holes at the ends, substantially as specified.

6. In a boiler, the combination, with a drum or shell provided with laterally-extending brackets or arms, of standards or columns provided with inwardly-extending brackets, rollers between the brackets of the columns and the brackets or arms of the drum or shell, loose plates bearing upon these rollers, and adjusting-screws extending through one pair of brackets or arms and impinging upon the loose plates, substantially as specified.



397,131. WAGON-AXLE. NATHANIEL S. KETCHUM, Marshalltown, Iowa. Filed Nov. 3, 1887. Serial No. 254,139. (No model.)

Claim.—1. The combination of the abutments *i* of a wagon-axle skein, the wood stock *a*, metal axle-tube *b*, perforated metal truss-block *g* within the tube, truss-rod G, and tightening-nuts *d'*, substantially as and for the purpose described.

2. A wagon-skein, C, constructed at its inner end with a hood, b^4, a semicircular channel, b^3, and a circular chamber, b^2, substantially as and for the purpose described.

397,132. PIPE-JOINT DELINEATOR. GEORGE S. KIMBALL, Detroit, Mich. Filed Oct. 9, 1888. Serial No. 287,770. (No model.)

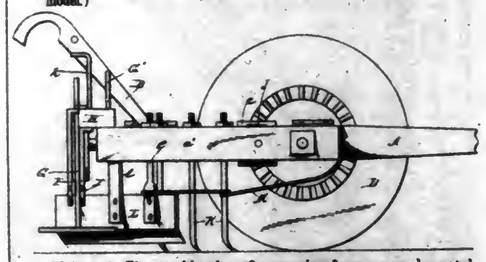
Claim.—1. The combination of the upper and lower plates, the means for extending and retracting the extension-arms, the extensible arms, and the delineating-needles, substantially as described.

2. The combination of the upper and lower plates, the mechanism for simultaneously extending or retracting the extensible arms, the extensible arms, and the delineator-needles, substantially as described.

3. The combination of the upper and lower plates, the mechanism for extending and retracting the extensible arms, the extensible arms, the guides for the extensible arms, and the delineating-needles, substantially as described.

4. The combination of the upper and lower plates, the mechanism for extending and retracting the extensible arms, the guides for the extensible arms, the extensible arms, the spring on the arm to retain the needle, and the delineating-needle, substantially as described

5. The combination of the upper and lower plates, the means for extending and retracting the extensible arms, the extensible arms, the flexible jacket, and the delineating-pins, substantially as described.



6. The combination of the upper and lower plates, the mechanism for extending and retracting the extensible arms, the guides for the extensible arms, the extensible arms, the flexible jacket, and the delineating-pins, substantially as described.

7. The combination of the upper and lower plates, the arms, the flexible jacket, and the delineating-needles, substantially as described.

8. The combination of the flexible jacket, the delineating-needles, and the means for extending the flexible jacket to a circular form, and means for preserving the alignment of the sections of the flexible jacket when in a circular form, substantially as described.

9. The combination of the flexible jacket, the delineating-needles, and the means for preserving the alignment of the sections of the jacket when unrolled, substantially as described.

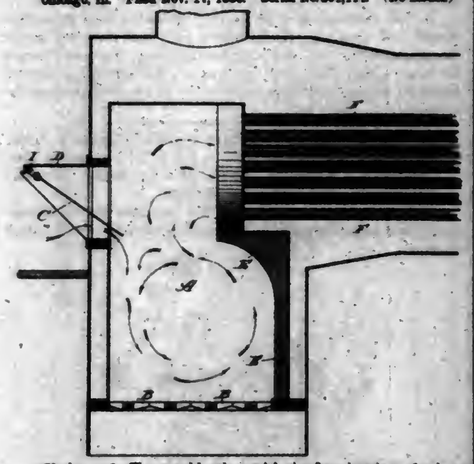
397,133. COTTON CHOPPER, SCRAPER, AND HARROW. JOHN M. P. LYON, Leeds, Ala. Filed May 5, 1888. Serial No. 272,964. (No model.)

Claim.—1. The combination of a carrying-frame, a supplemental frame pivotally connected thereto and carrying a ground-wheel, a spring for normally depressing the supplemental frame, a counter-shaft journaled in the supplemental frame and geared to the ground-wheel, a chopper-hoe, and devices connecting the chopper-hoe with the counter-shaft, substantially as described.

2. The combination of the main carrying-frame, an adjustable fulcrum pivotally connected at one end to the frame, a vertical fixed guide carried by said frame in juxtaposition to the free end of the adjustable fulcrum for guiding the fulcrum in a direct vertical line, a chopper-hoe pivoted to the fulcrum, and mechanism for reciprocating the hoe, substantially as described.

3. The combination of the main frame, the slotted fulcrum pivotally connected thereto, vertical guide passing through the slot, a chopper-hoe carried by the fulcrum, the guides between which the chopper-hoe reciprocates, and mechanism, as described, for reciprocating the hoe, substantially as set forth.

4. The combination of the main carrying-frame, a supplemental frame pivotally connected thereto and carrying a ground-wheel and a counter-shaft, which are geared together, a spring for normally depressing the supplemental frame, an adjustable fulcrum carried by the main frame, a chopper-hoe pivoted to the fulcrum and connected with the counter-shaft, the vertical harrow-teeth, and a scraper in rear of said teeth having the cutting-lip and angular end, substantially as described.



397,134. VALVE. GEORGE A. MATTESON, Gridersville, Ohio. Filed Aug. 31, 1888. Serial No. 284,272. (No model.)

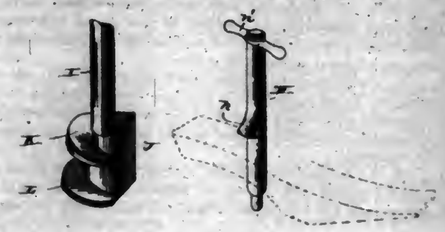
Claim.—1. In a valve, the combination, with the casing A, provided with a longitudinal opening, of the core mounted transversely in the casing and provided with an opening, H, adapted to register with the longitudinal opening, the valve-seat on the side of the core, the removable connection C, bolted to the upper end of the casing over the longitudinal opening thereof, and the check-valve provided with trunnions mounted in bearings at the sides of the said seat, the check-valve being less in width than the longitudinal opening, whereby it may be introduced and removed therethrough when the connection is removed, substantially as specified.

2. In a valve, the combination, with the casing, of the core mounted in a transverse bore in the casing and provided with an opening, H, adapted to register with a longitudinal opening therein, the valve-seat fitted in a recess, I, in the core and having the closed bearing R and the open bearing R' at opposite sides thereof, the check-valve provided with trunnions L' L', mounted in the said bearings, and a transverse rib, *l*, adapted to bear against the side of the bore when the valve is closed, substantially as specified.

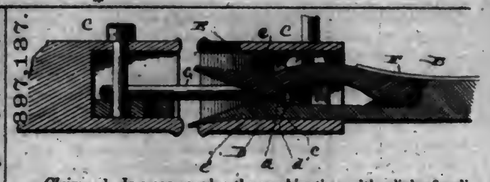
397,135. SMOKE-CONSUMING FURNACE. CORNELIUS MCGINNIS, Chicago, Ill. Filed Nov. 17, 1888. Serial No. 291,114. (No model.)

Claim.—1. The combination, with the fire-chamber of a locomotive, of an arch curved at its upper end, an inclined door for directing air against such arch, and an apron secured to the outside of the fire-chamber in which the door is hinged, substantially as described.

2. The combination, with the fire-chamber of a locomotive, of an arch curved at its upper end and extending back of the rearward end of the smoke-flues, an inclined door for directing air against such arch, and an apron secured to the fire-chamber in which the door is hinged, substantially as described.



3. The combination of the door C, apron D, levers G G, plate H, and arch E, all arranged and operating substantially as described.



397,136. SNAP-HOOK. HORACE G. MCLEAN, McPherson, Kans. Filed June 21, 1888. Serial No. 277,903. (No model.)

Claim.—In a snap-hook, the shank or body B, having eye A at one end and an open hook at the opposite end, lever D, provided with a hook at one end and with an outwardly-turned elevated portion, E, at the opposite end, and which has hinge lug or lugs *a* formed upon its inner side, said lever being pivoted to one side of shank B, so that the hook will open in a plane at right angles to the flat side of the jaw carried by the shank, pin *b*, which connects lug or lugs *a* to said shank, and spring *c*, located between elevated portion E and the shank of the hook, substantially as described.

397,137. CAR-COUPLING. SIMON P. MICKEY, Wood Lawn, Va. Filed Nov. 1, 1888. Serial No. 289,771. (No model.)

Claim.—1. In a car-coupler, the combination, with a link of ordinary construction, of a pivotal coupling-hook having the face of its point downward and a suitable shoulder between its point and shank, and a cam-block secured to a vertical shaft journaled in the draw-head in rear of the point of the hook and provided with inclined cam-ridges that engage under the hook and the link, substantially as described.

2. In a car-coupler, the combination, with the draw-head having the outer portion of its floor inclined downward and outward and the draw-bar having its outer portion secured in a central longitudinal recess in the said floor, and formed into an upwardly-facing coupling-hook provided with a suitable shoulder between its point and shank, of a downwardly-facing coupling-hook pivoted to the upper edge of the draw-bar and provided with a suitable shoulder between its point and shank, the spring secured to the draw-bar and bearing down on the shank of the pivoted hook, and the quadrant-shaped cam-block secured to a vertical shaft and provided with inclined cam-ridges engaging under the hook and the link, substantially as described.

3. In a car-coupler, the combination, with the link of ordinary construction, the lower fixed upwardly-facing coupling-hook having a vertical shoulder between its point and shank, the upper pivoted downwardly-facing coupling-hook provided with a similar shoulder between the point and shank, and the quadrant-shaped rotatory cam-block provided with two similar inclined cam-ridges, the upper one of which engages under the shank of the pivoted hook and lifts the point thereof out of the link, while the lower one simultaneously lifts the inner end of the link above the shoulder of the lower hook, substantially as specified.

4. The combination, with the draw-head having a flaring mouth, the draw-bar having its outer portion formed into the hook D, seated in a recess in the draw-head and provided with the shoulder *d*, and recess *d'*, the upper pivoted hook, E, provided with the shoulder *e*, and projection *d'*, and the spring F, of the shaft I, journaled in the floor and roof of the draw-head, the hand-wheel *i* on the upper end of said shank, and the quadrant-shaped cam-block secured to said shaft and provided with the inclined cam-ridge K to engage under the shank of the pivoted hook, and the similar cam-ridge, L, to engage under the entered end of the link, substantially as specified.

5. In a car-coupler, the combination of the lower upwardly-facing coupling-hook secured to the floor of the draw-head, the upper downwardly-facing coupling-hook pivoted to the draw-bar, and the shaft H, journaled in the draw-head, having the handle *h'* on its upper end, and provided with the lateral projection *h*, adapted to be turned upon the shank of the upper hook and keep the latter down on the lower hook, substantially as specified.

397,138. COULTER-CLAMP. RIPLEY A. MOORE, Hickory Plains, Ark. Filed Oct. 24, 1888. Serial No. 288,014. (No model.)

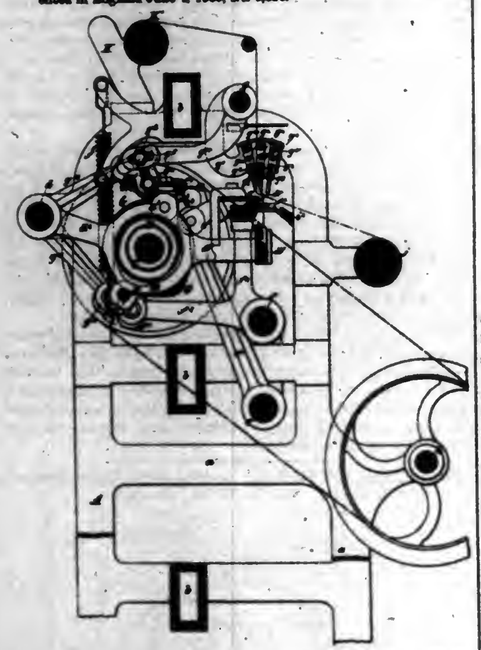
Claim.—The combination, with a plow-stock, of the plate *a*, having the perforated flanges a' a^2, the groove *d*, deeper at its lower than at its upper end, and the bolt-holes *e*, the perforated binding-bar *g*, wedge *f*, fitting in said groove *d* and against the rear edge of the colter, bolts *h*, passing through said beam or against the upper and lower faces of the same through said plate *a* and bar *g*, and nuts *h'*, all adapted to be attached to said beam and carry said colter, substantially as shown and described.

397,139. CANVAS-STRETCHER FOR PICTURE-FRAMES. WILLIAM MURPHY, St. John, New Brunswick, Canada. Filed Mar. 26, 1888. Serial No. 268,540. (No model.)

Claim.—1. A tongue or holding-plate, in combination with two contiguous parts of a frame, each part being saw-kerfed to receive one edge of said plate and the latter being bent at the middle in line with their meeting faces, for the purpose set forth.

2. A tongue or holding-plate, D, provided with oblique lateral teeth *d*, in combination with the parts B C of a frame, having in

397,139.



their mitered faces the saw-kerfs *b* to receive said teeth, and the body of said plate, substantially as set forth.

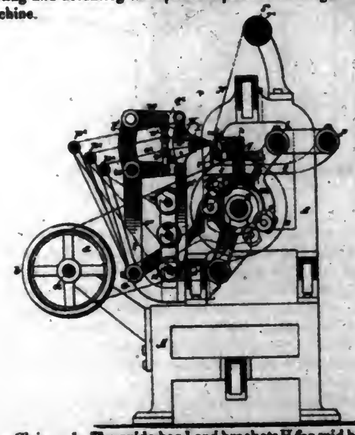
3. In combination with the parts B and C of the frame mitered and saw-kerfed, as described, the holding-plate or tongue D, bent in the middle and arranged with the convex side outward, said tongue or plate having lateral arms or teeth *d*, which enter said saw-kerfs, for the purpose set forth.

4. The wedge E, having slot *c*, in combination with the tongue D, having lateral teeth *d*, and the parts B C of the frame, having saw-kerfs *b*, all arranged and operating substantially as set forth.

5. In combination with two contiguous parts of a frame having corresponding saw-kerfs in their faces, a metallic tongue fitting into said saw-kerfs, and a slotted wedge fitting between said faces and straddling said tongue, substantially as set forth.

397,140. WARP-KNITTING MACHINE. HENRY R. PAYNE and WILLIAM CAMPION, Radford, County of Nottingham, England; said Campion assignor, by mesne assignments, to A. G. Jennings & Sons, Brooklyn, N. Y. Filed Jan. 31, 1888. Serial No. 262,256. (No model.) Patented in England June 4, 1885, No. 6,526.

Claim.—1. The combination of the vertically-movable needle-bar d', having bearded needles, levers d^3, carrying said needle bar and cams D, horisontally-reciprocating independent and separate presser-bar e', rock-shaft e, levers e^3, carried by the shaft e and supporting the separate presser-bar e' and cam E, for actuating the levers e^3, separate and horisontally-movable sinker-bar f', carrying points f^x and the comb-like sley i, that is secured to the bar f' below the point f^x, shaft f, levers f^3, carrying the separate sinker-bar f' and cams F, and the longitudinally and laterally movable guide-bars g^3, with mechanism, substantially as described, for moving said guide-bars, all as specified.



2. The combination of a needle-bar having bearded needles, levers d^3 and cams D, for supporting and moving said needle-bar, a separate and independent presser-bar, rock-shaft e, levers e^3, carried by the shaft and supporting the independent presser-bar and cams E, for giving independent movement to the presser-bar, and a separate sinker-bar carrying the sinkers, and carrying also the sley separate from the said sinkers, shaft f and levers f^3, carrying said sinker-bar and cams F, a shaft carrying the cams and guide-bars, and mechanism, substantially as described, by which an endwise or longitudinally-reciprocating motion and lateral motion is imparted to the guide-bars, substantially as set forth.

3. The combination of the guide-bar rock-shaft g, levers g', having forked arms g^3, guide-bar g^4, guided by said arms and levers, levers g^{14}, having slotted end, elbow-lever g^{16}, having slotted upper end, spindle g^{16}, slide-piece g^{17}, carrying said spindle and guided in the slotted ends of the levers, and cam-shaft C, having cams G G', substantially as set forth.

4. The combination of the levers g', guide-bar arms g^3, carried thereby, said arms having slots, screws g^{21} for said slots, and guide-bars g^4, guided in the arms g^3, and having pins g^5, that pass through the levers g' and arms g^3, all arranged so that the arms g^3 may be turned to tip the guide-bars, substantially as herein shown and described.

397,141. STRAIGHT-KNITTING-MACHINE. HENRY R. PAYNE, Nottingham, England, assignor of one-half to A. G. Jennings & Sons, Brooklyn, N. Y. Filed Mar. 31, 1888. Serial No. 269,104. (No model.) Patented in England June 7, 1886, No. 7,666.

Brief.—The invention consists in the improved devices for supporting and actuating the operative parts of a straight-warp-knitting machine.

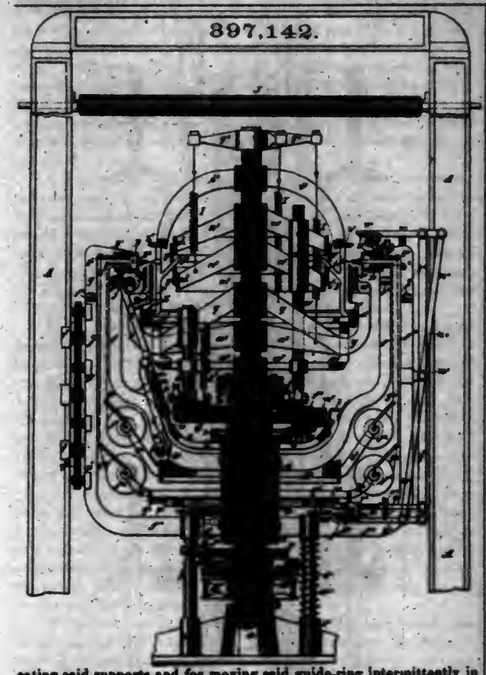
Claim.—1. The guide-bar I and brackets H for said bar, combined with the links v w, supporting said brackets, lever a^9, for moving said brackets, the lever L, for actuating said lever a^9, and with the lever t and the cam-shaft, substantially as described.

2. The guide bar I and its brackets H, combined with the links v w, levers t, supporting said links v w, shaft G, and the lever y, for actuating the levers t, and with the lever a^9, and the cam-shaft, substantially as described.

3. The guide-bar brackets H, their supporting-links v w, links v', and rods q^3 for the threads, combined with the levers t, that support the links v w, shaft G, and the lever y, for actuating the levers t, and with the lever a^9 and the cam-shaft, substantially as described.

4. The combination of the guide-bar brackets H, links v w, supporting said brackets, levers t, carrying said links v w, shaft G, lever y, for actuating the levers t, levers a^9 and L, for moving the brackets H, and the cam-shaft, all arranged for operation substantially as herein shown and described.

897,142. CIRCULAR-WARP-KNITTING MACHINE. HENRY R. PAYNE and WILLIAM CAMPION, Nottingham, England, said Campion assignor, by mesne assignments, to A. G. Jennings & Sons, Brooklyn, N. Y. Filed Apr. 30, 1888. Serial No. 272,800. (No model.) Patented in England Feb. 8, 1886, No. 1,824.



Brief.—The object of the invention is to so improve circular-warp-knitting machines that they may be worked much faster than the ordinary straight-warp machines.

Claim.—1. In a circular-warp-knitting machine, the guide-ring D and means, substantially as described, for moving said ring horizontally, combined with means, substantially as described, for moving said ring up and down, substantially as described.

2. In a circular-warp-knitting machine, the horizontally-movable guide-ring D, having the rack g, combined with the supports f, and with means, substantially as described, for moving said guide-ring, and with means, substantially as described, for reciprocating the supports f, as specified.

3. In a circular-warp-knitting machine, the standard B and supports f, combined with the circular guide-ring D, that is carried by said supports, and with means, substantially as described, for reciprocating said supports and for moving said guide-ring intermittently in either direction, substantially as specified.

397,142.

4. The standard B, supports f, and the guide-ring D, carried by said supports and having the rack g, combined with the worm h, pinion i, rack j, lever l, rod m, spring p, and pattern-wheel q, for actuating said lever l, substantially as described.

5. The standard B and bobbin-wheel d^3, that is adapted to carry the bobbins f^3 and to rotate on said standard, and the rack on the wheel d^3, combined with worm b^3, pinion a^3, rack z, lever l, rod m, spring p, and pattern-wheel q, for actuating said lever, substantially as described.

6. In a circular-warp-knitting machine, the standard B, supports f, guide-ring D on said supports, rack g on said ring, worm h, pinion i, rack j, lever l, rod m, and spring p, combined with the bobbin-wheel d^3, having a rack, worm b^3, pinion a^3, rack z, and pattern-wheel q on said standard, all arranged and operated substantially as herein shown and described.

7. In a circular-warp-knitting machine, the combination of the standard B, sleeve b, gear-wheel r on said sleeve, pinion s, meshing with said gear-wheel, pins u on said pinion, pattern-wheel q, and toothed wheel v on said pattern-wheel, all arranged and operated substantially as described.

8. The standard B and guide-ring supports f carried thereby, said supports having pendent rods r^4, the rods r^4 carrying rollers t^4, certain of said rods having springs w^4, combined with the sleeve b on the standard B, disk v^4, secured to said sleeve, and the cam on said disk, said cam engaging the roller t^4, whereby as said cam rotates the supports f will be reciprocated, substantially as described.

9. In a circular-warp-knitting machine, the standard B, sleeve c, guide-ring supports f^{10}, guide-ring D' on said supports, and rack a^4 on said ring, combined with the worm z^3, pinion z^2, rack w^2, levers t^2 u^2, rod g^2, spring r^2, and pattern-wheels v^2, substantially as herein shown and described.

10. In a circular-warp-knitting machine, the standard B and pattern-wheel v^2 carried thereby, said pattern-wheel having studs w^4, combined with the lever b^4, having rack d^5, pinion c^4, worm f^4, bobbin-wheel g^4, having a rack, lever t^3, rod w^4, lever v^3, rack w^3, pinion z^3, worm z^3, and guide-ring D', having rack a^4, substantially as described.

11. In a circular-warp-knitting machine, the standard B, pattern-wheel q, rod m, and lever l, actuated thereby, and rack j on said lever, combined with the sinker-ring arms y and means, substantially as described, for reciprocating said arms, pin x on said arms, that is adapted to engage the lever l, and with the pinion i, worm h, and guide-ring D, having rack g, substantially as herein shown and described.

12. The guide-ring support f^{10}, having brackets p^4, combined with the frame A, having brackets r^4, and with the rod q^4, passing through said brackets and rigidly secured to certain of said brackets, whereby the supports f^{10} are guided in their reciprocating motion and are held from turning in the machine, substantially as described.

13. In a circular-warp-knitting machine, the guide-ring D, means, substantially as described, for moving said guide-ring horizontally, and means, substantially as described, for raising and lowering said ring, combined with the needles g^3, and with means, substantially as described, for reciprocating said needles, as specified.

14. The standard B, having radial arms a^3 and rim a^5, supported by said arms, combined with the needle-jacks F, one end of which rests in the rim a^5, and with vertically-movable blades F^2, for actuating said needle-jacks, and means, substantially as described, for actuating said blades F^2, as specified.

15. The needle-jacks F, having arms f^3, supporting-rim a^5 for said jacks, and the guide-rim h^3, combined with the blades F^2, that contact the arms f^3 on opposite sides, and arms n^2, carrying said blades, which arms project from and slide on the standard B, and with means, substantially as described, for raising and lowering said arms n^2, as specified.

16. The standard B, arms n^2, that slide freely thereon, blades F^2, and rod c^2, carried by said arms, said rod having rollers p^2 and r^2, combined with the disk G, carrying cams g^3 s^3, that contact said rollers and give reciprocating motion to said rod c^2, needle-jacks F, and supporting-rim a^5, substantially as described.

17. In a circular-warp-knitting machine, the standard B, arms a^3 and b^3, and rims a^5 h^3, carried by said arms, combined with the needle-jacks F, that are supported and guided in said rims, and with means, substantially as described, for actuating the jacks, substantially as described.

18. In a circular-warp-knitting machine, the standard B, arms y, projecting therefrom and sliding freely thereon, sinker-ring E, carried by said arms and having sinkers f^2, and means, substantially as described, for actuating the arms y, and ring E, combined with the needles g^3, and with means, substantially as described, for reciprocating the needles, all arranged and operated substantially as herein shown and described.

19. The standard B, arms y, projecting therefrom, and sinker-ring E, carried by said arms, combined with the rod w^5, roller v^5 on said rod, cam w^7, disk G, carrying said cam, and sleeve b, surrounding the standard B and supporting the disk G, whereby the sinker-ring E will be raised and lowered, as set forth.

20. In a circular-warp-knitting machine, the standard B, arms a^3 and presser-ring H, carried by said arms, combined with means, substantially as described, for moving said presser-ring up and down to press the beards of the needles, and with the needles g^3, that are engaged by said presser-ring, and with means, substantially as described, for reciprocating the needles longitudinally, substantially as described.

21. The standard B and arms a^3, projecting therefrom and carrying the presser-ring H, combined with the rotary disk G, having cam f^6, and rod d^5, secured to the arm a^3 and having a roller, c^7, that rides on said cam f^6, whereby as the disk G rotates the presser-bar will be raised and lowered to press the needles, substantially as described.

22. The guide-ring D, means, substantially as described, for actuating the same, needle-jacks F, carrying needles g^3, and means, substantially as described, for actuating said jacks, combined with the sinker-ring E, means, substantially as described, for raising and lowering said sinker-ring, and with the presser H, and means, substantially as described, for actuating said presser, all arranged and operated substantially as herein shown and described, and for the purpose set forth.

23. In a circular-warp-knitting machine, the standard B, arms a^3 and blades F^2 on said arms, arms y and sinker-ring E on said arms, and the arms a^3 and the presser-ring H on said arms, said arms projecting from the standard B, combined with means, substantially as described, for reciprocating said arms n^2, y, and a^3, springs I, that are attached to said arms for relieving the weight carried by said arms, and with the needle-jacks F, and means, substantially as described, for supporting said jacks, substantially as specified.

24. In a circular-warp-knitting machine, the guides D^2 and means, substantially as described, for giving rotary and up-and-down motion to said guides, combined and operating with the reciprocating needles g^3, means, substantially as described, for reciprocating the needles, the sinkers d^3, means, substantially as described, for giving the sinkers up-and-down motion, and the presser-ring H, and with means, substantially as described, for giving said ring up-and-down motion, for the purposes set forth.

397,143. MAGAZINE-GUN. HENRY A. PITCHER, Bellsville, Wis. Filed Apr. 21, 1887. Serial No. 236,714. (No model.)

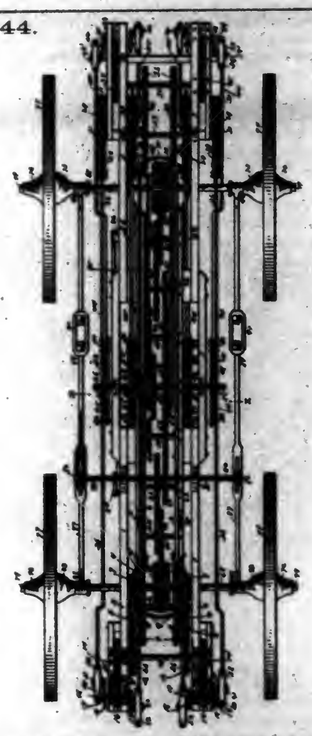
Claim.—1. The combination, with the lock mechanism, of the cylinder arranged under the barrel and having the vent communicating directly with the bore thereof, the piston in said cylinder in advance of the vent and connected to the lock mechanism, and the

397,143.

spring M, arranged in said cylinder and pressing rearward on the piston.

2. In a magazine fire-arm having the cylinder arranged under the barrel, and having the vent communicating directly with the bore of the barrel, the combination, with the lock mechanism, of the piston arranged in the cylinder in advance of the vent, the spring in said cylinder pressing rearward on the piston, the longitudinally-movable drive-rod G, attached to the piston and engaging with the tumbler P, which is pivotally attached to the segment I, and the link J, connecting the segment with the lock mechanism, substantially as set forth.

3. In a magazine fire-arm having the cylinder communicating with the bore of the barrel, the combination of the piston arranged in the cylinder, the drive-rod attached thereto, the tumbler engaging with said rod, the segment, the lock mechanism, the link connecting the latter to the segment, the spring-pressed connecting-rod attached to the segment, and the spring M, bearing rearward on the piston, substantially as described.



4. In a magazine fire-arm having the cylinder communicating with the bore of the barrel, the combination of the piston arranged in the cylinder, the spring M, pressing rearward on the piston, the drive-rod attached to the latter, the tumbler engaging with the drive-rod, the segment, the lock mechanism, the link connecting the latter to the segment, the follower, the spring S, pressing forward on the latter, and the rod connecting the follower to the segment, substantially as described.

397,144. ROAD-ENGINE. HEZEKIAH K. SAHS, Johnson City, Tenn. Filed Apr. 9, 1888. Serial No. 270,056. (No model.)

Claim.—1. In a road engine or vehicle, the combination of the frame, the wheels, and the axles, with the main or drive shaft provided with one or more central cog-wheels, and also with cog or ratchet wheels, a train of gearing connecting said main shaft and axles, levers fulcrumed upon said main shaft and provided with pawls for engaging said cog or ratchet wheels, cranks pivotally connected for vibrating the ends of said levers, and mechanism for imparting rotary motion to said cranks, substantially as described.

2. In a road engine or vehicle, the combination of the frame, the wheels, and the axles, with a drive-shaft provided with cog or ratchet wheels, gearing for transmitting the motion of said shaft to said axles, levers fulcrumed upon said drive-shaft and provided with pawls for engaging said cog or ratchet wheels, and with slotted frames at their rear ends, crank mechanism for vibrating said frames, a shaft provided with cog or ratchet wheels, gearing between the same and said crank mechanism, levers fulcrumed upon said shaft and provided with pawls for engaging said cog or ratchet wheels and with slotted frames at their front ends, crank mechanism for vibrating said frames and levers, a shaft provided with cog-wheels, and also with cog or ratchet wheels gearing intermediate of the same and said crank mechanism, and levers fulcrumed upon said shaft and operated from their rear ends, substantially as described.

397,144.

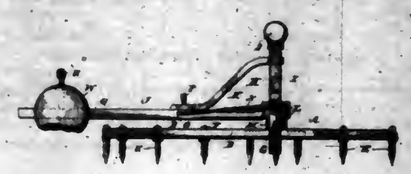
3. In a road engine or vehicle, the combination, with the frame, the axles, and their wheels, of a drive-shaft provided with four cog or ratchet wheels, gearing for communicating the revolutions of said shaft to said axles, levers fulcrumed upon said drive-shaft and provided with pawls for engaging said cog-wheels or ratchet-wheels and with longitudinally-slotted frames at their rear ends, shafts provided with cranks upon their ends, having pins which revolve and play within the slots of the said frames, a shaft having four cog or ratchet wheels, gearing between the same and said crank-shafts, levers fulcrumed upon said shaft and provided with pawls for engaging said cog or ratchet wheels, and with longitudinally-slotted frames at their front ends, crank-shafts provided with pins which revolve and play within the slots of said frames, a shaft provided with cog-wheels, intermediate gearing between the same and said crank-shafts, said shaft being also provided with two cog or ratchet wheels, and two foot-levers provided with treadles upon their rear ends, and which are fulcrumed upon said shaft, and with pawls engaging said cog or ratchet wheels, substantially as described.

4. In a road engine or vehicle, the combination of the foot-levers 6, the crank-shafts 38, and intermediate gearing between said crank-shafts and foot-levers, with the drive-shaft 46, provided with the cog-wheels 48, and the levers 44, pivoted upon said drive-shaft and provided at their front ends with bifurcated portions 45, having semicircular frames 49, pawls 50 in the ends of said bifurcated portions, and pawls 51 in the upper portions of said semicircular frames, and at their rear ends with longitudinally-slotted frames 40, which are connected to and vibrated by said crank-shafts, substantially as described.

5. In a road engine or vehicle, the combination of the crank-shafts 38, the arms 39, adjustably secured in perforations in the ends thereof and provided with crank-pins 39', the vibratory levers 44, the longitudinally-slotted frames 40, mounted upon said crank-pins and provided with the downwardly-projecting arms 41, having sleeves 42, fitted upon the ends of said levers and adjustable thereon by the set-screws 43, substantially as and for the purpose described.

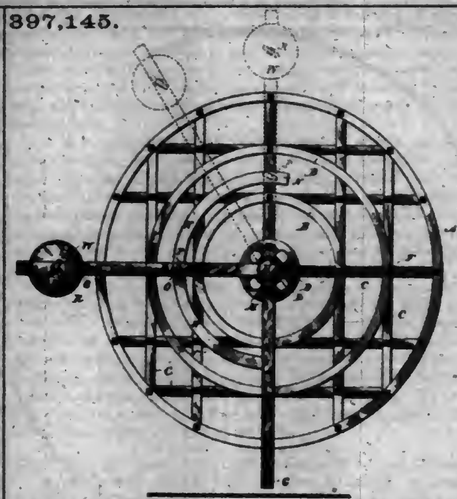
6. The combination of the frame provided with the sixth-wheel forming part of a circle which is open at the inner side and having a downwardly-projecting flange upon its inner edge, a correspondingly-shaped fifth-wheel fitted within said flanged sixth-wheel and provided with boxes or bearings upon its under side, the wheel-axle journaled in said boxes or bearings, and having a gear-wheel upon its middle, and gearing projecting through the open sides of said fifth and sixth wheels, substantially as described.

7. The combination of the frame provided with the sixth-wheel forming part of a circle which is open at the inner side and having a downwardly-projecting flange upon its inner edge, a cog-wheel and its shaft journaled in bearings in said frame, means for driving said cog-wheel, which partly projects through the open side of said sixth-wheel, a fifth-wheel fitted within said flanged sixth-wheel and having a shape corresponding thereto and provided with boxes or bearings upon its under side, and a wheel-axle journaled in said boxes or bearings and provided with a partly-spherical cog wheel which meshes with said cog-wheel which is journaled in the frame, substantially as described.



8. The combination of the frame and the wheel-axle journaled in bearings on the under side of said frame and provided with cups at its ends and with spindles projecting through said cups, which are provided with lugs or ribs upon their inner sides, with the wheels journaled upon said spindles and provided with hubs, also having lugs or ribs upon their inner parts which project and fit into said cups, and are adapted to permit their lugs or ribs to bear against those within said cups, substantially as and for the purpose described.

9. The combination of the frame 1, the pivoted axles 68, adapted to turn in one plane beneath said frame, the rock-shaft 80, provided at its ends with the upwardly and downwardly projecting arms 82 and 83, and with the arm 84 near one end, the downwardly and forwardly extending rods 87, having boxes 88 at their forward ends for the front axle and having their rear ends respectively pivoted to one of said upwardly-projecting arms 82 at one end of said rock-shaft and to one of said downwardly-projecting arms 83 at the other end of said shaft, the two rearwardly-extending rods 89, provided with turn-buckles 91 for adjusting their length, and with boxes 90 at their rear ends for the rear axle, and respectively pivoted at their forward ends, one to the upwardly-projecting arm 82 at one end of said rock-shaft and the other to the downwardly-projecting arm 83 at the other end of said shaft, the steering-lever 86, and the connecting-rod 85, pivoted thereto and to said arm 84, substantially as and for the purpose described.



10. A road engine or vehicle provided with the two pivoted axles 68, having cog-wheels 67 at their centers, which have the shape of parts of spheres, the main or drive shaft 46, provided with four cog or ratchet wheels, 48, and cog-wheels 52 and 54, intermediate gear or cog wheels between said cog-wheels upon the drive-shaft and said partly-spherical cog-wheels upon the axles, the levers 44, fulcrumed upon said drive-shaft and provided with pawls 50 and 51, pivoted between their bifurcated ends 45 and between their curved frames 49, and with the longitudinally-slotted frames 40 at their rear ends, the crank-shafts 38, having pins 39', playing and revolving in said longitudinally-slotted frames, the shaft 27, provided with four ratchet-wheels, 29, and with cog-wheels 32, gearing for communicating motion thereto from said crank-shafts, the levers 26, provided at their rear portions with bifurcated ends 30, which straddle said ratchet-wheels, are fulcrumed upon said shaft 27, and have pawls 31, engaging with said ratchet-wheels said pawls being pivoted between the ends of said levers and between frames 30, curving upward from their bifurcated ends, said levers 26 being provided at their forward ends with longitudinally-slotted frames 22, the crank-shafts 18, having their pins 21 moving in said frames 22, the shaft 2, having two cog or ratchet wheels, 4, and cog-gears 5, intermediate gearing between said cog-gears and said crank-shafts, the two foot-levers 6, having treadles 10 upon their rear ends, the springs 11 for raising them, said levers being fulcrumed at their forward parts upon said shaft 2 and provided with bifurcated ends 7, which straddle said cog or ratchet wheels, and are provided with pawls 9 for moving said cog or ratchet wheels, substantially as described.

397,145. HARROW. MATTS SNOW, Omaha, Nebr., assignor of two-thirds to Lawrence C. Enewold and Edward Peterson, same place. Filed Nov. 14, 1887. Serial No. 255,169. (No model.)

Claim.—The combination, in a rotary harrow, of a rotary frame provided with a central pivot, a draft-bar and weighted arm centered upon said pivot, brace-bars rigidly secured to the draft-bar and weighted arm, respectively, and pivoted to the central pivot, a semicircular bar rigidly secured to the draft-bar and in engagement with the weighted arm, and a set-screw for locking the semicircular bar to the weighted arm, all arranged and adapted to operate substantially as described.

397,145.

397,146. INDIAN-INK AND COLOR SLAB. EDWARD G. SOLTMANN, New York, N. Y. Filed Feb. 6, 1888. Serial No. 263,131. (No model.)

Claim.—1. An ink or color slab provided with a long and narrow combined grinding cavity and well having a bottom extending in a continuous longitudinal curve from the center to near each end and having converging walls, substantially as described.

2. An ink or color slab having a grinding cavity or well provided with a concave bottom and a secondary cavity or well open at an end of the slab, substantially as described.

3. An ink or color slab having a main grinding cavity or well and a secondary cavity or well comprising a main portion, and an end portion less depressed than the main portion and extending through an end of the slab, substantially as described.

4. An ink or color slab having a main cavity provided with a concave bottom and a secondary cavity extending through both ends, substantially as described.

5. An ink or color slab having a sliding cover, made light at one end and heavy at the other, as and for the purpose specified.

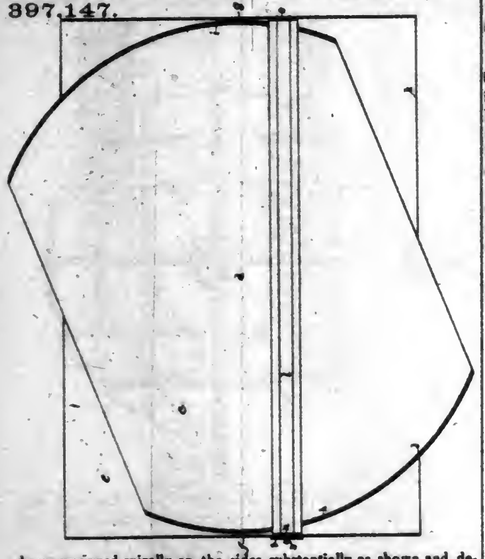
6. An ink or color slab having a sliding cover longitudinally curved in a vertical plane and made heavier at one end than at the other, as and for the purpose specified.

7. An ink or color slab having a sliding cover, made light at one end and heavy at the other and rabbeted in the slab, as and for the purpose specified.

397,147. ROTATABLE DRAWING-BOARD AND MECHANICAL RULER. CHARLES SPERRY, Fort Washington, N. Y. Filed June 22, 1888. Serial No. 277,911. (No model.)

Claim.—1. The combination of a drawing-board pivoted to a frame, graduated scales concentric with the pivot, and pointers for indicating the degrees of any angle at which the board may be placed, substantially as shown and described.

2. The combination of a drawing-board having racks along its sides, and a ruler having pinions gearing with and rolling on said racks to keep the ruler in a parallel direction when moved over the board, substantially as and for the purposes set forth.



3. The combination of a drawing-board which may be rotated on a frame having a rack at each end alongside of the board and a ruler having pinions working on said racks for drawing lines at all angles and moving the ruler in a parallel direction, substantially as shown and described.

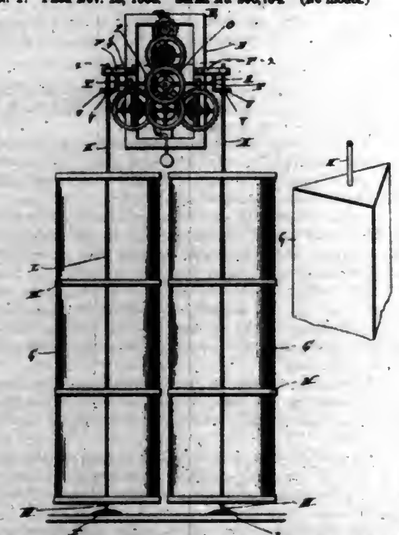
4. The combination of a ruler provided with a pinion at each end, which are connected by a shaft and gear in a rack at each side of a drawing-board, substantially as shown and described, and for the purposes set forth.

5. The combination of a ruler, pinions working on racks at each side of a drawing-board, a shaft, and index-wheels for measuring, shading, section-lining, and moving the ruler as desired, substantially as shown and specified.

6. The combination, with a drawing-board provided with racks, of a ruler provided with pinions, shaft, and index-wheels having in-

397,147.

dexes arranged spirally on the sides, substantially as shown and described, and for the purposes set forth.



7. The combination, with a drawing-board provided with racks, of a ruler provided with pinions, shaft, and index-wheels having indexes arranged spirally on the periphery, substantially as described, and for the purposes set forth.

8. A drawing-board provided with racks, in combination with a ruler moved and guided by a shaft and pinions working and rolling on said racks, and index-wheels for operating the ruler, substantially as and for the purposes described.

9. A drawing-board provided with graduated scales of degrees, turning on a frame having racks alongside of the board, in combination with a mechanically-moved ruler provided with pinions connected by a shaft and index-wheels, substantially as shown and described, and for the purposes set forth.

10. A rotatable drawing-board, scales, pointers, frame, and racks, in combination with a mechanical ruler, pinions, shaft, and index-wheels, all constructed and arranged for being operated as a T-square, protractor, triangles, parallel-ruler, and section-liner for measuring and drawing all lines at any angle or distance apart, substantially as specified.

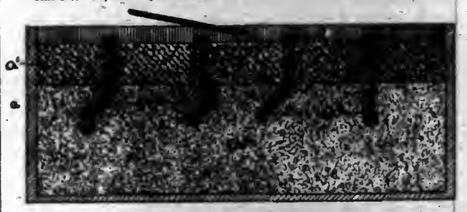
397,148. ADVERTISING-CLOCK. ANDREW V. STRAIT, Sidney, N. Y. Filed Nov. 13, 1888. Serial No. 290,734. (No model.)

Claim.—1. In an advertising-clock, the combination of the frame E, the clock mechanism therein, having the gear O, the shaft R, journaled transversely in frame E and having the pinion engaging said gear-wheel, the vertical axially-revoluble barrels, and the gears connecting the same to the shaft R, substantially as described.

2. The combination, with the clock mechanism having the gear O, of the transverse shaft R, having pinion P geared thereto, and having the crown-wheels T, the axially-revoluble barrels having the shafts K, and the pinions on the said shafts and in frictional contact therewith, the said pinions engaging the wheels T, whereby the barrels may be turned without affecting the clock mechanism, substantially as described.

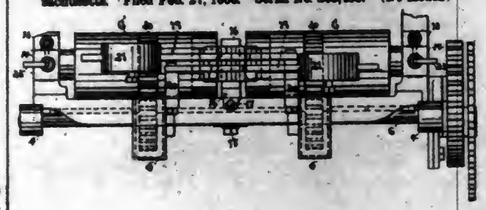
3. In an advertising-clock, the combination of the frame E, the clock mechanism therein, having the gear O, the shaft R, journaled transversely on the frame and having the gear P engaging gear O, and provided at its ends with the gears T, the arms F, projecting from opposite sides of the frame E, the vertical shafts K, having their upper ends journaled in said arms and having the barrels G, and the gears U on said shafts engaging wheels T, substantially as described.

397,149. REVOLVING HANDLE FOR ROLLING-PINS, &c. JOHN H. SUNDERMAN, Quincy, Ill. Filed June 6, 1888. Serial No. 276,211. (No model.)



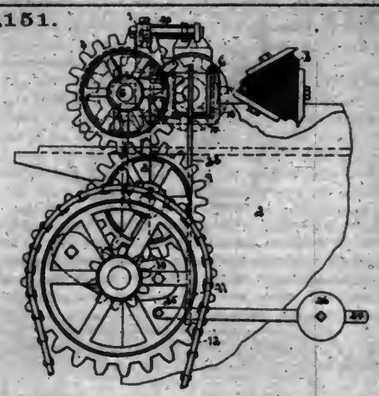
Claim.—1. A solid rolling-pin, A, having the pegs C rigidly secured therein and projecting therefrom, and having the heads *d* at the outer ends, and the revolving handles B, loosely mounted on the pegs and recessed at *b* to entirely receive the heads of the pegs within the handles, so that no portion of the peg-heads will project beyond the handles, as set forth.

2. A solid rolling-pin, A, having the pegs C rigidly secured therein and projecting therefrom, and having the heads *d*, and the revolving handles B, mounted on the pegs and recessed at *b* to receive the heads of the pegs within the handles, and the caps to close the outer ends of the recesses, as set forth.



3. As a new article of manufacture, the solid rolling-pin having the bores *a* in its ends, the handles B, having the bores *c* and the countersunk enlargements *b* at their outer ends, the pegs C, passed through the bores *c*, of the handles and secured in the bores *a* of the pin, said pegs having the enlarged heads *d* in the enlargements *b* of the handles, and the plugs D in the outer ends of said enlargements, substantially as described.

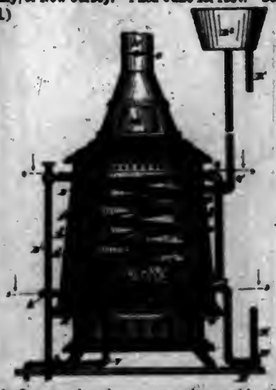
397,150. APPARATUS FOR BURNING KEROSENE-OIL FOR FUEL. GREENLEAF L. SWETT, Boston, Mass. Filed Feb. 20, 1888. Serial No. 265,764. (No model.)



Claim.—The combination of the containing-tank *a*, the mass-wick a^3 therein, the porous block *a'*, covering the top of the mass-wick, said porous block being provided with wick-holes, and individual wicks a^2, extending through said block onto the mass-wick, substantially as described.

397,151. ROLLS FOR PLANING-MACHINES. JOHN R. THOMAS, Boston, Mass., assignor to The S. A. Woods Machine Company, of Massachusetts. Filed Feb. 27, 1888. Serial No. 265,435. (No model.)

397,151.



Claim.—1. The combination, in a planing-machine, of a feed-roll, C, provided with the the gear around its periphery intermediate between its ends, and having the bearing-surface of the roll upon each side thereof, and the shaft 6 and its gear 7, engaging with gear 30 and driving the roll, substantially as described.

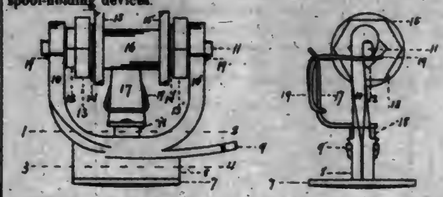
2. The combination, in a planing-machine, of a feed-roll, C, provided with the gear 30 around its periphery intermediate between its ends, and having the bearing-surface of the roll upon each side thereof and held in guideways which allow it to rise and fall to accommodate itself to the varying thickness of the lumber, and the shaft 6 and its gear 7, placed alongside of the roll in position to engage with gear 30 and allow the roll to rise and fall past the same, substantially as described.

3. The combination, in a planing-machine, of a feed-roll provided with the gear 30 around its periphery intermediate between its ends, and having the bearing-surface of the roll upon each side thereof and held in guideways which allow it to rise and fall to accommodate itself to the varying thickness of the lumber, and the shaft 6 and its gear 7, placed on the feed-in side of the roll in position to engage with the gear 30 and bring a compression upon the roll moving past it by the direction of its rotation, substantially as described.

4. The combination, in a planing-machine, of a divided feed-roll, C C', extending across the bed of the machine, and having its sections independently supported at the ends and over the middle of the bed, and each provided with a gear, 30, around its periphery intermediate between its ends, and having the bearing-surface of the section upon each side thereof, and the shaft 6 and its gears 7 7, respectively engaging with gears 30 and driving the sections of the roll, substantially as described.

397,152. APPARATUS FOR HEATING RAILROAD-CARS. HENRY R. TOWNE, Stamford, Conn., assignor to The Safety Car Heating and Lighting Company, of New Jersey. Filed June 13, 1887. Serial No. 241,187. (No model.)

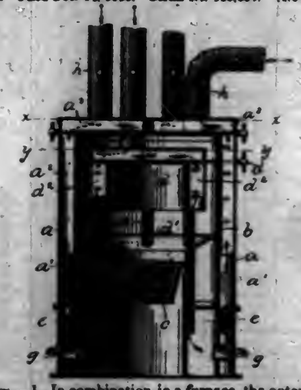
Claim.—1. In a car-heating system, the combination, with a system of water-circulating pipes within a car, of a water-heating device provided with a heating-coil, one portion of which is located within the combustion-chamber of said heater and the other portion within a transfer-chamber arranged external to said combustion-chamber, and said heating-coil connected to and forming part of the said water-circulating system, substantially as and for the purpose set forth.



2. In a car-heating system, the combination, with a system of water-circulating pipes within a car, of a water-heating device provided with a heating-coil, one portion of which is located in the combustion-chamber of said heater and the other portion in a transfer-chamber arranged external to said combustion-chamber, said coil connected to said water-circulating system, a main steam-pipe connected to the source of steam, and a branch pipe connected to said main pipe and said transfer-chamber, substantially as and for the purpose set forth.

3. In a car-heating system, the combination, with a system of water-circulating pipes within a car, of a water-heating device provided with a heating-coil, one portion of which is located within the combustion-chamber of said heater and the other portion within a transfer-chamber arranged independently of and separated from that portion of the device containing the combustion-chamber, and said coil connected to the said water-circulating system, substantially as and for the purpose set forth.

4. In a car-heating system, the combination, with a system of water-circulating pipes within a car, of a water-heating device provided with a heating-coil, one portion of which is within the combustion-chamber of said heater and the other portion within an independently-arranged transfer-chamber, said coil connected to the water-circulating system, a gas-heating device in said combustion-chamber, a main steam-pipe connected to the source of steam, and a branch pipe connected to said main pipe and to said transfer-chamber, substantially as and for the purpose set forth.

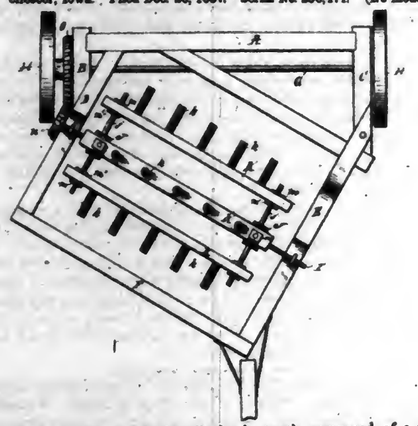


397,153. RACER FOR BRAIDING-MACHINES. JULIUS A. TURNER, Southfield, Mass. Filed May 12, 1888. Serial No. 273,706. (No model.)

Brief.—The invention relates particularly to the tension and spool-holding devices.

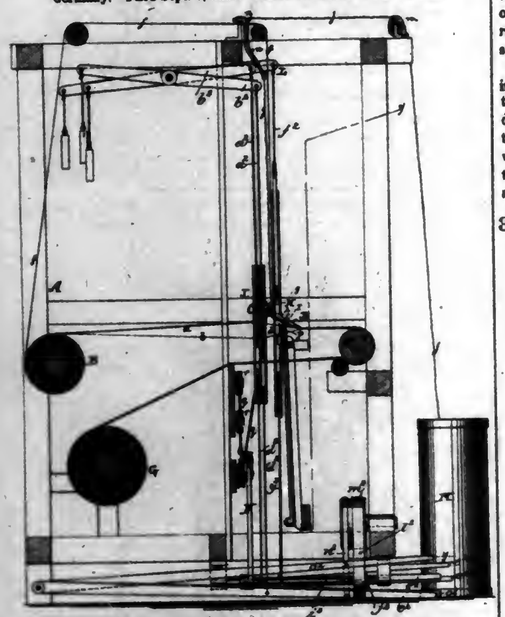
Claim.—In combination with the body or frame of the racer having the recessed arms 10 10', the spindle 11, nut 12, blocks 13 13', washers 14 14', chair 17, and bifurcated spring 19 19', all arranged, combined, and operating in the manner and for the purpose specified.

397,154. HOT-AIR FURNACE. LEWIS W. TURNER, Yalesville, Conn. Filed Dec. 14, 1885. Serial No. 185,637. (No model.)



Claim.—1. In combination, in a furnace, the outer heating-chamber, *a'*, having cold-air inlets *g* and hot-air flues *h* connecting therewith, the vertical diaphragms a^5, fixed between the upper part of the walls, but terminating short of the bottom of the heating-chamber, the dampers a^6, extending across the upper part of the furnace in continuation of the diaphragms, and the handles for operating the said dampers, located on the outside of the furnace-wall, all substantially as described.

2. In combination, in a furnace, the heat-circulator *d*, located in the combustion-chamber directly above the fire, the cold-air inlets to said chamber under the lower part, and the hot-air flue leading from the upper part, the vertical diaphragms d^5, that divide the annular heating-chamber, that stop short of the bottom of the annular chamber, leaving a space for the passage of air, and the damper d^6, hinged within the heater in continuation of the diaphragms and having a handle extending to the outside of the furnace, and the outer heating-chamber separated into heating-sections by means of the ver-

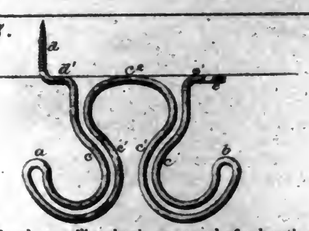


tical diaphragms that are extended by dampers, all substantially as described.

397,155. TOOTH FOR HORSE HAY-RAKES. ELWOOD TUSH, Manchester, Iowa. Filed Dec. 20, 1887. Serial No. 258,471. (No model.)

Claim.—The herein-described rake-tooth, composed of a wire coiled from end to end of the tooth, the coils touching throughout the length of the tooth, substantially as and for the purpose specified.

397,156. LOOM. ALWILL URBAHN, Nagelsbaum, near Burscheid Germany. Filed Sept. 9, 1887. Serial No. 249,205. (No model.)



Claim.—1. In a loom, the cord-guide I, having loops *o* and *p*, and its carriage J, combined with the lever N, cord *q*, connecting-carriage J, and lever N, shaft i^3, wheel j^3 on said shaft, wheel m^3, connected with the wheel j^3, and the treadles o^3, connected with the wheel m^3, all arranged and operating substantially as herein shown and described.

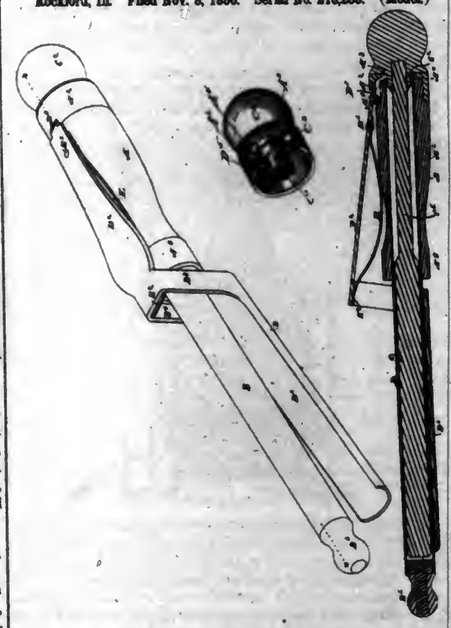
2. The combination of the cord-guide I, its carriage J, cord *q*, lever N on shaft i^3, shaft i^3, pulley j^3, treadles o^3, straps i^3 n^3, and wheel m^3, all arranged for operation substantially as described.

397,157. HOOK. CORNELIUS S. VAN WAGONER, Brooklyn, N. Y. Filed May 30, 1888. Serial No. 275,429. (No model.)

Claim.—1. An overhead or ceiling hook composed of a length of wire bent and forming two connected hooks standing back to back, the wire in each being in two lines substantially corresponding in contour, and having at one end of the wire a screw-threaded shank above one of the hooks and an eye at the other end above the other hook, substantially as described.

397,157.

2. An overhead or ceiling hook composed of a length of wire bent and forming two connected hooks standing back to back, and having the wire in each arranged in two lines corresponding in contour, and also having at the top of the hook a central bearing-surface for contact with ceiling, and similar parallel bearing-surfaces in both terminals of the wire above the hooks, substantially as described.



397,158. CAR-STARTER. NICHOLAS V. VIELE, Corning, N. Y. Filed Nov. 9, 1888. Serial No. 290,371. (No model.)

Claim.—1. The combination, with a car having a transverse timber secured thereto beneath the floor of the car, of a hammer pivoted to the car and adapted to automatically impart a blow to the rear face of the timber simultaneously with the starting of the car, substantially as and for the purpose specified.

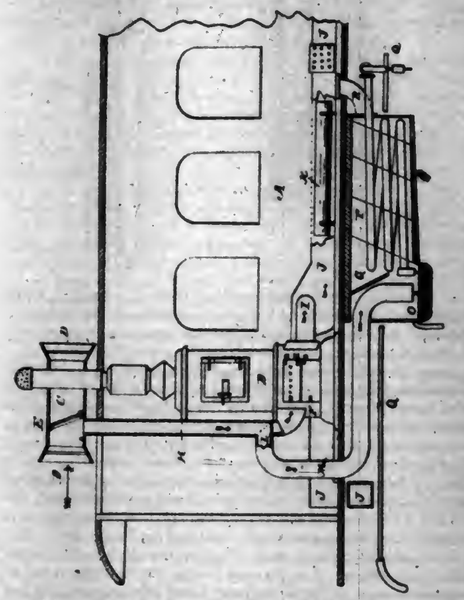
2. The herein-described improvement in car-starters, comprising, in combination, a car, a transverse timber secured thereto beneath the floor of the car, a hammer, the end of which is attached to a diagonal shaft journaled within boxes secured to the rear face of the timber, and a chain connecting the handle of the hammer with the whiffletree, whereby the hammer is caused to impart a blow to the timber at the moment of starting the car, substantially as described, and for the purpose specified.

397,159. HAIR CRIMPER AND CURLER. RICHARD W. WELDON, Rockford, Ill. Filed Nov. 8, 1886. Serial No. 218,253. (Model.)

Claim.—1. In a hair curler and crimper, the combination, with the handle A, having a tubular opening, A', through the longitudinal center thereof and provided with the combined cap and ferrule A^2, of

the jaws B D, the latter being hinged to the combined cap and ferrule A^2 and provided with the slot D^4, through which the jaw B passes, substantially as set forth.

2. In a hair crimper and curler, the combination, with the handle A, having a tubular opening through the longitudinal center thereof and provided with the combined cap and ferrule A^2, the former being perforated by the central circular opening, A^3, of the tubular jaw B, provided with the swivel-knob B', the cylindrical heating-iron C, of diminished diameter at C', the jaw D, composed of the semi-tubular part D', the flat portion D^2, hinged to the combined cap and ferrule A^2 at D^3, and the portion D^2, perforated by a slot, D^4, through which the jaw B is inserted, and the spring E, substantially as described.



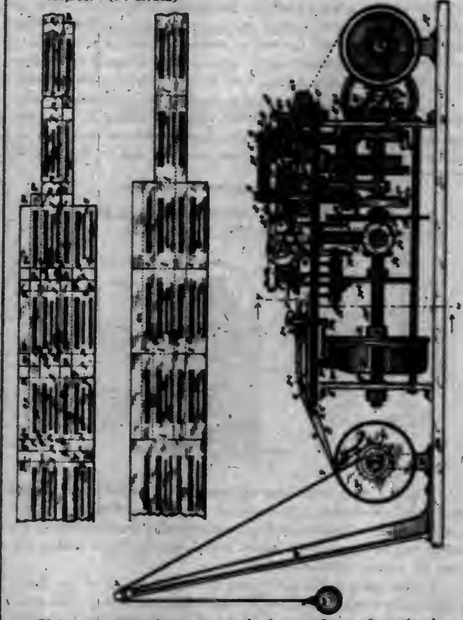
397,160. COIN-CONTROLLED FINGER-PULL. FREDERICK R. WHITE, Boston, Mass. Filed July 14, 1888. Serial No. 279,967. (No model.)

Claim.—1. A finger-pull consisting of a frame or casing, a rod having bearings and longitudinally movable in said casing, said rod being provided with a finger-hook or similar device extending beyond the casing, whereby said rod may be drawn outward, a spring to resist the drawing outward of said rod, a bar provided with ratchet-teeth connected with said rod, a pawl to engage the ratchet-teeth of said bar, a coin-chute to guide a coin into position on said pawl to disengage it from said ratchet-teeth, and a friction-clip having a limited movement on said ratchet-bar between said pawl and the teeth on said bar, as set forth.

2. The combination, in a finger-pull, of the longitudinally-movable rod and its rack-bar, with the friction-clip *k*, having a limited movement on said bar, a pawl to engage and be disengaged from said rack-bar, and a coin-chute to guide a coin into position on said pawl, substantially as hereinbefore set forth.

397,161. APPARATUS FOR HEATING RAILWAY-CARS. FRANCIS M. WILDER, Binghamton, N. Y., assignor, by mesne assignments, to The Safety Car Heating and Lighting Company, of New Jersey. Filed Aug. 29, 1887. Serial No. 248,119. (No model.)

Claim.—1. A car-heater comprising a stove within the car, an air-induction pipe, an eduction-pipe for the heated air, and one or more closed vessels containing a body of heat-absorbing material.



2. The combination, in a car-heater and with the air-heating drum thereof, of an air-induction pipe, an eduction-pipe for the heated air, and one or more closed vessels containing a body of heat-absorbing material.

3. A car-heater comprising a drum containing a steam-conveying pipe or pipes, a pipe or conduit for conveying air to the said drum, an air-flue connected to said drum and within the car for circulating the heated air, and a closed vessel or vessels containing a body of heat-absorbing material within said air flue or flues.

4. A car-heater comprising a stove within a car, an air-heating drum independent of the stove, an air induction and eduction pipe connected to said stove and drum, and a closed vessel or vessels containing a heat-absorbing material, so located as to be heated by the heated air conveyed by the eduction-pipe.

5. A car heater comprising a stove within a car, an air-heating drum independent of the stove, an air-induction and air-eduction pipe connected to said stove and drum, a closed vessel or vessels containing a heat-absorbing material, and a valve in the induction-pipe, whereby the stove or heating-drum may be operated independently of each other.

397,162. ART OF AND MACHINE FOR MAKING BOXES, &c. MCCLINTOCK YOUNG, Frederick, Md. Filed Aug. 30, 1886. Serial No. 212,210. (No model.)

Claim.—1. As an improvement in the art of manufacturing boxes from a strip of paper, &c., the described method of preparing the connected blanks for pasting and folding, consisting in intermittingly advancing the strip, and during intermissions in its advance movement cutting and creasing to successively and completely form the respective blanks of a series of unfolded unpasted blank connected at their ends by narrow necks, substantially as set forth.

2. As an improvement in the art of manufacturing boxes from a strip of paper, &c., the described method of preparing the connected printed blanks for pasting and folding, consisting in intermittingly advancing the strip, successively printing the respective blanks during intermissions in the advance movement of the strip, and cutting and creasing other blanks, also during intermissions in the advance movement of the strip, to successively complete the respective blanks of a series of unfolded unpasted blanks connected at their ends by narrow necks, substantially as set forth.

3. As an improvement in the art of manufacturing boxes from a strip of paper, &c., the described method of producing the connected box-tubes, consisting in intermittingly advancing the strip, during intermissions in its advance movement cutting and creasing it to successively completely form the respective unfolded unpasted blanks of a series, with the narrow necks connecting them at their ends, applying paste to the successive blanks, and during intermissions in the advance movement of the strip folding previously cut and pasted blanks into flattened connected box-tubes, substantially as set forth.

4. As an improvement in the art of manufacturing boxes from a strip of paper, &c., the described method of producing and compactly bundling and compressing the connected box-tubes, consisting in inter-

mittingly advancing the connected cut and creased blanks, applying paste, folding into flattened connected box-tubes, and winding them under tension into a compact roll, substantially as set forth.

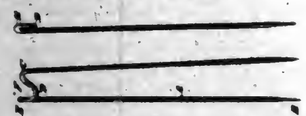
5. As an improvement in the art of manufacturing boxes from a strip of paper, &c., the described method of preparing the connected blanks and producing and compactly bundling and compressing the connected box-tubes, consisting in intermittingly advancing the strip, cutting and creasing it to successively form the respective blanks of a series, with the narrow necks connecting them, applying paste to the blanks, folding the blanks, and finally winding them into a compact roll, substantially as set forth.

6. As a new article of manufacture, the series of connected pasted flattened box-tubes, substantially as and for the purpose set forth.

7. A compact roll of connected pasted flattened box-tubes, substantially as and for the purpose set forth.

8. The combination of the paper-supplying roll, the vertically-reciprocating cutters and creasers, their head, the reciprocating frame by which the head is carried, pasting apparatus, substantially such as described, the primary folders carried by said reciprocating frame, the final folders, the springs acting upon them, feeding mechanism, substantially such as described, the spring by which it is moved one way, the main actuating-shaft, by mechanism substantially such as described, connected with which the reciprocating frame and the final folders are actuated and the feeding mechanism moved in opposition to its spring, and the bundling-roll automatically actuated to wind up the connected box-tubes, substantially as and for the purpose set forth.

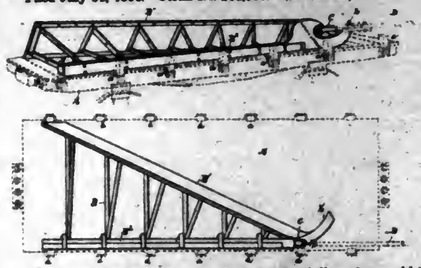
9. The combination of the former, the vertically-reciprocating primary folders slotted and provided with the folding-lugs, and the final folders provided with the folding-lugs to enter the slots between the lugs of the primary folders, substantially as and for the purpose set forth.



397,163. CAN-JACKET. William Zimmer, Jr., New York, N. Y.
Filed June 7, 1888. Serial No. 276,376. (No model.)

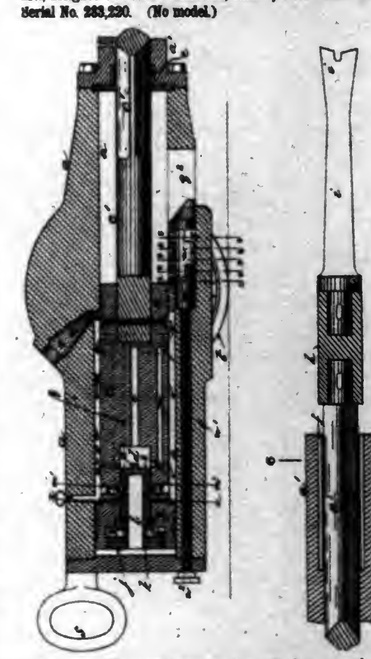
Claim.—1. A removable can-jacket of indented or corrugated sheet metal or other suitable material, comprising a body-section and a neck-section separated by a circumferential strengthening-rib, 10, and having its longitudinal edges joined together by a locked lap-joint, 11, substantially as set forth.

2. The combination, with a can for containing oil or the like, of a removable enveloping-jacket of indented or corrugated sheet metal or other suitable material, provided with a circumferential strengthening-rib between the neck and body sections, a locked lap-joint uniting its longitudinal edges, and a bottom of wood or other suitable material, and a wire confining in place the gathered-in neck-section, substantially as set forth.



397,164. HAIR-PIN. William B. Basta, Springfield, Ohio. Filed Jan. 23, 1887. Serial No. 225,766. (No model.)

Claim.—1. As an improved article of manufacture, a hair-pin composed of a body pointed at one end, bent near the other end, and extended laterally at an angle to the body portion, and then bent again and extended upwardly, whereby a shoulder or loop is formed between the said bends, which acts to engage the hair when turned crosswise the direction in which the strands are combed, and to disengage from the hair when turned in line with said strands.



2. As an improved article of manufacture, a hair-pin composed of a pointed body having a loop or shoulder near the upper end, which extends laterally from the body, and which acts to engage the hair when turned crosswise the direction in which the strands are combed, and to disengage from the hair when turned in line with said strands.

397,165. CAR-UNLOADER. Henry M. Barnhart, Marion, Ohio.
Filed July 31, 1888. Serial No. 281,560. (No model.)

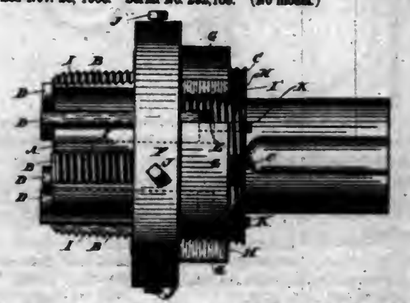
Claim.—A car-unloader consisting, essentially, of a mold-board running obliquely across the car for discharging the load to the one side of the car, a runner extending lengthwise of the car for engaging the adjacent side stakes of the car, the point of the plow curving upwardly and curved laterally in the direction away from the adjacent guiding-stakes, substantially as set forth.

397,166. DIRECT-ACTING ENGINE. Gustav A. Barta, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Aug. 20, 1888. Serial No. 283,220. (No model.)

Claim.—1. The combination of a cylinder, *a*, a piston, *b*, fitting therein, a tubular piston-rod, *c*, formed on or secured to said piston and provided with separate inlet and exhaust passages *n* and *q*, respectively, said passages *q* communicating with a circumferential recess or passage, *q'*, on the inner end portion of the piston-rod *c*, a distribution-valve, *k*, fitting within a chamber or cavity, *d*, in said piston-rod and having a central supply-passage, *l*, extending from its open end to lateral ports *m*, and annular passage *m'* adjacent to the inner end of the chamber *d*, the ports *m* and passages *l m'* being so arranged as to communicate alternately with the said inlet and exhaust passages *n* and *q q'*, inlet-passages n^3 in the tubular piston-rod *c* communicating with the chamber *d* between its inner end and the corresponding end of the distribution-valve *k*, an inlet-passage, *o*, in the piston-rod *c*, opening into the chamber *d* at its inner end behind the distribution-valve *k*, and an exhaust-passage, *p*, leading from the side of the chamber *d* and through the piston-rod *c* to the outside of the latter, an exhaust-passage, q^3, in the cylinder *a*, and inlet-passages *x* in the piston-rod *c*, communicating with the chamber *d* above the upper shoulder of the distribution-valve *k* when in its extreme inner position, the whole operating to hold, reverse, and cushion the distribution-valve *k* at the proper times and so govern the supply and exhaust of motive fluid to and from the piston *b* and distribution-valve *k*, substantially as shown and described.

2. The combination of the distribution-valve *k*, having a projection, *a*, with the inlet-passage *o*, substantially as shown, and for the purpose described.

3. The combination of cylinder *a*, piston *b*, and tubular piston-rod *c*, closed at its inner end, and extension piston-rod *c'*, with cylindrical casing *d'* closing the inner end of cylinder *a*, for cushioning the tubular piston-rod *c*, substantially as shown and described.



4. The combination of tube or casing *d'* and extension piston-rod *c'* with packing-strips *f*, substantially as shown, and for the purpose described.

5. The combination of exhaust ports or passages and valve *w* with the outlet and exhaust passages from piston and piston-rod, substantially as shown, and for the purpose described.

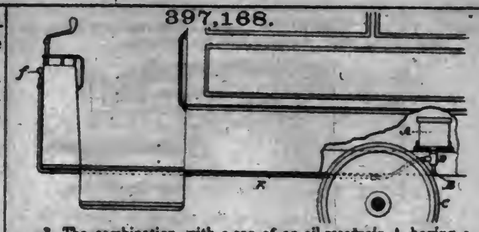
6. The combination of exhaust ports or passages and valve *w* with the outlet-passage *p*, and exhaust-passages *q q'* from piston *b* and piston-rod *c*, substantially as shown, and for the purpose described.

7. The combination of inlet ports or passages and valve *y* with outlet-passage from cylinder and inlet-passage in piston-rod, substantially as shown, and for the purpose described.

397,167. PIPE-TAP. Horace C. Bradford, Milwaukee, Wis.
Filed Nov. 28, 1888. Serial No. 292,108. (No model.)

Claim.—1. In a pipe-thread-cutting tool, the combination of the head-block A, provided with tap-grooves C and tap-adjusting threads I', cutting-taps B, located in their respective grooves C, inclosing-band F, surrounding said taps, tap-retaining blocks G, interposed between said inclosing-band F and the respective taps B, the threads of said blocks G being adapted to engage at one end in the threads I of the cutting-taps and at their other ends in the tap-threads I', formed upon the head-block A, and adjusting-screws J, operating in said inclosing-band F and engaging at their inner ends against said tap-retaining blocks G, substantially as and for the purpose specified.

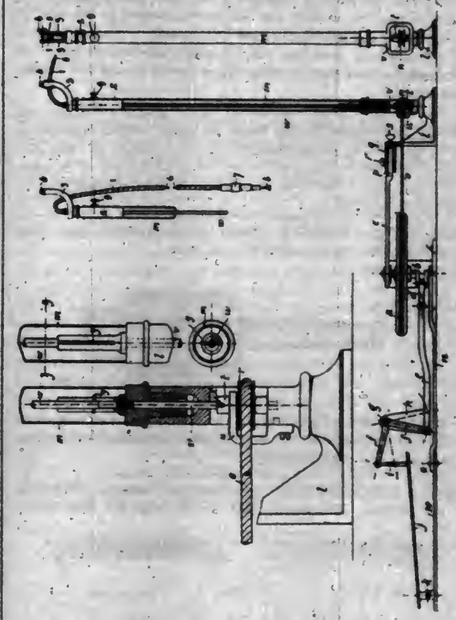
2. In a pipe-thread-cutting tool, the combination of the head-block A, provided with reamer-retaining grooves E, reamers D, located in their respective retaining-grooves, adjusting-screws K, operating in screw-threaded apertures provided therefor in the rear end of said head-blocks A, and adapted to bear at their front ends against the rear or inner ends of said reamers D, substantially as and for the purpose specified.



3. In a pipe-thread-cutting tool, the combination of the head block A, provided with tap-adjusting threads I', formed on its periphery at its rear or inner end, tap-retaining grooves C, and reamer-retaining grooves E, formed longitudinally in the periphery at its front end, cutting-taps B, and reamers D, located in their respective grooves C and E, inclosing-band F, surrounding said taps, tap-retaining blocks G, interposed between said inclosing-band F and the respective taps B, the threads of said blocks G being adapted to engage both upon the threads I of the cutting-taps, and the adjusting-threads I', formed upon the head-block A, adjusting-screws J, operating in said inclosing-band F and engaging at their inner ends against said tap-retaining blocks G, and adjusting-screws K, operating in screw-threaded apertures provided therefor in said head-block A and engaging at their inner ends against the rear ends of said reamers D, all substantially as and for the purpose specified.

397,168. DEVICE FOR LUBRICATING CAR-WHEELS. Samuel M. Briggs, Washington, D. C. Filed Oct. 2, 1888. Serial No. 286,944. (No model.)

Claim.—1. The combination, with the wheel of a car, of a lubricator having its discharge-opening located above the wheel and in close proximity to the flange or face thereof, so as to discharge the lubricant thereon, substantially as set forth.



2. The combination, with a wheel of a car, of a lubricator having its discharge-pipe located above the wheel or in close proximity to the flange or face thereof, so as to discharge the lubricant thereon, and an operating-handle conveniently located to be operated by the driver or engineer, substantially as and for the purpose set forth.

397,168.

3. The combination, with a car, of an oil-reservoir, A, having a discharge-pipe, B, located in close proximity to the flange of a wheel, the valve D, and pipe E, with wire or chain F, substantially as and for the purpose set forth.

397,169. DENTAL ENGINE. John S. Campbell, London, England. Filed Apr. 30, 1888. Serial No. 272,226. (No model.) Patented in England Mar. 26, 1888, No. 4,574, and in France May 31, 1888, No. 190,926.

Claim.—1. In combination with a dental engine, a treadle, *j*, connected with the crank of the driving-wheel *a* and centered on the free end of a bar, 10, pivoted to a bar, 12, which is itself pivoted to the axis of said driving-wheel, all as and for the purposes set forth.

2. A dental engine having a horizontal driving-wheel, *a*, fitted in a frame, *c*, the axis of said frame being adjustably connected on one side with a pivoted frame, *l*, carrying a suitable stand, and on the other side with a treadle, *j*, pivoted bars 10 and 12, on one of which the treadle is centered, and intermediate gearing, *i f e d*, substantially as described and shown.

3. A dental engine having its main driving-wheel placed horizontally on a short vertical axis near the floor, said wheel being operated by a treadle fulcramed on a base-bar, 10, pivoted to a bar, 12, pivoted on the axis of said wheel, substantially as shown and described.

4. The combination in a dental engine of two adjusting-frames, *l* and *c*, with a suitable stand, a treadle, *j*, driving-wheel *a*, pulley *n*, and cord, substantially as shown and described.

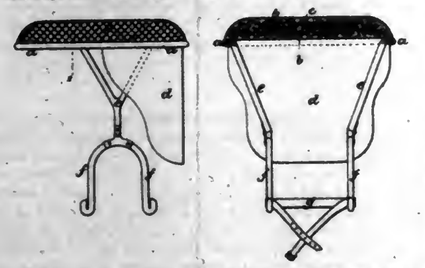
5. The combination of an extensible stand consisting of an adjustable frame, *l*, pulley *n*, axis *t*, axis *r*, rod *w*, tube *m*, sliding tube 2, cheeks 3 3, set-screw *q*, spring 6, and sheathing 1, with an adjustable frame, *c*, horizontal driving-wheel *a*, treadle *j*, and gears *i f e d b*, all substantially as shown and described.

6. A stand for the spring provided with an adjustable spring-supporter held between two cheeks, 3 3, and provided with a screw, 4, whereby it may be adjusted up or down, substantially as shown and described.

397,170. SLIDE-VALVE. FRANK C. GLEAVER, Terre Haute, Ind. Filed Aug. 14, 1888. Serial No. 282,716. (No model.)

Claim.—1. The combination of the slide-valve formed with a packing-groove about its vertical faces, said groove having a steam-passage in its back wall and steam-ports leading therein, the packing arranged in said packing-groove, the balance-ring with upwardly and inwardly inclined exterior sides, cross-bars to set over the valve-top, and springs disposed between the top of the valve and the cross-bars of the balance-ring, substantially as described, and for the purpose specified.

2. In combination, the slide-valve formed with a balance-ring seat of less exterior diameter than the yoke-seat and formed with a packing-seat, the packing arranged in said seat, steam-ports leading to the back of the packing, the balance-ring formed to set over the top of the valve and having upward and inwardly inclined outer faces and provided with cross-bars, and the springs between the top of the valve and the cross-bars, substantially as described, and for the purposes stated.

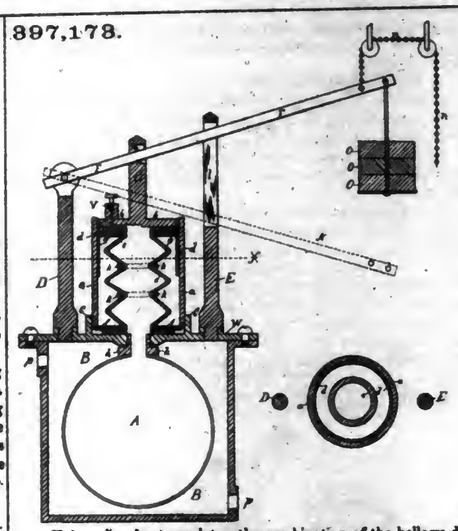


3. The combination, with the slide-valve formed with a packing-seat, said packing-seat having one of its edges formed to incline, as shown, and having steam-passages opening through its back, of a packing arranged in said packing-seat and having one of its edges formed to fit the incline of the seat, substantially as described, and for the purpose specified.

397,171. HOSE-PIPE. EDWARD H. CROSBY, Boston, Mass. Filed Nov. 1, 1888. Serial No. 289,733. (No model.)

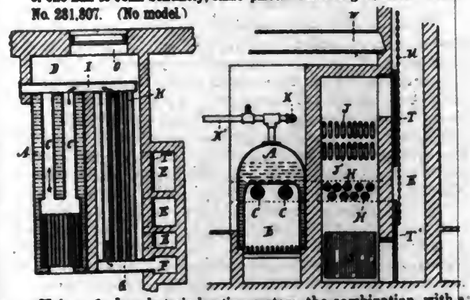
Claim.—The hose pipe or nozzle *a* and a support or bracket secured to it, combined with an electric generator held by said support, all as and for the purpose specified.

397,172. SUNSHADE. ELIZABETH DEAN, Hastings, County of Sussex, England. Filed Aug. 21, 1888. Serial No. 283,304. (No model.)



Claim.—1. A sunshade supported above the wearer's head by means of supporting-rods attached to the framing thereof, such supporting-rods being forked at their lower ends, so as to fit over the shoulders of the wearer, and securely held in position by a suitable strap passing around the body, substantially as and for the purpose specified.

2. The combination, with the frame *a*, supporting a cover of suitable material, *b*, of the folding supporting-rods *c*, shoulder-pieces *f*, and attaching-strap *g*, constructed and arranged substantially as and for the purpose specified.

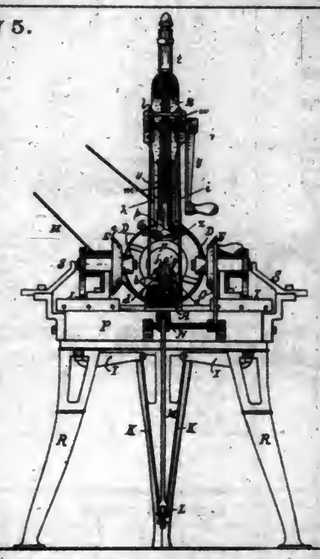


3. The combination, with the frame *a*, net-work *e*, attached thereto, and means—such as a strap—to secure the same to the person, of the cover *b*, stretched over and under such net-work, and filling *b'*, whereby the penetration of heat is more effectually prevented, substantially as specified.

397,173. AUTOMATIC DRAFT-REGULATOR. GEORGE E. DIXON, Chicago, Ill. Filed Oct. 22, 1887. Renewed Dec. 24, 1888. Serial No. 294,565. (No model.)

Claim.—In a heat-regulator, the combination of the bellows diaphragm *e e* and the chamber A, communicating with it, the cylinder *a*, surrounding the bellows diaphragm, the piston *b*, and piston-rod G, and the piston provided with a cock, V, and also with an annular guide, *d*, which closely fits the inside of said cylinder and to which the top portion of the bellows diaphragm is attached, as and the purpose specified.

397,174. FURNACE. JOHN F. DURRAN, Detroit, Mich., assignor of one-half to John Schuloly, same place. Filed Aug. 2, 1888. Serial No. 281,807. (No model.)



Claim.—1. In a hot-air heating system, the combination, with a steam-generator, of an air-heating chamber located in proximity thereof, a system of horizontal flues carrying the products of combustion from the generator through the lower portion of said air-chamber, a system of steam-heating coils located in the upper portion of said air-chamber, one or more hot-air flues communicating with said air-chamber through inlets located near the top and bottom of said air-chamber, respectively, and a damper for each of said openings, said dampers being connected in pairs to open or close said inlets into the hot-air flues, substantially as described.

2. In a hot-air heating system, the combination of the steam-generator A, provided with the smoke-flue C, the smoke-flue I, communicating therewith, the air-chamber D, located in rear and on one side of the steam-generator, the smoke-flues H, passing through the lower portion of said air-chamber and communicating with the chimney, the steam-coils J, located in the upper portion of the air-chamber, the pipe K, communicating with the steam-generator and the steam-coils J, the return-pipe M to the generator, the hot-air flues E, having inlets R and S, located, respectively, near the top and bottom of the air-chamber, the dampers T and T', connected in pairs to close and open the inlets into the air-flues, and the partition P, dividing the air-chamber and provided with the damper Q and cold-air inlet O, substantially as described.

397,175. MACHINE FOR FORMING INTERLOCKING EYES. ROBERT FARIES, Decatur, Ill. Filed Sept. 29, 1888. Serial No. 286,736. (No model.)

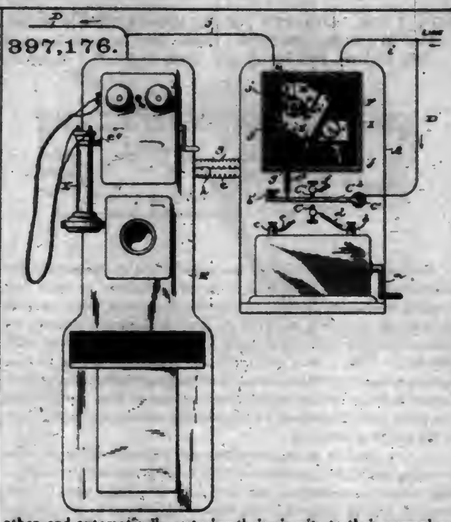
Claim.—1. In a machine for forming interlocking eyes of sections of wire, a stud, a wire-holding device, and bending-levers fulcrumed below the stud and arranged to carry the ends of the wires over the bodies thereof, all in combination, as set forth.

397,175.

2. In a machine for forming interlocking eyes of sections of wire, a stud, a wire-holding device, and bending-levers fulcrumed to swing in vertical frames and carry the ends of the wires over the bodies thereof, all in combination, as set forth.

3. In a machine for forming interlocking eyes of sections of wire, a rotative tubular standard having projections on its upper end, and a stud having longitudinal reciprocating motion in the standard, in combination, as set forth.

4. In a machine for forming interlocking eyes of sections of wire, a tubular rotative standard having projections on its upper end, a stud having longitudinal reciprocating motion in the standard, and levers fulcrumed below the stud in a manner to swing vertically past the same, all in combination, as set forth.



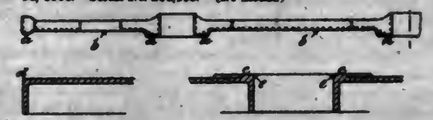
5. In combination, a stud, a wire-holding device, a pair of levers fulcrumed below the stud to swing in vertical planes, and a pair of levers fulcrumed above the stud to swing in vertical planes at right angles to the planes of motion of the lower pair of levers, as and for the purpose set forth.

6. In combination with stud *c* and a wire-cramping device, levers *d* and *e*, having fingers *f* and *g*, respectively, as and for the purpose set forth.

7. In combination, stud *c*, levers *d* and *e*, having fingers *f* and *g*, respectively, crank-lever *y x*, head *l* above the termination of *x*, lateral guides for head *l*, and rods *h i*, connecting the levers with the head, as and for the purpose set forth.

8. In combination, stud *c*, levers *d* and *e*, having fingers *f* and *g*, respectively, crank-lever *y x*, head *l* above the termination of *x*, rods *h* and *i*, connecting head *l* with levers *d* and *e*, levers *o* and *p*, having extensions *q* and *z*, respectively, head *r* below the termination of *x*, rods *m* and *n*, connecting head *r* with levers *p* and *o*, and lateral guides for heads *l* and *r*, as and for the purpose set forth.

397,176. TELEPHONE OR ANALOGOUS ELECTRIC SYSTEM. ANTHONY R. FERDINAND, Oshkosh, Wis. Filed Oct. 3, 1888. Serial No. 287,472. (No model.)



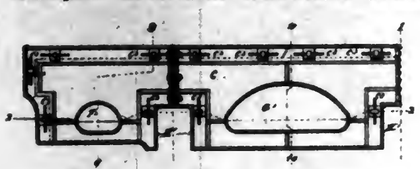
Claim.—1. In a telephone or analogous electric system, the combination, with the main line and instruments or stations thereon, of supplemental generators adapted to be electrically connected to said main line and generating stronger currents than those which operate the instruments, electro-magnets, and armatures attracted thereby under the action of a current from one of said supplemental generators, and mechanism connected to said armatures and adapted for automatically cutting out the instruments or stations on the line other than those which are to communicate with each other and eliminating their resistance, substantially as set forth.

2. In a telephone or analogous electric system, the combination, with the main line and instruments or stations thereon, of supplemental generators adapted to be electrically connected to said main line, and generating stronger currents than those which operate the instruments, electro-magnets, and armatures attracted thereby under the action of a current from one of said supplemental generators, and mechanism connected to said armatures and adapted for automatically cutting out for a predetermined time the instruments or stations on the line other than those which are to communicate with each other, and automatically restoring their circuits to their normal condition at the expiration of said period, substantially as set forth.

3. In a telephone or analogous electric system, the combination, with the main line and instruments or stations thereon, of a supplemental generator adapted to be electrically connected to said main line and capable of generating a current of electricity greater than the ordinary currents used to operate the instruments on said line, electro-magnets normally electrically connected to said main line and the instruments thereon, and armatures within the field of attraction of said electro-magnets only when the latter are acted upon by the said strong current, mechanism mechanically connected to said armatures for automatically cutting out said instruments and bearing a device for making a shorter and more direct temporary circuit on the main line at any point where an instrument is cut out, practically free from resistance at such point, suitable switches and electric circuits and other mechanism mechanically connected to the last-named mechanism, for restoring the normal circuits at such point or points at the expiration of a predetermined time, substantially as set forth.

397,176.

397,177. MANUFACTURE OF FRAME-PLATES FOR ROLLING-STOCK. SAMUEL FOX, Harrogate, County of York, England. Filed Jan. 18, 1888. Serial No. 261,105. (No model.)



Claim.—1. The method or process of manufacturing frame-plates for rolling-stock with flanges and with square corners and fillets or projections, which consists in cutting a suitable plate to approximately the form, but somewhat larger than the required frame-plate, heating same, producing by pressure the required flange or flanges at one side and bulgings or embossments at the contrary side, reheating the plate, and by pressure forming out of the metal of said bulgings or embossments the desired square corners and fillets or projections, substantially in the manner hereinabove described.

2. As a new article of manufacture, a pressed-steel frame-plate having a flange or flanges at one side and fillets or projections at the other side, formed integral with the body of the frame-plate itself, substantially as described.

3. The method or process of manufacturing frame-plates with flanges and with fillets or projections, which consists in cutting a suitable plate to approximately the form, but somewhat larger than the required frame-plate, heating the same to produce by pressure the flange or flanges at one side and bulgings or embossments at the contrary side, and by reheating and by pressure between two dies forming out of the metal formed by said bulgings or embossments the desired fillets or projections, substantially as described.

4. As a new article of manufacture, a pressed-steel frame-plate for rolling-stock, having fillets or projections on one side and flanges formed on the other side, the fillets and the flanges being integral with the body of the frame-plate itself and of greater thickness at the junction than the body of the plate from which they are formed, substantially as described.

397,178. APPARATUS FOR THE MANUFACTURE OF FRAME-PLATES FOR ROLLING-STOCK. SAMSON FOX, Harrogate, County of York, England. Filed Jan. 18, 1888. Serial No. 261,166. (No model.)

Claim.—1. A machine for the manufacture of frame-plates for rolling-stock, comprising a head, a movable platform or table, and actuating mechanism for the said movable platform or table, comprising hydraulic cylinders and rams or their equivalent, a male die attached to the said head, and a female die attached to the said movable platform or table, a floor within the said female die having recesses therein and openings for the reception of flanging-punches, and punches adapted to flange various required openings and to form embossments on a plate under treatment, all substantially as described and shown, for the purposes specified.

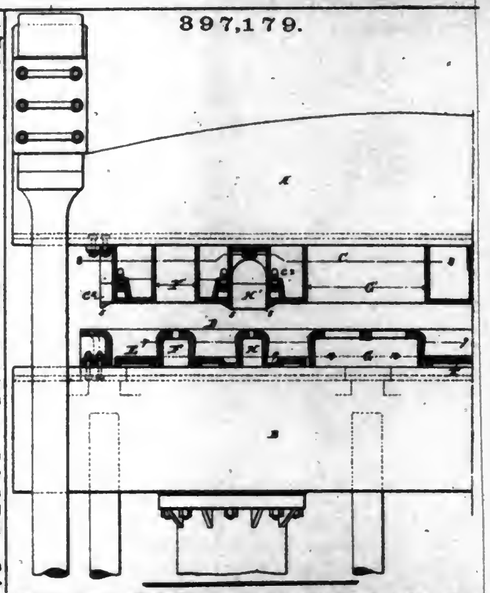
2. In a machine for the manufacture or formation of frame-plates for rolling-stock, the combination of a head, a movable platform or table, actuating mechanism, and male die comprising a part, C, parts C' and C^3, with projections 5, said parts being secured to the principal part C by bolts and cotters C^3, so that they may be quickly released therefrom, substantially as described.

3. In a machine for the manufacture or formation of frame-plates for rolling-stock, the combination of a head, a movable platform or table, actuating mechanism, a male die with openings, a female die, D, floor E, with openings and recesses 6, adapted to be used in conjunction with punches F G H to enter corresponding openings in the male die, so that when a frame-plate is compressed between the male and female dies it will be flanged at one side and be formed with bulgings or embossments at the other side, substantially as described, for the purpose specified.

4. In a machine for the manufacture or formation of frame-plates for rolling-stock, the combination of a head, A, a movable platform or table, B, actuating mechanism, a male die comprising principal part C, parts C' and C^3, with projections 5, cotters C^3, and openings at F', G', and H', a female die, D, a table or floor, E, recessed at 6, and punches F G H, all substantially as described, for the purpose specified.

5. In a machine for the manufacture or formation of frame-plates for rolling-stock, the combination of a head, a movable platform or table, actuating mechanism, male die I, female die J, and floor K, adapted to receive parts L and mandrels M and N, so as to convert the bulged or embossed parts of a frame-plate previously flanged and bulged or embossed into fillets and square corners, substantially as described, for the purpose specified.

6. The combination, in a machine for flanging metal, of a male die and a female die, the said male die having an adjustable outer surface or surfaces, consisting of an independent surface or surfaces normally fitting the metal and pressing the same against the female die, but capable of withdrawal therefrom, thus allowing for the shrinkage of the surrounding metal in the process of cooling, substantially as described.



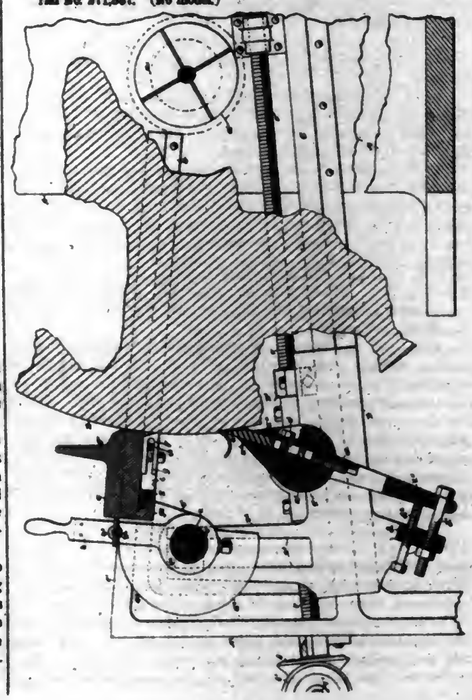
7. In a machine for flanging metal, the combination of a male and female die for flanging metal, and the punch F, forming part of the female die, and having a greater diameter on the plane 7 7, first passing through the metal, than it has on the plane 19 19, where the metal ultimately rests, substantially as described.

397,179. PROCESS OF MANUFACTURING FRAME-PLATES. SAMSON FOX, Harrogate, County of York, England. Original application filed Jan. 18, 1888, Serial No. 261,166. Divided and this application filed Nov. 21, 1888. Serial No. 291,470. (No model.)

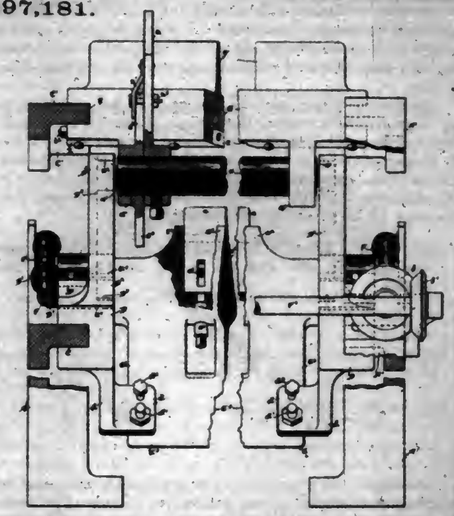
Claim.—1. The process of forming a flanged metal plate in which the flanges are practically at right angles to the plate without permitting the said plate to warp or bind upon the pressing-dies, which consists in pressing the same between a properly-shaped male and female die and in gradually withdrawing the lateral pressure of the male die upon the flange during the process of cooling, and simultaneously with said cooling, substantially as described.

2. The process of forming a flanged metal plate in which the flanges are practically at right angles to the plate without permitting the said plate to warp or bind upon the pressing-dies, which consists in pressing the same between a properly-shaped male and female die and in gradually withdrawing the vertical and lateral pressure of the male die upon the flange during the process of cooling, and simultaneously with said cooling, substantially as described.

397,179.



397,180. HOSE-STRAP. ISAAC N. GLAUBER, Cleveland, Ohio. Filed Sept. 29, 1888. Serial No. 286,745. (No model.)



Claim.—A hose-strap consisting of an endless wire ring of greater diameter than the hose and embracing the hose, the slack portion of the ring being crossed and twisted to form an endless hose-strap and an endless loop, substantially as set forth.

397,181. ROTARY-CUTTING VENEER-MACHINE. ELIAS S. GORHAM and CHESTER R. GORHAM, Euclid, Ohio. Filed Apr. 21, 1888. Serial No. 271,387. (No model.)

397,181.

Claim.—1. In a rotary-cutting veneer-machine, the combination, with a knife and mechanism for pivotally supporting, adjusting, and feeding the same, of ways for such knife-supports to travel on, said ways being so disposed that the edge of the knife in its movement describes a plane making an angle with the plane of the beveled face of the knife greater than a right angle, substantially as set forth.

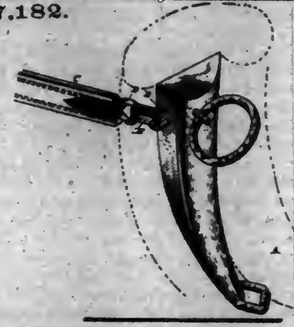
2. In a rotary-cutting veneer-machine, the combination, with presser-bar, knife, and mechanism for supporting and feeding each in unison, of ways, respectively, for the presser-bar and knife mechanism to travel on, such ways converging in the direction toward the axis of the log, substantially as set forth.

3. In a rotary-cutting veneer-machine, the combination, with converging ways, substantially as indicated, of knife and presser-bar operating, respectively, on the different ways, the said knife and presser-bar being operatively connected, so as to move in unison by means of one set of feed mechanism, substantially as set forth.

4. In a rotary-cutting veneer-machine, the combination of inclined ways, sliding blocks mounted on such ways, knife-head having trunnions journaled in the sliding blocks, bolts, and adjusting-screws for turning the knife-head on its axis and rigidly holding the adjustment of the knife-head, substantially as set forth.

5. In a rotary-cutting veneer-machine, the combination, with knife and knife-stock, the latter being pivotally mounted on sliding blocks, of ways for such sliding blocks to travel on, such ways being so disposed that the edge of the knife in its movement describes a plane making an angle with the plane of the bevel face of the knife greater than a right angle, substantially as set forth.

6. In a rotary-cutting veneer-machine, the combination, with knife and supporting mechanism and presser-bar, of converging ways, substantially as indicated, whereby the knife-head and presser-bar are fed along different radial lines of the log, substantially as set forth.



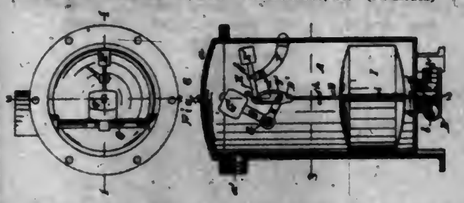
7. In a rotary-cutting veneer-machine, the combination, with two sets of ways, knife and supporting mechanism, presser-bar, and supporting cross-head operating, respectively, on such ways, substantially as indicated, of upright ways connected with the knife mechanism, and sliding blocks operating in such upright ways, the sliding blocks being connected with the cross-head of the presser-bar, the parts being arranged substantially as described, whereby the presser-bar is actuated by the movement of the knife mechanism, substantially as set forth.

8. In a rotary-cutting veneer-machine, the combination, with presser-bar and cross-head, substantially as indicated, of shaft journaled in boxes connected with such cross-head, said shaft having eccentric-wrists and sliding blocks journaled on such wrists, and ways for embracing such sliding blocks, said ways being connected with the knife-supporting mechanism, the parts being arranged substantially as indicated, whereby the presser-bar is adjusted toward or from the log by rotating such shaft, substantially as set forth.

397,182. HAME AND TUG COUPLING. JOHN GRAY, Jefferson, Iowa. Filed Aug. 22, 1888. Serial No. 283,411. (No model.)

Claim.—The combination, with the hame-staple and with the tug-clip twisted at right angles, as set forth, of an elongated draft-link interposed between the staple and clip to insure a direct draft, and a flexible double-jointed connection.

397,182.



397,183. FOLDING BEDSTEAD. WILLIAM J. GRIBBEL, Fort Wayne, Ind. Filed Feb. 3, 1888. Serial No. 262,904. (No model.)

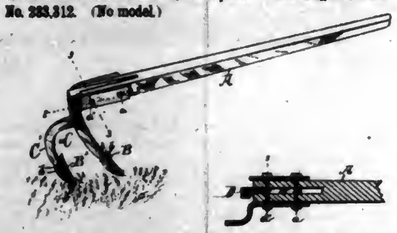
Claim.—1. The combination, with the main frame having the offset, as described, and provided with the dovetailed grooves in the tops of the side walls, of the movable bars F, having their ends tenoned to enter the said groove, the rocking bearings notched at their upper ends to receive journals of the bed-frame, having the rollers L on the upper outer sides of the side rails, and the vertically-curved guides H, arranged in the stationary frame and having the offsets P at their upper ends, substantially as specified.

2. In a folding bed, the combination, with the main frame having the offset, as described, of the horizontal bearings *b*, provided with apertures *c*, the guard-bar *e*, the rocking bearings D, having the bearing-notch at their upper ends and prongs at their lower ends to enter the apertures of the fixed bearing *b*, the vertically-curved guides H, secured to the side walls of the stationary frame and having the offsets P at their upper ends, and the bed-section B, having the lateral studs E, to enter the notches of the rocking bearings, and the rollers L, to enter the curved guideways H of the main frame, substantially as specified.

397,184. MEASURING STEAM-TRAP. GEORGE GUPTE, Wilkesbarre, Pa. Filed Mar. 20, 1888. Serial No. 268,516. (No model.)

Claim.—1. In a steam-trap, the combination, with an inclosing-case, of a discharge-valve, a bell-crank lever pivoted in the case and provided with a weight, a slotted plate, and pin-connection interposed between said valve and lever, whereby the valve may be operated suddenly by said weight, a float, a rod provided with collars and arranged intermediate between the said float and bell-crank lever, whereby the said weight may be overbalanced each time said float reaches its highest and lowest positions, and a register actuated at each discharge of liquid from the case.

2. In a steam-trap, the combination of an inclosing-case, a float in the case, a discharge-valve, a slotted plate secured to the said valve, a weighted bell-crank mounted on a rock-shaft and provided with a pin engaging with the slot in the said plate, a register operated by the motion of the rock-shaft simultaneously with the opening of the valve, and a rod provided with collars above and below the float and



connected to the bell-crank, whereby an equal volume of water may be discharged at each opening of the valve.

3. In a steam-trap, the combination of an inclosing-case, a float in the case, a discharge-valve at the bottom of the case, a slotted plate, and a stem secured to the valve, a counter-balance for the weight of the said valve, its stem, and the plate, a weighted bell-crank mounted on a rock-shaft and provided with a pin engaging with the slot in said plate, a register operated by the motion of the rock-shaft simultaneously with the opening of the valve, and a rod provided with collars above and below the float and connected to the bell-crank, so that the water may be discharged intermittently in equal volumes.

4. In a steam-trap, the combination of an inclosing-case, a float in the case, a discharge-valve, a slotted plate secured to the said valve, a weighted bell-crank lever pivotally supported in the case and provided with a pin engaging with the slot in the said plate, and a rod connected to the said pin and provided with collars above and below the float, whereby the said valve may be intermittently opened and closed.

5. In a steam-trap, the combination of an inclosing-case, a float, a discharge-valve, a slotted plate, and a valve-stem secured to the valve, a counterbalance for the weight of the valve, its stem, and the plate, a weighted bell-crank lever pivotally supported in the case and provided with a pin engaging with the slot in the said plate, and the rods pivoted on the ends of the said pin and provided with collars above and below the float, so that the said valve may be opened and closed suddenly when the float reaches its highest and lowest points, substantially and for the purpose set forth.

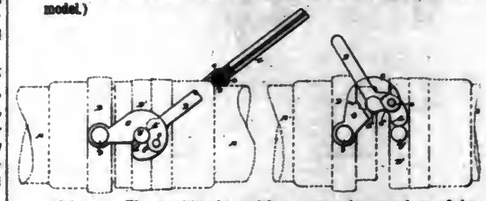
397,185. CULTIVATOR. JOSEPH B. HIMES, Ladoga, Ind., assignor of one-half to John C. Himes, same place. Filed Aug. 21, 1888. Serial No. 283,312. (No model.)

Claim.—1. In a hand hoe or cultivator, the combination of the handle A, formed bifurcated at the end to which the hoes are fastened, the shanks C C', with the blades thereon, secured to said handle by the bolts *a* and *a'*, and the wedge D, slotted and mounted astride said bolts *a* and *a'* in the bifurcated end of the handle, said wedge being formed with a series of shoulders, *d''*, substantially as described, and for the purpose specified.

2. The combination, in a hand hoe or cultivator, of the bifurcated handle, the shanks bolted thereto by the bolts *a* and *a'*, the hole through which one of said bolts passes being formed elongated, as described, the blades adjustably secured on said shanks, and the wedge D, adjustably secured between the parts of the bifurcated end of said handle, substantially as set forth.

397,186. GLASS-MOLD. STEPHEN HIPKINS, Jr., Martin's Ferry, Ohio. Filed Sept. 11, 1888. Serial No. 285,104. (No model.)

Claim.—1. In a mold, the combination, with the body portion and the plunger, of the die-block adapted to work through and extend across the side of the said mold and having its inner end touching or approaching close to the said plunger, whereby a spout or mouth piece is formed on the article cast below its upper edge, which edge is continuous.



2. The combination, with the section A of the mold, having a recess in its upper edge, and the ring, of the plunger and the pivoted die-block, substantially as described.

3. The combination, with the sections A and B, having their inner edges chamfered, the section A having a recess, *a*, in its upper edge, and the ring D, having a corresponding recess, of the pivoted die-block adapted to fit in the said recess, substantially as set forth.

4. The combination, with the sections A and B, having their upper edges chamfered outward, and the ring D, having an annular groove, *d'*, in its lower edge and an inner flange, *d*, of the pivoted die-block adapted to form a spout or mouth-piece, substantially as described.

5. The combination, with the sections A and B, having their upper edges chamfered outward, the section A having a notch, *a*, in its edge and the recess *a'*, of the ring D, having an inner flange, *d*, and an annular groove, *d'*, in its lower edge, the plunger, and the die-block pivoted to the section A, and having its former constructed to fit in the notch *a*, and having a recess, *f*, in its under side, substantially as described, for the purpose specified.

397,187. HOSE-COUPLING. JOHN I. HOLTON and LOUIS H. BRITTON, New Lisbon, Ohio. Filed Sept. 20, 1888. Serial No. 286,767. (No model.)

Claim.—1. The combination, with two opposing members of the coupling, hooks pivoted to one member, the free end of the hooks being adapted to engage fastenings on the other member of the coupling, of a bail pivoted to the free end of such hooks and provided with hooked ends, which latter project beyond the free ends of the hooks for drawing the hook ends to and off of such fastenings, substantially as set forth.

2. The combination, with hooks and fasteners for engaging the free end of the hooks in holding the coupling together, substantially as indicated, of a bail pivoted to the free end of such hooks, such bail having seats on either side of the fulcrum thereof for respectively engaging the hook-fasteners with the reverse movements of the bail, substantially as set forth.

3. The combination, with coupling, hook, and bail, substantially as indicated, of a lever having a forked end adapted to engage the periphery of the bail, the prongs of the lever having inwardly-projecting lugs set in pairs to embrace laterally the wire or body of the bail, substantially as set forth

397,188. PEDAL FOR VELOCIPEDES. THOMAS R. JEFFERY, Ravenswood, Ill. Filed Dec. 27, 1887. Serial No. 258,963. (No model.)

Claim.—1. A velocipede-pedal comprising a yielding foot-block and a metal foot-support, the latter formed of two pieces of sheet metal united for a portion of their width to form a vertical ridge, the other portions forming a trough to receive the yielding foot-block, substantially as set forth.

2. A velocipede-pedal comprising a yielding foot-block and a metal foot-support, the latter formed of two pieces of sheet metal united for a portion of their width to form a vertical ridge, the other portions forming a trough to receive the yielding foot-block, the edges of said trough being bent inwardly to secure the block, substantially as set forth.

3. In a velocipede-pedal, in combination with the end pieces, C, a metal foot-support, one side trough-shaped to receive a foot-block, the other side a vertical ridge, and ears in the angles formed by the trough and the ridge, by means of which the foot-support is secured to the end pieces, substantially as set forth.

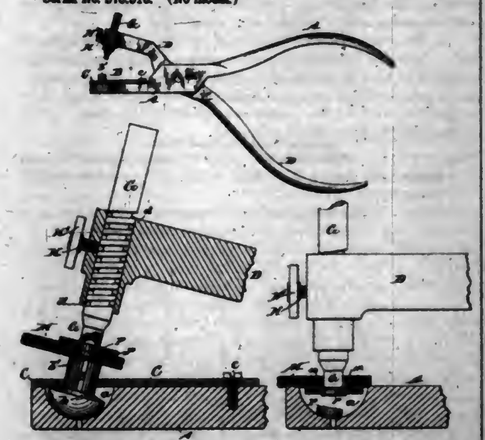
397,189. PROCESS OF FORMING VEHICLE-WHEELS. THOMAS R. JEFFERY, Ravenswood, Ill. Filed Jan. 20, 1888. Serial No. 261,267. (No model.)

Claim.—The hereinabove-described process of forming vehicle-wheels, which consists of, first, forming a strip of metal into a trough; second, bending the trough to the circumference of the rim; third, inserting the spokes and securing them to the hub; fourth, mounting the hub upon bearings; fifth, revolving the wheel upon such bearings with the rim in contact with forming-tools, whereby the channel or shoulder is turned upon each of its edges; sixth, applying to the rim another strip of metal adapted to engage with the channels or shoulders, whereby the channels of the trough are connected, substantially as set forth.

397,190. SPRING-HINGE. JOSEPH KEEBE, Chicago, Ill. Filed Aug. 20, 1888. Serial No. 283,232. (Model.)

Claim.—1. In a spring-hinge, the combination, with two or more leaves pivoted together, of a torsion-spring, a projecting arm connected therewith and having a free outer end, and a bearing-piece upon one of said leaves, against which the free end of said projecting arm can ride during the operation of the hinge, substantially as described.

2. In a spring-hinge, the combination, with the leaves for attachment to the door and jamb, respectively, and the intermediate leaf pivoted to said door and jamb leaves, of a torsion-spring, a projecting arm connected therewith and having a free outer end, and a bearing-piece upon said intermediate leaf, said arm and said bearing-piece being movably sustained with respect to each other, and one of said parts being provided with an irregular surface, against which the other is held in a manner free to ride, whereby a varying spring-pressure in the action of the hinge is secured, substantially as described.



3. In a spring-hinge, the combination, with an upper and lower set of leaves for attachment to the door and to the jamb, respectively, and intermediate leaves pivoted to said door and jamb leaves, of a torsion-spring located intermediate of said upper and lower sets of leaves, a projecting arm at each end of said spring, and a bearing-piece located upon each of the intermediate leaves, against which said arms are held in a manner free to ride, substantially as described.

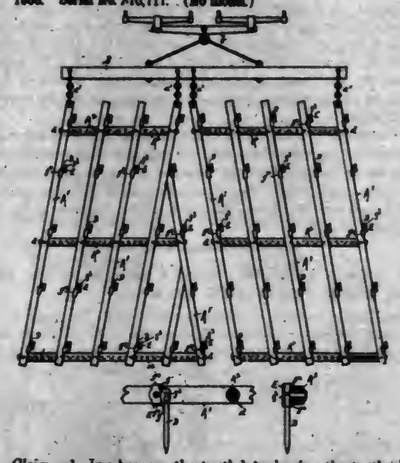
4. In a spring-hinge, the combination, with two or more leaves connected together, one of said leaves being provided with a cut-away space, of a spring located within said cut-away space of one of the leaves and extending beyond the face of the leaf with which it is connected, said spring having its ends held against outward movement, a projecting arm connected to the spring, and a bearing-piece upon one of said leaves, with which said arm engages, substantially as described.

5. In a spring-hinge, the combination, with two or more leaves pivoted together, of a spring, an arm projecting therefrom, one of said leaves being provided with a bearing-piece having a wearing-face, over which said arm freely rides, said wearing-face extending across the plane of said leaf, substantially as described.

6. In a spring-hinge, the combination, with several leaves pivoted together, of a spring, an arm projecting therefrom having an angular end, one of said leaves being provided with a bearing-piece, over which the angular end of said arm freely rides, substantially as described.

397,191. WATCH-MAKER'S TOOL. FREDERICK LEACH, New York, N. Y., and VINCENT L. FIORAVOTTA, Jersey City, N. J. Filed June 2, 1888. Serial No. 276,518. (No model.)

Claim.—1. In a jeweler's tool, the levers A D and pivot E, in combination with the freely-rocking abutting piece B and punch G, arranged for joint operation as herein specified.

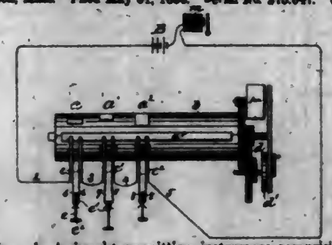


2. In a jeweler's tool, the levers A D, pivoted at E, abutting piece B, having a convex base, a contraction, *b*, and bearing-face *b'*, in combination with the swinging plate C, having the slot *c'*, as herein specified.

3. In a jeweler's tool, the punch G, screw-threaded as shown, and the screw H H', standing at an angle thereto, adapted to engage and release the threads of the punch at will, in combination with each other and with the levers A D, pivoted at E, as herein specified.

397,192. REMEDY FOR RHEUMATISM, &c. JOHAN F. LINDGREN, Crookston, Minn. Filed Oct. 15, 1888. Serial No. 288,058. (No specimens.)

Claim.—The herein-described medicinal compound, composed of water, senega (*Polygala senega*) root, castor-oil, cooking-soda, sirup, saltpeter, lemon-juice, blue-berry juice, (*Vaccinium corymbosum,*) red pepper, and essence of peppermint, substantially as set forth.

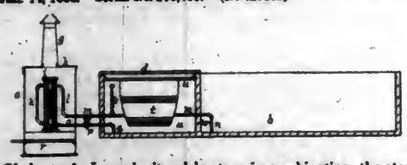


397,198. HARROW. OSMON LUSH, St. Paul, Minn. Filed Apr. 16, 1888. Serial No. 270,717. (No model.)

Claim.—1. In a harrow, the tooth-bars having the teeth pivoted thereon and adapted to project beyond either side thereof, in combination with keepers E, having stop-surfaces *g'* *g''* and stop-lips *g''*, adapted to keep said teeth in place, substantially as and for the purpose set forth.

2. In a harrow, the tooth-bars having the teeth pivoted thereon and adapted to project beyond either side thereof, in combination with keepers E, having stop-surfaces *g'* *g''*, stop-lips *g''*, and ribs *g''*, whereby said teeth are held in place and said keepers secured to said bars by one bolt only in each, substantially as and for the purpose set forth.

397,194. MULTIPLE-SIGNAL TRANSMITTER. MORRIS MARTIN, Malden, Mass. Filed May 31, 1888. Serial No. 275,647. (No model.)

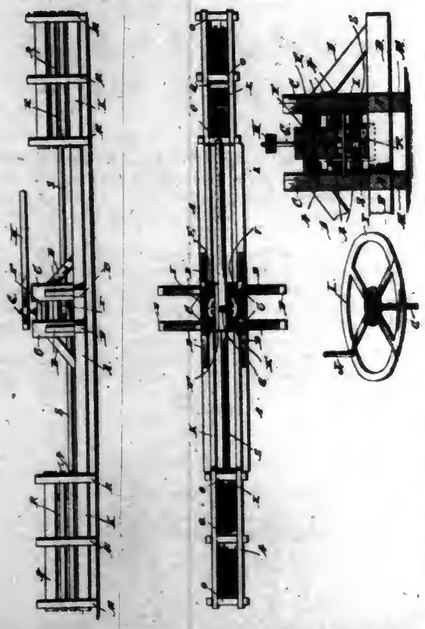


Claim.—1. A signal-transmitting instrument comprising a number of distinct signaling-surfaces or break-wheels connected to move simultaneously, the co-operating members of each of said break-wheels being permanently connected in series with one another, combined with a shunt-circuit around the co-operating members of each break-wheel and circuit-controllers in said shunts, whereby any desired one of said shunts may be retained open and the remainder closed during the simultaneous movement of said break-wheels, substantially as described.

2. The combination of a motor and drum moved thereby with a series of contact-surfaces on said drum and pairs of springs co-operating therewith, constituting independent break-wheels, one of said surfaces being continuous under all said springs, and the different

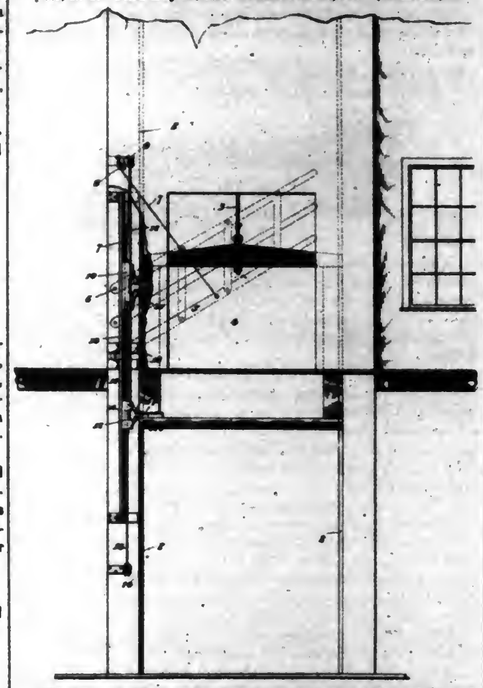
pairs of springs being connected in series with one another, and shunts around each pair of springs, substantially as described.

3. A signal-transmitting instrument comprising a motor and a number of distinct signaling-surfaces or break-wheels moved simultaneously thereby, the co-operating members of each of said break-wheels being permanently connected in series with one another, combined with separate shunt-circuits around each of said break-wheels, substantially as and for the purpose described.



397,195. AGRICULTURAL HEATER. CARSON A. MASTERSON, Decatur, assignor of one-half to Jeremiah M. Duncan, Lintner, Ill. Filed Jan. 14, 1888. Serial No. 260,735. (No model.)

Claim.—1. In agricultural heaters, in combination, the steam-chamber *a*, containing the feed-receptacle *t*, the water-tank, the heater, the pipe *m*, having branches *o* and *n*, the one in the steam-chamber, the other in the water-tank, and the pipe *o*, terminating in the steam-chamber, the water-tank and steam-chamber being separated by a partition having an opening smaller than the pipes, as and for the purpose set forth.



2. In agricultural heaters, in combination, the steam-chamber and the water-tank separated by a partition provided with a small opening, the heater separate from the tank and steam-chamber, and pipes larger in internal diameter than the opening in the partition connecting the heater with the steam-chamber and with the tank, as and for the purpose set forth.

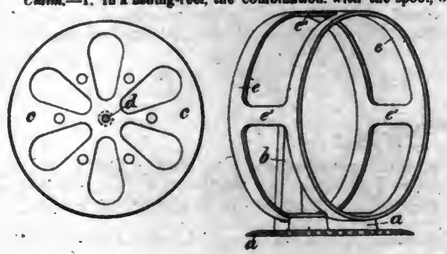
397,196. HAY-PRESS. THOMAS T. MAYES, Belton, Tex. Filed Aug. 16, 1888. Serial No. 282,847. (No model.)

Claim.—The improved hay-press herein described and shown, comprising the parallel beams A A, the standards C, erected on said beams near the centers thereof, the transverse bars E, connecting the standards in pairs, the longitudinal bearing-bars F, secured to and between the said transverse bars, the king-bolt journaled in said bearing-bars, the sweep secured to the upper end of the king-bolt, the drive-wheel secured to the lower end of the king-bolt and having a single depending crank-pin, the press-boxes at the ends of the beams A A, the plungers in said press-boxes, and the pitmen having their outer ends pivoted to the plungers and their inner ends pivoted on the crank-pin of the drive-wheel, all combined and operating substantially as specified.

397,197. ELEVATOR-HATCHWAY. CYRUS A. MCALLISTER, Rochester, N. Y. Filed May 26, 1888. Serial No. 275,089. (No model.)

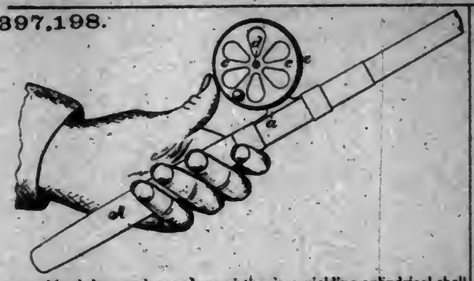
Claim.—1. The combination, in an elevator, of the weight and gate with a counterbalancing-weight, pulleys, and cords passing over said pulleys and connected each to both weights, a weight-lifting plate, and a releasing-plate, all constructed and arranged substantially as specified, whereby one weight may be made to overbalance the gate, and may subsequently be itself overbalanced by the other weight acting with the gate.

2. In combination with a movable gate or door, a cord and pulleys, a counterbalancing-weight provided with two spring-actuated catches, 15, a lifting-plate secured to the elevator-car, and a releasing-plate secured to the well-frame, substantially as specified, whereby the weight may be lifted or depressed positively, as desired.



3. A weight for use in counterbalancing an elevator-door, consisting of a body provided with pivoted catches, and a spring, 16, secured to the body and having its free ends arranged to normally press against the catches, substantially as specified.

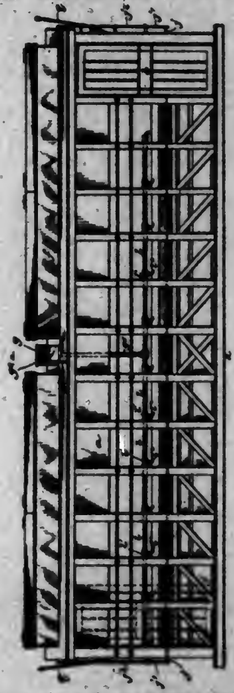
4. The combination of the pivoted gate, the swiveled pulley-block near the front of the elevator-well, a counterbalancing-weight, a fixed pulley, a cord connecting the gate and the weight, the cord running over both the fixed and movable pulley, a second weight, fixed pulley, and connecting-cord, all substantially as specified.



5. The combination of the elevator-car, spring-plate, weights 10 and 11, provided with spring-actuated catches 15 and constructed and arranged to move on guides, cords connecting the weights, the pulleys, and a gate connected by a cord with one of the weights, substantially as specified, whereby the weights may be alternately raised and depressed and the gate opened and closed.

397,198. FISHING-REEL. AUGUST F. MEISSELBACH and WILLIAM MEISSELBACH, Newark, N. J. Filed Oct. 27, 1888. Serial No. 289,322. (No model.)

Claim.—1. In a fishing-reel, the combination, with the spool, of



397,198.

a combined drag and guard, consisting in a yielding cylindrical shell encircling the flanges of the spool, with its inner face adjacent to their peripheries, and adapted, when pressed by the operator, to make a frictional contact with the rotating flanges, substantially as shown and described.

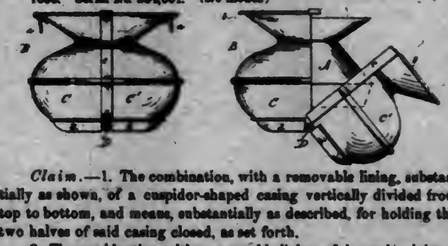
2. In a fishing-reel, the combination, with the support of the spool-stud and the spool, of the leaf-spring *e*, secured at one end to the said support, and having at its opposite end an inwardly-projecting pin, *p*, the said spring being provided with a slot, *o*, having a sliding button therein and inclined in relation to the said support for the spool-stud, as and for the purpose set forth.

397,199. STOCK-CAR. JAMES MONTGOMERY, East Millstone, N. J. Filed Apr. 4, 1888. Serial No. 269,697. (No model.)

Claim.—1. In a stock-car, the water-tank *g*, straddling the ridge-pole substantially midway between the ends of the car and provided with distributing-pipes g^2 g^3, terminating in outlets composed of horizontal openings leading from opposite sides of such pipes over the drinking-troughs, combined with such troughs, substantially as described.

2. In a stock-car, water-tanks *g*, straddling the ridge-pole substantially midway between the ends of the car and provided with distributing-pipes g^2 g^3, each having the opposite openings, *n' n'*, and closed by screw-caps *n*, and arranged over the drinking-troughs, combined with such drinking-troughs, substantially as described.

3. The gutter composed of the vertical protection-board k', slanting bottom k^2, and braces k^3, connecting the protection-board and bottom and securing them to the side of the car, in combination with the tilting drinking-trough arranged wholly within such gutter and of a width and depth relatively to its journal to fill the spaces between the protection-board and sides of the car both when in use and when not in use, and means for tilting the troughs, substantially as described.



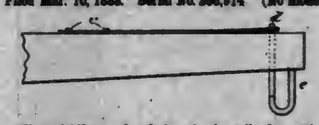
4. The gutter composed of the vertical protection-board k', slanting bottom k^2, and braces k^3, connecting the protection-board and bottom and securing them to the side of the car, in combination with the tilting drinking-trough arranged wholly within such gutter and of a width and depth relatively to its journal to fill the spaces between the protection-board and sides of the car both when in use and when not in use, and having its journal extended through and outside of the end of the car and connected with the crank j', from which the operating-rod j^3 extends up to the roof, substantially as described.

5. A folding hay-rack fixedly hinged at its lower end to the side of the car and adapted to be folded up flat against the side of the car, and provided with a lip to engage stationary stops depending from the upper part of the car when the rack is inclined for use, substantially as described.

6. The hay-rack hinged at its lower end to the side of the car and adapted to fold up against the side of the car, and having a lip to engage stationary stops depending from the top of the car, combined with a shutter-board and means to move it to open and close such rack, substantially as described.

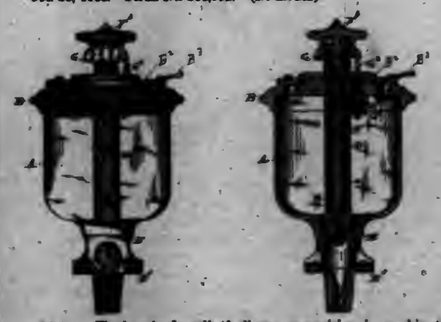
7. A hay-rack for stock-cars having a main slatted portion behind which the hay is placed, combined with a shutter-board hinged to the upper portion of the car and adapted to close and open the rack by a pivotal movement, substantially as described.

397,200. SPITTOON. ALBERT E. MOORE, St. Albans, Vt., assignor to Isaac S. Boricy and Alvin F. Bullard, same place. Filed Aug. 23, 1888. Serial No. 284,001. (No model.)



Claim.—1. The combination, with a removable lining, substantially as shown, of a cuspidor-shaped casing vertically divided from top to bottom, and means, substantially as described, for holding the two halves of said casing closed, as set forth.

2. The combination, with a removable lining, of the spring-jointed casing, each half of said casing being provided with a ring or bail for pulling said halves apart, as set forth.



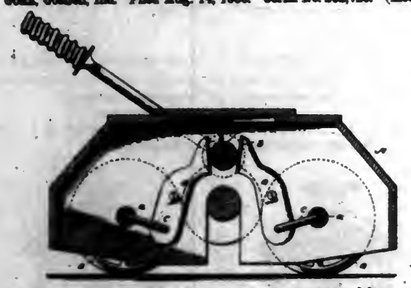
3. The combination, with a removable lining, of a jointed casing, a spring-hinge for automatically closing said casing, and the bottom guard-pieces for keeping the hinge from touching the floor, as set forth.

397,201. WHIFFLETREE-HOOK. SAMUEL O. NICHOLS, Weare, N. H. Filed Mar. 10, 1888. Serial No. 266,914. (No model.)

Claim.—The whiffletree-hook herein described, consisting of the hook E, the movable pin *d*, in combination with the strap-spring *e*, constructed in the manner and for the purpose specified.

397,202. OIL-CUP. CHARLES H. NUHN, Rochester, N. Y. Filed Oct. 23, 1888. Serial No. 288,962. (No model.)

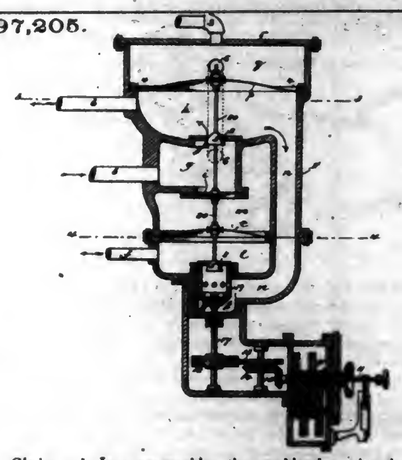
Claim.—The herein-described oil-cup, comprising, in combination, an oil-chamber provided with a central vertical tube formed near its lower end with apertures for the passage of oil from the chamber, and having its lower end contracted, a valve-stem within said tube



having its lower end contracted to fit the contracted lower end of the tube, and its upper end provided with a cap the depending lower edge of which is cam-shaped and provided with a series of notches and a corresponding series of indicating-characters, and a vertically-moving spring-actuated catch seated within a chamber formed in the cover of the oil-chamber and adapted to engage the notches in the cap upon the valve-stem, substantially as for the purpose described.

397,208. SAWING-MACHINE. WILLIAM R. PATTERSON, Cologne, Minn. Filed Aug. 25, 1888. Serial No. 283,725. (No model.)

Claim.—In a sawing-machine, the combination of the standard provided with a vertical slot, *a*, the beam B, provided with a bolt, *b*, which passes through the slot *a* and is engaged by a thumb-nut, *b'*, the inclined support C, provided with a guide-slot, *c*, and an engaging-hook, M, the hanger D, comprising the parallel bars *d d*, projecting at their ends above and below the beam, the swinging arm E, pivoted near its rear end between the extremities of the said bars and provided at its front end with a guide-block, F, having a slot, *f*, the adjusting-bolt I, arranged in the beam between the hanger and the standard and connected to the rear end of the swinging arm by the coiled spring L, the saw G, operating in the slots *c* and *f*, and provided at its rear end with a block, H, sliding on the swinging arm, and the guiding-arm O, pivoted to the block F and bearing on the beam B, to prevent sagging of the swinging arm, substantially as specified.



397,204. CARPET-SWEEPER. HIRAM W. RU TOB and HENRY A. GOAR, Goshen, Ind. Filed Aug. 14, 1888. Serial No. 282,729. (Model.)

Claim.—1. The combination, in a carpet-sweeper, of levers pivoted to the end walls of the case, and having one end connected with the driving-wheels by means of angular rods or journals, and a cam adapted to engage the opposite ends of the said levers to move the driving-wheels, substantially as specified.

2. The combination, with a sweeper-case, of the cam, such as E, having a central aperture and lugs, the handle-bail engaging said aperture and lugs, and pivoted levers connected with the journals of the driving-wheels and adapted to engage the said cam, whereby the driving-wheels may be moved with respect to the case, substantially as specified.

397,205. GAS-MACHINE. EDWARD D. SELF, South Orange, N. J. Filed Jan. 9, 1888. Serial No. 260,131. (No model.)

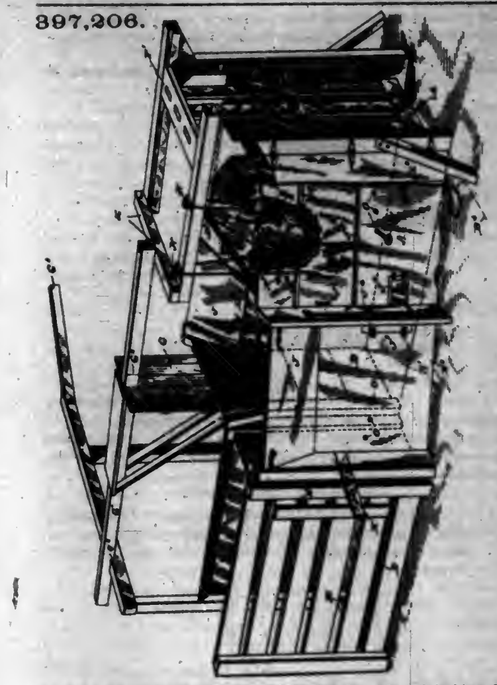
Claim.—1. In a gas-machine, the combination, with the carburetor and the pipe for supplying air thereto, of the pipe for supplying pure air to the gas, a regulating-valve for controlling the amount of pure air admitted, and a diaphragm connected to said valve and subjected to and operated by the pressure of the air passing to the carburetor, substantially as described.

2. In a gas-machine, the combination, with the carburetor and the pipe for supplying air thereto, of the pipe for supplying pure air to the gas, a regulating-valve for controlling the amount of air admitted to the carburetor, a regulating-valve for controlling the amount of pure air admitted to the gas, and a diaphragm subjected to and operated by the pressure of the air admitted to the carburetor and connected to and controlling both of said valves, substantially as described.

3. In a gas-machine, the combination, with the carburetor and the pipe for supplying air thereto, of the pipe for supplying pure air to the gas, a regulating-valve for controlling the amount of air admitted to the carburetor, a regulating-valve for controlling the amount of pure air admitted to the gas, a valve-rod carrying both of said valves, and a diaphragm connected to said rod and subjected to and operated by the pressure of the air admitted to the carburetor, substantially as described.

4. In a gas-machine, the combination, with the carburetor and the pipe for supplying air thereto, of the pipe for supplying pure air to the gas, a regulating-valve for controlling the amount of air admitted to the carburetor, a regulating-valve for controlling the amount of pure air admitted to the gas, a valve-rod carrying both of said valves, a diaphragm connected to said rod and subjected to and operated by the pressure of the air admitted to the carburetor, and a second diaphragm, also connected to said rod and subjected to and operated by the pressure of the pure air admitted to the gas, substantially as described.

5. In a gas-machine, the combination, with a carburetor and the pipe for supplying air thereto, of the pipe for supplying pure air to the gas, a regulating-valve for controlling the amount of air admitted to the carburetor, a regulating-valve for controlling the amount of pure air admitted to the gas, a valve-rod carrying both of said valves, a diaphragm connected to said rod and subjected to and operated by the pressure of the air admitted to the carburetor, and a second diaphragm, also connected to said rod and subjected to and operated by the pressure of the pure air admitted to the gas, substantially as described.



6. In a gas-machine, the combination, with a carburetor, the pipe *b*, for supplying air thereto, and the pipe *f*, for supplying pure air to the gas, of the regulating apparatus having the chambers *g h*, communicating with the two parts of the pipe *b*, the chamber *l*, communicating with the pipe *f*, the duct *n*, and chamber *k*, affording communication between the chambers *h l*, the diaphragm *p*, the rod 20, connected to the diaphragm, and the valves 3 5, connected to said rod and controlling the passages between the chambers *g h* and *k l*, respectively, substantially as described.

397,206. COMBINED STALL AND STOCK-HANDLING APPARATUS. CHARLES F. SEEDS, Fairfield, Nebr. Filed Mar. 12, 1888. Serial No. 267,013. (No model.)

Claim.—1. A stall provided with a side, B, hinged at the front corner of said stall opposite to chute D to open outwardly, in combination with the chute located outside the plane of the closed position of the hinged side, substantially as specified.

2. A stall provided with a side, B, hinged at the front corner of said stall opposite to chute D to open outwardly, in combination with the chute located outside the plane of the closed position of the hinged side, and provided with the door C, substantially as specified.

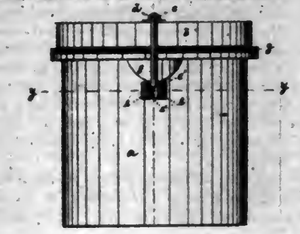
397,206.

3. A stall provided with a side, B, hinged at the front end of the stall opposite to chute D to open outwardly, in combination with the chute provided with the door C, located outside the plane of the closed position of the hinged side, and a locking-pole, substantially as specified.

4. In a stall provided with the downwardly and backwardly inclined series of holes O, located in each side near the front of the stall, the combination of a bar or rod fitting said holes and removable planks H for the rear of the stall, substantially as specified.

5. A stall provided with removable planks H, sliding door F, and adjustable doors J J, in combination with a vertically-adjustable platform and gangway, substantially as specified.

6. For use in harnessing, haltering, bitting, and saddling, the stall provided with the sliding front door and with doorways in a side, and having oppositely-placed series of holes O near its rear, and a rod, O', fitting said holes, substantially as specified.



7. The stall provided with doorways in its sides, having the front sliding door, F, and removable planks H at the rear, for use in roaching and trimming mules, substantially as specified.

8. In a stall provided with sides oppositely perforated near the rear, the combination of a bar or rod adapted to fit the perforations, and a sliding removable door, F, whereby the animal may be held to have his teeth or mouth operated on or to be drenched, substantially as specified.

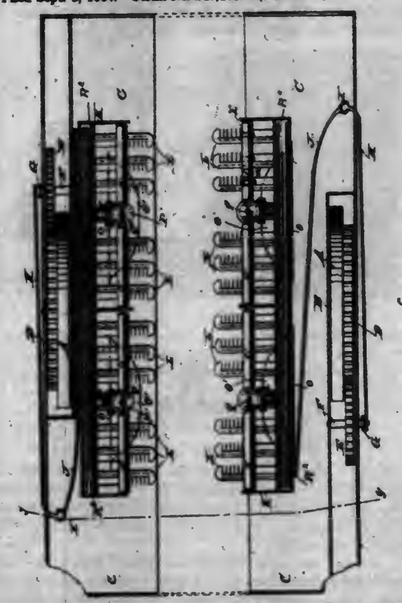
9. The stall provided with the front door, F, movable lengthwise of the stall, and with separately-removable planks H H for use in administering injections, substantially as specified.

10. In a stall having a removable side provided with small doorways, slinging-belts, and a rope, L^3, having ring L^4, said rope being secured to the stall near its front, substantially as specified.

397,207. COVER-FASTENER. GUSTAV STAIB, Tompkinsville, N. Y. Filed Dec. 11, 1888. Serial No. 293,236. (No model.)

Claim.—The combination of can *a*, having grooves *d* and curved guards *f*, with cover *b*, and with spring-bail *c*, having inwardly-bent arms *c'*, substantially as specified.

397,208. TOOL FOR NICKING HEADS OF SCREWS. JAMES F. THAYER, Providence, R. I. Filed Sept. 14, 1888. Serial No. 285,439. (No model.)



Claim.—1. The herein-described hammer for forming the nick hereinbefore described, the same comprising a shank provided with a projecting tongue, having the salient angles rounded and the re-entrant angles filleted, substantially as specified.

2. The hammer herein described, having a cup-shaped recess at one end provided with a projecting tongue, having the salient angles rounded and the re-entrant angles filleted, substantially as and for the purpose specified.

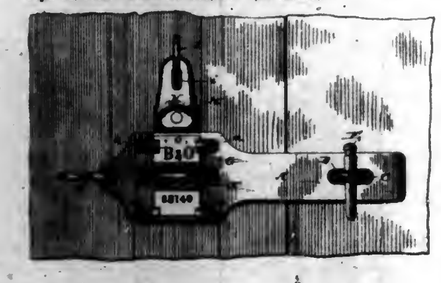
3. In combination with a screw-blank-forming die, a hammer for making a screw head and nick simultaneously, the same having one end thereof corresponding in shape to the face of the head of the screw to be formed, said end being provided with a projecting tongue the salient angles of which are chamfered or rounded and the re-entrant angles filleted, substantially as and for the purpose specified.

397,209. COTTON-PICKER. JAMES W. WALLIS, Birmingham, Ala. Filed Sept. 5, 1887. Serial No. 249,165. (No model.)

Claim.—1. In a cotton-harvester, the combination, with the frames carrying the pickers, of wheels on which said frames are supported, and a track for said wheels, which is composed of a straight section and a curved section placed opposite each other and meeting at their corresponding ends, substantially as shown and described, whereby the reciprocating frames make the circuit of the track and thus have a laterally and longitudinally swinging motion, as specified.

2. In a cotton-harvester, the combination, with the main driving-wheels, of frames carrying the pickers, and devices connecting said wheels and frames for reciprocating the latter, wheels for supporting said frames, a track on which these wheels run, vertical shafts mounted in the frames and having gears fixed thereon, means for rotating said shafts, pickers carried by the frames, and means for imparting motion to the pickers from the gears on the said shaft, as shown and described.

3. In a cotton-harvester, the combination, with frames carrying sets of pickers, of wheels on which said frames travel, a track for these



wheels which describes an irregular orbit, the section O' of the track nearest the center of the machine being convex toward the center of the machine and the opposite section O straight, as shown and described, whereby the picking-frames have a laterally-swinging and also longitudinal movement, as and for the purpose specified.

4. In a cotton-harvester, the combination, with frames carrying the pickers, and means connected with the driving-wheels for reciprocating the frames, of grooved wheels on which these latter travel, tracks on which the grooved wheels run, vertical shafts which derive motion from said grooved wheels, rollers arranged horizontally and deriving motion from said vertical shafts, and pickers supported on the picking-frames and operated by said rollers, substantially as shown and described.

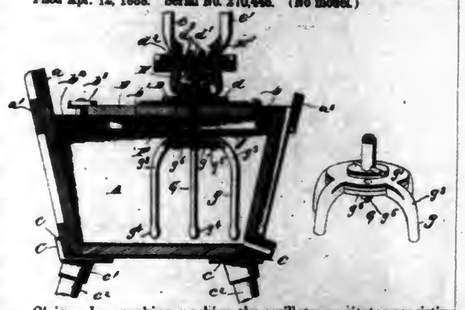
5. In a cotton-harvester, the combination, with a frame, C, and the main driving-wheels, of a gear-wheel secured to each of the latter, a second gear-wheel, E, meshing with the first, and a crank-shaft whereon it is mounted, reciprocating frames K, carrying the pickers, tracks composed of sections arranged opposite each other and meeting at their corresponding ends, whereon said frames travel, and the pitman H and link J, jointed together and loosely connected with the crank-shaft and reciprocating frames, for imparting motion to the latter, as shown and described.

6. In a cotton-harvester, the combination, with the main driving-wheels and frame C, supported by the same, of a gear-wheel secured to each of said driving-wheels, a second gear-wheel meshing into the first and secured to a shaft mounted in said main frame, a crank-arm secured to the said shaft, a pitman pivotally connected with said crank-arm, a link which is connected to the pitman by a universal joint, frames carrying the pickers connected with the link, wheels supporting said frames, and tracks on which said wheels travel in an irregular orbit, the said tracks being composed of straight and curved sections placed opposite each other and meeting at their corresponding ends, as shown and described.

397,210. SEAL-LOCK. ORRIN T. WELCH, Topeka, Kans. Filed Sept. 21, 1888. Serial No. 285,960. (No model.)

Claim.—1. In a seal-locking device, the combination, with a hasp having projections on the face thereof for holding the seal between the hasp and projections, of a locking device arranged at the side of the hasp and adapted to hold the seal in position on the face of hasp, substantially as described.

2. In a seal-locking device, the combination, with a hasp having a longitudinal slot, of a loop projecting through said slot, a breakable seal secured upon the hasp and passing through the loop, and a locking device arranged at the side of the hasp to secure the seal, substantially as described.



3. In a seal-locking device, the combination, with a hasp supporting a breakable seal, of a locking device arranged at the side thereof, the said device being provided with a bolt and projections to engage with the hasp, substantially as described.

4. In a seal-locking device, the combination, with a hasp carrying a seal, of a locking device arranged at the side thereof and adapted to engage with the hasp, and provided with a blind-bolt to engage with a fixed seat, substantially as described.

5. In a seal-locking device, the combination, with a hasp carrying a seal, of a locking device having a recess in the base thereof, a spring-bolt supported in said recess, and a fixed block provided with a seat for said bolt and adapted to be embraced by the locking device, substantially as described.

6. In a seal-locking device, the combination, with a hasp carrying a seal and having recesses in the under side, of a seal-locking device provided with projections O, adapted to engage the said recesses and to be held in locking position thereby, substantially as described.

397,211. WASHING-MACHINE. EDGAR E. WILLIS, Decatur, Ill. Filed Apr. 12, 1888. Serial No. 270,442. (No model.)

Claim.—In a washing machine, the oscillatory agitator consisting of the disks g' g^4, of equal diameter, each having the integral opposite depending arms g curving outwardly from the disk and extending vertically downward, and the bolts to connect the disks then together, substantially as specified.

397,212. APPARATUS FOR HEATING RAILWAY PASSENGER CARS. MARSHAL WOOD, Alderson, W. Va., assignor to himself and ALEX. McVEY MILLER, same place. Filed Feb. 14, 1888. Serial No. 264,017. (No model.)

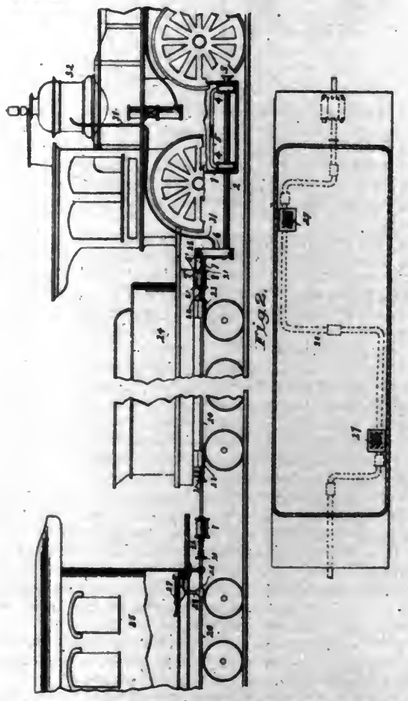


Fig 2.

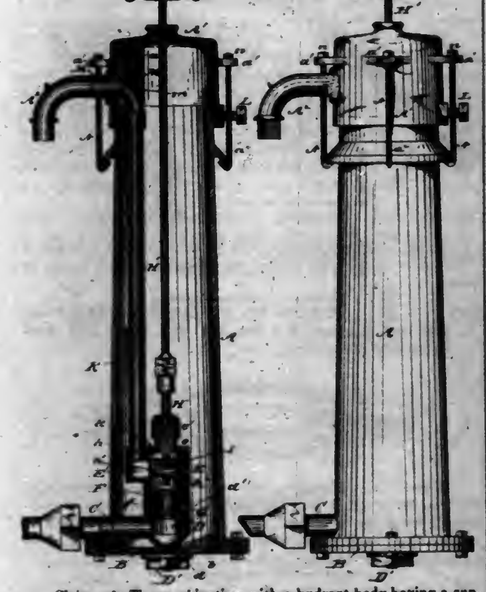
Claim.—1. An apparatus for heating railway passenger-cars, consisting of air-tubes having open ends projecting in front of the fire-box of the locomotive, passing through reservoirs in the fire-box connected by hollow tubes serving as grate-bars, and passing to a hot-air drum beneath the cab of the locomotive, said hot-air drum being connected by a tube and flexible coupling with an air-pipe beneath the tender, which is connected in turn with air-pipes suspended beneath the cars of the train and provided with branch pipes and perforated openings in the floors of the said cars, said pipes being connected together between the cars by suitable flexible couplings, substantially as described.

2. In an apparatus for heating railway passenger-cars, the combination, with register-openings in the bottoms of the said cars connected with a main hot-air pipe leading to a hot-air drum located beneath the cab of the locomotive, which in turn is connected by hot-air pipes passing through the fire-box of the locomotive, with open ends projecting beyond the same, of a steam-pipe connecting the hot-air drum beneath the locomotive with the steam-drum, substantially as described.

3. In an apparatus for heating railway passenger-cars, the combination, with open end air-pipes passing through the fire-box of the locomotive and beneath the cars of the train and connected with suitable openings in the said cars, of reservoirs located in the fire-box of the locomotive and connected by tubular bars forming the grate-bars of the fire-box, substantially as shown and described.

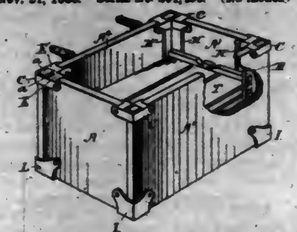


4. In an apparatus for heating railway passenger-cars, the combination, with the fire-box 1, of the air-pipes 2, having funnel-shaped ends 3, and the reservoir-boxes 4, connected by tubular grate-bars 5, substantially as described.

5. In an apparatus for heating passenger railway-cars, the combination, with the V-shaped heating-drum 6, located beneath the cab of the locomotive and having a pipe, 7, connecting with the main heating-pipe located beneath the cars of the train, of air-pipes 2, passing through the fire-box 1, having open ends 3 and connected with the reservoirs 4, joined by hollow grate-bars 5, located in the fire-box 1, substantially as described.

6. In an apparatus for heating railway passenger-cars, the combination, with the heating-drum 6, the air-pipes 2, connected with said heating-drum, passing through the fire-box 1, and having open ends 3, and the reservoir-boxes 4 and grate-bars 5, connected with the said air-tubes 2, of the steam-pipe 31, connecting the hot-air drum 6 with the steam-dome 32, substantially as shown and described.

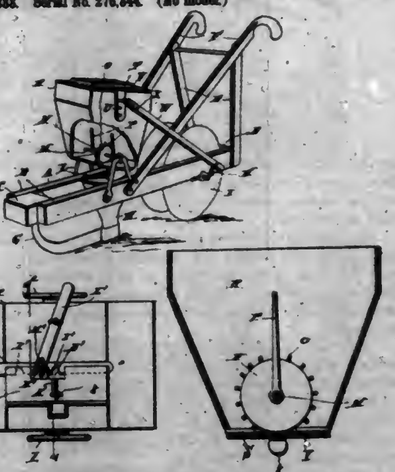
7. An apparatus for heating passenger-cars of a railway-train, consisting of the air-pipes 2, with openings 3, passing through the fire-box 1 of the locomotive, connecting with reservoir-boxes 4 and hollow grate-bars 5, and the hot-air drum 6, having pipe 7, with coiled springs 22 and spring-hook 6', and freely resting in the lug 7 of coupling 8, and a series of air-pipe sections, 20, connected by couplings 8, and with registers 27 in the cars 25, substantially as shown and described.



397,213. HYDRANT. EDWARD ZWIEBEL, Pottsville, Pa. Filed June 15, 1888. Serial No. 277,171. (No model.)

Claim.—1. The combination, with a hydrant-body having a supply-pipe and a centrally-arranged block containing a chamber communicating with the supply-pipe, of a valve-casing provided with a tubular plug fitting into the block and communicating with the chamber, a valve seating upon the upper end of the plug, a discharge pipe and nozzle, a rotatable and vertically-movable cap bearing upon the upper end of the discharge-pipe, and means for drawing the cap downward over the hydrant-body, substantially as described.

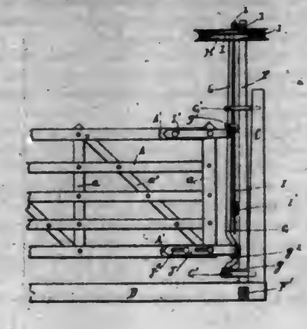
2. The combination, with the body A, rotatable cap A', valve-casing E, and discharge-pipe K, of the T-shaped piece M, inserted between the upper end of the pipe K and the under side of the cap A' and provided with a passage, m, substantially as described.



397,214. SHIPPING-CASE. BENJAMIN S. ATWOOD, Whitman, Mass. Filed Nov. 21, 1888. Serial No. 291,490. (No model.)

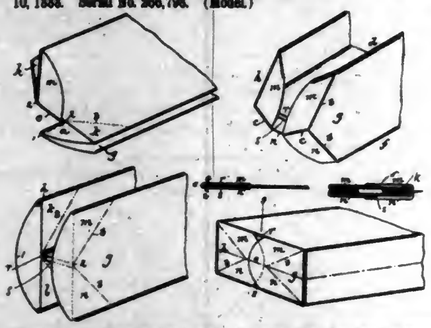
Claim.—1. In a shipping-case, the combination of the side and end pieces, A A' A^3 A^3, having tenons a a', with the socket-clasps C C, having exterior and interior angle-pieces, K K', and cross-bars E E', substantially as described, and for the purpose set forth.

2. In a shipping-case, the combination of the side and end pieces, A A' A^3 A^3, with a bracing and staying device consisting of the corner attachments C and L, and the rods H H, passing through the corner attachments and riveted to them, substantially as described, and for the purpose set forth.



397,215. PLANTER. JOHN J. BALLARD, Terrell, Tex. Filed June 12, 1888. Serial No. 276,844. (No model.)

Claim.—1. The combination, in a planter, of the oscillating hopper having the opening S in its lower side, the slides Y on the bottom of the hopper, the seed-slide guided between said slides Y, the operating-lever L', pivoted on the bottom of the hopper, and the rigid arms secured to the frame of the planter or other fixed point and arranged in the path of the lever, substantially as described.



2. The combination, in a planter, of the oscillating hopper having the opening S in its lower side, the slides Y on the bottom of the hopper, having the slots A', the set-screws Z, engaging said slots and securing the slides in place, the seed-slide guided between the opposing edges of the slides Y, and the operating-lever L', pivoted on one of the screws Z and engaging the seed-slide, substantially as described.

397,216. GATE. EDWARD H. BAUER, Carbon Centre, Pa. Filed May 10, 1888. Serial No. 273,473. (No model.)

Claim.—The gate A, having latch B pivotally secured thereto, and provided with hinges J J', the former of which has slots J^2 to vary the angle of its suspension, as illustrated, in combination with the upright C, having a catch, E, with a central pin, *e*, the upright C, having bearings G', the bent spindle G, having stops g g^2, respectively above and below the hinges J J', the former having a depending lip, for the purpose set forth, the terminal grooved wheel H, mounted on said spindle, the lateral extensions F', having uprights F, in which pulleys *i* are secured, and the cord I, whose middle portion is secured circumferentially, at one place only, to the wheel H, passing one turn in the groove, and whose ends traverse the pulleys *i*, terminating in weights I', in the manner specified and illustrated.

397,217. PAPER BAG. LORENZO D. BENNER, Peoria, Ill., assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Mar. 10, 1888. Serial No. 266,796. (Model.)

Claim.—1. The herein-described square bag, having a bottom formed of the opposite side portions, g k, extending from the bellows sides toward the center of the bag-bottom, so as to overlap each other and the opposite portions r s of the other sides of the bag, substantially as described.

2. The herein-described square bag, having a bottom formed of the opposite side portions, g k, extending from the bellows sides toward the center of the bag-bottom, so as to overlap each other and the opposite portions r s of the other sides of the body of the bag, said opposite side portions having diagonal fold-lines *b*, substantially as described.

3. A bellows-sided bag having a bottom formed of opposite side portions, g k, extending from the bellows sides toward the center of the bag-bottom and overlapping each other, and the opposite portions r s of the other side of the bag-body extending therefrom toward the center of the bag-bottom, the portions k l of the portions r s being folded back thereupon on diagonal lines extending from the sides of the bag, substantially as described.

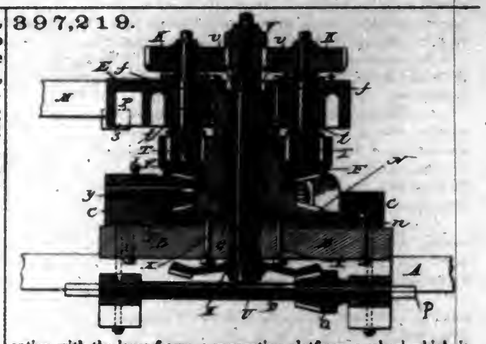
397,218. INSULATING PIPE-COUPLING. SIGMUND BERGMANN, New York, N. Y. Filed June 12, 1888. Serial No. 276,835. (No model.)

Claim.—1. A coupling-piece comprising metallic portions provided with communicating gas-passages, and insulating material between said metallic portions extending inwardly beyond the walls of the gas-passages, said gas-passages comprising an enlarged cavity adjacent to the insulating material, substantially as specified.

2. A coupling-piece comprising metallic portions provided with communicating gas-passages, and insulating material between the metallic portions extending inwardly beyond the walls of the gas-passages, the walls of the gas-passages adjacent to the insulating material being chamfered off, substantially as specified.

3. A coupling-piece comprising metallic portions provided with communicating gas-passages, pieces of insulating material between said metallic portions, and mica between said pieces of insulating material, substantially as specified.

4. A coupling-piece comprising metallic portions having communicating gas-passages enlarged at their inner ends, and insulating material between said metallic portions, substantially as specified.



397,219. HORSE-POWER. DANIEL BERLEW, Springfield, Ohio. Filed Feb. 13, 1888. Serial No. 263,913. (No model.)

Claim.—1. In a horse-power, the wheel F, provided with an internal and an external set of teeth, in combination with master-wheel N, having a vertically-extended hub, pinions T J K V, and gear U, substantially as described.

2. A central vertical shaft and a hollow post thereon, in combination with the lever-frame, a supporting-platform, a wheel which is internally and externally toothed, a master-wheel, and gearing connecting said wheels with the tumbling-shaft, substantially as described.

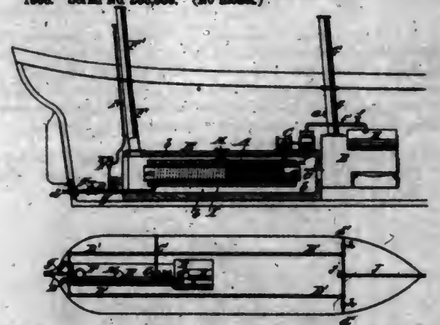
3. In a horse-power, the combination of a wheel having internal and external teeth, a master-wheel having an extended hub, on which said first-mentioned wheel is mounted, pinions between said wheels, and gearing connecting said wheels with the tumbling-shaft, substantially as described.

397,219.

397,220. TENNIS-RACKET. ROBERT B. BROWN, Washington, D. C. Filed Sept. 29, 1888. Serial No. 286,748. (No model.)

Claim.—The combination, with the solid frame of a racket, of a thin short re-enforcing strip of metal secured to the frame at its throat.

397,221. JUNCTION-BOX FOR ELECTRICAL CONDUCTORS. WILLIAM M. CALLENDER, New York, N. Y. Filed Mar. 10, 1888. Serial No. 266,802. (No model.)

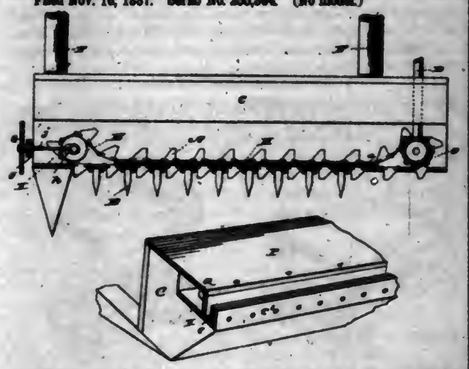


Claim.—The combination, with tubes containing insulated electrical conductors, such tubes being threaded at their ends, of internally-threaded junction-boxes fitting around the said ends, the said junction-boxes being made in halves and being provided with means for attachment to the tubes, substantially as set forth.

397,222. PREPARATION OF PEPTONIZED FOODS. DENISON W. CHAPMAN, South Park, Ill. Filed Nov. 9, 1888. Serial No. 290,403. (No specimens.)

Claim.—1. The process of manufacturing peptonized foods, which consists in removing the fats from albuminoids, heating the remaining portion to the boiling-point, coagulating the albumen by the addition of hydrochloric acid, separating the liquid portion from the coagulated albumen, washing such albumen, adding such washings to the liquid portion already separated, evaporating such liquid portion to the condition of a soft extractive, meanwhile digesting the coagulated albumen into solution, as above described, adding sodium carbonate to the solution, evaporating it to the condition of a soft extractive, finally mixing the two extractives, evaporating the mixture to dryness, and powdering the same, substantially as described.

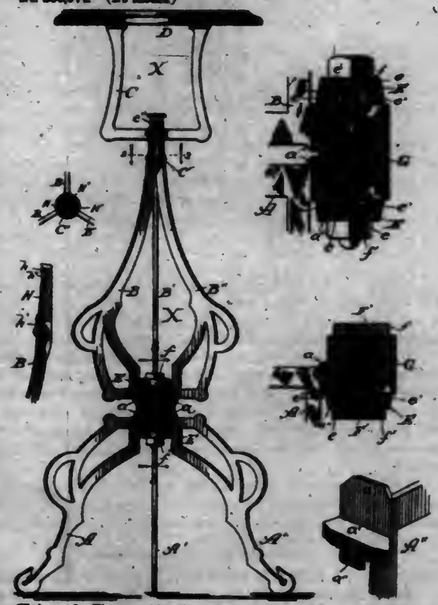
2. The process of manufacturing peptonized foods, which consists in boiling the soluble and insoluble constituents of an albuminoid for time sufficient to extract the soluble constituents and coagulate the soluble albumen, separating the fats, separating the insoluble fiber and coagulated albumen from the liquids, washing the insoluble parts, adding sodium carbonate to the liquid parts and evaporating them to the condition of a soft extractive, meanwhile artificially digesting the fiber and coagulated albumen into solution, as above set forth, neutralizing such solution by the addition of sodium carbonate and evaporating it to the condition of a soft extractive, finally mixing the two extractives, evaporating such mixture to dryness, and powdering the same, substantially as described.



397,223. PNEUMATIC PROPELLING AND STEERING APPARATUS. ROBERT A. CHESBROUGH, New York, N. Y. Filed Oct. 19, 1888. Serial No. 288,032. (No model.)

Claim.—1. The combination, in an apparatus for propelling a ship or other vessel, of a steam-generator consisting of a hollow coil and a furnace for heating it, a force-pump connected with one end of said coil to force water thereinto, and a pipe or nozzle proceeding from the other end of the said coil into the outside water for the ejection therefrom of steam generated in said coil from the water forced thereinto by the pump, substantially as herein described.

2. The combination, in an apparatus for propelling and steering a ship or other vessel, of a steam-generator consisting of a hollow coil and a furnace for heating it, a force-pump connected with one end of the said coil for forcing water thereinto, two or more pipes or nozzles proceeding in different directions from the other end of said coil into the outside water for the ejection of steam therefrom, and stop-valves in said pipes or nozzles for closing either of them at pleasure, substantially as and for the purpose herein described.



397,224. ENDLESS CUTTING APPARATUS. ASA CLARK, ROBERT A. ASHLEY, and CHARLES ASHLEY, Stockton, Cal., assignors to said Asa Clark and Robert A. Ashley, and Lucius E. Ashley, same place. Filed Nov. 16, 1887. Serial No. 255,364. (No model.)

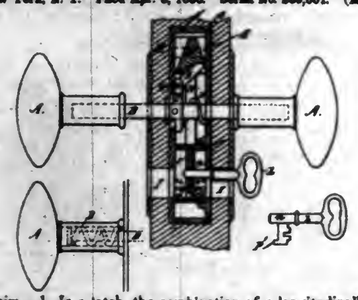
Claim.—1. The bar C, having its forward upper side recessed, as shown, in combination with the angle-iron secured in the said recess, the vertical strip *a*, secured to the angle-iron a short distance behind its vertical flange, the metallic strip P, secured upon the top of the bar C and extending over the strip *a*, the guard-fingers having perforated attaching-flanges, the endless chain composed of the links and alternately-arranged perforated plates upon which the cutters are secured, and means for driving the endless chain, substantially as specified.

2. The combination, with the bar C, having its forward upper side recessed, as shown, of the angle-iron secured in the said recess and having the vertical flange perforated, the vertical strip *a*, secured to the angle-iron a short distance behind the vertical flange, the chain composed of the links and alternately-arranged perforated plates, the cutters, the sprocket-wheel O at one end of the finger-bar, the bevel-gear on the shaft D, meshing with the sprocket-wheel, and the pulley E at the opposite end of said bar, substantially as specified.

397,225. DETACHABLE LEG AND STANDARD FOR STOOLS OR TABLES. GILBERT R. GLOW, Chicago, Ill. Filed July 25, 1888. Serial No. 280,974. (No model.)

Claim.—1. The combination of legs adapted for use in a chair, stool, or table, having at one end thereof a vertical face and a web having a horizontal face on one side thereof and a lug on the other side thereof, a central piece against the side of which said vertical face may be placed and against one end of which the horizontal face of said web may come in contact, a cap fitting over the lugs on said web, and a bolt whereby the said cap and legs and central piece may be rigidly secured together, all substantially as described.

2. The combination of legs adapted for use in a chair or stool, having at one end thereof a vertical face and a horizontal web having a lug on one side thereof, a central piece against the sides of which said vertical face may be placed and against one end of which the face of said horizontal web will be in contact, a cap fitting over the lugs on said horizontal web, and a bolt adapted to secure said cap, legs, and central piece rigidly together, the said bolt being hollow and having a screw-thread cut therein adapted to receive a threaded spindle secured to the seat of said chair, all substantially as described.



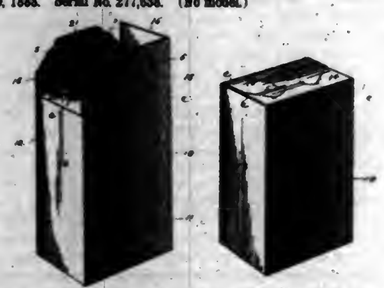
3. The combination of legs adapted for use in a chair or stool, having at one end thereof a vertical face and a horizontal web with a lug on one side thereof, a central piece against the sides of which said vertical face may be placed and against one end of which the face of said horizontal web will be in contact, a cap fitting over the lugs on said horizontal web, and a bolt adapted to secure said cap, legs, and central piece rigidly together, the said bolt being hollow and adapted to receive a spindle secured to the seat of said chair or stool, all substantially as described.

4. In a table, the combination of legs having a vertical face at one end thereof and a horizontal web having a lug thereon, a central piece against the sides of which said vertical face may be placed and against the end of which said horizontal web comes in contact, a standard consisting of three or more pieces, having at one end a like vertical face and a horizontal web with lugs thereon, caps fitting over the lugs on said legs and pieces forming said standard, and a bolt passing through said caps and central piece, whereby the said several pieces may be rigidly secured together, all substantially as described.

5. In a table, the combination of legs having a vertical face at one end thereof and a horizontal web having a lug thereon, a central piece against the sides of which said vertical face may be placed and against the end of which said horizontal web comes in contact, a stand-

ard consisting of two or more pieces, each of said pieces having at one end thereof a like vertical face and horizontal web with lug thereon, and the other end of said pieces forming a part of a spindle, upon which may be placed a rotary frame, caps fitting over said lugs on said horizontal web, and a bolt passing through the said caps and said central piece, whereby the said legs and the said pieces forming the standard may be rigidly secured to said central piece, all substantially as described.

397,226. COMBINED LATCH AND LOCK. MIGUEL E. DE AGUERO, New York, N. Y. Filed Apr. 6, 1888. Serial No. 269,881. (Model.)

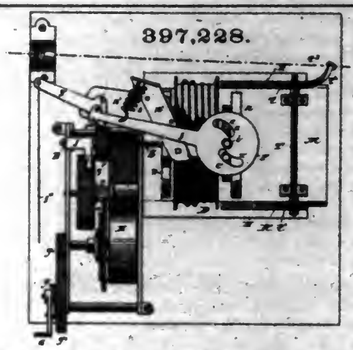


Claim.—1. In a latch, the combination of a longitudinally-movable knob-shaft, B, collar C thereon, spring D, push-lever E, jointed to said collar, a lever fulcrumed at G, having arms F and H, latch R, and spring P, substantially as described.

2. In a combined lock and latch, the combination of a knob-shaft movable in the direction of its length, a spring to resist the movement, a push-piece jointed to the shaft, a two-armed latch-lever operated by said push-piece, and a spring to close the latch, with a cam projection on the latch-lever and a revoluble key-tumbler for co-operating with said cam in locking said latch, substantially as described.

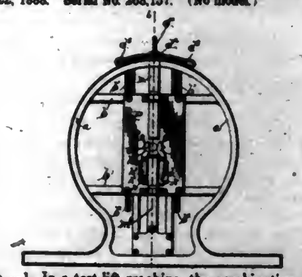
3. The combination of a revolving tumbler, J, having rim *r* and slot *d*, a lock-casing having projections *a b c*, and a suitable key having corresponding projections and indentations, whereby the tumbler may be revolved, substantially as described.

397,227. LOCK FOR PAPER BOXES. FRANK E. DE LOSE, Philadelphia, Pa., assignor to Charles L. Lockwood, same place. Filed June 20, 1888. Serial No. 277,638. (No model.)



Claim.—A box or tray provided with opposite closing-flaps adapted to lie one over the other, one flap provided with a tongue on its end and with a pair of slots between its hinged and tongued ends, and the other tongue formed by an incision within the body of the flap, providing oppositely-extending enlargements 6, and a slot at the base of said tongue, the first-mentioned tongue and its flap adapted to underlie the other tongue and said tongue to enter the slot at its base, and the enlargements of said other tongue adapted to enter the slots in said underlying flap, whereby the said flaps are locked together, substantially as described.

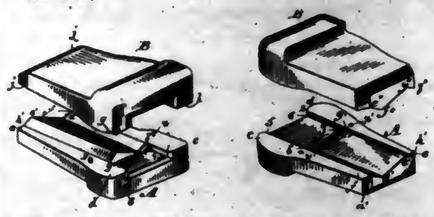
397,228. MECHANISM FOR OPERATING DUMB-WAITERS. GARRETT M. BERRICK, Brooklyn, N. Y. Filed June 16, 1888. Serial No. 277,319. (No model.)



Claim.—1. In a mechanism for operating dumb-waiters or elevators, a hoisting-drum, in combination with a coiled spring and a train of two or more gear-wheels interposed between said motor and the drum, one of which gears is adapted to be moved laterally for throwing it into and out of mesh with the rest of the train to connect or disconnect the motor and the drum, a pawl for holding said gearing and motor stationary when the drum is disconnected from the motor, and a brake for controlling the movements of the drum, substantially as described.

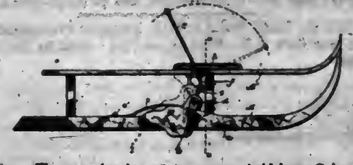
397,228.

2. In a mechanism for operating dumb-waiters or elevators, the combination of a hoisting-drum, D, a spring, H, and the train of gear-wheels *o p q r*, with the sliding sleeve K, upon which the gear *r* is mounted, the pawl *j*, connected to said sleeve by means of an arm, *j''*, the lever *t* and rope *t'*, for operating said sleeve, and a brake for controlling the movement of the drum D, substantially as described.



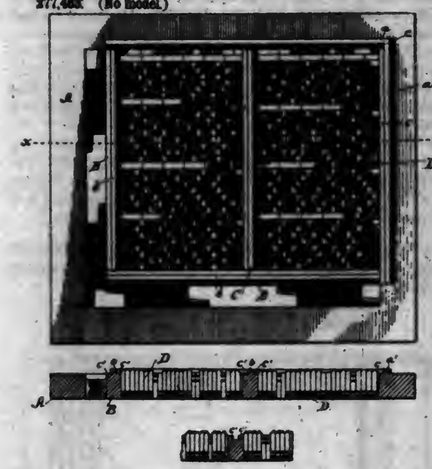
397,229. COIN-CONTROLLED LIFTING-MACHINE. BERNHARD FÜCHTER, Syracuse, N. Y., assignor to John Lighton, same place. Filed Mar. 22, 1888. Serial No. 268,157. (No model.)

Claim.—1. In a test-lift machine, the combination, with the lifting-bar provided with locking-studs and a coin-chute, of a pair of spring-actuated locking-dogs pivoted below the end of the coin-chute and provided in their upper ends with a curved seat for the coin, and having their lower ends notched and formed with inclines both above and below the notches, substantially as and for the purpose set forth.



2. In a test-lifting machine, the combination, with the lift-bar and its springs, the bar being formed with locking-studs and provided with a rack-bar, and an adjustable hand-hold, the indicator-hand, the graduated dial-plate, and the connecting-spindle between the indicator-hand and the lift-bar provided with a pinion and a bent arm, of a coin-chute for delivering the coin to the locking-dogs, a pair of spring-actuated locking-dogs engaging the lift-bar at one end and formed to receive the coin in their other end, and a second coin-chute for delivering the coin to the receiver, all constructed and arranged to operate substantially as and for the purpose set forth.

397,230. DEVICE FOR SHARPENING ROCK-DRILLS. FREDERICK A. GRACE, Hickory, N. C. Filed June 2, 1888. Serial No. 275,823. (No model.)



Claim.—A swage divided in two parts, having in one half, A, the plane *a' b' c' d'*, parallel to the plane *e' f' g' h'*, and the two, forming equal angles with the plane *d' c' f' e'*, made to correspond to and fit into the opposite plane surfaces of the half B, and having a rectangular cavity in the side A, bounded on the lower side by the triangular plane figure *b' c' 9*, placed at an oblique angle with the planes which it intersects, and the irregular plane *c' f' g' 7*, also at oblique angles with the planes which it intersects, the planes *b' c' 9* and *c' f' g' 7* corresponding with planes of similar shape and formed upon the side B, so that the base of the triangular facet in B shall be *f' g'* and the base-lines of the irregular facet in B shall correspond to *b' c' f'* in A.

397,231. BRAKE FOR SLEDS. FREDERICK GRITTNER, Bennington, N. Y. Filed Apr. 24, 1888. Serial No. 271,960. (No model.)

Claim.—The combination of the runner A A', lever C, bent rod *f*, connecting-piece *e*, and shoes B B, the latter being curved at the bottom and having the inclines *b b* on their outsides, with the springs *a a* working in connection therewith, and also the central spring, *c*, all substantially as and for the purpose specified.

397,232. MATRIX IMPRESSION-GUARD FOR TYPE-FORMS. ROBERT B. HASTIE, Washington, D. C. Filed June 16, 1888. Serial No. 277,462. (No model.)

Claim.—1. The matrix guard-chase having guard-strips formed upon its upper side, as and for the purpose set forth.

2. The matrix guard-chase having upon its upper side type-high guards formed near its inner edge, having low margins e between the guards and said edge, substantially as described.

3. The matrix guard-furniture consisting of the low body having upon it a central longitudinal guard-strip type-high, substantially as described.

4. The matrix guard-furniture consisting of the low body having upon it a central longitudinal guard-strip type-high, said guard-strip extending beyond the end of the body to form a close joint with an adjacent guard, substantially as described.

5. In a matrix type-form, the middle strip or stick of low body having a central longitudinal groove to define the dividing-line between the pages of the plate, substantially as described.

6. The combination, in a matrix type-form, of a matrix guard-chase having guard-strips upon its upper side with matrix guard-furniture having a central guard-strip upon it, substantially as described, said guard-strips surrounding the form, as and for the purpose set forth.

7. The combination, in a matrix type-form, of a matrix guard-chase having guard-strips upon its upper side with matrix guard-furniture having a central guard-strip upon it and a middle strip having a central longitudinal groove, substantially as described.

397,233. CAR-AXLE BOX. WILLIAM R. HEFFNER, Huntingdon, Pa. Filed Oct. 31, 1888. Serial No. 289,613. (No model.)

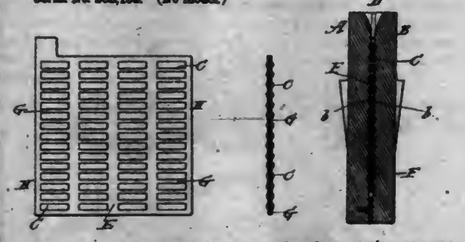
Claim.—1. The combination, with the car-axle box having an opening in its outer end, of the cover formed with a flange, and an asbestus ring around the body of said cover beneath said flange, substantially as described.

2. The combination, with the car-axle box having an opening in its outer face, of the cover formed with lugs on its inner face, and an asbestus ring around the body of said cover and retained in place by said lugs, substantially as described.

3. The combination, with the car-axle box having an opening in its front or outer end, of a cover for said opening formed with a flange, a cross-bar on the inner face of said cover and extended beyond the periphery thereof to form lugs, as shown, and an asbestus ring around the body of the cover between said flange and lugs, substantially as shown and described.

397,233.

4. The combination, with the car-axle box formed on its inner face with the cam-surfaces, of the cover provided on its inner face with lugs, as described, and the spring-bar on the outer face of said cover and engaging the lug G, substantially as described.



5. The combination, with the car-axle box formed on its inner face with the cam-surfaces, and with the stop K between said cam-surfaces, and having a notch, *f*, of the cover, the cross-bar on the inner face thereof, and forming the lugs *h* and *i*, the inclined lug G on the outer face of the box, and the spring-bar on the outer face of the cover engaging the lug G, substantially as shown and described.

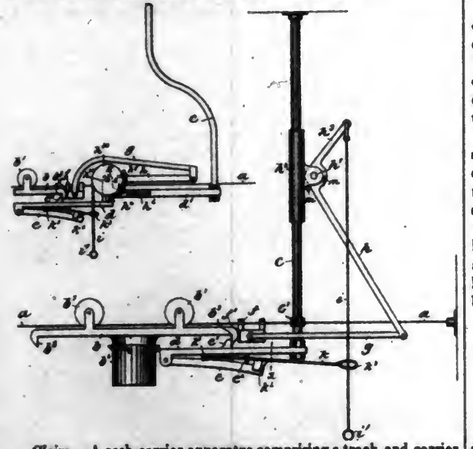
397,234. SPRING-BED OR UPHOLSTERED SPRINGS. CHARLES B. HOWELL, Wilmington, N. C. Filed July 2, 1888. Serial No. 278,235. (No model.)

Claim.—The combination, with the mattress having an open bottom, of a covering for said bottom secured thereto by a suitable glue or adhesive substance, whereby access of vermin to the interior of the mattress is prevented, substantially as described.

397,235. METHOD OF FORMING SECONDARY-BATTERY ELECTRODES. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed Jan. 27, 1888. Serial No. 262,132. (No model.)

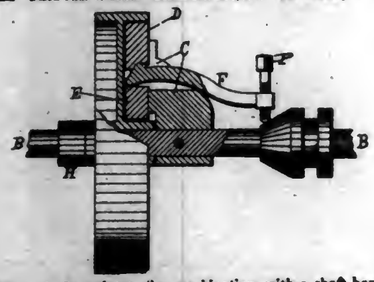
Claim.—The method of forming secondary-battery elements, consisting in warming the mold, arranging previously-formed pieces of active material close together and holding them rigidly in said mold, setting the mold on end, so that the active material pieces are located one above the other, and finally casting the fluid-conducting metal around said active material pieces while so held.

397,236. ROAD-CART SPRING. RICHARD E. JOHNS, Goldsborough, N. C. Filed Oct. 25, 1888. Serial No. 289,091. (No model.)



Claim.—The thill 1, in combination with the spring 4, consisting of the overlapping layers 5, 6, and 7, the former provided with an eye, 8, and connected with the shackle 10 by the bolt 9, and the latter provided with the forward-bent portion 12, and connected by the bolt 13 to the thill, the clip 15, having the nuts 16, for connecting the spring with the thill, and having the interposed block 14, and the clip 17, having the tie-plate 21, nuts 23, wood block 22, interposed between the plate and spring, and the rubber roll 20, having the spindle

397,236.



19, passing through the slotted openings formed in the clips, substantially as specified.

397,237. CASH-CARRIER. THOMAS M. KENNEY, Cambridge, Mass. Filed May 24, 1888. Serial No. 274,903. (No model.)

Claim.—A cash-carrier apparatus comprising a track and carrier movable thereon, combined with a lock that engages a carrier at the station, and releasing-arm provided with a cam co-operating with said lock, a propelling-lever having a long arm that acts upon the carrier, and an operating-cord connected with the short arm and passing through an eye in the releasing-arm for the lock of the carrier to operate the same by the lateral pressure of said cord, substantially as described

397,238. CLUTCH MECHANISM. CHARLES A. KIRK, Meriden, Conn. Filed Jan. 7, 1888. Serial No. 260,037. (No model.)

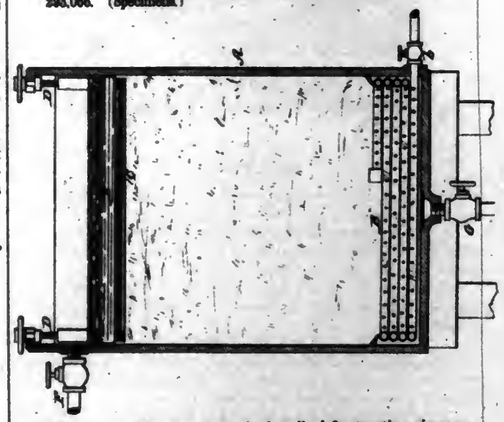
Claim.—1. In a clutch, the combination, with a shaft having a pulley loosely mounted thereon, of a carrier rigidly secured to said shaft, said carrier comprising a hub or body provided with an arm recessed upon its face, said arm extending at right angles to said shaft and having two movable blocks or shoes mounted within said recess, and a lever arranged to impart a separating motion to said blocks or shoes, all arranged and operating substantially as shown and described.

2. In a clutch, the combination, with a shaft having a pulley loosely mounted thereon, of a carrier rigidly secured to said shaft, said carrier having two movable blocks or shoes mounted therein, and an actuating-lever interposed between and adapted to impart a separating motion to such blocks or shoes, causing them to contact simultaneously, one with the rim and the other with the hub of said pulley, and a spring adapted to retire said shoes from contact when the actuating-lever is released, all arranged and operating substantially as shown and described.

3. In a clutch, the combination of the wheel A, the shaft B, and the carrier C, having perforations *a a* and slot L, the shoes D and E, mounted within said slot, and the spring G, the lever F, adjusting-screw P, and cone K, all constructed and arranged to operate substantially as herein shown and described, and for the purpose specified.

397,239. PIANO-FORTE ACTION. HELLMUTH KRAMICH and JACQUES RAGE, New York, N. Y. Filed Oct. 16, 1888. Serial No. 288,266. (No model.)

Claim.—1. The combination, with a damper-lever and damper-head, of a clip secured to the damper-head and adapted to be adjusted lengthwise of the damper-lever, substantially as specified.



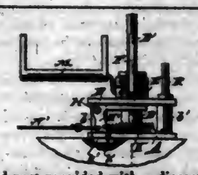
2. The combination, with a damper-lever and damper-head, of a clip consisting of a strip of metal bent between the ends in a cylindrical form and having the ends lapped, substantially as specified.

3. The combination, with a damper-lever and damper-head, of a clip consisting of a strip of metal bent between the ends in a cylindrical form and having the ends lapped, and a screw passing through the lapped ends and entering the head, substantially as specified.

4. The combination, with a damper-lever and damper-head, of a screw passing through an extension from the damper-lever into the damper-head, and constructed to permit the oscillation of the head relatively to the damper-lever upon the axial line of said screw, substantially as specified.

5. A damper-lever having a cylindrical portion of wire, a clip having a cylindrical portion fitting the cylindrical portion of the lever, a damper-head, and a screw for tightening the clip upon the damper-lever, all being so combined that the clip and the damper-head may be rotated around the damper-lever, substantially as specified.

397,240. PROCESS OF MAKING FIBER FROM PINE-NEEDLES. WILLIAM LATIMER, Wilmington, N. C. Filed Dec. 10, 1888. Serial No. 293,066. (Specimens.)



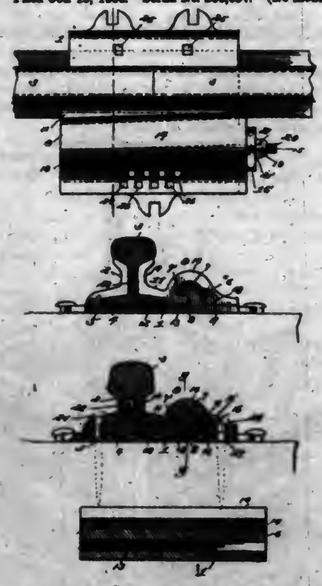
Claim.—1. The process herein described for treating pine-needles for making fiber for spinning and weaving into textile fabrics for bagging and for other purposes, which consists in first actively boiling the needles for a few minutes in an alkaline solution until a head of foam is raised, then lowering the temperature to below the boiling-point and slowly digesting the mass for a period of ten hours, more or less, and then drawing off the solution, and washing the mass with pure water, substantially as shown and described.

2. The process herein described of treating pine-needles for making fiber for spinning and weaving into textile fabrics for bagging and other purposes, which consists in first actively boiling the needles for a few minutes in an alkaline solution until a head of foam is raised, then lowering the temperature below the boiling-point and slowly digesting the mass for ten hours, more or less, and then draining off the solution and subjecting the cooked needles to a series of successive washing and steeping or soaking operations in clean water, each of said washing and soaking operations being at a lower temperature than the preceding one, substantially as specified.

397,241. MUSIC-LEAF TURNER. FRANK H. LOUGHLIN, Syracuse, N. Y. Filed June 13, 1888. Serial No. 276,926. (No model.)

Claim.—1. The combination, with a base, a spring-actuated elbow-lever pivoted to the same, and an upwardly-extending vertical post secured to the upper surface, of a series of spring-actuated drums

397,241.



revolving upon said post provided with a diametrical peripheral slot, arms horizontally projected from said drum, and a perpendicular latch provided with an offset upon one edge and notches in the opposite edge, all combined to operate substantially as shown and described.

2. The combination, with a base, a spring-actuated elbow-lever pivoted to the same, and an upwardly-extending vertical post or bar, of a series of spring-actuated drums revolving upon said post provided with a diametrical peripheral slot, slitted arms horizontally projected from the drums, a perpendicular latch provided with an offset upon one edge and notches in the opposite edge, a foot-lever, and connections between said foot-lever and elbow-lever, substantially as shown and described.

3. The combination, with a supporting-block provided with a dovetail groove, a base provided with a dovetail rib adapted to enter said groove, a spring-actuated elbow-lever pivoted upon said base, and a vertical post or bar extending upward from the same, of a series of spring-actuated drums revolving upon said post provided with a diametrical peripheral slot, slitted arms horizontally projected from the drums, a perpendicular latch provided with an offset upon one edge and notches in the opposite edge, a stop-pin secured upon the base, a foot-lever, and connections between said foot-lever and elbow-lever, all combined to operate substantially as set forth.

397,242. RAIL-JOINT. IVES LYND and WALTER T. LYND, Troy, N. Y. Filed Oct. 15, 1888. Serial No. 288,057. (No model.)

Claim.—1. A rail-joint consisting of a bed-plate having a flange on one edge and a tapering flange adjacent to its opposite edge, with a groove in the inner side of the tapering flange, which extends from end to end of the flange and is tapering vertically and laterally, in combination with a pair of abutting rails resting in the bed-plate and bearing at one side against the first-named flange, and a key-plate bearing at one edge against the opposite side of the rails and having its other edge engaging the tapering groove in the tapering flange, the key-plate being wedge-shaped laterally and vertically, substantially as described.

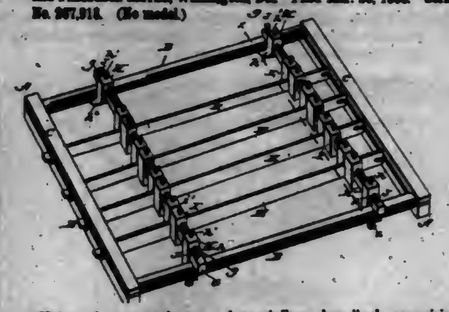
2. In a rail-joint, a key-plate constructed to lie lengthwise between the abutting ends of a pair of rails held in a bed-plate and an inclined flange of the bed-plate, the key-plate being wedge-shaped laterally and vertically, substantially as described.

3. A rail-joint consisting of a bed-plate having a flange on one edge and a tapering flange adjacent to its opposite edge, with a groove on its inner side extending from end to end of the tapering flange and tapering laterally and vertically, in combination with a pair of abutting rails resting in the bed-plate and bearing at one side against the first-named flange, and a key-plate wedge-shaped laterally and vertically and having one edge bearing against the opposite side of the rails and its other edge engaging the tapering groove, with a locking-bolt for holding the key-plate to the bed-plate, substantially as described.

4. A rail-joint consisting of the bed-plate 1, formed with the raised flange 2 at one edge and the tapering flange 6 adjacent to the opposite edge, with the inside groove, 8, tapering from end to end of flange 6 both laterally and vertically, in combination with abutting rails 3, resting on bed-plate 1 and bearing against flange 2, with their flange 4 located in recess 5, and a key-plate, 9, formed with the raised flange 10, bearing against the side of rails 3, the horizontal portion 11 resting on the flange 12 of rails 3, the flange 13 resting on bed-plate 1 and projecting into and fitting tapering groove 8, and the portion 14 extending over flange 6, with a bolt, 15, extending through a groove, 16, in plate 9, and a lug, 16', on bed-plate 1 and secured by a nut, 19, on the threaded end 20 of bolt 15, held by a nut-lock, substantially as described.

5. A key-plate for rail-joints, formed with a horizontal portion to bear against the flange of a rail and a bed-plate, and a raised flange at one edge to rest against the side of a rail and having its opposite edge tapering laterally and vertically, substantially as described.

6. In a rail-joint, the combination, with a bed-plate having a tapering flange adjacent to one edge extending from end to end of the bed-plate, and having an inside groove tapering laterally and vertically, of a key-plate having one edge tapering laterally and vertically and fitting into the tapering groove, the key-plate being adapted to be wedged between the tapering flange and a pair of abutting rails resting on the bed-plate, substantially as described.



397,243. HOISTING-MACHINE. VOLNEY W. MASON, Providence, R. I. Filed Mar. 31, 1888. Serial No. 268,113. (No model.)

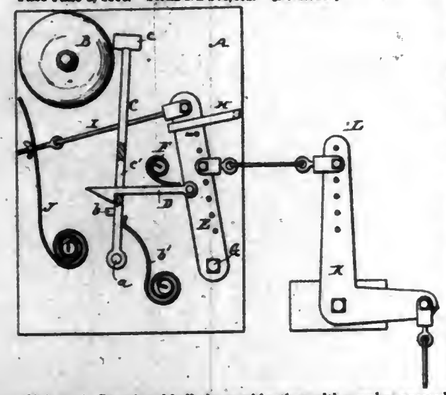
Claim.—1. In a hoisting-machine, the combination, with the eccentrically-mounted hoisting-drum, its wheel, and operating-bar, of the driving-wheel arranged directly above the drum-wheel, and the brake arranged directly below the drum-wheel, as herein shown and described, whereby the weight of the drum, its wheel, and lever will all coact by gravity to hold the load when the lever descends, as set forth.

2. In a hoisting-machine, the combination, with a hoisting-drum provided with a driving-pulley, of the slotted standards A, in which the said drum is mounted, a rod, O, passing through the slots in the said standards, set-screws screwing in the said standards and against the under side of the said rod, and a brake-shoe on the said rod, substantially as shown and described.

397,244. STONE-SAWING-MACHINE GAGE. LEWIS MELSHEIMER and FREDERICK MEYER, Wilmington, Del. Filed Mar. 30, 1888. Serial No. 267,918. (No model.)

Claim.—1. An attachment, substantially as described, comprising a cross-bar, guides thereon, and clamps having near one end sockets in which the ends of the cross-bar may be secured, and having their lower ends curved outward and provided with a clamping-screw, substantially as set forth.

2. In a stone-sawing apparatus, the combination, with the frame having side bars, of the cross-bar having guides for the saws, the



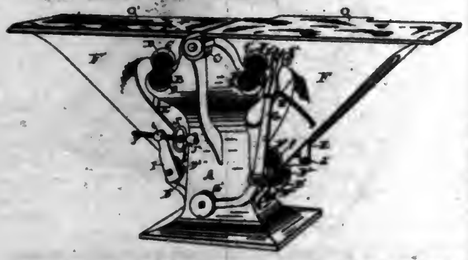
clamps having openings fitted to receive the cross-bar, such clamps being adjustable along the side bars of the frame, and set-screws for securing the clamps in any suitable adjustment along said side bars, substantially as set forth.

3. The herein-described improvement in stone-sawing apparatus, comprising a cross-bar provided with guides for the saws, and clamps connected adjustably with the ends of said cross-bar, said clamps being provided with set-screws, whereby they may be secured in any suitable adjustment along the side bars of the saw-carrying frame, substantially as set forth.

4. In a stone-sawing apparatus, a cross-bar provided with guides secured on and adjustable thereabong, such guides being provided on their sides with downwardly-facing shoulders, substantially as and for the purposes specified.

5. The improved stone-sawing apparatus consisting of the frame having side bars, B, the cross-bars, the clamps having openings fitted to receive the cross-bars and provided with set-screws, whereby they may be secured in any suitable adjustment along bars B, and the guides having on their sides downwardly-facing shoulders, substantially as set forth

397,245. SIGNAL-BELL. ENGELBRECHT OLSEN, Walkerville, Mont. Filed June 8, 1888. Serial No. 276,462. (No model.)



Claim.—1. In a signal-bell, the combination, with a spring-pressed striking-lever, of an operating-lever having a series of perforations set to scale for the attachment of the pull-cord, a tension-spring, a rod secured to the operating-lever and tension-spring, and a spring-pressed trip-lever pivoted to the operating-lever and engaging the striking-lever, substantially as herein shown and described.

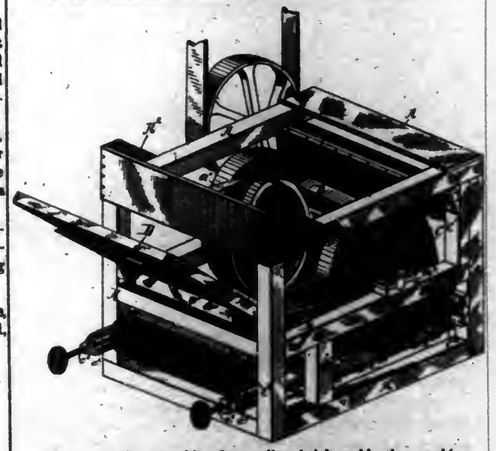
2. The combination, with the bell B, attached to a base-plate, the striking-lever C, having a slot, c', and head c, and the trip-lever D, having a hooked end to engage with slot c', of the spring b', the spring F, the lever E, tension-rod I, and spring J, substantially as shown and described.

3. The combination, with the base A, the bell B, the striking-lever C, and the spring b', of the trip-lever D, operating-lever E, provided with perforations, the tension-rod I, and the spring J, having apertures in its free end, substantially as shown and described.

397,246. CYLINDER PLANER. FRANK B. PHILBRICK, Waterville, Me., assignor of one-half to Frank B. Webber, same place. Filed Aug. 1, 1888. Serial No. 281,699. (No model.)

Claim.—1. In a cylinder planer, the combination of a standard or support, a bed or table supported by brackets, cams for forming a vertically-adjustable connection between said brackets and said standard, each of said cams having two cylindrical bearings eccentric with each other, bearings in said support each formed to surround or inclose more than the lower half and less than the whole of one of the cam-bearings, and bearings in the bracket formed to surround more than the upper half and less than the whole of the other cam-bearing, whereby the said cam may be inserted endwise into its position, substantially as described.

2. In a cylinder planer, the combination of a standard or support, a bed or table supported by brackets, cams for forming a vertically-adjustable connection between said brackets and said standard, each of said cams having two cylindrical bearings eccentric with each other, bearings in said support and formed integral with it and so formed as to inclose or surround more than the lower half and less than the whole of one of the cam-bearings, and bearings in said brackets formed integral therewith and formed to surround more than the upper half and less than the whole of the other cam-bearing, substantially as shown.



3. In a cylinder planer, the combination of a base or support, a bed or table supported by brackets, cams for raising and lowering said brackets and having bearings in said support and in said brackets, a lever attached to said cams for rotating the same, and means for clamping the same in any desired position, substantially as shown.

4. In a cylinder planer, the combination of a base or support, a bed or table supported by brackets, an upper and a lower set of cams for connecting said brackets with said support, arms connected with said cams and a link connecting said arms, a hand-lever connected with one set of cams, and means for clamping the same in place, substantially as shown.

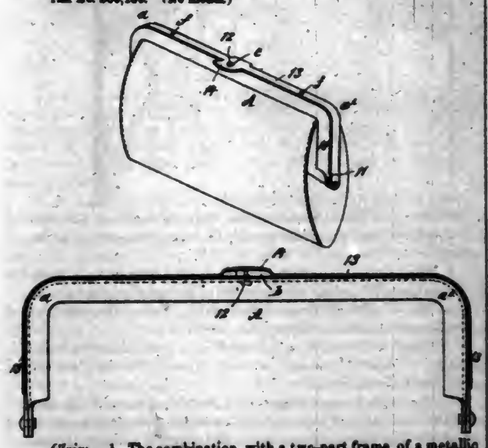
5. In a cylinder planer, the combination of a support, a rear table and a front table supported by brackets, cams for forming a vertically-adjustable connection between said standard and said brackets, a lever for rotating said cams, a rigid handle and a pivoted handle at the upper end of said lever, a segment passing through an opening in said pivoted handle, a pinching-surface above and below said segment, and a spring for forcing said handles apart and clamping said lever, substantially as shown.

6. In a cylinder planer, the combination of a base or support, a front table, a rear table supported by brackets, cams for raising and lowering said brackets and having bearings in said support and in said brackets, a lever for rotating said cams, a nut pivoted to the end of said lever, a screw working in said nut and having one end secured to a stud pivoted to said support, and a hand-wheel for rotating said screw, whereby said bed or table may be accurately adjusted for small vertical distances, substantially as shown.

397,247. MOLD-SANDING MACHINE. GEORGE POTTS, Indianapolis, Ind. Filed July 20, 1888. Serial No. 280,537. (No model.)

Claim.—1. In a machine for sanding brick-molds, the combination of the frame-work, a large wheel arranged at each side of the frame-work and having rests for the molds on their inner adjacent sides a short distance from their peripheries, and an endless apron mounted upon suitable rollers journaled on said frame-work and arranged to bear against the under and rear sides of said large wheels, substantially as set forth.

2. The combination, in a machine for sanding molds, of the frame-work, the wheels B, formed with the annular flanges b and mounted upon the shaft B', which is journaled in suitable bearings on said frame-work, and the apron C, mounted upon suitable rollers and arranged to bear against the under and rear sides of said wheels B, one of said rollers being journaled in adjustable bearings, whereby the tension of said apron may be regulated, substantially as set forth.



3. In a machine for sanding molds, the combination of the frame-work, the wheels B, the apron C, arranged as described, the chute A',

for guiding the molds into the machine, and the arms a', for receiving them from said machine, substantially as set forth.

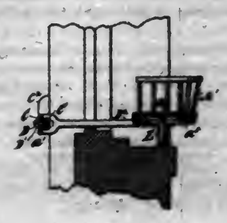
4. The combination, in a machine for sanding molds, of the frame, the wheels B, arranged to receive the molds between their adjacent sides and provided with the annular flanges b, upon which said molds may rest, and the apron C, mounted upon the rollers C' C^2 C^3 and arranged to bear against the rear and under sides of said wheels B, the shaft of one of said rollers being provided with a gear-wheel by which power may be applied for driving the machine, substantially as set forth.

5. The combination, in a machine for sanding molds, of the wheels arranged to receive and support the molds, and the endless apron C, mounted on suitable rolls and formed of a width to extend across the machine from one wheel to the other and provided with the reinforcing stripe c, substantially as described, and for the purposes specified.

397,248. FASTENING FOR POCKET-BOOK, PURSE, OR SATCHEL FRAMES. LOUIS B. FRANAB, Brooklyn, N. Y. Filed Oct. 25, 1888. Serial No. 289,139. (No model.)

Claim.—1. The combination, with a two-part frame, of a metallic spring-strip secured at each end to one of the frame members, said spring-strip being adapted to engage the other frame member, as and for the purpose stated.

2. The combination, with a two-part frame, of a metallic spring-strip secured at each end to one of the frame members, said spring-strip being provided with a thumb-piece adapted to engage the other frame member, as and for the purpose stated.



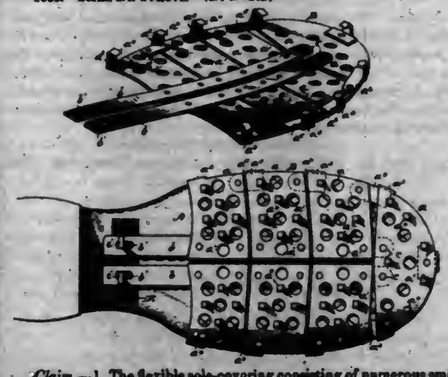
3. The combination, with a two-part frame, of a stud carried by one of the frame members and a metallic spring-strip secured at each end to the other frame member, said spring-strip being adapted to engage the stud, as and for the purpose stated.

4. The combination, with a two-part frame, of a stud carried by one frame member and a spring-strip secured at each end to the other frame member, said spring-strip being provided with an aperture adapted to receive the stud, as and for the purpose stated.

5. The combination, with a two-part frame, of a stud carried by one of the frame members, a spring-strip secured at each end to the other frame member and formed with an aperture adapted to receive the stud, and with an upwardly-flaring thumb-piece, as and for the purpose stated.

6. The combination, with a two-part frame, bent as described, of a metallic spring-strip secured to one of the frame members and adapted to engage the other frame member, the strip being continued over the bends of the frame, substantially as described.

397,249. SUPPORT FOR PERSONS CLEANING WINDOWS. WILLIAM PROUT, Brooklyn, N. Y. Filed Aug. 16, 1888. Serial No. 282,824. (No model.)



Claim.—1. The combination, with a seat, of arms or brackets extending rigidly therefrom and having bifurcated ends, a bar rigidly secured within said bifurcated ends, an adjustable bar movable in said bifurcated ends, one of said bars having a longitudinal slot, a clamping-bolt, a bearing-piece on the outer bar extending beyond the inner face of the inner bar, and a bearing-piece on the inner bar substantially flush with its face, substantially as specified.

2. The combination of a seat, arms extending rigidly from the seat, bars connected to the arms, one of said bars having an adjustable connection thereto, and the other bar having a rigid connection, a slotted bar extending across the seat-frame, and a flexible support adjustable in the slot of said bar, substantially as specified.

397,250. SOLE-PROTECTOR FOR BOOTS OR SHOES. EVAN ROWLANDS and DAVID J. ROWLANDS, Youngstown, Ohio. Filed May 23, 1888. Serial No. 274,371. (No model.)

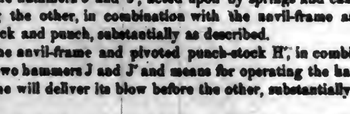
Claim.—1. The flexible sole-covering consisting of numerous small metallic wearing-plates grouped edge to edge in suitable form and number to cover the sole, and flexible metallic connections between said plates, substantially as described, whereby a shoe-sole may be covered and protected from destruction in walking on coals or highly-heated substances, and at the same time permitted to bend freely under the weight of the wearer.

2. The toe-plate, the two spring-arms pivoted thereto, the series of plates attached to the spring-arms and provided with lips to engage the edges of the sole, and the fastening-plate e, said elements combined for joint operation, as described.

3. In a sole-protector for a shoe, the longitudinal pivoted strips b, and the series of plates or sections a, secured to said strips and provided with the arms a^4 and with the lips a^5.

4. A sole-protector consisting of the series of small plates united by flexible strips, as described, each plate provided with a series of perforations with studs on the under face and with lips to engage the edges of the sole.

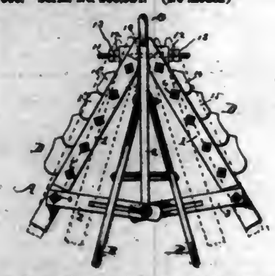
397,251. ADJUSTABLE SHELF-SUPPORT. LOUIS SCHMITT, New York, N. Y. Filed Sept. 20, 1888. Serial No. 286,736. (No model.)



Claim.—1. A shelf support or bracket formed, substantially as described, with an upper member, as d, to bear against the end of the shelf, a second central member, as c, projecting from the first at an angle more or less acute to pass under the shelf, and a third lower member, as b, forming, substantially, an extension of the first, and terminating in sharp points projecting in a direction opposed to the

second member to engage the standard provided for the support of the shelf.

2. The shelf-bracket constructed of a wire doubled and closed upon itself to form one end of the bracket, and having its two free ends pointed and bent at an angle with the length of the bracket to form its opposite end, and its central portion bent outwardly in a loop to project in a direction opposed to that of the pointed ends and at an angle inclined more or less toward its closed end, substantially in the manner and for the purpose herein set forth.



3. The shelf-bracket constructed of an upper member to bear against the end of the shelf, a central member projecting therefrom at an angle more or less acute to pass under the shelf, and a lower member forming, substantially, an extension of the first, and consisting of two elastic laterally-expanding arms terminating in sharp points projecting therefrom in a direction opposed to the central member of the bracket, substantially in the manner and for the purpose herein set forth.

397,252. LACE-HOLE PROTECTOR FOR DRIVING-BELTS. GEORGE W. SOUTHWICK, Stamford, Conn. Filed May 21, 1888. Serial No. 274,694. (No model.)

Claim.—The lace or eyelet hole protector herein described, consisting of flat U-shaped metal body portion having prongs B formed on its two branches adapted to penetrate the solid material of the belt back of the eyelet, and having on the inner side of the bend a flange, C, projecting in the same direction as the prongs and adapted to form a flat bearing at one side of the eyelet-hole, substantially as and for the purpose described.

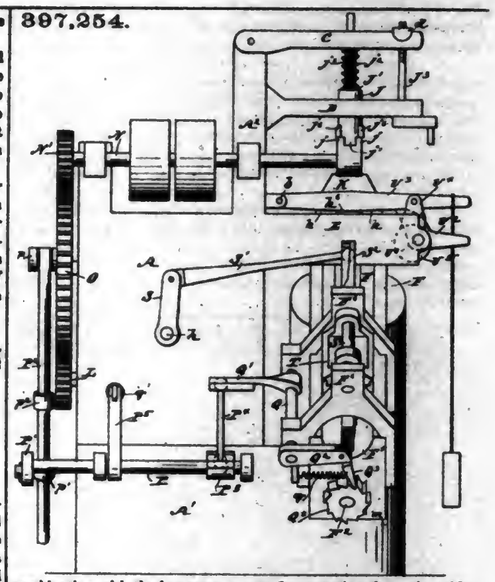
397,253. CULTIVATOR. ELIJAH H. SPENCER, Winona, Miss. Filed Oct. 20, 1888. Serial No. 289,061. (No model.)

Claim.—1. In a cultivator-frame provided with side beams, 1 1, and central draft-beam, 2, the combination of front wheel, E, adjustable slotted rear connecting-bars, 3 3, and a series of plows or cultivator-teeth properly secured in said side beams and of gradually-increased size from the front ends to the rear of said beams, all as herein shown and described.

2. A cultivator provided with a series of plows or cultivator-teeth of gradually-increased size from the front to the rear of the same, as herein shown and set forth.

397,254. RASP-CUTTING MACHINE. PHILIP S. STORER, Tremont, N. J. Filed Oct. 6, 1888. Serial No. 287,286. (No model.)

Claim.—1. The punch-stock held in the anvil-frame and pivoted at or about its center, in combination with a spring or springs applied to its upper end above the pivot, the cutter or punch being held in the stock with its point below the pivot, substantially as shown and described.



2. The hammers J and J', acted upon by springs and cams, one preceding the other, in combination with the anvil-frame and the punch-stock and punch, substantially as described.

3. The anvil-frame and pivoted punch-stock H', in combination with the two hammers J and J' and means for operating the hammers so that one will deliver its blow before the other, substantially as described.

4. The anvil-frame and pivoted punch-stock and the plate d', acted upon by springs for returning the punch-stock, in combination with the hammers, substantially as described.

5. The anvil-frame having the pivoted rod H^9 passed therethrough, in combination with the punch-stock H', secured to the said shaft H^9, the sliding plate H^6, and means, substantially as described, for moving the said plate, substantially as described.

6. The punch-stock H', attached to rod H^9 and the anvil-frame K, and means for moving the rod H^9 and punch-stock laterally, in

combination with the hammers, means for operating them, the table F, feed-table F', and means for moving the same, substantially as described.

7. The combination, with the rod H^3, punch-stock H', anvil-frame K, sliding plate H^6, rod H^9, and lever H^4, of the spirally-grooved cam H^5 and means, substantially as described, for turning the said cam intermittently, as and for the purposes set forth.

8. The pinion N', crank w, and rod W', in combination with walking-beam W^2, pawl L^4, ratchet L^5, shaft M', cam H^2, and plate H^6, substantially as described.

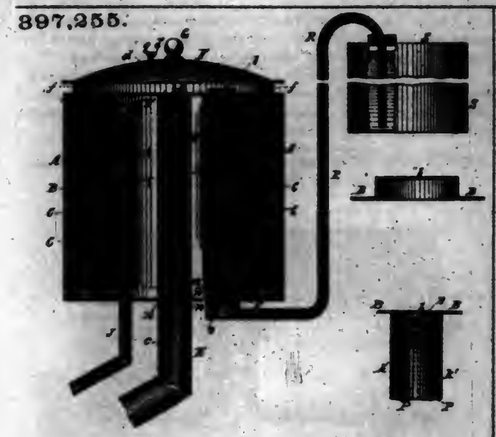
9. The pinion L, connecting-rod L^2, shaft M, and arms L' L^3, connected to the shaft, and the arm L^3 and pawl L^4, pivoted to the upper end of the same, in combination with the shaft M', ratchet L^5, cam H^2, lever H^4, connecting-rod H^8, sliding plate H^6, shaft H^9, punch-stock H', and anvil-frame K, substantially as described.

10. The inclined table F, the punch-stock, means for operating the same, the hammers, and means for operating them, in combination with the feed-table F', held in the inclined table F, and means for intermittently moving the same longitudinally, substantially as described.

11. The inclined table F, made concaved at its upper surface, the feed-table F', the rock-shaft S^2, elongated segmental rack T, secured to the said shaft, and the segmental rack T', secured to the said table and meshing with the said elongated rack T, in combination with worm-shaft P^2, connected to the said table F, the rock-shaft Q, pawl Q^3, and ratchet-wheel Q^4, attached to the worm, substantially as and for the purposes set forth.

12. The large gear-wheel O, provided with crank-pin p and rod P^4, in combination with the shaft P, arm P', opposite arm, P^5, connecting-rod P^4, opposite arm, Q', shaft Q, arm Q^2, pawl Q^3, ratchet-wheel Q^4, feed-shaft P^2, and the feed-table F', connected thereto, substantially as described.

13. The lever H^4, attached to the shaft A, the cam H^2, and means for intermittently turning the same, in combination with the arm S, attached to the shaft A, the connecting-rod S', arm S^2, shaft S^3, elongated segment T, and segment T', attached to the feed-table F', for rocking the same, substantially as described.



14. The anvil-frame K, formed with shoulder or projection U', and the pivoted lever U, engaging with said projection, in combination with the weighted lever U^2, connected to the presser-foot, the cam-lever U^3, acting on lever U, and the eccentric U^5, connected to said cam-lever and acting on the weighted lever U^2, substantially as described.

15. The combination, with the anvil-frame, the hammer, and punch, of supporting-springs for the said frame arranged to lift it and the punch out of contact with the blank, substantially as described.

16. The vertically-movable anvil-frame K, in combination with the hammers J J', adapted to be connected together and to the anvil-frame to operate as one, substantially as described.

397,255. GASOLINE APPARATUS FOR ILLUMINATING AND HEATING PURPOSES. JOSEPH STRASSER, Cincinnati, Ohio. Filed May 26, 1887. Serial No. 239,236. (No model.)

397,255.

Claim.—1. In a gasoline apparatus, the combination of the storage or gasoline reservoir, tube or conduit *l*, and expansible gas-storage chamber connected to the gas-space of the storage-tank B by said intervening tube or conduit *l* and receiving the gas in the storage-chamber while the latter is filling, substantially as and for the purposes specified.

2. In a gasoline apparatus, the combination of the storage gasoline and gas reservoir and an automatic expansible receiving-chamber connected to the gas-space of the storage-reservoir for receiving the gas of the storage-chamber while the latter is filling, substantially as and for the purposes specified.

3. In a gasoline apparatus, the combination of the siphon-tube R and the storage-chamber B, provided with expansible chamber formed by the cover F of the tank, having downwardly-extended sides within the vessel A and outside of the tank B and connected to the tank B by conduit *l*, substantially as and for the purposes specified.

4. In a gasoline apparatus, the combination of the storage gasoline and gas reservoir and an expansible gas-receiving chamber connected thereto by tube *l*, and oil-delivery pipe E, connected to the fluid-space of said reservoir and to a burner, and gas-delivery pipe J, communicating with the gas-space of said reservoir and with an auxiliary burner, and a gas-tight conduit connecting the reservoir with a vessel from which the supply of gasoline is drawn, substantially as and for the purposes specified.

5. In a gasoline apparatus, the combination of the siphon-tube R, one end of which is adapted to be inserted into an oil-supply receptacle, as S, and the other end connected to the storage-chamber B, provided with expansible storage-chamber formed by the cover F of the tank, having downwardly-extended sides within the vessel A and outside of the tank B, and connected to the tank B by conduit *l*, and oil-delivery pipe E, connected to the said fluid-space of said reservoir and to a burner, and gas-delivery pipe J, communicating with the gas-space of said reservoir and with an auxiliary burner, substantially as and for the purposes specified.

6. In a gasoline apparatus, the combination of the reservoir and the feed pipe or siphon, vertical tube P, and its valve and float for controlling the flow of gasoline into the reservoir, and an expansible air-chamber located in conjunction with tube P, and the said reservoir adapted to draw oil from the siphon into the tube P, and the reservoir A, substantially as and for the purposes specified.

7. In combination with a gasoline-reservoir, vaporizing-burner, and an expansible air-chamber connected with said reservoir, an auxiliary heating-burner arranged in suitable relation to the main burner, and a pipe connecting the auxiliary burner to the air-space of the reservoir and provided with capillary material holding gasoline, and through which the air is forced on its way from the air-chamber to the auxiliary burner, substantially as and for the purposes specified.

8. In a gasoline apparatus, the combination of an expansible air-chamber and connections, the reservoir B, lying beneath said expansible chamber and directly connected therewith, capillary material, *k'*, and vertical tube I, likewise located in said reservoir, provided with auxiliary burner J', located below said reservoir, substantially as and for the purposes specified.

9. The construction and arrangement of the reservoir B, provided with outlying wall or casing A, cover F, having wall C, stem *c*, for guiding the cover in its vertical movement, vertical tube D, located in the said reservoir, provided with aperture *n*, and extending below into the reservoir-pipe E and connected to the burner lying below the reservoir, substantially as and for the purposes specified.

10. In a gasoline-reservoir, the combination of an oil-inlet pipe located at the bottom of the reservoir, inlet-valve opening into the said bottom of the reservoir and affording means of communication between said inlet-pipe and reservoir, valve *v*, located in said pipe and preventing the reservoir from overfilling and connected to the vertical rod passing up and connected to the vertically-movable float, substantially as and for the purposes specified.

11. In combination with a reservoir, B, the upright casing P, orifice *l*, inlet-pipe located at the bottom of said casing, valve-opening located at or near the bottom of said casing and forming the means of communication between the said inlet-pipe R and said casing, and valve *v*, for regulating the inflow of oil through said valve-opening, and connected to a vertical stem provided at its top with float *x*, moving vertically in said casing and guided thereby, the said reservoir surrounding and inclosing said casing P, valve *v*, float *x*, the space of said reservoir being connected with the casing P and delivery-pipe E, communication in said reservoir being established between the reservoir and perforations of casing P and the delivery-pipe E, substantially as and for the purposes specified.

12. In a gasoline-reservoir, capillary covering *k'*, located in said reservoir, vertically-moving float *x*, and valve *v*, located at the lower end of the tube P and, in conjunction with said float, preventing the said reservoir from being overflowed with gasoline, substantially as and for the purposes specified.

13. The combination of the reservoir B, provided with aperture *l*, located above the capillary material *k'*, inclosing float *x* and valve *v*, said capillary material being located within said reservoir, vertically-moving cover F, forming roof of said reservoir, and siphon R, forming the connection between the filling-reservoir and the storage-reservoir, substantially as and for the purposes specified.

14. In a gasoline apparatus, the construction and arrangement of the vertical tube I, located in the reservoir and having its sides and inlet covered with capillary covering *k'*, the other end of said tube communicating with the auxiliary burner, and an expansible chamber opening directly onto the surface of the gasoline in said reservoir, substantially as and for the purposes specified.

15. In a gasoline apparatus, the construction and arrangement of the vertical tube I, located in the gasoline-reservoir, having its side and flared inlet *n* covered with capillary covering *k'*, the other end of said tube communicating with the burner, and an expansible air-chamber opening directly onto the surface of the fluid which surrounds said tube I, substantially as and for the purposes specified.

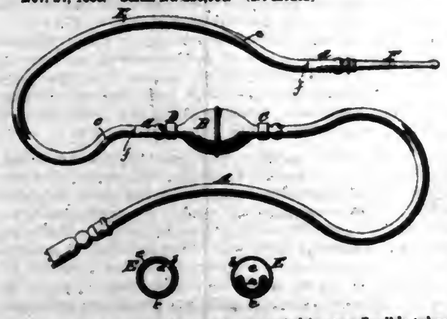
16. In a gasoline apparatus, the oil-reservoir, conduit E, conveying the oil from the reservoir to the vaporizing-burner, outlet-tube I, located in said reservoir and projecting in part above the surface of the oil therein, and provided with capillary covering *k'*, covering the inlet end of said tube and extending down the sides of said tube into the oil and terminating in the pipe J, connected with the auxiliary burner arranged to heat the vaporizing-burner, and expansible air-chamber for forcing air through the capillary covering *k'* over the mouth of said tube I on through said tube to the auxiliary burner, substantially as and for the purposes specified.

17. In a gasoline apparatus, the oil-reservoir, conduit E, conveying the oil from the reservoir to the vaporizing-burner, outlet-tube I, located in said reservoir and projecting in part above the surface of the oil therein, provided with capillary covering *k'*, covering the inlet end of said tube and extending down the sides of said tube into the oil and terminating in the pipe J, and cover g', for holding the covering *k'* in place over the opening *g*, connected with the auxiliary burner arranged to heat the vaporizing-burner, and expansible air-chamber for forcing air through the capillary covering *k'* over the mouth of said tube I on through said tube to the auxiliary burner, substantially as and for the purposes specified.

18. In a gasoline apparatus, the oil-reservoir, conduit E, conveying the oil from the reservoir to the vaporizing-burner, outlet-tube I, located in said reservoir and projecting in part above the surface of the oil therein, and provided with capillary covering *k'*, covering the inlet end of said tube and extending down the sides of said tube into the oil and terminating in the pipe J, connected with the auxiliary burner arranged to heat the vaporizing-burner, and expansible air-chamber for forcing air through the capillary covering *k'* over the mouth of said tube I on through the said tube to the auxiliary burner, and inlet oil-controlling valve *v* and float *x*, substantially as and for the purposes specified.

19. In a gasoline apparatus, the combination of the reservoir B, expansible air-chamber F, oil-inlet valve *v*, float *x*, controlling the passage-way between the inlet-pipe and the reservoir, casing P, with capillary covering *k'*, and having orifice *l*, opening into the air-chamber F, tube I, having capillary skirt *k'* on its sides and over its open inlet end, the latter communicating with the air-space of the reservoir, the other end of tube I communicating with the auxiliary burner, and tube E, connected at one end with the oil-space of the reservoir

and at the other end with the vaporizing-burner, substantially as and for the purposes specified.



20. In a gasoline apparatus, the combination of the reservoir for oil, expansible air-chamber, opening *l* at the upper end of tube or casing P, the siphon-pipe connected with the lower end of said tube or casing, and the passage-way between said tube and said pipe being controlled by a valve, the said orifice or opening *l* connecting with the expansible air-chamber, substantially as and for the purposes specified.

21. The combination of a gasoline-reservoir provided with opening *l* to receive the air and pipe leading from the gasoline-space of the reservoir to the vaporizing-burner located at a lower level, textile material, tube I, and pipe J, to convey the gas to the auxiliary gas-burner, suitably arranged to heat the vaporizing-burner, substantially as and for the purposes specified.

22. In a gasoline apparatus, the combination of the reservoir B and cylindrical vertical perforated casing P, inlet feed-pipe R, connected to the interior of the casing at the bottom of the latter, and valve *v*, located between the feed-pipe R and the interior of said casing and controlling the communication between said feed-pipe and the interior of said casing, float *x*, located within said casing, and rod connecting valve *v* and float *x* and capillary material *k'* against the sides of the casing P, said casing P being at the same time a support for the capillary material and a guide for the float, substantially as and for the purposes specified.

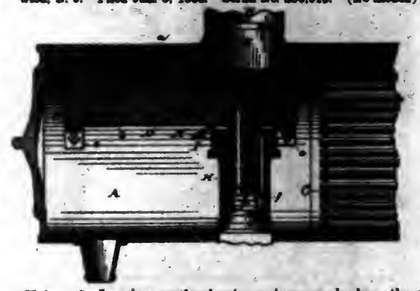
23. In a gasoline apparatus, the combination of the liquid-supply pipe E, connecting the liquid-space of the reservoir with a vaporizing-burner located at a lower level, the air or gas supply pipe J, and tube I, connecting the air or gas space of the reservoir with an auxiliary heating-burner suitably arranged to heat the vaporizing-burner, the conduit *l*, connecting the air or gas space of the reservoir with the expansible chamber, and capillary material suitably arranged between tube I and conduit J, substantially as and for the purposes specified.

397,256. SYRINGE. BENJAMIN F. SUTTON, Brooklyn, N. Y. Filed Nov. 27, 1886. Serial No. 220,061. (No model.)

Claim.—1. A conduit for a syringe, comprising two flexible tubes, one within the other, the space between the two being the conduit-passage, substantially as and for the purpose herein described.

2. A syringe having in its discharge-conduit a flexible air-chamber contracting under pressure and expanding on cessation of pressure applied in working the syringe, substantially as and for the purpose herein set forth.

3. The combination, with the discharge-conduit of a syringe, of a flexible tube or chamber arranged within said conduit and communicating with the outer air, substantially as and for the purpose herein described.



397,257. HOLDER FOR STRAINERS. LIDA A. TARRING, Baltimore, Md. Filed Mar. 21, 1888. Serial No. 268,019. (No model.)

Claim.—1. The holder for the strainer, composed of a ring of metal extended laterally to form couples of spiral springs, and three tongues on opposite sides of said ring, substantially as set forth.

2. The combination, with the strainer and the vessel upon which it is supported, of the holder formed of a metallic ring extended laterally on opposite sides into spirals, and tongue-shaped bearings adapted to take hold onto said vessel, as and for the purpose set forth.

397,258. SPARK-ARRESTER. GEORGE B. TAYLOR, New Brunswick, N. J. Filed Jan. 5, 1888. Serial No. 259,915. (No model.)

Claim.—1. In a locomotive having a long smoke-box, the combination, with the stack and exhaust, of a protecting-screen constructed as a complete inclosing-body, with which the stack and exhaust are connected, such screen-body having greater horizontal than vertical dimensions and provided with extended top and bottom screen-surfaces, and such screen-body being further located in the upper portion of the smoke-box, so as to leave the lower portion of the smoke-box free for holding cinders, substantially as set forth.

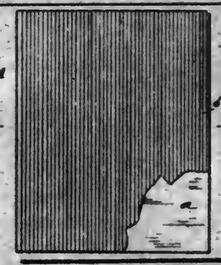
2. In a locomotive having a long smoke-box, a protecting-screen constructed as a complete inclosing-body, with which the stack and exhaust are connected, such screen-body having greater horizontal than vertical dimensions and provided with extended top and bottom screen-surfaces, and such screen-body being further located in the upper portion of the smoke-box, so as to leave the lower portion of the smoke-box free for holding cinders, in combination with a pipe in the bottom of the smoke-box for discharging the cinders, substantially as set forth.

3. In a locomotive having a long smoke-box, the combination, with such long smoke-box and with the stack and exhaust, of a protecting-screen located in the upper portion of such smoke-box and extending lengthwise thereof, such screen being a complete inclosing semi-cylindrical body conforming to the shape of the walls of the upper portion of the smoke-box, from which it is separated by a uniform space, the stack and exhaust being connected, respectively, with the upper and lower sides of such screen-body, substantially as set forth.

4. In a locomotive, the combination, with a short exhaust-nozzle, of a directing-pipe rising from the nozzle and having an open lower end, and a pipe inclosing the directing-pipe, such inclosing-pipe being closed at its bottom and open at its top, substantially as set forth.

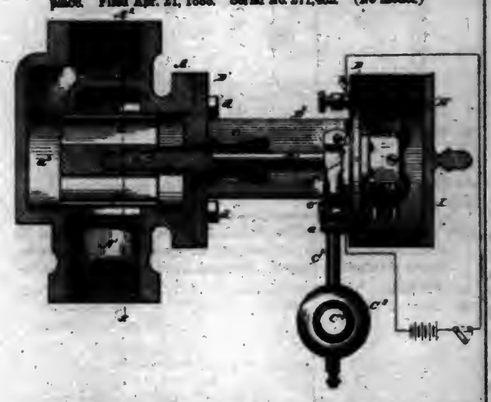
5. In a locomotive, the combination, with a short exhaust-nozzle, of a directing-pipe rising from the nozzle and having an open lower end, a pipe inclosing the directing-pipe, such inclosing-pipe being closed at its bottom and open at its top, and a screen protecting the open upper end of the inclosing-pipe, substantially as set forth.

6. In a locomotive, the combination, with a short exhaust-nozzle, of a directing-pipe rising from the nozzle and having an open lower end, a pipe inclosing the directing-pipe, such inclosing-pipe being closed at its bottom and open at its top, and a hood over the open upper end of the inclosing-pipe, substantially as set forth.



7. In a locomotive, the combination, with the stack and a protecting-screen, of a short exhaust-nozzle, a directing-pipe rising from the nozzle and having an open lower end, and a pipe inclosing the directing-pipe and closed at its lower end and open at its upper end, substantially as set forth.

8. In a locomotive, the combination, with the stack and a protecting-screen constructed as a complete inclosing-body, of a short exhaust-nozzle, a directing-pipe rising from the nozzle and having an open lower end, and a pipe inclosing the directing-pipe and closed at its lower end and open at its upper end, substantially as set forth.

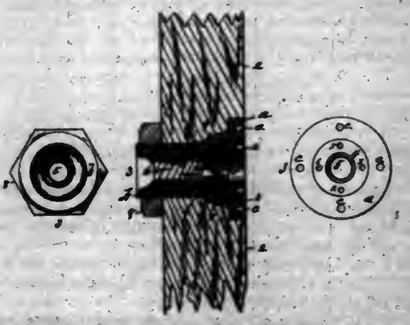


397,259. NAPHTHALINE PAPER. ADOLPH THIEPEN, New York, N. Y. Filed Apr. 21, 1887. Serial No. 235,630. (No specimens.)

Claim.—As a new article of manufacture, the sheet *a*, having a coating, *b*, of naphthaline in two or more superposed layers, the first presenting a rough appearance, the second filling up the interstices of the first layer and presenting a hard, compact, porcelain-like appearance with a smooth surface, substantially as described.

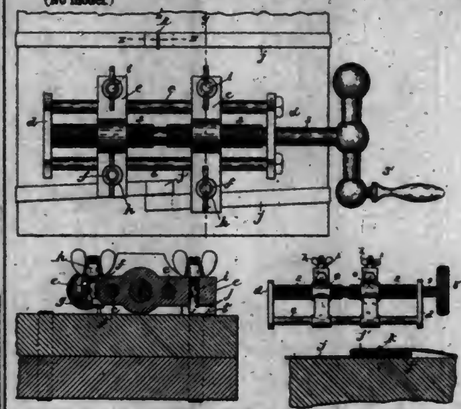
397,259.

397,260. ELECTRIC STOP-VALVE. ROBERT WELLER, Pittsburg, Pa., assignor to himself, Joseph Weller, and Hugh Ferguson, all of same place. Filed Apr. 21, 1888. Serial No. 271,462. (No model.)



Claim.—1. The combination, with an oscillating valve and its case having arms D^2 and plate D, of a valve-stem extending from the valve to the plate D and having a weighted arm attached, a notched disk connected to and operated by the valve-stem, an armature provided with a tooth for engaging the notch of the disk, and an electro-magnet for operating the armature, the said armature and electro-magnet being supported upon plate D, substantially as and for the purpose described.

2. The combination, with the steam-valve and its weighted arm, of the diminishing gear E F', the notched disk F^2, the toothed armature, and its electro-magnet, substantially as and for the purpose described.

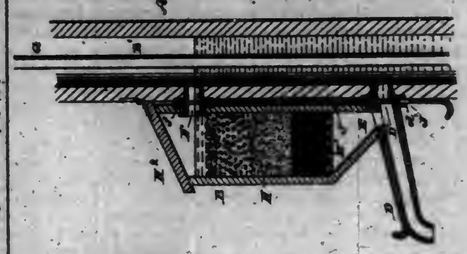


3. The combination of the valve-chamber having ports *a'* and a^2, the valve C, with stem C', the detachable head D', with arms D^2 and plate D, the toothed segment E, pinion E', and notched disk F^2, the toothed armature G, and the electro-magnet, substantially as and for the purpose described.

397,261. BUSHING-CASING FOR CASKS. PETER J. WIESTHAL, Holyoke, Mass. Filed July 16, 1883. Serial No. 280,108. (No model.)

Claim.—A bushing-case for casks, consisting of the tubular metallic case S, having a bushing-socket in its outer end, one or more spurs projecting from the base of said socket, combined with a bushing of soft material fitting said socket and engaging with said spurs, a ring screwing into said socket against said bushing, and a nut screwing onto the shank of said case, substantially as set forth.

397,262. MEANS FOR SECURING METALLIC BANDS TO BOXES. JOHN H. WILLIAMS, Boston, Mass., assignor of one-half to J. C. Hooper and J. A. Hooper, same place. Filed July 2, 1887. Serial No. 243,226. (No model.)

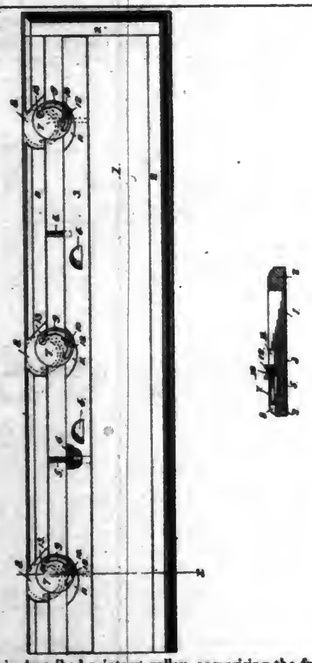


Claim.—1. The combination, with the shaft having the right and left hand screw-threads thereon, means for turning said shaft, and the two blocks mounted on and adapted to be moved by said right and left hand screw-threads, whereby they are adjusted with relation to each other, of band-clamps carried by said blocks, thumb-pieces for engaging or disengaging said clamps with the band, and guide-rods for holding the clamps in alignment with each other, substantially as described.

2. The combination of the blocks *c c*, each having at one end a wire-band-clamping device and at the other end a flat-band-clamping device, a right and left screw engaged, as described, with said blocks, and a guide rod or rods to guide the blocks in the movements imparted to them by the screw-shaft.

3. The wire-clamp composed of a block, *c*, having a socket, and a bolt adapted to work in said socket and having a head or enlargement containing a groove formed to receive a wire band, said head arranged to pass within the socket a distance sufficient to bite and firmly hold the wire at the edge, substantially as described.

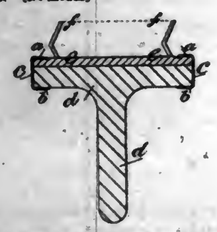
397,263. FILTER-PUMP. ORSON H. WOODWORTH, Columbia City, Ind. Filed Aug. 26, 1888. Serial No. 283,953. (No model.)



Claim.—1. The pump-stock A, having spout D, fitted in the stock, and the filter-chamber B, connected to the stock by tube F and to the spout D by opening E, in combination with the valve J, formed with opening J' and fitted in the spout D and tube F, substantially as and for the purposes set forth.

2. The pump-stock A, spout D, connected to the pump-stock and formed in its upper surface with the opening E, and the filter-chamber B, connected with the pump-stock bore by passage F, in combination with the sliding plate J, having aperture J' and fitted in channels *d f* in the spout and passage F, substantially as and for the purposes set forth.

397,264. SELF-LOCKING GALLEY. J. HATFIELD YOUMANS, Asbury Park, N. J. Filed Nov. 16, 1887. Serial No. 255,302. (No model.)

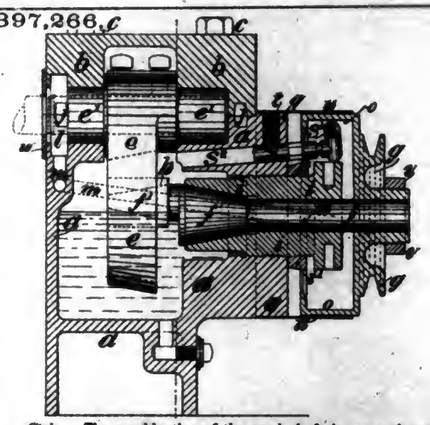


Claim.—1. A printer's galley comprising the rectangular frame, the movable bar or stick therein, and the disks or plates pivoted eccentrically to the frame and having curved slots extending to or beyond points diametrically opposite the pivots, and pins extending through the slots into the bar or stick, said pivots and pins being in alignment with each other and with the direction or line of movement of the bar or stick, whereby the bar or stick will be automatically locked when thrown fully forward, substantially as set forth.

397,264.

2. The herein-described printers' galley, comprising the frame 2, sliding bar or stick 3 therein, the disks 7, pivoted at 13 eccentrically to the frame, and having curved slots 9, extending at their outer ends to points in line with or beyond diametrical lines through the points' greatest eccentricity of said disks, the pins 10, projecting from the bar or stick 3 through the slots 9, and the binding-nuts 12 on said pins, the said pivots, outer terminals of the slots, and the pins 10 being, when the bar is thrown fully forward, in approximate alignment with each other and with the direction or line of movement of the bar, substantially as and for the purpose herein set forth.

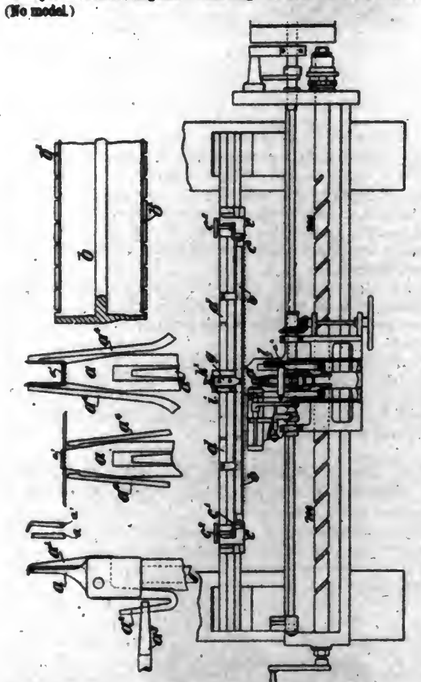
397,265. DEVICE FOR SECURING CARD-CLOTHING TO THE FLATS OF CARDING-ENGINES. GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed Feb. 23, 1888. Serial No. 264,973. (No model.)



Claim.—1. The herein-described clamp for securing strips of card-clothing to carding-engine flat-bars, and consisting of a spring-clip adapted to grip the edge of the bar and the foundation material of the card fillet, and to cover and conceal the edge of the latter and the bar, all substantially as described.

2. The combination of a carding-engine flat-bar and card-clothing to be secured thereto, with spring-clips gripping the edges of the bar and the foundation material of the card-fillet, substantially as set forth.

397,266. DOFFER-COMB HEAD FOR CARDING-ENGINES. GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed Feb. 27, 1888. Serial No. 265,461. (No model.) Patented in England Jan. 5, 1887. No. 144.



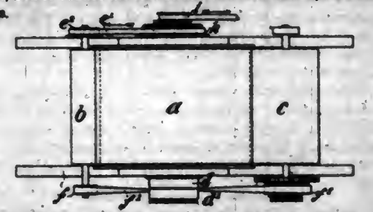
Brief.—The driving-pulley is provided with a drip-catcher, into which empties a pipe communicating by a passage in the box with a channel formed at the joint between the box and cover and common to both. A pipe having a mouth-piece inside of the drip-catcher conveys the drippings back to the oil-chamber through a passage in the box. The oil exuding from the bearing of the comb-shaft is thus intercepted and prevented from passing along the comb-shaft.

397,266.

Claim.—The combination of the comb-shaft, its operating-spindle, and connecting devices with the comb-motion box, having a channel, *j*, in the box and its cover to intercept the exuding oil, a passage, *m*, and a spout, *n*, leading therefrom, and a drip-catcher carried by the operating-spindle and into which the spout empties, all substantially as described.

397,267. APPARATUS FOR ATTACHING CARD-CLOTHING TO FLAT-BARS. GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed Aug. 21, 1888. Serial No. 283,305. (No model.)

Claim.—1. In a machine for wiring card-clothing to flat-bars, the setting-tool *e f*, provided with a finger or fingers to enter nicks in the flat-bar, in combination with the seating in the frame, into which the said tool slides, substantially as set forth.



2. The setting-tools provided with fingers to enter into nicks in the flat-bars, in combination with the dog apparatus to receive and hold the flat-bar, substantially as set forth.

3. The setting-tools *e f*, the seatings for such setting-tools, the bar-holders, the wire-gripping jaws, and the clamping-tool to bend up the wire points, in combination with the sliding carriage provided with ordinary mechanism for cutting lengths of wire, bending such wire into staples, and forcing such staples through the card-clothing foundation and the nicks in the flat-bar, substantially as set forth.

4. The carriage provided with ordinary mechanism for cutting lengths of wire, bending such wire into staples, and forcing such staples through the card-clothing foundation and the nicks in the flat-bar, in combination with a clamping-tool, *g g'*, connected to the carriage to bend up and clamp the wire points, all substantially as described.

397,268. MEANS FOR DRIVING CARDING-ENGINE CYLINDERS. GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed Aug. 21, 1888. Serial No. 283,306. (No model.) Patented in England May 5, 1887, No. 6,566.

Brief.—The object of the invention is to simplify the mechanism for driving the cylinders of a carding-engine, to render the same more compact, and to reduce the side strains and side wear upon shafts and bearings.

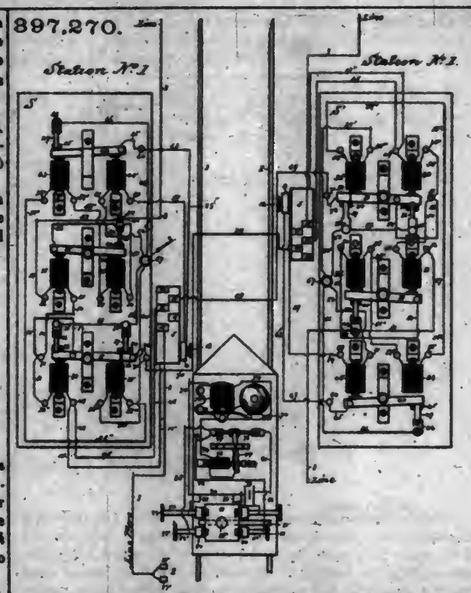
Claim.—The combination of the frame, the main cylinder and its shaft having at one side of and close to the frame the ordinary driving-pulley and at the other side a pulley, *h*, with the doffer-cylinder having a pulley, and the taker-in having pulleys c^3 and *f* at opposite sides of the frame, a belt for transmitting motion from the pulley *h* to the pulley c^3, and a belt to transmit motion from the pulley *f* to the pulley on the doffer, all substantially as set forth.

397,269. SHUTTLE FOR SEWING-MACHINES. CHARLES H. REMOUT, San José, Cal. Filed Sept. 16, 1887. Serial No. 249,579. (No model.)

Claim.—1. The tension-spring *j*, provided with the tongue *j* within the body of the spring, the hook *l*, projecting from the rear of the spring and having its end bent downward and forward, and the tongue *k*, projecting from the rear end of the spring over the hook *l*, substantially as herein shown and described.

2. The combination, with a recessed shuttle, of the spring *j*, provided with the tongue *j'* within the body of the spring, the hook *l*, projecting from the rear end of the spring and having its end bent downward and forward into the recess of the shuttle, and the tongue *k*, projecting forward over the hook *l*, substantially as herein shown and described.

397,270. ELECTRIC RAILWAY-SIGNAL. ANNA E. BODA, Columbus, Ohio. Filed Aug. 22, 1888. Serial No. 283,431. (No model.)



Claim.—1. A series of electric-railway-signal stations arranged upon both sides of a railway and at suitable distances apart, in combination with two independent series of contact-points at said stations, a main-line wire, a moving train, an audible alarm, conducting-arms, and a battery located on said moving train, an electro-magnet in circuit with said battery, an armature-lever and contact-points in circuit therewith and with said battery, and an armature-lever located on said moving train, whereby an audible alarm may be sounded thereon, substantially as described.

2. In an electric signal, the combination, with a series of electro-magnets, their armature-levers, a main-line wire and suitable ground-connections, of a signal-post provided with two separate series of contact-points connected to said line-wire, a reversely-arranged system of signals, a battery mounted upon a moving train, an audible alarm connected with one pole of said battery, a switch-lever, and conducting-arms extending from said moving train and electrically connected with one pole of said battery, and a contact-point intermediate of said switch-lever and conducting-arms, substantially as described.

3. In an electric railway-signal, the combination, with a duplicate reversely-arranged system of signals, of a signal-post provided with a pivotally-mounted bridge or plate carrying a double series of independent alternating contact-points, a spring normally holding said bridge in an inclined position, a main-line wire, two contact-points connected therewith, and a battery and conducting-arms mounted upon a moving train, whereby electrical impulses are sent over said main line to the signals, substantially as described.

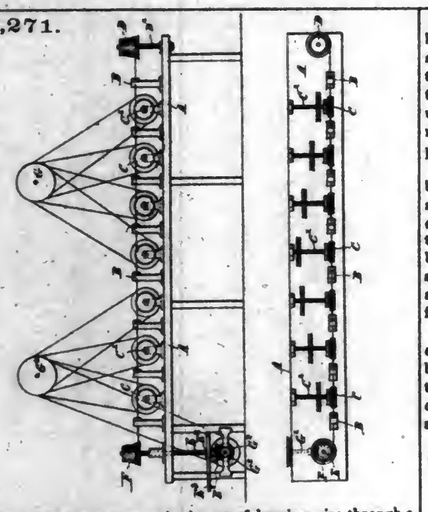
4. In a system of electric signals, the combination, with a series of electric circuits, of a signal-post having a pivotally-mounted bridge

397,270.

provided with contact-points, connecting-wires leading to the respective circuits, a bracket connected to said bridge, a main-line wire, and a spring which normally draws said bridge into inclined position for making electrical contact between said bracket and a wire leading to one of said signal-circuits, substantially as described.

5. An electric railway-signal consisting of two contact-points, 87' 88', a main-line wire, 3, which is electrically connected therewith, an electro-magnet, 30, which is normally in circuit with said line-wire, an armature-lever, 31, in the same circuit, and a wire, 53, leading to the earth, in combination with a conducting-arm, 82, and a suitable battery on a moving train, whereby said armature-lever is operated to shunt the circuit transmitted to it from said battery when said conducting-arm comes in contact with said contact-points, substantially as described.

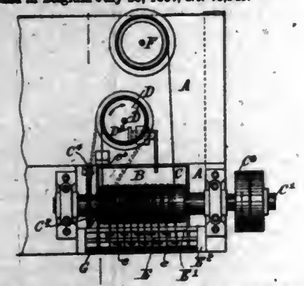
6. The combination, in an electric signal, of an electro-magnet, 30, a contact-point, 15, and wires connecting said point with the coil of said magnet, an armature-lever, 31, which is normally in circuit with said magnet and the earth, an electro-magnet, 38, and wires connecting the same with said magnet 30, the line-wire 3, connecting with the signals of another station, and a conducting-arm, 82, and a battery, B, mounted upon a moving train, whereby the signals of the stations are simultaneously set, substantially as described.



7. The combination, in an electric signal, of a contact-point, 16, an electro-magnet, 30, and wires connecting the coil thereof with said contact-point, an armature-lever, 31, which is normally in circuit with said magnet and the ground and provided with an insulated end, 32, a connecting-wire, 72 and 70, a contact-point, 19, on the opposite side of the track, a moving train, the conducting-arms 82 and 82', and the battery B and the connections mounted on said train, substantially as and for the purpose described.

8. The combination, in an electric signal, of a contact-point, 17, an electro-magnet, 48', connecting therewith by suitable conducting-wires, an armature-lever, 44, operated by said magnet, a contact-point, 47, connecting-wires 63 66, extending therefrom to ground, contact-point 18, conducting-arms 82 82', battery B, alarm 75', alarm-magnet 75, magnet 76, armature-lever 77, contact-points 78 79, and their electric connections, whereby an alarm is sounded upon a moving train, substantially as described.

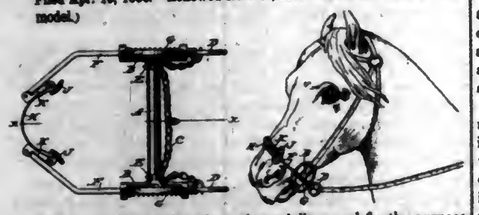
9. The combination, in an electric signal, of the pivoted bridge 5, the post 4, the bracket 7, the contact-point 15, the connecting-wire 12', and line-wire 3 with the binding-post 58, contact-point 41, armature-lever 39, wire 53, electro-magnet 38', wire 55', electro-magnet 48, wire 58', electro-magnet 30', wire 34', leading to the earth, a moving train, and the conducting-arms 82 82', and the battery B, carried by said train, whereby the signals are returned to normal position, substantially as described.



397,271. METHOD OF DRAWING WIRE. ALFRED S. BOLTON and THOMAS BOLTON, Cakemore Mills, near Cheadle, County of Stafford, England. Filed June 26, 1887. Serial No. 242,726. (No model.) Patented in England July 8, 1886, No. 8,977; in Germany May 13, 1887, No. 42,610; in France July 21, 1887, No. 184,923, and in Belgium July 25, 1887, No. 76,943.

397,271.

Claim.—The improvement in the art of drawing wire through a successive series of dies at one operation, consisting in subjecting the wire between the several dies to the action of successive pulling surfaces running at a velocity in excess of the maximum rate of speed imparted to the wire and permitting the draft between the successive dies to regulate itself by the slipping of the wire on said surfaces, substantially as herein described.

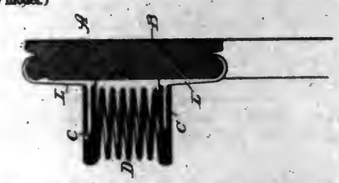


397,272. APPARATUS FOR DRAWING WIRE. ALFRED S. BOLTON and THOMAS BOLTON, Oakamoor Mills, near Cheadle, County of Stafford, England. Filed Sept. 17, 1888. Serial No. 285,606. (No model.) Patented in England June 6, 1887, No. 8,133; in France July 21, 1887, No. 184,923, and in Belgium July 25, 1887, No. 78,343.

Claim.—1. In a wire-drawing apparatus, a row or rows of dies arranged between and parallel with a fixed guide-bar and a rotary draft cylinder or drum, such cylinder or drum serving to impart to the wire under treatment rates of draft varying with the elongation of the wire, as and for the purpose above described.

2. In a wire-drawing apparatus, a row or rows of dies arranged between and parallel with a fixed guide-bar and a rotary draft cylinder or drum, in combination with a lubricating-trough into which the draft cylinder or drum dips for the purpose of lubricating the passing wire under treatment preparatory to each successive drawing.

397,273. SAFETY BRIDLE-BIT. LUCAS P. BRITT, New York, N. Y. Filed Apr. 10, 1888. Renewed Nov. 10, 1888. Serial No. 290,453. (No model.)



Claim.—1. The combination, substantially as and for the purpose set forth, of a bridle-bit, lateral movable rods supported by the bit to extend forward upon the horse's nose, a flexible band connecting their ends, and pads hinged to said ends to bear inward upon the nose when the rods are drawn back.

2. The combination of a bridle-bit, lateral movable rods supported by the bit to play in bearings formed in its cheek-pieces, springs actuating said rods to force them forward, bridle rings or loops attached to the rods by which to draw them back, a flexible band connecting the forward ends of said rods, and pads hinged to said ends to bear upon the horse's nose when the rods are drawn back against the resistance of the springs, substantially in the manner and for the purpose herein set forth.

3. The combination of a bridle-bit, lateral movable rods supported by the bit to play in bearings formed in its cheek-pieces, springs actuating said rods to force them forward, bridle rings or loops at the rear ends of the rods by which to draw them back, a curb-chain attached to said ends and passing through rings on the cheek-pieces, a flexible band connecting the forward ends of said rods, and pads hinged to said ends to bear upon the horse's nose when the rods are drawn back against the resistance of the springs, substantially in the manner and for the purpose herein set forth.

4. The combination, with the bridle-bit, its cheek-pieces, the lateral rods supported by and moving in said cheek-pieces, the flexible band connecting their forward ends, and the pads pivoted thereto, of the springs fitted in the cheek-pieces to actuate said rods and hold open the pads, substantially in the manner and for the purpose herein set forth.

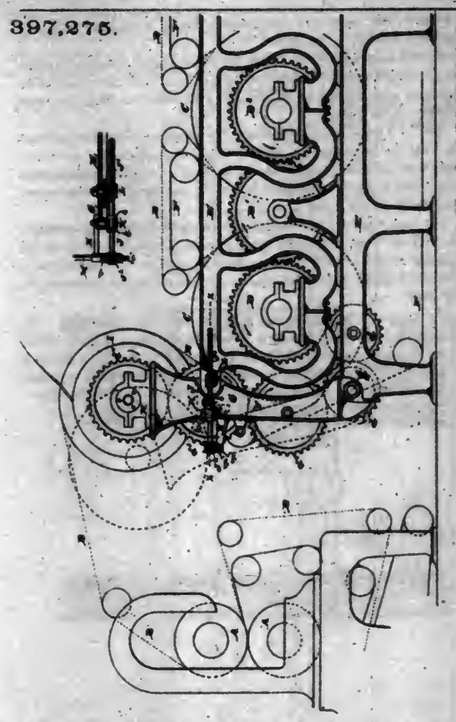
397,274. SPRING ATTACHMENT FOR ROCKING-CHAIRS. WILLIAM I. BUNKER, Chicago, Ill. Filed Sept. 1, 1888. Serial No. 284,379. (No model.)

Claim.—1. In a platform rocking-chair, the combination of a base-rail, a rocker resting and rocking thereon, a spring-bracket having an arm or arms extending to the top of the rocker and clasping or hooking onto the same, a spring-bracket attached to the base-rail, and a coiled spring connecting the spring-brackets together, substantially as described.

2. In a platform rocking-chair, the combination of a base-rail, a rocker resting and rocking thereon, a spring-bracket having an arm or arms extending to the bottom of the base-rail and clasping or hooking onto the same, a spring-bracket attached to the rocker, and a coiled spring connecting the spring-brackets together, substantially as described.

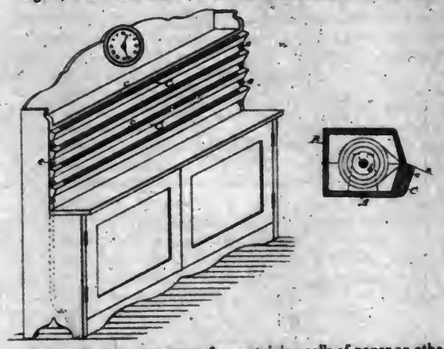
3. In a platform rocking-chair, the combination of a base-rail, a rocker resting and rocking thereon, spring-brackets having an arm or arms extending to the top of the rocker and to the bottom of the base-rail, respectively, and clasping or hooking onto the same, and a coiled spring connecting the spring-brackets together, substantially as described.

4. In a platform rocking-chair, the combination of a base-rail, a rocker resting and rocking thereon, a spring-bracket having an arm or arms extending to the edge of the rocker or base-rail and clasping or hooking onto the same, a spring-bracket attached to the member of the chair which is unclasped by the arm or arms, and a coiled spring connecting the spring-brackets together, whereby the rocker and base-rail are adjustable longitudinally to secure the proper location and leverage for the spring, substantially as described.



397,275. PAPER-MAKING MACHINE. HENRY L. CARTER, Philadelphia, Pa., and THOMAS H. SAVERY, Wilmington, Del. Filed June 4, 1888. Serial No. 275,962. (No model.)

Claim.—1. In a paper-making machine, the combination, with the drying-rolls and the frame supporting said rolls, of a guide-cylinder supported on the front of said frame, and driving-gear connecting said guide-cylinder with the mechanism actuating the drying-rolls, so as to rotate it with the same peripheral velocity, all substantially as and for the purpose specified.



2. In a paper-making machine, the combination, with the drying-rolls and the frame supporting said rolls, of an adjustable guide-cylinder, said cylinder being supported on movable bearings connected with the front of the frame of the drying-cylinders, and driving-gear connecting said guide-cylinder with the mechanism actuating the drying-rolls, so as to rotate it with the same peripheral velocity, all substantially as and for the purpose specified.

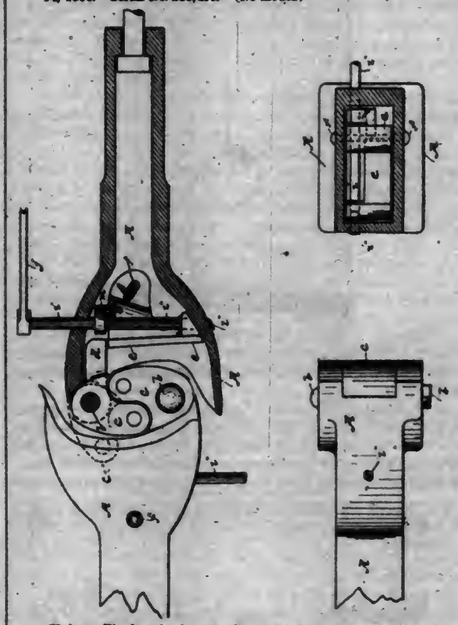
3. In a paper-making machine, the combination, with the drying-rolls and the frame supporting said rolls, of an internally-heated guide-cylinder supported on the front of said frame, and driving-gear connecting said guide-cylinder with the mechanism actuating the drying-rolls, so as to rotate it with the same peripheral velocity, all substantially as and for the purpose specified.

397,275.

397,276. CONSERVATORY FOR PAPER. ISAAC M. CHASE, Washington, D. C. Filed Dec. 10, 1887. Serial No. 257,561. (No model.)

Claim.—1. A conservatory for containing rolls of paper or other fabrics, provided with a cutting-rail having a groove in its upper face, and bearings for revolving the rolls, all constructed and arranged as shown, and substantially as herein described.

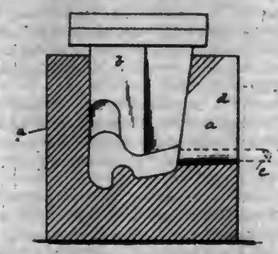
2. In a conservatory for rolls of paper or other fabrics, a cutting-rail provided with a groove for the insertion of a knife, and an adjustable partition for different lengths of rolls, substantially as set forth.



3. In a conservatory for rolls of paper or other fabrics, a cutting-rail provided with a groove and a tension device for the paper, substantially as specified.

4. The combination of one or more receptacles for containing rolls of paper or other fabrics, and having a cutting-rail provided with a groove for the insertion of a knife, and arranged on a stand or cabinet, substantially in the manner shown and herein specified.

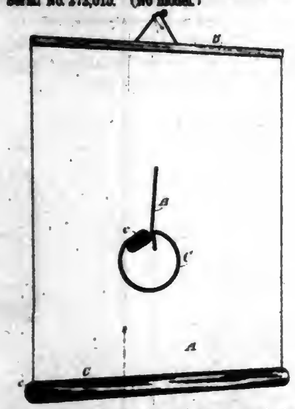
5. A conservatory for rolls of paper or other fabrics, consisting of a receptacle, A, having a movable part for inserting said rolls, and a cutting-rail, C, with a groove, *c*, for the insertion of a knife, and provided with adjustable journals, all arranged substantially as and for the purpose set forth.



6. The conservatory herein described, consisting of the receptacle A, the movable cover or front for inserting the rolls of paper or other fabrics, and provided with a cutting-rail, C, having groove *c* for the insertion of a knife, and an adjustable partition, D, all constructed and arranged substantially as and for the purpose specified.

397,277. CAR-COUPLING. EVANDER H. COLWELL, Allegheny, Pa., assignor of one-half to Christian F. Kennewag, same place. Filed Sept. 14, 1888. Serial No. 285,409. (No model.)

Claim.—The herein-described car-coupler, consisting of the draw-head A, having an enlarged open head, in which is hinged, by means of a bolt, *b*, a hook, *c*, the inward extension, *d*, of the said hook *c* adapted to engage with and be locked by a latch-piece, *e*, the shaft *i*, for operating the latch *e*, the crank *m*, attached to said shaft *i*, and the bolt or pin *f*, passed through a slot, *g*, in the latch-piece *e*, for confining the same in a proper position, substantially as set forth and described.



397,278. METHOD OF PRODUCING FORGED ARTICLES FROM SCRAPS OF METAL. EVANDER H. COLWELL, Allegheny, assignor of one-half to Christian F. Kennewag, Allegheny County, Pa. Filed Sept. 14, 1888. Serial No. 285,410. (No model.)

Claim.—1. The herein-described method of forming forgings from wrought iron, steel, &c., consisting of placing a bundle of scrap or small pieces of iron into a female die, *a*, the said bundle being at a welding heat, and subjecting the same to a pressure brought against a male die, *b*, whereby forgings from wrought-iron, wrought-steel, &c., may be formed.

2. The improvement in the art of making forgings of the class described, consisting in assembling small or scrap pieces of metal into a bundle, heating the bundle to a welding heat, placing the bundle within a female die constructed to give one part of the bundle the desired external contour, and finally forcing a male die upon the bundle within the female die, whereby the bundle is subjected to a heavy pressure and forged into a homogeneous body of the external contour corresponding to the particular dies used, substantially as described.

397,279. SHEET-METAL BINDING. WILLIAM DUNCAN, Hinsdale, assignor to himself, and ALEXANDER S. JOHNSTON, Chicago, Ill. Filed Apr. 27, 1888. Serial No. 272,015. (No model.)

Claim.—1. A binding for the edges of maps and the like, consisting of a tubular strip of metal, one edge thereof being permanently united with the edge of the sheet by a folded seam, substantially as described.

2. A binding for the edges of maps, curtains, and the like, consisting of a strip of sheet metal of tubular form, one edge thereof being permanently united to the edge of the sheet by a folded seam, the other edge of said strip bearing against the opposite side of the sheet, whereby additional hold is had on the sheet, substantially as described.

397,280. PHONOGRAPH RECORDER AND REPRODUCER. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Sept. 27, 1888. Serial No. 286,552. (No model.)

Claim.—1. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of the recording or reproducing point connected therewith and capable of a retarded movement independent of the movement of the diaphragm, substantially as set forth.

2. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of the recording or reproducing point connected with said diaphragm and capable of movement independent thereof, and provided with a retarding device for controlling such independent movement, substantially as set forth.

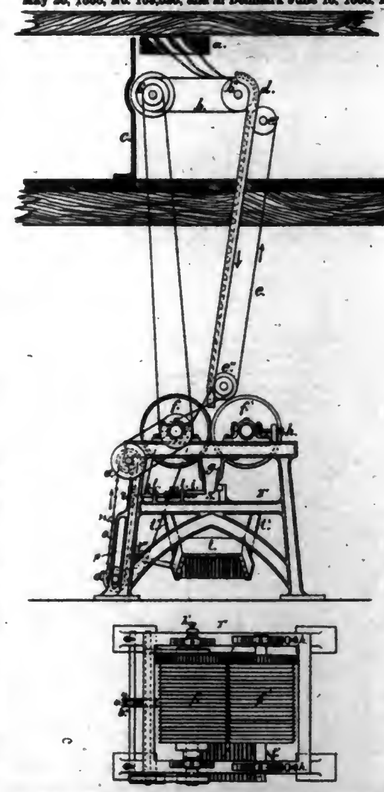
3. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of the recording or reproducing point pivotally connected therewith, so as to have a movement independent thereof, and provided with a retarding device controlling such movement, substantially as set forth.

4. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of the recording or reproducing point connected therewith and capable of a retarded movement independent of the diaphragm, and a spring for holding said point against the sound-record, substantially as set forth.

5. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of the recording or reproducing point connected therewith and capable of a retarded movement independent of the diaphragm, and a spring connected with said diaphragm for holding said point against the sound-record, substantially as set forth.

6. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of the recording or reproducing point pivotally connected therewith, a sprig for holding said point against the sound-record, and a retarding device for controlling the movement of said point on its pivot, substantially as set forth.

7. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of the recording or reproducing point pivotally connected therewith, a spring connected with the diaphragm for holding said point against the sound-record, and a retarding device for controlling the movement of said point on its pivot, substantially as set forth.



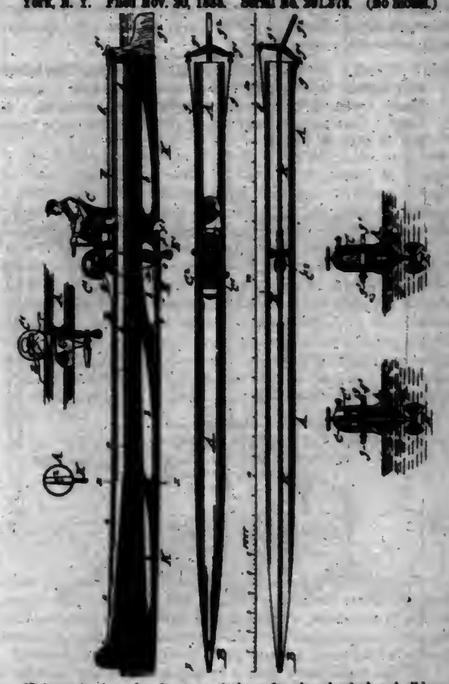
8. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of a lever pivoted upon said diaphragm so as to have a movement independent thereof, and carrying the recording or reproducing point, and a retarding device connected with said lever, substantially as set forth.

9. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of a lever pivoted thereto and carrying the recording or reproducing point, and a fan attached to said lever, substantially as set forth.

10. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of the recording or reproducing point connected with said diaphragm and capable of movement independent thereof, and a fan or equivalent device for retarding such movement, substantially as set forth.

11. In a recorder or reproducer for phonographs, the combination, with the diaphragm, of a lever pivoted thereto and carrying the recording or reproducing point, a fan attached to said lever, and a spring for holding said point against the sound-record, substantially as set forth.

397,281. MACHINE FOR MAKING PACKING-SHAVINGS. OLE EVENSTAD and OLAUS SUNSTAD, Rasten, Storelvedalen, Norway. Filed Oct. 2, 1888. Serial No. 287,008. (No model.) Patented in Germany Mar. 21, 1888, No. 45,685; in Belgium Apr. 16, 1888, No. 81,134; in France May 23, 1888, No. 189,823, and in Denmark June 13, 1888, No. 430.



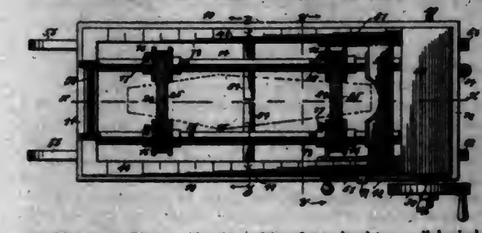
Claim.—1. The combination, with rotary slitting-rolls provided with annular beveled ribs, the faces of the ribs of one roll being placed in contact with the faces of the ribs of the other roll, of screws for adjusting one of the rolls in longitudinal and the other roll in lateral direction, substantially as set forth.

2. In a machine for making narrow shavings for packing purposes, the combination of rotary rolls provided with annular beveled ribs, the faces of which are arranged in contact with each other, a hopper below said rolls, and an intermittently-actuated cutting device below the hopper for cutting off the narrow shavings in the proper length, substantially as set forth.

3. In a machine for making narrow shavings for packing purposes, the combination, with rotary slitting-rolls having annular ribs beveled at the circumference, the faces of the ribs of one roll being in contact with the faces of the ribs of the other roll, of a hopper below said rolls, an intermittently-actuated cutting device below said hopper, and an inclined oscillating screen suspended below the cutting device, substantially as set forth.

4. The combination, with a pair of slitting-rollers and a planing-machine, of a horizontal conveying-belt located below the cutter of the planing-machine, and a conveyer extending from said belt to the slitting-rollers, substantially as herein shown and described.

397,282. TUBULAR RACING-BOAT. FRANK FERRIER, Jr., New York, N. Y. Filed Nov. 20, 1888. Serial No. 291,573. (No model.)



Claim.—1. A racing-boat consisting of a closed tubular shell having a sharply-pointed bow and longitudinal balancing-keel below said shell, a shaft supported in bearings of said keel, a propeller-screw on said shaft, and mechanism, substantially as described, for imparting rotary motion to the propeller-shaft, substantially as set forth.

2. A racing-boat composed of a closed tubular shell having a sharply-pointed bow, a longitudinal balancing-keel having openings, a propeller-shaft supported in bearings of the keel, a propeller on said shaft, a crank-wheel supported on bearings at the top of the shell, and a belt-and-pulley transmission for imparting rotary motion from the crank-wheel to the propeller-shaft, substantially as set forth.

3. A racing-boat composed of a closed tubular shell having a tapering bow and a longitudinal balancing-keel secured rigidly to the shell at the under side of the same, substantially as set forth.

4. A racing-boat composed of a closed tubular shell having a tapering bow, a longitudinal balancing-keel having openings for the lateral passage of water, and a propeller the shaft of which is supported in bearings of the keel, substantially as set forth.

397,283. BURIAL APPARATUS. GEORGE I. GERRISH, Rapid City, Dak. Filed Oct. 9, 1888. Serial No. 287,670. (No model.)

Claim.—1. The combination, with a frame having parallel winding-shafts, of drums on said shafts, a pin, 21, secured to each of the drums of one shaft, and a yielding hood, 22, extending over the end of each pin, an uncovered pin projecting from each of the opposite drums, and slings having apertures at their ends to receive said pins, whereby when the slings are unwound from the drums having the uncovered pins they will become detached and may then be wound upon the opposite drums.

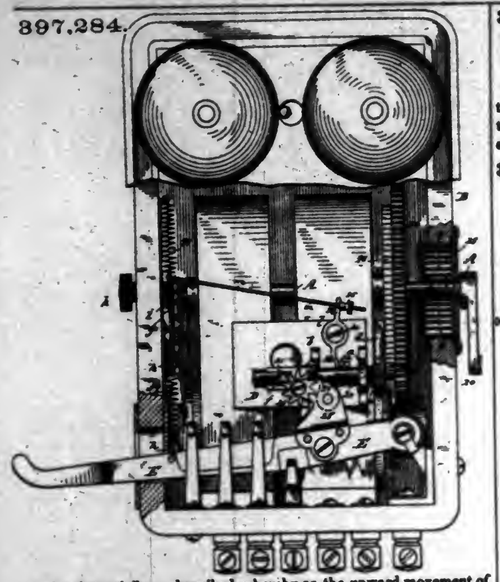
2. The combination, with a frame, legs supporting the same, and longitudinal winding-shafts journaled in said frame, of adjustable drums sliding upon the said shafts, a pin and spring-hood secured to the drums on one shaft, and a pin attached to the drums of the opposite shaft, slings rigidly secured to one set of drums and detachably attached to the opposite set of drums, bevel-gears 31 on the ends of said shafts, a transverse shaft, 29, a bevel-gear, 32, thereon, meshing with the gear 31 on the shaft to which the slings are detachably connected, the sliding gear 33, also on the shaft 29, and means for throwing it into and out of engagement with the other gear, 31, substantially as and for the purpose specified.

3. The combination, with a frame, legs supporting the same, and longitudinal winding-shafts journaled in said frame, of adjustable drums sliding upon the said shafts, a pin and spring-hood secured to the drums on one shaft, and a pin attached to the drums of the opposite shaft, slings rigidly secured to one set of drums and detachably attached to the opposite set of drums, racks attached to the sides of the frame, an adjustable guide-plate supported by said racks, and means, substantially as shown and described, for rotating the winding-shafts, as and for the purpose specified.

4. The combination, with a frame, legs supporting the same, winding-shafts journaled longitudinally in the said frame, drums adjustably secured to the said shafts, the drums upon one shaft being provided with a pin and apertured spring-hood, and the drums upon the opposite shaft provided with a pin only, of slings clamped to one set of drums by the said hood and pin and provided with a ferrule engaging the pin upon the opposite set of drums, racks secured to the inner side face of the frame, a guide-bar supported by said racks, a transverse drive-shaft connecting with the winding-shafts, a shifting mechanism, and means, substantially as shown and described, for rotating the drive-shaft, as and for the purpose specified.

5. The combination, with a frame, legs supporting the same, winding-shafts journaled longitudinally in the said frame, drums adjustably secured to the said shafts, the drums upon one shaft being provided with a pin and apertured spring-hood, and the drums upon the opposite shaft provided with a pin only, of slings clamped to one set of drums by the said hood and pin and provided with a ferrule engaging the pin upon the opposite set of drums, racks secured to the inner side face of the frame, a guide-bar supported by said racks, a transverse drive-shaft connecting with the winding-shafts, a shifting mechanism, a brake-lever pivoted to the frame and engaging the drive-shaft, a hand-wheel secured to one outer end of the drive-shaft, and means, substantially as shown and described, for manipulating the brake-lever, as and for the purpose specified.

6. The combination, with a frame, winding-shafts journaled in said frame provided at one end with a bevel-gear, winding-drums adjustably held on said shafts, and slings held to the drums of one shaft and detachably held to the drums of the other shafts, of a transverse shaft provided with a fixed bevel-gear engaging the bevel-gear of one winding-shaft, a second bevel-gear mounted to slide on said transverse shaft and turn with the same, a spring on said shaft between said gears, and a shifting-lever engaging the sliding gear, substantially as shown and described.



397,284. TELEPHONE CALL-BOX. ARMIRO GRIFFITH, Springfield, and HENRY A. DURFEE, Westfield, Mass. Filed Nov. 6, 1888. Serial No. 290,126. (No model.)

Claim.—1. In a telephone call-box, the combination, with the magneto-operating shaft provided with the ratchet-wheel, the enlarged wall surrounding a portion of said shaft, and the swinging receiver holder-arm, of an involute spring by its inner end secured to said shaft and having its outer end free for a spring-bearing on said wall, substantially as described, and a pawl normally located for engagement with said ratchet-wheel, and means actuated by said holder-arm whereby on the downward movement thereof said pawl will be thrown out of engagement with said ratchet, for the purpose described.

2. In combination, the magneto-shaft adapted to have a spring-reversed rotation and detent devices adapted normally to prevent such reversal, the short-circuit spring and its contact-pin, the swinging receiver holder-arm, and movable connections actuated by the said holder-arm and in engagement with said arm and said short-circuit spring, and also with said detent devices, whereby on the downward movement of the said holder-arm said spring will be drawn from its contacting-pin, and said magneto-shaft will be freed for its reverse rotation, substantially as described.

3. In a telephone call-box, the combination, with the magneto-operating shaft having the ratchet-wheel thereon, the enlarged surrounding wall, and the swinging receiver holder-arm, of an involute spring by its inner end secured to said shaft, and having its outer end free for a spring-bearing on said wall, a sliding shaft having a spring-pawl thereon normally located for engagement with said ratchet and provided with a stud, 22, and a toothed wheel and spring-pawl therefor carried by said swinging arm and located in relation to said shaft-

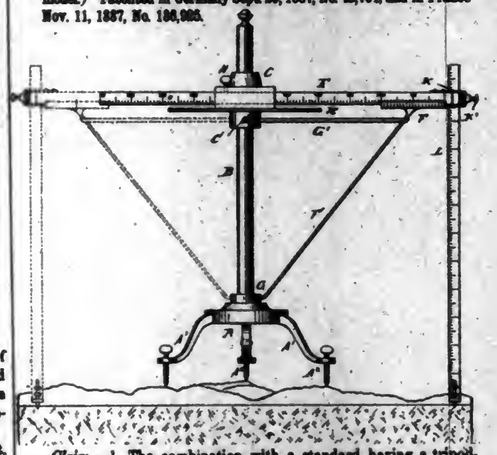
397,284.

stud, substantially as described, whereby on the upward movement of the said holder-arm said toothed wheel will produce no effect on said slide-shaft, but on the downward movement thereof said shaft will be moved longitudinally to carry said pawl out of a position for engagement with said ratchet, substantially as described.

4. The combination, with the magneto-shaft having the ratchet, the surrounding circular wall and the involute spring, substantially as described, and the holder-arm, of the slide-shaft having the stud 22 and pin 18 thereon, and guiding-lugs therefor, the pawl loosely fitted on the end portion of the slide-shaft, having the slot 19 engaging said slide shaft, the spiral spring 20, applied between and secured to a guide-lug and said pawl for exerting an outward pressure on said pawl and slide-shaft, and a pressure on said pawl for a partial rotation thereof on its shaft, and the toothed wheel and spring-pawl therefor carried by said holder-arm and arranged for operation on and with relation to said shaft-stud 22, substantially as and for the purpose described.

5. The combination, with the guiding-lugs *a* and *b*, the latter having the right-angled extension with the longitudinal slot therein, of the slide-shaft D, for carrying the spring-pawl provided with the pin 23, and the sleeves 21 and 22, the former bearing on the walls of said slot, substantially as and for the purposes described

6. The combination, with the short-circuit contact-spring *g* and the contacting part *i* therefor, and the swinging receiver holder-arm, of the slide-shaft D, having an abutment, 32, mechanism, substantially as described, interposed between said holder-arm and said slide-shaft to secure a longitudinal slide of the latter on the downward movement of the former, an intermediately-pivoted tilting lever having one end in engagement with said abutment for being swung thereby, and a connecting-rod between the other end of said lever and said contact-spring *g*, for drawing same away from its contacting part on the swinging of said lever in one direction, substantially as described.

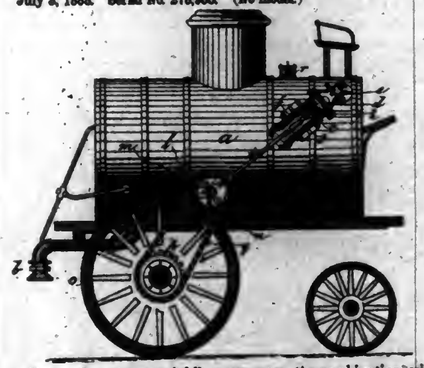


7. The combination, with the contact-spring *g*, having an aperture, 37, therein, and the tilting lever *l*, intermediately pivoted and having an aperture, 34, in one arm thereof, of the connecting-rod *m*, by one end portion passing through the spring-aperture 37 and headed thereat, and at its other end portion passing through the lever-arm aperture 34 and screw-threaded, and the adjusting check-nut 35, substantially as and for the purposes described.

8. In a telephone call-box, the magneto-shaft A, provided with the ratchet-wheel and the enlarged circular wall surrounding a portion of said shaft, the involute spring by its inner end secured to said shaft, and by its outer end in spring bearing on said wall, the swinging receiver holder-arm, and the short-circuit contact-spring *g* and its contacting button *i*, combined with a sliding shaft having a spring-pawl normally located for engagement with said ratchet and provided with a stud, 22, and abutment 32, a toothed wheel and spring-pawl therefor carried by said swinging arm and located in relation to said shaft for the operation on said slide-shaft, as described, an intermediately-pivoted tilting lever, *l*, by one arm in position to be engaged by said slide-rod abutment 32, and a connecting-rod, *m*, between and in engagement with the other arm of said lever and said contact-spring *g*, all substantially as and for the purpose described.

397,285. PREPARING DYNAMITE. GUSTAV R. F. GUTER, Unterlüss, Prussia, Germany. Filed Dec. 13, 1887. Serial No. 257,666. (No specimens.) Patented in France Feb. 1, 1887, No. 181,183; in Belgium June 9, 1887, No. 77,763, and in England June 23, 1887, No. 8,970.

Claim.—The herein-described method of manufacturing cartridges, consisting in pressing kieselguhr into the form of cartridges, then carbonizing them, and finally saturating them with nitro-glycerine, substantially as set forth.

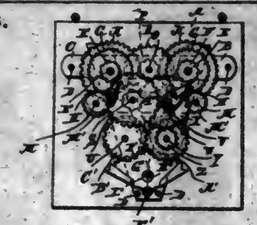


397,286. APPARATUS FOR LEVELING AND SQUARING STONE. MAX HÄNSEL, Christianstadt, Prussia, Germany, assignor to Richard Hänsel, Breslau, N. Y. Filed Nov. 20, 1888. Serial No. 291,380. (No model.) Patented in Germany Sept. 29, 1887, No. 43,761, and in France Nov. 11, 1887, No. 186,925.

Claim.—1. The combination, with a standard having a tripod-base, of a sleeve mounted to turn on said standard, a rule mounted to slide in said sleeve, a rule mounted to slide in the end of said sliding rule, and a graduated disk on the sleeve and below the rule mounted to slide in said sleeve, substantially as herein shown and described.

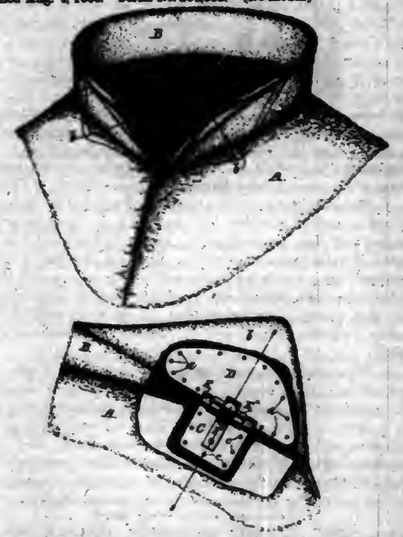
2. The combination, with a standard, of a sleeve mounted to rotate on said standard, the rule E in said sleeve, the guide F, an arm, F', supporting said rule, and the rule I, mounted to slide in the end of the rule E, substantially as herein shown and described.

397,287. STREET-SPRINKLING APPARATUS. MICHEAL HAUGHEY, St. Louis, Mo., assignor of one-half to James Griffin, same place. Filed July 3, 1888. Serial No. 278,935. (No model.)



Claim.—In a street-sprinkling apparatus, the combination, with a carriage, of a water-tank mounted thereon, an air-pump mounted on the tank and delivering thereinto, a floating sprocket-wheel journaled on one arm of a counterbalanced bell-crank lever fulcrumed on the tank, a crank on said sprocket-wheel for operating a piston-rod which is pivotally connected to the piston of the pump, a sprocket-wheel on the hub of the carriage-wheel, and a chain belt for communicating motion from said sprocket-wheel to the floating sprocket-wheel, substantially as and for the purposes described.

397,288. MOTOR. ERNST T. HEINRICH and JOHN HOFFMANN, Fredsburg, Tex. Filed Aug. 23, 1888. Serial No. 283,515. (No model.)



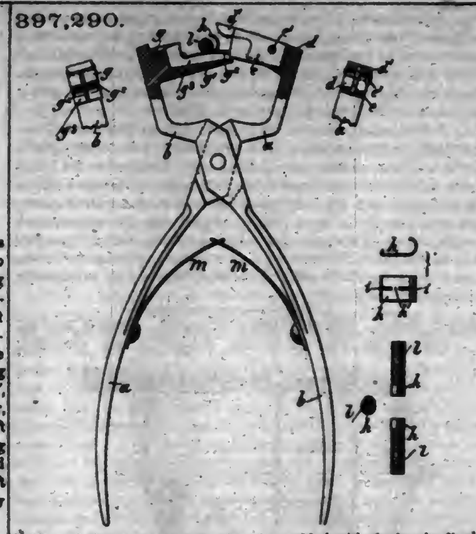
Claim.—In a fan-motor, the V-shaped frame B, the shafts E, journaled in the upper corners thereof, the ratchet-wheels F and spur-wheels G, secured to said shafts, the spring-actuated pawls pivoted to the frame and engaging the ratchet-wheels, sleeves loose on shafts E,

397,288.

and having the spur-wheels K fast to said sleeves, the volute springs L, with their inner ends fast to shafts E and their outer ends fast to wheels K, the winding-shafts M, having the pinions M', engaging wheels G, the shaft O between shafts E, having the pinion P, engaging wheels K, and provided further with the spur-wheel R, the shaft S, having pinion T, engaging wheel R, and provided with the spur-wheel U, the shaft V, having the pinion W and spur-wheel X, the former engaging wheel U, the shaft Y, having the pinion Z, engaging wheel X, and provided also with the wheel A', the counter-shaft C', having wheel B', of the same size as wheel A' and engaging the latter, the spurred sectors D' E', secured to said shafts Y C', the rock-shaft having the spurred sector G', provided with opening H' and engaging sectors D' E' alternately, the screw I, engaging the frame and adapted to engage the opening H', for the purpose set forth, and the fan-shaft detachably secured to the rock-shaft, all in combination, substantially as described.

397,289. GARMENT-COLLAR. CHARLES F. HENNING, Chicago, Ill. Filed Aug. 4, 1888. Serial No. 281,982. (No model.)

Claim.—The combination, with the main part or body of a garment and the collar thereof, of hinged plates attached to the body and the collar, one of said plates being provided with a flat surface or surfaces adjacent to its pivotal axis, and the other with a spring-actuated part bearing upon said flat surface, substantially as described.



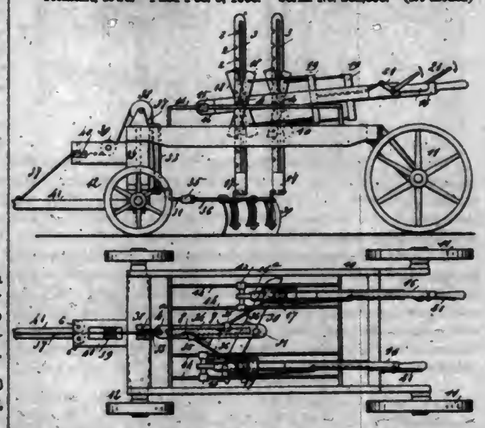
397,290. TOOL OR INSTRUMENT FOR CUTTING CORDS AND TYING STRIPS OF SHEET METAL. GUSTAV HELLER, Zittau, Saxony, Germany. Filed Apr. 2, 1888. Serial No. 270,046. (No model.)

Claim.—1. A tool or instrument for simultaneously cutting and binding cords, consisting of two arms or branches, *a b*, pivoted to each other and having their jaws *d g* provided with tongues or extensions *d' g'*, the tongue *d'* being divided by a slit and carrying a removable knife, *c*, and the tongue *g'* being provided with ribs or flanges g^2 and having a groove, g^3, between said ribs, substantially as and for the purpose herein described.

2. In a tool or instrument for simultaneously cutting and binding cords or similar fabrics, the combination, with the pivoted arms or branches *a b* and the jaw *d*, having the divided tongue or extension *d'*, of the removable knife *c*, secured in place by the screw *i*, substantially as herein described.

3. In a tool or instrument for simultaneously cutting and binding cords or similar fabrics, the combination, with the pivoted arms or branches *a b* and the divided tongue or extension *d'*, carrying the

397,290.



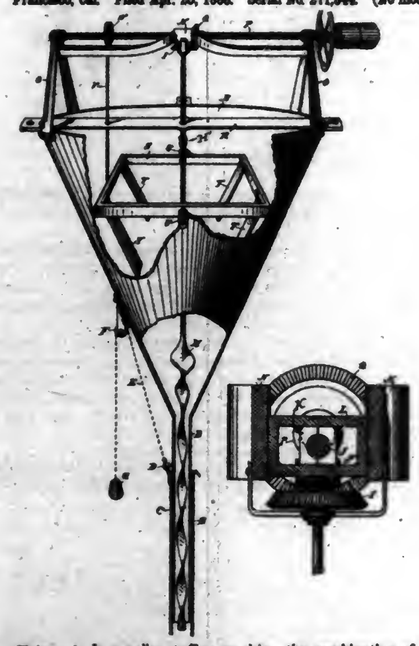
knife *c*, of the tongue or extension *g'*, provided with the longitudinal groove g^3, for engagement with said knife, substantially as herein described.

4. In a tool or instrument for simultaneously cutting and binding cords or similar fabrics, the combination, with the tongue or extension *d'*, of the tongue or extension *g'*, having the longitudinal ribs or flanges g^2, for guiding the extension *d'* and preventing lateral displacement thereof, substantially as herein described.

5. A tool or apparatus for simultaneously cutting and binding cords or similar fabrics, consisting of pivoted arms *a b*, having jaws *d g* and tongues or extensions *d' g'*, engaging with each other, so that they may be pressed nearer to or farther from each other, whereby provision is made for cutting and binding either thin and light or thick and heavy cords, substantially as herein described.

397,291. ROAD-GRADING MACHINE. JAMES M. HOLLAND, Mount Pleasant, Iowa. Filed Feb. 3, 1888. Serial No. 262,853. (No model.)

Claim.—1. In a road-grading machine, the combination, with the main frame, of a double-toothed rack connected thereto, a blade adjustably connected to the double-toothed rack, and braces extending forward from the blade to blocks which engage the rack-teeth, substantially as described.



2. In a road-scraper, the combination, with the main frame, of a bar having its forward end loosely connected to the main frame, a blade pivoted at about its center to the said bar, braces having one end connected to the blade and the other ends adjustably connected to the said bar, independent standards adjustably secured in the frame and having their lower ends pivotally connected to the blade, and catches for locking the standards in the position to which they have been adjusted, substantially as described.

3. In a road-grading machine, the combination, with the main frame, of levers adjustably mounted thereon, catches carried by the

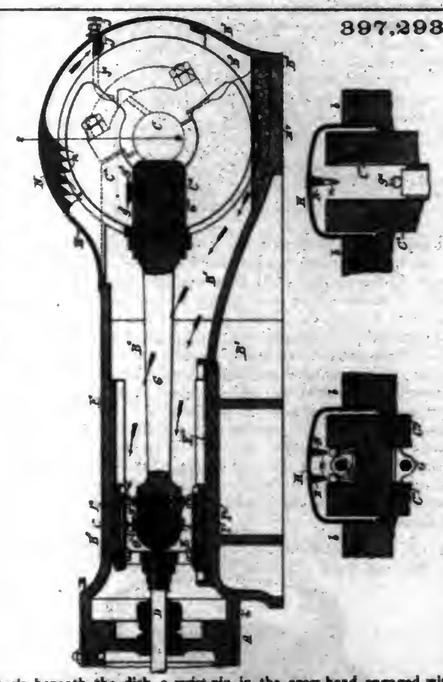
, levers, standards formed with notches that are engaged by the catches, a blade or shovel connected to the lower ends of the standards, a double-toothed rack connected to the frame of the machine and centrally connected to the blade or shovel, blocks engaging the rack-teeth, and diagonal braces extending from the blocks to the ends of the blade or shovel, substantially as described.

4. In a road-scraper, the combination, with the frame 10, of levers adjustably mounted thereon, catches 18, carried by the levers, equalizers to which the catches are connected, rods connected to the equalizers, handle-levers connected to the rods, and spiral springs arranged in connection with the rods, slotted standards formed with recesses 2, the pintles or pins of the catches passing through the standard-slots, a double-toothed bar connected to the main frame of the machine and to the shovel, blocks carried by said bar, and diagonal braces connected to the blocks and to the ends of the shovel, all substantially as described.

397,292. COLLAR-STUFFING MACHINE. GEORGE E. HOYT, San Francisco, Cal. Filed Apr. 25, 1888. Serial No. 271,844. (No model.)

Claim.—1. In a collar-stuffing machine, the combination of the receiver or hopper having an extension from its lower end, over which the collar-tube slips, and a hook and counter-balance, by which the collar-tube is held in place upon the filling-tube, and the auger and its actuating mechanism, substantially as described.

2. The packing screw or auger having the upper end of its shaft polygonal and sliding loosely through the gear I, by which the rotary motion of the auger is produced, in combination with the head L, to which the upper end of the auger-shank is connected, the guides N, within which the head slides, and the box K, in which the crank J turns, said box sliding transversely in the head L, substantially as herein described.



397,293. LUBRICATING DEVICE FOR ENGINES. ALBERT L. IDE, Chicago, Ill. Filed Aug. 4, 1888. Serial No. 281,944. (No model.)

Claim.—1. The combination, with an engine crank-shaft and a crank-disk connected therewith, of a casing or housing surrounding the disk, having an oil tank or basin beneath said disk, said casing or housing being provided with a depending pointed projection, by which the oil flowing from the inner surface of the casing or housing may be directed or carried to a part to be lubricated.

2. The combination of an engine crank-shaft, a crank-disk connected therewith, and a housing or casing surrounding the disk and provided with depending pointed projections upon the said housing or casing, and having an oil tank or basin beneath said disk, an oil-receptacle secured to the connecting-rod and arranged beneath said pointed projections, and having a pipe and a passage leading from said oil-receptacle to the bearing-surface to be lubricated.

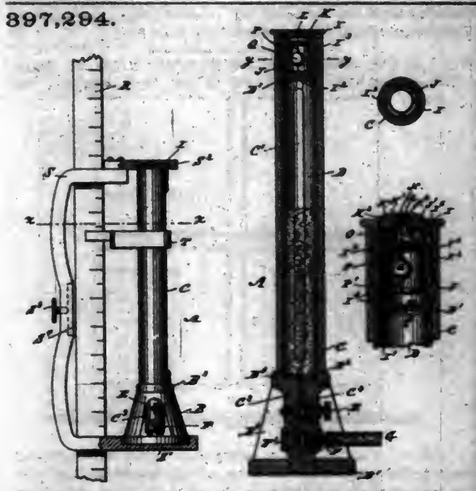
3. The combination, with an engine crank-shaft, a crank-disk, connecting-rod, and cross-head, of a casing or housing surrounding the disk, connecting-rod, and cross-head, and having an oil tank or

397,293.

basin beneath the disk, a wrist-pin in the cross-head engaged with the connecting-rod, and an oil-cup upon the said connecting-rod communicating with the bearing-surface of the wrist-pin, said oil-cup being located in position to receive the lubricant thrown upon the surface of the cross-head by the crank-disk, substantially as described.

4. The combination, with a crank-shaft, crank-disk, connecting-rod, and cross-head of hollow box form, of a casing or housing surrounding said disk, connecting-rod, and cross-head, and having an oil tank or basin located beneath the crank-disk, a wrist-pin upon the cross-head engaging the connecting-rod, and an oil-cup upon the connecting-rod communicating with the bearing-surface of the wrist-pin, said hollow cross-head being provided upon its upper wall with a depending projection located over the said oil-cup, substantially as described.

5. The combination, with an engine crank-shaft, a crank-disk, crank-pin, and connecting-rod, of a casing or housing surrounding the disk and having an oil tank or basin beneath the same, and provided with pointed projections, an oil-cup upon the connecting-rod communicating with the bearing-surface of the crank-pin, said pointed projections depending from the top of said housing or casing over the oil-cup for the purpose of delivering to the said oil-cup oil thrown upon the housing by the disk, substantially as described.



397,294. LEVELING-INSTRUMENT. CHARLES A. KARR, Green Elm, Kans. Filed June 4, 1888. Serial No. 275,963. (No model.)

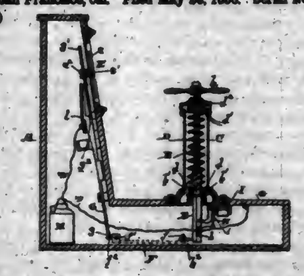
Claim.—1. In a hydrostatic leveling-instrument, standards, and a tube for connecting the bases of the standards with each other, in combination with a cap secured to the upper end of each standard and provided with an air-inlet, a valve held to slide in the said cap and adapted to be raised and lowered, a plug held adjustably on the said cap, a chain supported by the said plug and connected with the said valve, and a weight held on the said chain inside of the said valve, substantially as shown and described.

2. In a hydrostatic leveling-instrument, the combination, with the standards, of a cap secured to the upper end of the standards and provided with an air-inlet, a valve held to slide in projections on the inside of the said cap, a plug provided with a spiral projection fitting into a similar offset on the said cap, a rod held yieldingly in the said plug, a chain connected with the said rod and passing through the open mouth of the valve into the interior of the latter, said chain being also connected with the bottom of the valve, and a weight held on the said chain in the said valve, substantially as shown and described.

3. In a hydrostatic leveling-instrument, the combination, with the base B, provided with the flanged ring B^2, of the tube C, fitting into the said flanged ring B^2, and provided with the reduced end C^2, secured to the bottom of the said base and having a central recess, a cock held in the said reduced end C^2 to open and close the said recess,

397,294.

and an outlet-plug screwing into the said reduced end and adapted to be connected with a flexible tube, substantially as shown and described.



4. In a hydrostatic leveling-instrument, the combination, with the base B, provided with the flanged ring B^2, of the tube C, fitting into the said flanged ring B^2 and provided with the reduced end C^2, secured to the bottom of the base and having a central recess, a cock held in the said reduced end C^2 to open and close said recess, an outlet-plug screwing into the said reduced end and adapted to be connected with a flexible tube, and a filling-plug, F, screwing in the said reduced end, substantially as shown and described.

5. The combination, with the liquid-containing standard, of a clamp having horizontal arms recessed on their adjacent faces to receive the ends of the standard and provided with vertically-aligned apertures, a leveling-rod passing through said apertures, a block on the inner side of the clamp, and means for pressing the block against the leveling-rod, substantially as set forth.

6. In a hydrostatic leveling-instrument, the combination, with the standard A, of the clamp S, supporting said standard A, a leveling-rod on which the said clamp is held to slide, and a pointer held adjustably on the said standard and indicating on the graduations of the said standards and the said leveling-rod, substantially as shown and described.

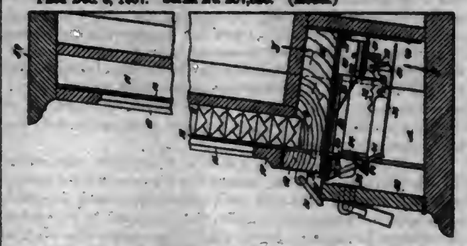
7. In a hydrostatic leveling-instrument, the combination, with the leveling-rod, of a standard held to slide on the said leveling-rod, and the pointer T, held to slide on the said standard, being provided with the plate T', the L-shaped arm T^4, and the spring T^5, substantially as shown and described.

397,295. COIN-CONTROLLED LIFTING-MACHINE. JOSEPH G. KRABBET, San Francisco, Cal. Filed May 26, 1888. Serial No. 275,203. (No model.)

Claim.—1. In a lifting-machine, the pull-rod and the locking-lever holding it normally inoperative, in combination with a normally-open electric circuit, separated contacts in said circuit for receiving a temporary conductor to close the circuit, one of said contacts being pivoted, an electro-magnet in the circuit for disengaging the locking-lever from the pull-rod, and the mechanism for relieving the temporary conductor to open the circuit again, consisting of a weighted lever on the pivoted contact, said lever having a spring, and the vertically-movable rod G, operated by the pull-rod and having an enlarged portion for binding on the spring of the weighted lever, thereby swinging the pivoted contact, substantially as herein described.

2. In a lifting-machine, the box or casing having a platform, the dial or register on the face of the box and the pointer moving over it, and the spring-resisted pull-rod B, in combination with the mechanism for transmitting the movement of the pull-rod to the pointer, consisting of the pin on the base of the pull-rod, the rock-shaft F, having the end arms, the vertically-movable rod G, having a rack on its upper end, and the pinion, substantially as herein described.

3. In a lifting-machine, the box or casing having a platform, the dial or register on the face of the box and the pointer moving over it, and the spring-resisted pull-rod B, in combination with the mechanism for transmitting the movement of the pull-rod to the pointer, consisting of the pin on the base of the pull-rod, the rock-shaft having the adjustable arm over the pin and the arm on its other end provided with an adjustable pin, the vertically-movable rod G over the adjustable pin and having a rack on its upper end, and the pinion on the pointer-shaft, substantially as herein described.



4. In a lifting-machine, the spring-resisted pull-rod having a pin in its lower end, the dial or register having a pointer moving over it, and the mechanism for operating the pointer, consisting of the rock-shaft having end arms and operated by the pin of the pull-rod, the vertically-movable rod G, operated by the rock-shaft and having a rack on its upper end, and the pinion on the pointer-shaft, in combination with the locking-lever engaging the pull-rod and holding it normally inoperative, a normally-open electric circuit having a fixed contact and a pivoted contact normally separated and adapted to receive a temporary conductor to close the circuit, an electro-magnet in the circuit for releasing the locking-lever, the weighted lever on the pivoted contact, the movable rod G, having a spring, and the enlargement for swinging the pivoted contact and releasing the temporary conductor, whereby the circuit is opened again, substantially as herein described.

397,296. COMPOUND TO RESTRAIN THE SETTING OF PLASTER, &c. GEORGE R. KING, New Brighton, N. Y. Filed Sept. 17, 1888. Serial No. 285,634. (No specimens.)

Claim.—1. The above-described composition of matter, composed, essentially, of animal gelatinous or vegetable glutinous matter and hydrated lime, substantially as set forth.

2. The above-described composition of matter, composed, essentially, of animal gelatinous or vegetable glutinous matter and hydrated lime combined and reduced to a finely-divided condition, substantially as set forth.

397,297. VENDING APPARATUS. FRANK M. LEAVITT, Brooklyn, N. Y., assignor to The Automatic Selling Machine Company, same place. Filed Dec. 8, 1887. Serial No. 257,323. (Model.)

Claim.—1. A stationary toothed rack, a reciprocating slide, and a gravity-pawl pivoted to said slide, which engages said rack, said slide having a reciprocating movement greater than the length of said rack, whereby when said slide reaches its limit of motion in either direction said pawl will, under the influence of gravitation, swing clear of said rack, in combination with a pawl-tripping slide located at the rear of said rack in the path of said gravity-pawl, said slide normally holding said pawl in engagement with said rack, substantially as set forth.

2. A stationary toothed rack, a reciprocating slide, and a gravity-pawl pivoted to said slide, which engages said rack, said slide having a reciprocating movement greater than the length of said rack, whereby when said slide reaches its limit of motion in either direction said pawl will, under the influence of gravitation, swing clear of said rack, in combination with a gravity-pawl-tripping slide in the rear of said rack, said pawl in its lowermost position being in the path of said gravity-pawl so as to hold said pawl in engagement with said rack, but when said pawl-tripping slide is in its upper position it is disengaged from said pawl, whereby said pawl is free to swing clear of said rack, substantially as set forth.

3. A stationary toothed rack, a reciprocating slide, and a gravity-pawl pivoted to said slide, which engages said rack, said slide having a reciprocating movement greater than the length of said rack, whereby when said slide reaches its limit of motion in either direction said pawl will, under the influence of gravitation, swing clear of said rack, in combination with a pivoted lever and a pawl-tripping

slide resting upon one end of said lever and co-operating with said gravity-pawl, substantially as set forth.

4. A stationary toothed rack, a reciprocating slide, and a gravity-pawl pivoted to said slide, which engages said rack, said slide having a reciprocating movement greater than the length of said rack, whereby when said slide reaches its limit of motion in either direction said pawl will, under the influence of gravitation, swing clear of said rack, in combination with a pivoted lever, a pawl-tripping slide resting upon one end of said lever and co-operating with said gravity-pawl, and a coin-chute for directing a coin onto the other end of said lever, substantially as set forth.

5. A stationary toothed rack, a reciprocating slide, and a gravity-pawl pivoted to said slide, which engages said rack, said slide having a reciprocating movement greater than the length of said rack, whereby when said slide reaches its limit of motion in either direction said pawl will, under the influence of gravitation, swing clear of said rack, and said slide having a laterally-projecting pin, in combination with a pawl-tripping slide in the rear of said rack and in the path of said projecting pin, substantially as set forth.

6. The combination, with a slide, of a pawl carried thereby and provided with a pin or projection, a rack with which the pawl engages, a pawl-tripping slide formed with an inclined face against which the pawl-pin normally rests, a lever arranged in connection with the tripping-slide, and a coin-chute arranged in connection with the lever, substantially as described.

7. The combination, with a slide, of a pawl connected thereto and provided with a pin or projection, a rack with which the pawl engages, a pawl-tripping slide formed with a bearing-face, 7, against which the pawl pin or projection normally rests, a lever arranged in connection with the tripping-slide and formed with fingers 9, and a chute arranged above the lever-fingers, substantially as described.

8. The combination, with a slide, of a pawl connected thereto and provided with a pin or projection, a rack with which the pawl engages, a pawl-tripping slide formed with a bearing-face, 7, against which the pawl pin or projection normally rests, and with a second bearing-face, 7ª, a lever arranged in connection with the tripping-slide, and a chute arranged above the lever, substantially as described.

9. The combination, with a slide, of a pawl connected thereto and provided with a pin or projection, a rack with which the pawl engages, a pawl-tripping slide formed with a bearing-face, 7, and a flange, *c*, a lever arranged in connection with the tripping-slide, and a coin-chute arranged in connection with the lever, substantially as described.

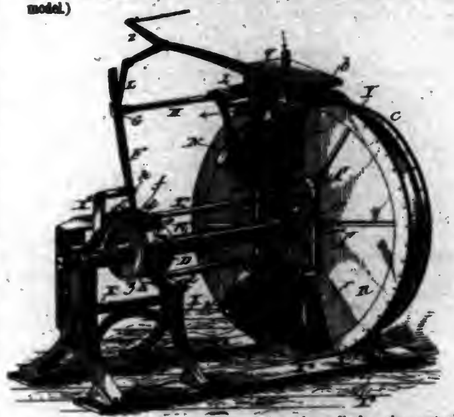
10. The combination, with a slide, of a base-plate upon which the slide is mounted, a casting connected to the base-plate and formed with a side flange or rib, a rack, and a vertical way, a block connected to the slide and formed with a recess that is entered by the casting rib or flange, a pawl pivotally connected to the block and provided with a pin or projection, a pawl-tripping slide mounted in the vertical way and formed with an inclined face against which the pawl pin or projection bears, a lever arranged to bear against the lower end of the tripping-slide, and a coin-chute arranged in connection with the lever, substantially as described.

11. The combination, with a slide, of a base-plate upon which the slide is mounted, a casting connected to the base-plate and formed with a side flange or rib, a rack and a vertical way, a block connected to the slide and formed with a recess that is entered by the casting rib or flange, an angular arm, 46, which bears against the block, a spring arranged in connection with the arm, a pawl pivotally connected to the block and provided with a pin or projection, a pawl-tripping slide mounted in the vertical way and formed with an inclined face against which the pawl pin or projection bears, a lever arranged to bear against the lower end of the tripping-slide, and a coin-chute arranged in connection with the lever, substantially as described.

12. The movable slide, in combination with a pivoted arm, the swinging portion of which is in retractive engagement with said slide only when said slide is at and near its rear-ward position, and a retracting-spring acting upon said pivoted arm, substantially as set forth, whereby said spring acts to pull back said slide only during the latter portion of its rearward movement.

13. The reciprocating slide, in combination with the pivoted angular arm 46 and the spring 48, substantially as set forth.

14. A coin-chute having a lateral slot and being bent to form a recess having a horizontal shelf or bottom, in combination with an escapement-lever the two ends of which alternatively engage said slot and recess, respectively, substantially as set forth.



15. A vending-machine having a package-receptacle for containing the packages to be sold, in combination with a sliding package-drawer having a recess which constitutes a continuation of said package-receptacle when said drawer is closed, the front portion of said drawer extending above the bottom of said recess to a distance substantially equal to the thickness of one of the packages, and the rear portion of said drawer, which constitutes a platform upon which the packages in said package-receptacle rest when the drawer is open, extending above the bottom of said recess a distance less than the front portion of said drawer, substantially as set forth.

397,298. METAL SHEET FOR SURFACING WALLS, &c. HENRY A. LEE, Glen Ridge, N. J. Filed July 30, 1888. Serial No. 281,436. (No model.)

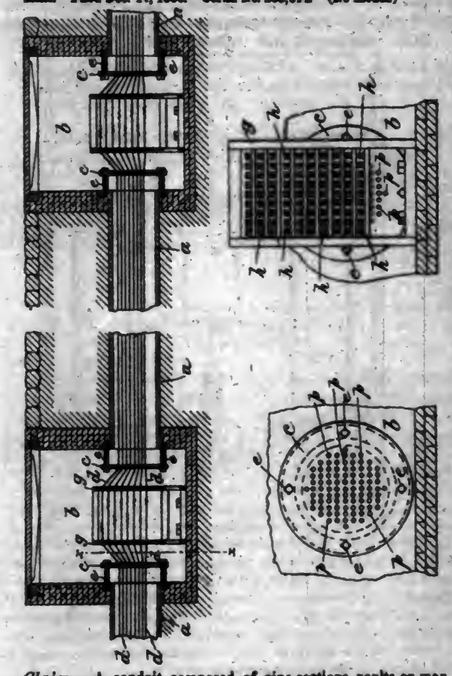
Claim.—A metallic wall or ceiling plate having two intersecting beads or ribs near and parallel to two of the edges of the sheet, with flat portions between the beads or ribs and the adjacent edges of the sheet, substantially as specified.

397,299. REVOLVING-PISTON STEAM-ENGINE. WILLIAM R. LEONARD, Lincoln, Nebr. Filed Dec. 12, 1887. Serial No. 257,694. (No model.)

Claim.—1. In a rotary-piston engine, the cylinder, the central rotary shaft and its pistons, and the pivoted gates movable axially across the cylinder, in combination with the grooved cam on the central shaft and the gate-operating pitman connected with said cam.

2. In a rotary-piston engine, the cylinder, the central shaft and its three pistons, the two gates pivoted near the center of the cylinder and arranged to swing across its interior in the direction of its axis, the steam-chest with ports leading to the cylinder, the slide-valve, cams on the main shaft, and connections from one cam to the gates and from the other cam to the valve, whereby the gates are opened in advance of and closed behind the pistons and the steam admitted to and delivered from the cylinder at the required times.

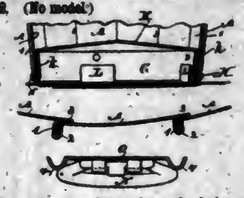
3. In combination with the cylinder, pistons, gates, and steam-chest provided with ports leading to the cylinder on opposite sides of the gates, the slide-valve adjustable at right angles to its working-path that it may be brought over either series of ports at will, and a second valve, substantially as shown, for closing those ports which are for the time being out of use, whereby the motion of the engine may be reversed at will.



4. In a rotary engine, and in combination with the two independent series of ports to permit reversal of the engine, the main sliding valve K, adapted to close the two series of ports alternately, and the slide-valve mounted in the valve K and adjustable laterally therewith, whereby it may be caused to operate with either series of ports at will.

5. In a rotary engine, the cylinder having the concave heads, in combination with the central shaft and its pistons, the gates pivoted to swing through and across the cylinder in the direction of its axis, and the external gate-receiving chambers, N.

6. The cylinder, the shaft and its pistons, and the gates, in combination with the steam-chest and its connecting-ports, the slide-valve,



the rod H, connected thereto, the slide G, to which the rod is connected, the lever F, the cam on the main shaft to actuate the lever, and the lever Z, to move the slide.

397,300. ELECTRIC-WIRE CONDUIT. WILLIAM B. MACK, Boston, Mass. Filed Dec. 17, 1888. Serial No. 293,514. (No model.)

Claim.—A conduit composed of pipe-sections, vaults or man-holes communicating with said sections, insulating-plates secured within the man-holes opposite the ends of the pipes, said plates being perforated for the passage of the wires and separated from the ends of the pipes, and frames within the vaults provided with insulating-wire supports, all arranged substantially as set forth.

397,301. ASH OR GARBAGE CAN. TIMOTHY W. MCKENYER, Brooklyn, and JOHN M. SMITH, New York, N. Y. Filed Oct. 5, 1888. Serial No. 287,302. (No model.)

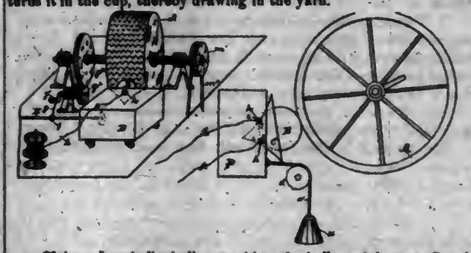
Claim.—1. The sheet-metal can formed of the stripe A, having returned folds 1 and folds 2, interlocking to form double seams, and the folds 3, lying flat against the adjacent sheets at the inside of the can, substantially as set forth.

2. The combination, in the sheet-metal can having the vertical strips A, double-seamed together at the edges, of the sheet-metal bottom K, the hoop G, having a wired edge, and clips L, passing below and around the wired edge of the hoops G and extending up the body of the can and riveted, substantially as set forth.

3. The combination, with the sheet-metal can formed of stripe A, double-seamed together at the edges to form ribs, of the handles N and loop-frames O, having clips that receive the ribs of the double seams, substantially as set forth.

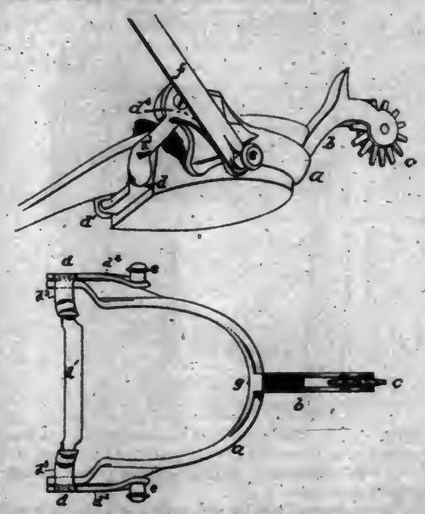
397,302. CUT TOY FIGURE. JOHN MCLOUGHLIN, New York, N. Y. Filed Aug. 20, 1888. Serial No. 284,033. (No model.)

Claim.—1. A cut toy figure made from stiff paper or the like, comprising the object represented and a ground, as *d*, both in one piece, the lower part or legs of the object extending into the ground, and the ground cut through along the outlines of the legs, so as to free them, whereby the object and the ground may be turned or bent to stand at right angles, and the ground be made to form a broad base to support the object in an erect position, as set forth.



397,302.

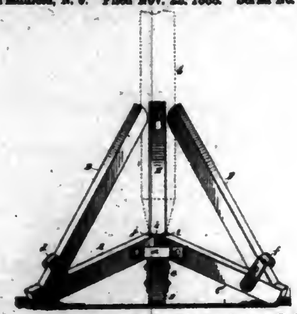
2. A cut toy figure made from stiff paper or the like, comprising the object represented and a ground, as *d*, both in one piece, the lower part or legs of the object extending into the ground, and the ground cut through along the outlines of the parts of the objects that extend into it, and the ground having printed or marked on it a design in elevation, as described.



397,303. BASE-BALL WINDING AND ROLLING MACHINE. BENJAMIN B. NEWELL, Boston, assignor to Henry C. Harwood and Harrison Harwood, Natick, Mass. Filed July 29, 1882. Serial No. 67,895. (No model.)

Brief.—The objects of the invention are to secure uniform tension in the winding of base-balls, to obviate the necessity of pounding and rewinding, and to save time; and the main features are a bell-shaped cup which holds the ball and allows for its increase in size, and a wide-faced friction-wheel which comes in contact with the ball and turns it in the cup, thereby drawing in the yarn.

Claim.—In a ball-winding machine, the ball-receiving cup C and ball-winding wheel A, combined and operating substantially as and for the purpose set forth.

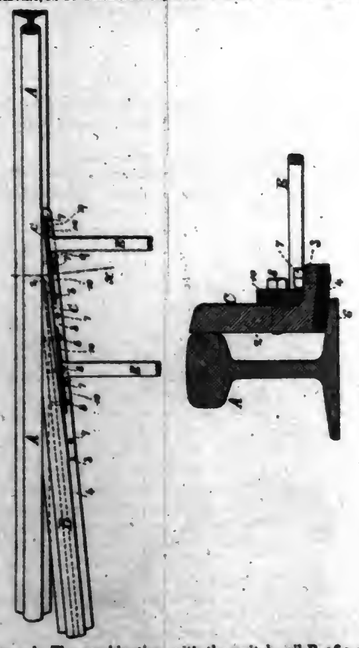


397,304. SPUR. WALTER NICHOLLS, New Britain, Conn., assignor of one-half to James H. Francis, same place. Filed Aug. 16, 1888. Serial No. 282,879. (No model.)

Claim.—1. In a spur, the combination of the spur-bow, the lever-clamp pivoted to the inner ends of the bow and formed with the oppositely-turned arms and clamping-bar *d'* to engage the shank and heel of the boot, and the fastening-strap attached to the ends of the lever-clamp, substantially as described.

2. In a spur, the combination of the spur-bow having the inwardly-projecting pin *g*, the lever-clamp pivoted to the inner ends of the bow and formed with the oppositely-turned arms and clamping-bar *d'* to engage the shank and heel of the boot, and the fastening-strap attached to the free ends of the lever-clamp, substantially as described.

397,305. STAND FOR CHRISTMAS-TREES, &c. THEODORE B. OSBORNE, Plainfield, N. J. Filed Nov. 22, 1888. Serial No. 291,533. (No model.)

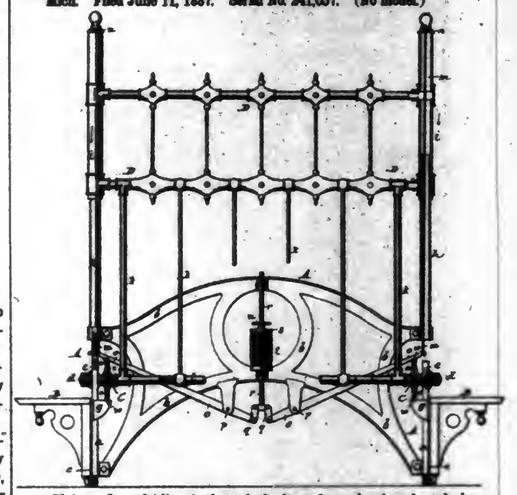


Claim.—1. The combination, with the legs A B C, pivoted to form a toggle-joint, of the gripping-arms D E F, pivoted to and converging above said legs, substantially as described.

2. The combination, with the legs A B C, pivoted to form a toggle-joint, of the gripping-arms D E F, connected to said legs by knuckle-joints and converging above said legs, substantially as described.

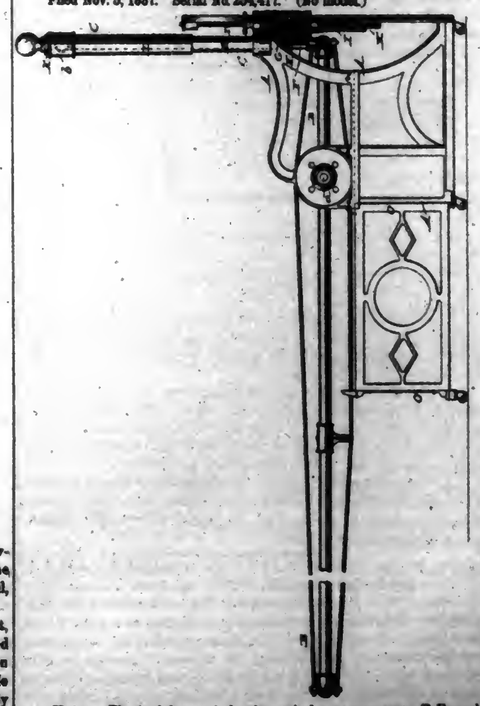
3. The combination, with the legs A B C, pivoted to form a toggle-joint, of the gripping-arms D E F, connected to said legs by knuckle-joints, and the lazy-tongs device consisting of the levers *q r s*, pivoted to said legs and pivotally connected beneath the converging ends of said legs, substantially as described.

397,306. POINT FOR SWITCH-RAILS. TIMOTHY G. PALMER, Schultzville, N. Y. Filed Nov. 17, 1888. Serial No. 291,115. (No model.)



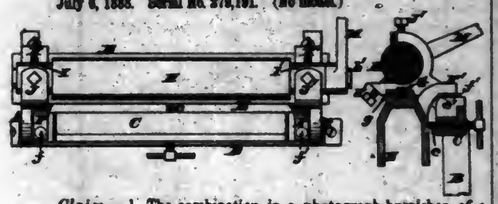
Claim.—1. The combination, with the switch-rail B, of a removable point having an inclined side adjacent to the main rail of the track, and bolts for connecting the removable point to the switch-rail, substantially as set forth.

2. The combination, with the switch-rail B, of a removable point, C, having a vertical flange, 2, one side of which is beveled and adapted to set against the main rail of the track, and a flange, 3, resting upon the flange 4 of the switch-rail, and bolts for securing the removable switch-point to the flange and body of the switch-rail, substantially as set forth.



3. The combination, with the switch-rail B and the tie-rods E, having T-heads, of the removable switch-point C, adapted to rest upon the flange 4 of the rail B, and the bolts 7, 8, and 9, for connecting the removable point to the switch-rail and for connecting the bars E to the removable point and switch-rail, substantially as set forth.

397,307. FOLDING BEDSTEAD. JOSEPH PERRET, Grand Rapids, Mich. Filed June 11, 1887. Serial No. 241,057. (No model.)

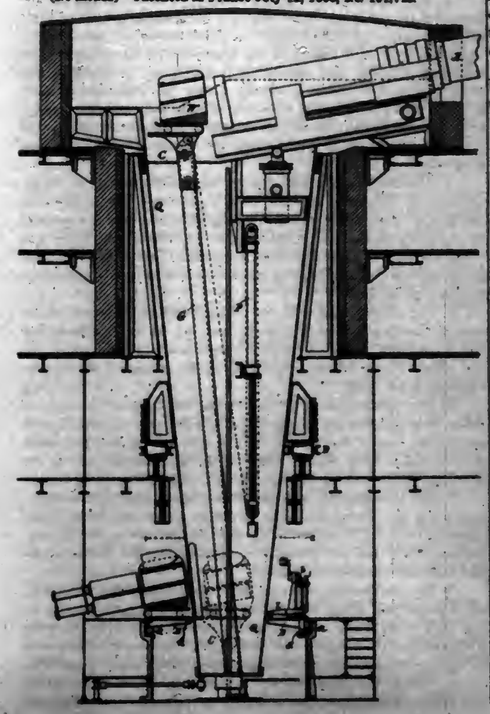


Claim.—In a folding bedstead, the base-frame having the tubular posts *h h*, and the head-frame having sleeves to slide over the base-frame posts, in combination with the bed-bottom frame pivoted on journals of the base-frame, pitmen to connect the bed-frame with the head-frame, the rods *m*, concealed within the posts and connected to the head-frame, the spring *l*, mounted in the base-frame, and levers O, connecting the spring to the rods, substantially as shown and described, and for the purpose set forth.

397,308. FOLDING BED. JOSEPH PERRET, Grand Rapids, Mich. Filed Nov. 5, 1887. Serial No. 254,417. (No model.)

Claim.—The bed-frame A, having tubular corner-posts B E, and the bed-bottom frame B, pivoting on journals of the base-frame, in combination with the head frame or board having tubes D D, whereby it is adapted to slide vertically along the posts of the base-frame, pitmen F, connecting the head-board with the inner end of the bed-bottom frame, the spring J, levers H, connected therewith, the pitmen G, connecting the levers with the head-board, the momentum-opposing springs M M, and the capped rods connecting the sliding head-frame therewith, substantially as shown and described.

397,309. PHOTOGRAPH-BURNISHER. SILAS H. RANDALL, Wyoming, Ohio, assignor of one-half to James D. Randall, same place. Filed July 6, 1888. Serial No. 278,191. (No model.)

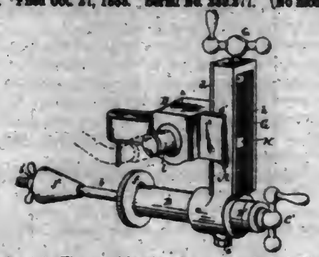


Claim.—1. The combination, in a photograph-burnisher, of a feed-roll, H, two vertically-adjustable journal-boxes, I I', held by opposing set-screws J K J' K' against bearings L of the main frame, as herein described.

2. The combination, in a photograph-burnisher, of an adjustable burnishing-bar holder, E, swung upon the main frame, and a screw, C, whereby said holder is adjusted, which screw projects from the main frame against the holder on the side of its attachments to said holder and below them, as herein described.

3. The combination, in a photograph-burnisher, of a burnisher swung upon a pair of pivots, an intermediate regulating-screw by which said burnisher is raised and lowered, and a feed-roll journaled in independently vertically-adjustable boxes, the axis of said roll being normally parallel to the axis of said pivots, as herein described.

4. The combination, in a photograph-burnisher, of a main frame, a vertically-adjustable feed-roll, a burnishing-bar, a swung burnishing-bar holder, and a screw whereby the holder is adjusted, which screw projects from the main frame against said holder upon the side of its attachments to the main frame and below them, as herein described.



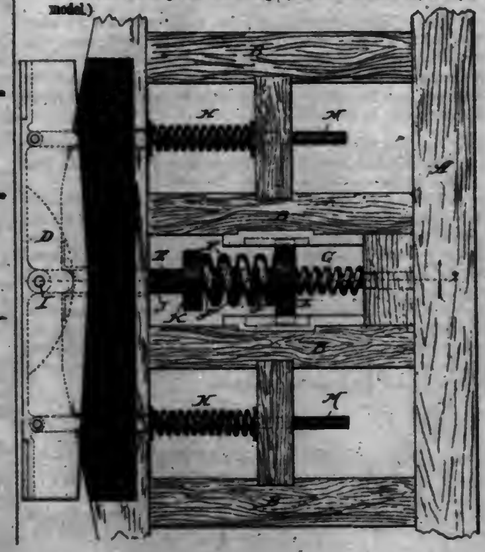
397,310. LOADING APPARATUS FOR TURRET-GUNS. HENRI SCHNEIDER, Paris, France. Filed Nov. 14, 1888. Serial No. 290,854. (No model.) Patented in France July 12, 1888, No. 191,743.

Claim.—1. The combination, with the turret and well, of an elevator cage or cages, guides for the same located in said well, means for raising and lowering the cage or cages, and a platform near the bottom of the well rotatable independently of the turret and well, substantially as described.

2. The combination, with the rotatable turret and well, and with the trolley-carrying elevator or elevators, of the platform near the bottom of the well rotatable independently thereof, mechanism for rotating said platform, and clutch mechanism for locking said platform temporarily to said turret and well, and for disengaging it therefrom, as desired, substantially as described.

397,311. DRILLING-MACHINE. FREDERIC SCHOFF, Philadelphia, Pa. Filed Oct. 27, 1888. Serial No. 289,877. (No model.)

Claim.—1. The combination, in a pulley-hub-drilling machine, of the mandrel B, adapted to be secured to the hub of the pulley, and a screw-shaft in said mandrel, with a standard, A, carrying the drill-carriage, and a nut detachably secured to said standard and meshing with the threads on the screw, substantially as described.



2. The combination of the mandrel carrying the drilling mechanism, having a screw-spindle, *b*, and a nut thereon, with a cone-sleeve on said spindle and acting with the mandrel to clamp the hub of the pulley to the frame, substantially as described.

3. The combination of the mandrel B, the screw-shaft C, sliding standard A, having a nut engaging with the screw-shaft C, said standard having guideways, and a carriage adapted to said guideways and provided with a nut, with a vertical screw-shaft in said standard engaging with the nut, so that by turning the shafts C and G the carriage may be moved both from or toward the pulley and from or toward the center of the pulley, substantially as described.

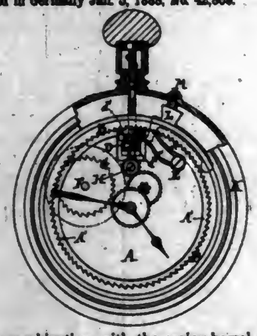
4. The combination, in a drilling and tapping machine, of the standard having a screw, and a nut adapted to the screw, with a drill-carriage adapted to be raised or lowered by said screw, and means for securing the carriage to and detaching it from the nut without disturbing either the nut or the carriage, substantially as set forth.

5. The combination of the standard A, screw-shaft G, and a nut, H, adapted to said screw, with a carriage, D, having a T-slot in which the shank of the nut H is confined, substantially as described.

397,312. SPRING-BUFFER FOR RAILWAY-CARS. CHARLES A. SCHROYER, Chicago, Ill. Filed Aug. 7, 1888. Serial No. 282,188. (No model.)

Claim.—1. In connection with an extensible platform, a spring-buffer comprising a buffer-stem, buffer-springs, a follower, and an auxiliary spring compressible before the buffer-springs, substantially as described.

2. In connection with an extensible platform, a spring-buffer comprising a buffer-stem, buffer-springs F and *f*, an auxiliary spring, G, a follower between the springs F and *f* and G, all the springs being supported upon the buffer-stem and the auxiliary spring being first compressed when the cars are brought together, the buffer-springs being somewhat compressed when the cars are brought near enough to couple, and being still further compressible to take up the buffing strain, substantially as described.

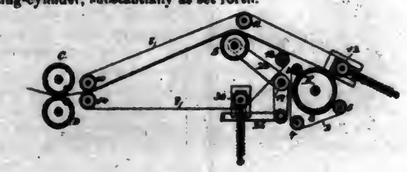


3. The combination of a vestibule angle-plate, a buffer-stem, buffer-springs F and *f*, a follower, L, and an auxiliary spring, G, compressible before the buffer-spring, substantially as described.

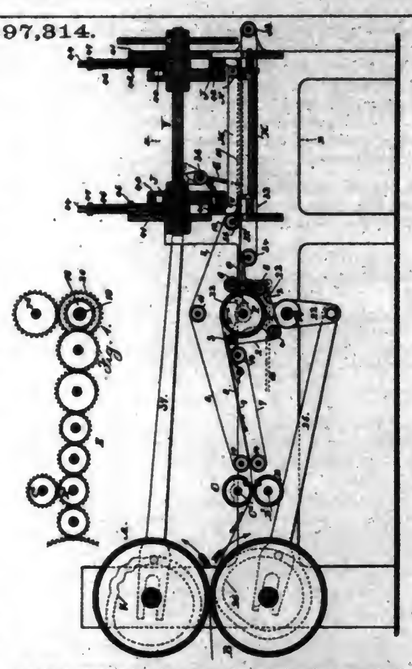
4. The combination of a vestibule angle-plate, a buffer-stem, buffer-springs, a weaker auxiliary spring, and a follower between the springs, all the springs being supported on the stem, and the auxiliary spring being first compressed when the cars are brought together, the buffer-springs being somewhat compressed when the cars are brought near enough to couple, and being still further compressible to take up the buffing strain, substantially as described.

5. The combination of a vestibule angle-plate, a buffer-stem, buffer-springs F and *f*, a weaker auxiliary spring, G, a follower, L, and springs H H, mounted on rods M M, which aid the spring G in forcing out the angle-plate and keep it in proper position, substantially as described.

6. The combination of the face-plate of the extensible hood of a vestibule-car, a buffer-stem connected therewith, buffer-springs, a follower, and an auxiliary spring compressible before the buffer-springs, substantially as described.



397,313. STEM WINDING AND SETTING WATCH. HIPPOLYTE SCHÜTZ, Reconvillier, Switzerland, assignor to Kuhn & Fleche, same place. Filed June 21, 1888. Serial No. 277,749. (No model.) Patented in France Feb. 10, 1887, No. 187,194; in Belgium Oct. 15, 1887, No. 79,123, and in Germany Jan. 5, 1888, No. 42,809.



Claim.—The combination, with the spring-barrel and the wheel G, of the ring B, having inclined or ratchet teeth on the inner edge thereof, the stem C and pinion D, having inclined or ratchet teeth at one end gearing with the teeth on the ring B and gear-teeth on the other end, and the train of gear-wheels to the hands, and the spring E, substantially as set forth.

397,314. MEANS FOR COLLECTING AND EVENING UP SHEETS FOR PRINTING-MACHINES. WALTER SCOTT, Plainfield, N. J. Filed Nov. 21, 1887. Serial No. 255,714. (No model.)

Claim.—1. The combination, with the type and impression cylinders and the cutting-cylinders, of the collecting-cylinder and the rollers and tapes or belts for conveying the sheets from the cutting-cylinders to the collecting-cylinder, and mechanism, substantially as specified, for discharging the groups of sheets successively from the collecting-cylinder, one of the rollers or cylinders being movable laterally during the gathering of each group of sheets to lessen the time occupied in the travel of the respective sheets of the group from the cutting-cylinders to the collecting-cylinder, so as to bring the ends of all the sheets in the group of sheets in line with each other upon the collecting-cylinder, substantially as set forth.

397,314.

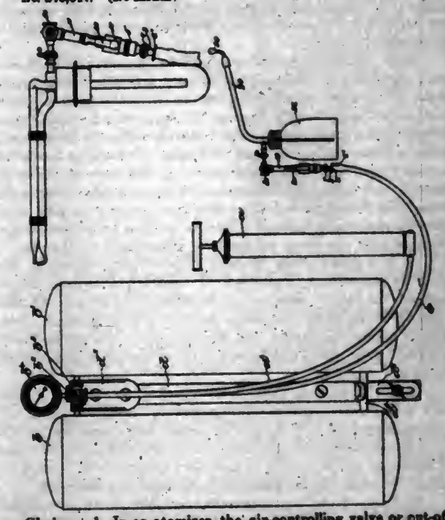
2. The combination, in a press for printing from a web of paper, of cutting-cylinders for perforating the paper, a collecting-cylinder, and belts for conveying the paper from the cutting-cylinder to the collecting-cylinder, the swinging lever-frames 22 and shaft 19, carrying the same, the connecting-rod 25, and cam 26, for swinging such frames progressively during the delivery of each group of sheets and varying the delivery of the respective sheets in the group to bring their ends into line with each other upon the collecting-cylinder, substantially as set forth.

3. The combination, with the cutting-cylinders C D and the delivery-belts 8 and 9 and their rollers, of a collecting-cylinder, F, the belts 2, passing partially around the same, the rollers for carrying such belts 2, the lever-frames 22 and their shaft 19, for supporting the collecting-cylinder, and mechanism, substantially as specified, for swinging the lever-frames gradually during the collection of each group of sheets to bring the collecting-cylinder nearer to the cutting-cylinders, and thereby insure the proper position of the sheets one upon the other in the group of sheets around the collecting-cylinder, substantially as set forth.

4. The combination, with the cutting-cylinders, the collecting-cylinder, the conveying-belts and rollers, and a switch for delivering the groups of sheets from the collecting-cylinder, of conveying-belts for receiving the sheets from the collecting-cylinder, a stop, N, against which the front edges of the sheets are arrested, and vibrating fingers acting against the rear edges of the sheets to even up the same, substantially as set forth.

5. The combination, with the belts 32 and their rollers, of the stop N, vibrating fingers G, shaft 36, carrying the same, connecting-rod 37, and cam K, for vibrating the fingers, and a folding-blade, M, and rollers H, for folding and delivering the groups of sheets, substantially as set forth.

6. The combination, with the folding-blade M, of the pair of slides 40, supporting the folding-blade, and the pair of slideways 41 on opposite sides of the frame of the machine, and the revolving shaft and cams, also upon opposite sides of the machine, for moving the slides and blade, and the folding-rollers H, substantially as set forth.



7. The combination, with the folding-blade M, of the slides 40, supporting the folding-blade, the slideways 41 on the frame of the machine, the cams J, and revolving shaft 36, for moving the folding-blade, and the rods and springs for counterpoising the folding-blades and slides, substantially as specified.

8. The combination, in a paper-folding machine, of the rollers H H, the folding-blade M, the parallel line of vibrating fingers G, acting on one edge of the sheets, and mechanism, substantially as specified, for giving motion to the parts, and the stop N, whereby the sheets after being superimposed are evened up and folded, substantially as set forth.

9. The combination, with the type and impression cylinders and the cutting-cylinders, of the collecting-cylinder and the rollers and tapes or belts for conveying the sheets from the cutting-cylinders to the collecting-cylinder, and mechanism, substantially as specified, for discharging the groups of sheets successively from the collecting-cylinder, one of the rollers or cylinders being movable laterally during the gathering of each group of sheets to lessen the time occupied in the travel of the respective sheets of the group from the cutting-cylinders to the collecting-cylinder, so as to bring the ends of all the sheets in the group of sheets in line with each other upon the collecting-cylinder, substantially as set forth.

10. The combination, with mechanism, substantially as specified, for collecting and superimposing sheets of paper, of the folding-blade and rollers, a vibrating evener acting at the front and back edges of the sheets after they are superimposed to cause said sheets to coincide with each other, substantially as set forth.

397,315. ATOMIZER. ASAHEL M. SHURTLEFF, Boston, Mass., assignor to Codman & Shurtleff, same place. Filed June 2, 1888. Serial No. 275,817. (No model.)

Claim.—1. In an atomizer, the air-controlling valve or cut-off comprising the valve-case and spring-controlled valve and valve-stem, and the bent lever, as 20, for moving said valve-stem, substantially as described.

2. In an atomizer, the air-controlling valve or cut-off comprising the valve-case, valve, and valve-stem, combined with the operating-lever and the adjusting-screw 23, which engages the valve-stem when the lever is moved, substantially as described.

3. In an atomizer, the air-controlling valve comprising the valve-case, valve, and valve-stem, combined with the coupling connecting the tube *c* with the air-controlling valve and upon which the said air-controlling valve is free to be turned, substantially as described.

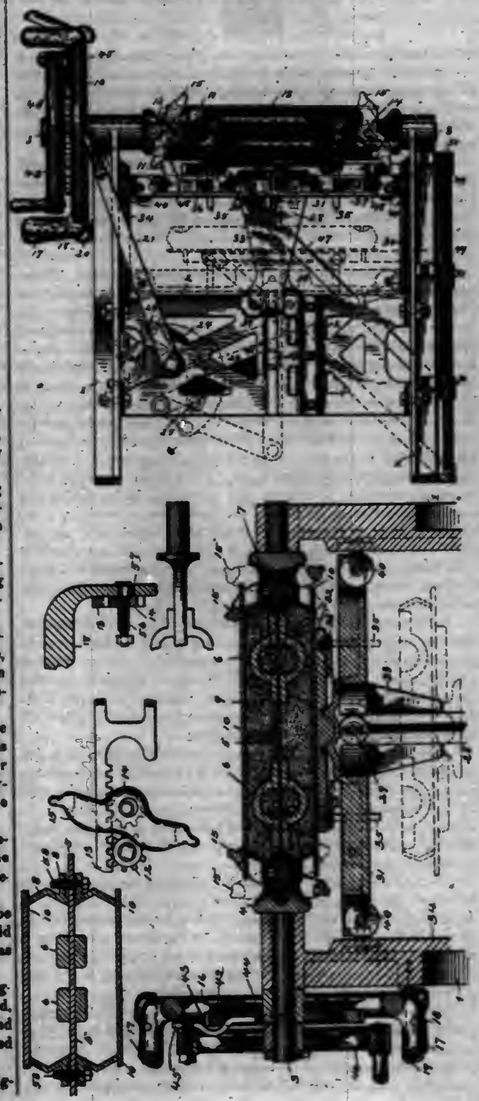
4. In an atomizer, the air-controlling valve comprising the valve-case 10 and air-filter connected with it at its lower end, the valve, and the operating-lever therefor, combined with the coupling 2, upon which the said air-controlling valve is free to be revolved, substantially as described.

5. In an atomizer, the air-controlling valve connected with the air-pipe *c* by a coupling upon which the said air-controlling valve is free to revolve, combined with the frictionally-jointed coupling or nozzle comprising a tapering nozzle, 26, flange 27, and an interiorly-screw-threaded nut connecting said air-controlling valve with the atomizing-tube, substantially as described.

6. In an atomizer, the air-controlling valve comprising the valve-case and valve, combined with the air-filter rigidly connected to the valve-case, and the air-tube leading to the filter, substantially as described.

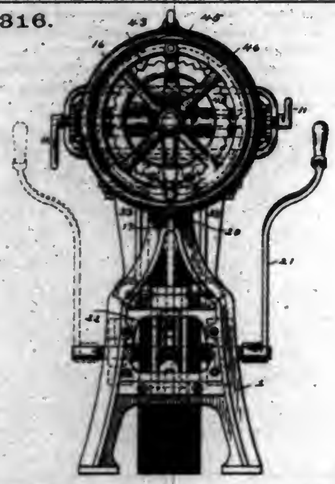
7. In an atomizer, the air-tube 30, combined with the liquid-tube 34, placed in said air-tube 30, and the spring 37, supporting said liquid-tube, and the longitudinally-movable nozzle, substantially as described.

8. In an atomizer, the air-controlling valve having the operating-lever 20, and tube or cylinder 19, to which the said valve is connected, combined with a coupling or nozzle connected with the opposite end of the tube or cylinder 19 by and rotatable upon a hub, 24, extended at right angles to the said cylinder, substantially as described.



9. In an atomizer, the air-controlling valve having the operating-lever 20, and the tube or cylinder 19, combined with the jointed or reversible coupling or nozzle 26, attached to one end thereof, substantially as described.

10. In an atomizer, the tube or cylinder, as 19, combined with the coupling or nozzle 26, and with a thumb-rest, 60, at its rear end, substantially as described.



397,316. SAND-MOLDING MACHINE. ABRAHAM L. TEETOR, Indianapolis, Ind., assignor of one-half to William C. Whitehead, same place. Filed June 16, 1888. Serial No. 277,304. (No model.)

Claim.—1. A sand-molding machine comprising, in combination, a reversible molding-table mounted in bearings at the top of the machine, a pair of clamps connected by a rack-bar which is operated by means of a lever and pinion at one end of the table, whereby the upper clamps are thrown in position for holding the board upon the flask, a frame-work providing bearings for the axle of such reversible molding-table, and a hand-wheel mounted on such axle provided with latches engaging with projections connected to the uprights of the frame for locking the reversible molding-table in a horizontal position, substantially as shown and described.

2. A sand-molding machine comprising, in combination, a reversible molding-table mounted in bearings at the top of the machine, a frame-work supporting and providing bearings for the axle of such molding-table, a hand-wheel mounted on such axle and provided with

897,816.

latches engaging with projections on the frame for locking such table in a horizontal position, and a vertically-movable table resting upon self-adjusting center and corner bearings below the reversible molding-table, mounted on guides in the frame and connected by suitable rods and links to a shaft provided with a lever for operating the elevating mechanism, substantially as shown and described.

3. A sand-molding machine comprising, in combination, a reversible molding-table mounted at the top of the machine, a frame-work providing bearings for the axle thereof, and vibrating mechanism for jarring such table and the pattern supported by it, said mechanism being mounted on and constructed and arranged to strike upon such axle, substantially as shown and described.

4. A sand-molding machine comprising, in combination, a frame-work, a reversible molding-plate mounted in bearings at the top thereof, a pair of clamps connected to each end of such molding-plate, a rack-bar for operating such clamps, a pinion whose inner face bears against the inner face of such clamp, provided with an eccentric hub mounted upon a stud-pin passing through such clamp and connected to the frame, a pinion mounted on a transverse shaft, a lever for operating such pinion, whereby motion is communicated to the rack-bar and the clamps thrown down so as to bind the top of the flask placed upon the molding-plate, a table mounted on self-adjusting bearings for supporting the lower half of the flask when the table is reversed, a vertically-moving cross-head carrying such table and mounted on guides in the frame and connected by suitable links or rods to a shaft provided with a lever for operating the lifting mechanism, and a swinging crane hinged to a rod connected with one side of the frame-work, and provided with fingers resting upon the cross-head beneath the adjustable table which carries the flask-section, such fingers adapted to support the flask, whereby the latter may be swung back out of the machine, substantially as shown and described.

5. In a sand-molding machine, a self-adjusting vertically-moving table for supporting and lowering the lower half of the flask, mounted upon a universal bearing at its center and provided at or near its edges with universally-jointed steadying-pins having an adjustable frictional resistance, and supported by a cross-head mounted on guides in the frame and adapted to be raised or lowered by means of suitable mechanism, substantially as shown and described.

6. In a sand-molding machine, a reversible molding-plate provided with trunnions having bearings in the top of the frame and carrying a pair of pivoted double clamps at each end, a rack-bar on each side connected to such clamps at each end, operated by suitable pinions, and lever mechanism, whereby the clamping of the upper bail of the clamp will release the grip of the lower by the same movement, substantially as shown and described.

7. In a sand-molding machine, the vibrating mechanism herein described, comprising a wheel, 46, loosely mounted upon the axle 3, which carries the reversible molding-frame 4, the double cam-lever 44, pivoted at 45 to the rim of such wheel, its middle arm depending to strike the axle, its other end terminating in a fork provided with two lateral arms forming a pallet, 43, and the cam-wheel 42, keyed upon the axle 3, substantially as shown and described.

8. In a sand-molding machine, a swinging crane, 47, having fingers 48, loosely hinged to the rod 50 by eyes 49, the upper one of which carries a friction-wheel, 55, engaging with the cam-block 53, secured to the rod 50, and the reverse-cam 54, having one end secured to an arm of the cross-head 31, substantially as shown and described.

9. A sand-molding machine comprising, in combination, a frame composed of the uprights 1, connected by the bridge-plate 2, having the cross-head 31 moving therein by friction-wheels 40 upon guides 34, the reversible plate or frame 4, provided with trunnions 3, having bearings in the top of the frame, a hand-wheel, 16, mounted upon one of such trunnions for revolving the same, provided with latches 17, pivoted at 18 in recesses 19, such latches engaging with a projection, 20, upon the outside of the frame, the pattern-plate 5, carried in strips 7, for supporting the pattern 6, the double reversible clamps 15, having frictional contact with the pinion 14, and being eccentrically mounted thereon, the latter engaging with the rack-bar 13, the pinion 12, having a lever for revolving the same, such pinion also engaging with the rack-bar for operating the clamps at each end, the adjustable table 32, for supporting the lower section of the flask, carried in self-adjusting bearings at the top of the cross-head, the casting 33, link 28, pivoted at 27 to link 26, the latter pivoted at 25 in the side of the frame and connected by a wrist with the curved link 24, the latter connected with the crank or arm 22, whose other end is connected with a shaft upon which a lever, 21, is mounted for operating the elevating mechanism, and counteracting springs, substantially as shown and described.

10. A sand-molding machine comprising, in combination, a frame-work supporting in bearings upon its top a reversible molding-plate, means for locking such molding-plate in a horizontal position, a table resting upon self-adjusting bearings for supporting the flask-section carried upon a cross-head movable vertically within the frame, mechanism, substantially as described, for raising and lowering such table, a crane hinged to the frame and carried up and down by the movement of such cross-head, and means for automatically swinging the crane when it has reached its lowest point, carrying the flask away from the machine and closing it into the machine by the elevation of the cross-head, operating and arranged substantially as described.

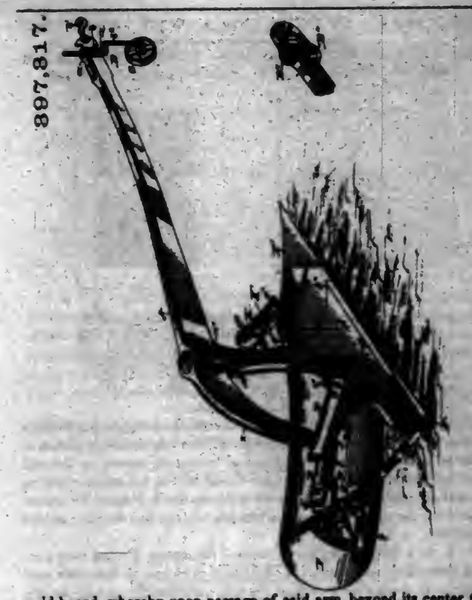
11. In a sand-molding machine, a crane having fingers for carrying the flask-section, hinged to a rod connected to the frame of such machine, the fingers resting, when closed, upon a cross-head movable vertically in the frame, such crane provided with an automatic opening and closing mechanism, and means whereby this mechanism is actuated by the ascent and descent of the cross-head, substantially as shown and described.

12. A sand-molding machine comprising, in combination, a frame-work carrying a reversible molding-plate in bearings upon its top, such molding-plate having a pair of double clamps connected at each end with mechanism for operating such clamps, whereby the bringing of the upper pair in position to lock them upon the flask releases the grip of the lower clamps, substantially as shown and described.

13. In a sand-molding machine, the combination, with a reversible molding-plate journaled in a frame-work, and means for locking such molding-plate in a horizontal position, of a self-adjusting vertically-moving table for supporting or lowering the lower flask-section, mounted upon a universal bearing at its center and provided at or near its edges with universally-jointed steadying-pins having an adjustable frictional resistance for lowering such flask evenly at all points from the pattern, substantially as shown and described.

897,817. FLOW. MARGUM J. TODD, Corning, N. Y. Filed Apr. 21, 1888. Serial No. 271,429. (No model.)

Claim.—1. As an improvement in plows of the class herein described, the arm pivotally secured to the reversible mold-board, and having a double-hooked or arrow-head-like end formed therewith for latching said mold-board on either side of the plow-standard, substantially as shown and described, said arm being secured to the mold-board or to its crotch, as set forth.



2. As an improvement in plows of the class herein described, the combination, with the mold-board and reversing-arm, of the spring having a pivotal bearing on a direct line with the axis of the pivoted arm and that of the revolving mold-board of the plow, substantially as shown, and for the purpose stated.

3. As an improvement in plows of the class herein described, the hooked arm pivotally secured to the reversible mold-board and the spring having a pivotal bearing at one end on a direct line with the rear pivotal stud of the mold-board and the axis of said arm, to which it is pivotally secured at its other end, substantially as shown and described.

4. As an improvement in plows of the class herein described, the arm pivotally secured to the reversible mold-board, and having a double-hooked or arrow-head-like end, and the spring pivotally secured to said arm at one end, and having a pivotal bearing on a line with the pivoted connection of said arm and of the mold-board pivot, substantially as shown and described.

5. As an improvement in plows of the class herein described, an arm pivotally secured at one end to the reversible mold-board and having a spring-pressure applied thereto, the pivotal center of which spring-pressure is on a line with the axis of said arm and that of the

897,817.

mold-board, whereby upon passage of said arm beyond its center to the right or left said spring-pressure will force the same in its movement, as shown and described.

6. As an improvement in plows of the class herein described, the arm pivotally secured to the mold-board for locking the same on either side of the plow-standard, and having a spring-pressure applied thereto capable of having a central point of greatest pressure over which said arm passes in describing its circle in reversing said mold-board, thus throwing said spring on either side of the pivot of the arm and forcing the same into position, as set forth.

7. The combination, with the reversible mold-board, of the arm having the double-hooked or arrow-head-like end and the toe-plate secured to the rear side of said arm, substantially as shown and described.

8. As an improvement in plows of the class herein described, the pivoted beam having sliding plates secured to its rear end and operated by means of an arm secured to the mold-board or crotch, said beam being held at its rear ends by means of the depending lugs of said sliding plates bearing one against a lug of the plow-standard and the other held by the end of the hooked arm or sliding finger, substantially as shown and described.

9. The shifting beam having the slotted plates secured to its rear end by means of a set-screw, said plates being held against the under side of a cross-bar of the standard and operated by the securing-arm of the reversible mold-board, substantially as shown and described.

10. As an improvement in plows of the class herein described, the pivoted beam having the sliding plates provided with depending lugs, and the arm having a sliding finger secured thereto, substantially as shown and described.

11. As an improvement in plows, the herein-described pivotally-secured slicer and turner, having a wing or plate at an angle to and operated by the mold-board, with which it comes in contact, substantially as shown and described.

12. The slicer and turner comprising the concaved outwardly-projecting wing or plate, the head-block, and the pivotal rod, in combination with the reversible mold-board, by which said slicer and turner is operated, substantially as shown and described.

13. The rod adjustably secured at one end in the plow-standard, and having the slicer and turner at its outer forward end, and capable of being operated by the reversible mold-board, substantially as shown and described.

14. The combination, with the standard and mold-board, of the rod, the slicer and turner, and the spring connected thereto and to said rod, substantially as shown and described.

15. The combination, with the reversible mold-board, of the pivotally-secured slicer and turner operated by said mold-board and having a relative position thereto, substantially as shown and described.

16. The combination, with the reversible mold-board, of the slicer and turner, the head-block having the grooved sides, and the rod, substantially as shown and described.

17. The combination, with the shifting beam having the adjustable sliding plates, of the arm secured to the reversible mold-board and the finger attached thereto for forcing said beam from side to side to the extent to which the sliding plates are secured with relation to the beam, substantially as shown and described, whereby more or less movement is given to the beam by the end of the finger being lengthened or shortened to correspond with the joint length of the sliding plates, substantially as shown and described.

18. As an improvement in plows, the herein-described standard of skeleton formation having grooved sides, the landside-plates fitting flush in said grooved sides, and a shoe having its projecting walls bearing against the lower edges of said landside-plates, substantially as shown and described.

19. As an improvement in plows, the standard having landside-plates secured to the sides thereof and independent of the shoe, substantially as shown and described.

20. The standard having landside-plates disposed on the sides thereof and secured to each other by a bolt passing through apertured ears or lugs, substantially as shown and described.

21. As an improvement in plows, the standard having the hooks formed in its under side near the toe end thereof, the shoe provided with a groove or recess wherein said hook projects, and having its under side curved or hollowed, and the nutted bolt passed through said shoe and standard, substantially as shown and described.

22. As an improvement in plows, the standard having the grooved sides, the landside-plates fitting said grooved sides and provided with lower beveled ends, and the tapering shoe having upwardly-projecting beveled side walls, substantially as shown and described.

23. As an improvement in plows, the standard of skeleton formation having grooved sides, the landside-plates having right-angular lugs or bars secured to their inner sides, the overlapping apertured ears or lugs, the shoe, and the securing-bolt, substantially as shown and described.

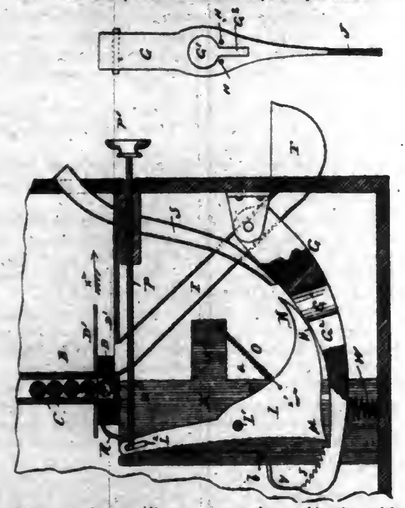
24. The combination, with the standard having grooved sides and the hook near its forward end, of the landside-plates fitting said grooved sides and provided with lower beveled edges, the inwardly-projecting apertured ears or lugs, the short right-angular plates, the shoe having the outwardly beveled or inclined side walls and curved or hollowed on its under side, and the securing-bolt, substantially as shown and described.

25. As an improvement in plows of the class herein described, the rocking section or block secured to the front edge of the plow-standard, in combination with the mold-board, substantially as shown and described.

26. As an improvement in plows having the standard and a reversible mold-board, the rocking section or block having beveled sides and secured to said plow-standard so as to be in alignment with one side thereof when moved by the said mold-board, substantially as shown and described.

897,818. CROSS-HEAD FOR STEAM-ENGINES. JOHN J. TURKIS, Oswego, N. Y., assignor to Thomson Kingsford, same place. Filed Oct. 10, 1888. Serial No. 287,751. (No model.)

Claim.—1. A cross-head provided with a transversely-convexed bottom bearing and with longitudinal top bearings on opposite sides of the cross-head, in combination with a correspondingly-concaved guide, and gibs secured to the said guide and projecting over the top bearings of the cross-head, as set forth.



2. A cross-head composed of a bottom plate formed convex in cross-section on its under side and with horizontal longitudinal top bearings on opposite sides of the cross-head, and ears projecting from said bottom plate, all formed in one piece, in combination with a correspondingly-concaved guide, gibs secured to the guide and projecting over the horizontal top bearings of the cross-head, and the wrist-pin connected to the said ears, substantially as described and shown.

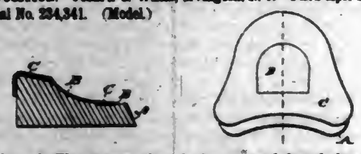
3. In connection with the wrist-pin P, the cross-head formed with the ears D D, having seats for the wrist-pin and split transversely from said seats through the tops of the ears, and formed with longitudinal sleeves *b b* at the upper ends of the split portions, and bolts *c c*, passing through the sleeves and provided with nuts for adjustably clamping the split parts of the ears together, substantially as described and shown.

4. In combination with the piston-rod I, the cross-head provided with the bridge *d*, having the eye *d'* for the reception of the end of the

piston-rod and split longitudinally vertically from said eye through the top of the bridge, and the bolt *c*, clamping the split portions of the bridge together, substantially as described and shown.

397,319. VENDING APPARATUS. JOHN W. VADNER, Jersey City, N. J. Filed Oct. 1, 1888. Serial No. 286,875. (No model.)

Claim.—1. In a vending apparatus, the combination, with a pivoted lever, of a coin-chute for conducting a coin to said lever, an additional lever adapted to operate the coin-receiving lever, a slide-rod connected with said additional lever, and a feeding device for delivering the article to be sold, which feeding device is operated from the slide-rod, substantially as herein shown and described.



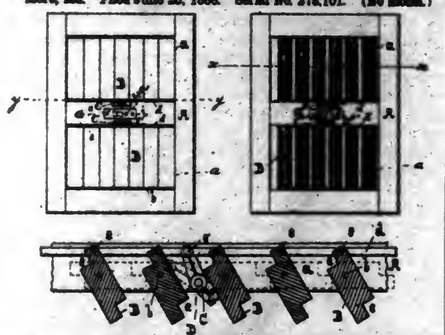
2. In a vending apparatus, the combination, with a pivoted lever provided with ratchet-teeth, of a coin-chute for conducting a coin upon said lever, a spur-lever adapted to engage said ratchet, a rod for manipulating the spur-lever, and an article-delivery slide connected with said manipulating-rod, substantially as herein shown and described.

3. In a vending apparatus, the combination, with an article-delivery slide, of a spur-lever connected with the same, a coin-receiving lever engaging the spur-lever, and a coin-chute adapted to direct the coin between the spur-lever and the coin-receiving lever, substantially as herein shown and described.

4. In a vending apparatus, the combination, with the lever G, having an opening, G', slot G^2, and teeth J, of the lever L, having the spur M and prong N, a delivery-slide connected with the lever L, a rod for manipulating said lever L, a coin-chute for directing the coin between the prong N on the lever L and the upper surface of the lever G, and a spring for pressing the lever G toward the lever L substantially as set forth.

5. In a vending apparatus, the combination, with a delivery-slide, of a rod for moving the same, a pivoted lever, L, connected with said rod and provided with the spur M and prong N, the lever G, having the aperture G' and slot G^2, pins H, and teeth J, a coin-chute for directing the coin upon the upper surface of the lever G, and a spring for pressing the lever G toward the lever L, substantially as set forth.

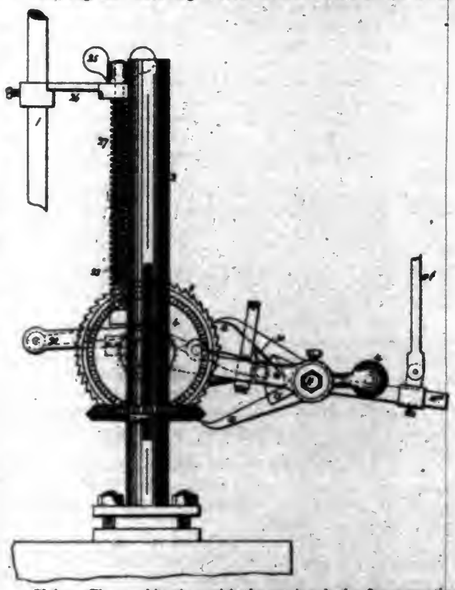
397,320. PROCESS OF MAKING DENTAL PLATES BY ELECTRO-DEPOSITION. JOSEPH G. WARD, Irvington, N. J. Filed Apr. 11, 1887. Serial No. 234,341. (Model.)



Claim.—1. The process of producing a metal dental plate, which consists in first casting a form from the mouth of the patient and then depositing a substantially rigid plate thereon, substantially as set forth.

2. The process of forming a complete metal dental plate ready for the setting of the teeth, which consists in casting a form from the mouth of the patient, electro-depositing a substantially rigid plate thereon, stripping the plate from the form, and then trimming and adjusting the shape, as set forth.

397,321. WITHDRAWN.

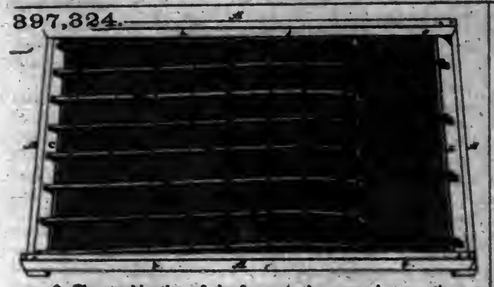


397,322. FREIGHT-CAR DOOR. EDWARD H. WHITAKER, Baltimore, Md. Filed June 25, 1888. Serial No. 278,101. (No model.)

Claim.—1. In a freight-car door having a ventilation-opening, a series of pivoted slats situated in the said opening united by means of pins to a bar, combined with a crank connected loosely to the said bar and having on its shaft a toothed segment, and a worm-wheel on a shaft in gear with the said toothed segment and adapted for operation from the outside of the door, substantially as and for the purpose specified.

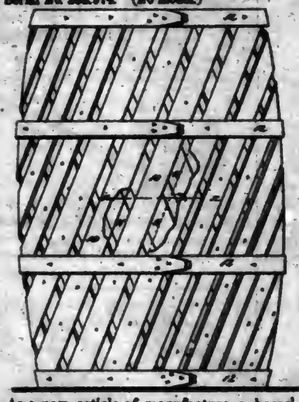
2. In a freight-car door, a series of ventilating pivoted slats having their edges rabbeted to one-half their thickness, so that they may overlap to form a plain or flush surface, substantially as and for the purpose specified.

397,323. VALVE-GEAR. RICHARD WILEY, Mirfield, County of York, England. Filed Aug. 9, 1888. Serial No. 282,392. (No model.)



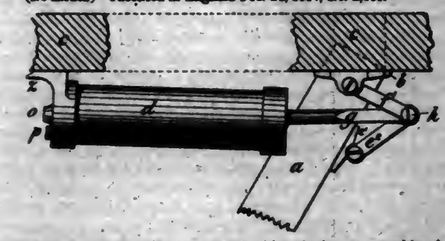
Claim.—The combination, with the ratchet device for converting vibratory into intermittent rotary motion, the governor-rod 1, and the controlling mechanism intermediate between the pawls of said ratchet device and rod, whereby the engine-governor is made to control the rotation of the ratchet-wheel shaft, of the stem 2 of the cut-off valve, the wheel 3 thereon, and the wheel 4 on the ratchet-wheel shaft meshing with the wheel 3, substantially as set forth.

397,324. SPRING BED-BOTTOM. EDWARD YEOMAN, Chicago, Ill. Filed May 23, 1888. Serial No. 274,830. (No model.)



Claim.—1. The combination of the frame A, the woven bottom B, and springs F with the strips D, castings G, to which the strips are secured, the rods G, which connect the castings laterally, and the adjustable rods which connect the castings with the frame in a line with the strips, and which rods are located at one end of the bed, substantially as shown.

397,324.

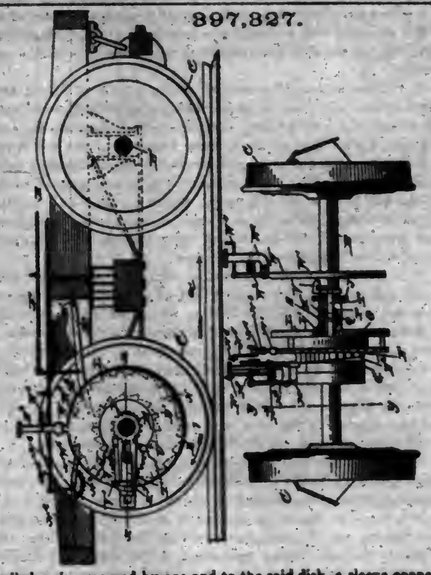


2. The combination of the frame A, the woven bottom, the supporting-strips, and the springs placed between the bottom and the strips, with the triangular castings to which the strips are secured in pairs, the adjustable rods H J, and the swivels I, the rods and swivels being located at one end of the bed, and the rods J being secured at their outer ends to the end rail of the frame, substantially as shown.

397,325. BARREL. ISAAC J. W. ADAMS, Laurel, Del. Filed Dec. 3, 1888. Serial No. 292,974. (No model.)

Claim.—As a new article of manufacture, a barrel made up of supporting-hoops and outer and inner sets of splints, said splints crossing each other diagonally, and being nailed to each other and to the supporting-hoops, substantially as described.

397,326. PNEUMATIC DOOR-CHECK. ROBERT ADAMS, Southwark, County of Surrey, England. Filed July 23, 1888. Serial No. 280,735. (No model.) Patented in England Feb. 21, 1887, No. 2,685.



Claim.—In a door closing and checking device, the combination, with the cylinder, the vibratory piston-rod, and a single-armed link, of the pivoted double-armed link *f' f'*, connected to the piston-rod and single-armed link, one of said links being attached to the door and the other to the door-frame, substantially as described.

397,327. CAR-STARTER. WILLIAM P. AKERS and JOHN C. LEDBETTER, Jr., Jacksborough, Tex. Filed May 28, 1888. Serial No. 275,390. (No model.)

Claim.—1. In a car-starter, the combination, with a crank-arm held rigid on the axle, of a notched disk adapted to be engaged by the said crank-arm, a coiled spring secured by one end to the said disk, and a sleeve connected with the axle on which the other end of the said spring is secured, said disk being held to rotate loosely on the said sleeve, substantially as shown and described.

2. In a car-starter, the combination, with a crank-arm provided with an adjustable wrist-pin and held rigidly on the axle, of a notched disk adapted to be engaged by the wrist-pin of the said crank-arm, a

397,327.

coiled spring secured by one end to the said disk, a sleeve connected with the axle, and on which the other end of the said spring is secured, a ratchet-wheel connected with the said disk, and a pawl engaging the said ratchet-wheel, substantially as shown and described.

3. In a car-starter, the combination, with a crank-arm provided with an adjustable wrist-pin and held rigidly on the axle, of a notched disk adapted to be engaged by the wrist-pin of the said crank-arm, a coiled spring secured by one end to the said disk, a sleeve on which the said disk is held to rotate, and on which is also secured the other end of the said spring, a ratchet-wheel connected with the said disk and engaged by a fixed pawl, a ratchet-wheel formed on the said sleeve and provided with a spiral cam, and a wheel secured on the axle and carrying a sliding block adapted to engage the said spiral cam, substantially as shown and described.

4. In a car-starter, the combination, with a crank-arm provided with an adjustable wrist-pin and held rigidly on the axle, of a notched disk adapted to be engaged by the wrist-pin of the said crank-arm, a coiled spring secured by one end to the said disk, a sleeve on which the said disk is held to rotate, and on which is also secured the other end of the said spring, a ratchet-wheel connected with the said disk and engaged by a fixed pawl, a ratchet wheel formed on the said sleeve and provided with a spiral cam, a wheel secured on the axle and carrying a sliding block adapted to engage the said spiral cam, and a lever connected with the said sliding block to move it in and out of contact with the said spiral cam, substantially as shown and described.

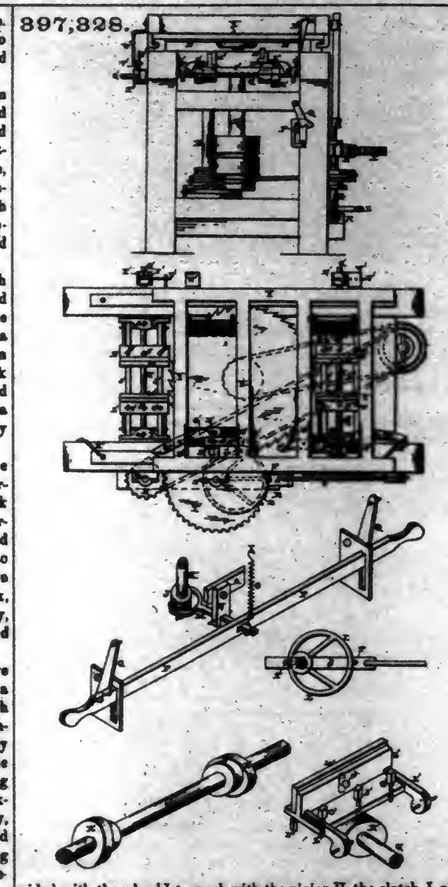
5. In a car-starter, the combination, with a crank-arm provided with an adjustable wrist-pin and held rigidly on the axle, of a notched disk adapted to be engaged by the wrist-pin of the said crank-arm, a coiled spring secured by one end to the said disk, a sleeve on which the said disk is held to rotate, and on which is also secured the other end of the said spring, a ratchet-wheel connected with the said disk and engaged by a fixed pawl, a ratchet-wheel formed on the said sleeve and provided with a spiral cam, a wheel secured on the axle and carrying a sliding block engaging the said spiral cam, and a pawl adapted to engage the ratchet-wheel on the said sleeve, substantially as shown and described.

6. In a car-starter, the combination, with a crank-arm provided with an adjustable wrist-pin and held rigidly on the axle, of a notched disk adapted to be engaged by the wrist-pin of the said crank-arm, a coiled spring secured by one end to the said disk, a sleeve on which the said disk is held to rotate, and on which is also secured the other end of the said spring, a ratchet-wheel connected with the said disk and engaged by a fixed pawl, a ratchet-wheel formed on the said sleeve and provided with a spiral cam, a wheel secured on the axle and carrying a sliding block engaging the said spiral cam, a pawl adapted to engage the ratchet-wheel on the said sleeve, and a lever connected with the said sliding block to move it in and out of contact with the said spiral cam, substantially as shown and described.

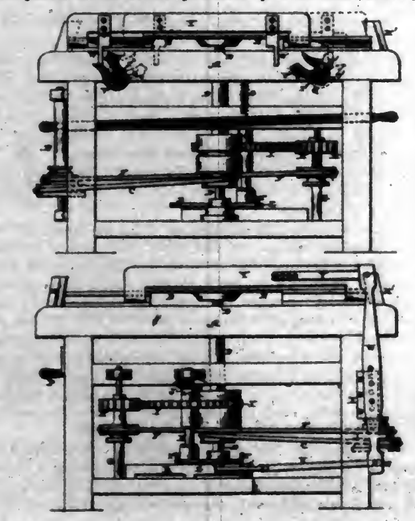
7. In a car-starter, the combination, with an axle, of a crank-arm secured on the said axle, a wrist-pin held to slide radially in the said crank-arm, a spring for pressing the said wrist-pin inward in the said crank-arm, a plate held on the extreme inner end of the said wrist-

pin, a spring provided with a notch adapted to engage the said plate, and also provided with a bevel, and a lever having a ring adapted to engage the said bevel of the said spring, substantially as shown and described.

8. In a car-starter, the combination, with an axle, of a crank-arm secured on the said axle, a wrist-pin held to slide radially on the said crank-arm, a spring for pressing the said wrist-pin inward in the said crank-arm, a plate held on the extreme inner end of the said wrist-pin, a spring provided with a notch adapted to engage the said plate, and also provided with a bevel, a lever having a ring adapted to engage the said bevel of the said spring, a disk provided with a notch adapted to be engaged by the said wrist-pin, and a coiled spring connected with the said disk and wound up by the rotation of the said disk, substantially as shown and described.



9. In a car-starter, the combination, with a sleeve connected with the axle and provided with a gear-wheel, of a coiled spring secured by one end to the said sleeve, a disk on which the other end of the said spring is secured, said disk turning loosely on the said sleeve, a second gear-wheel meshing into the gear-wheel on the said sleeve, a screw-rod operated by the said second gear-wheel, a threaded block held to slide on the said disk and screwing on the said screw-rod, and a wrist-pin adapted to engage the said disk and held to slide in a crank-arm secured to the axle, said wrist-pin being operated on by the said threaded block, substantially as shown and described.



10. In a car-starter, the combination, with the axle and a sleeve connected with the said axle, said sleeve being provided with a gear-wheel, of a coiled spring secured by one end to the said sleeve, a disk on which the other end of the said spring is secured, a second gear-wheel meshing into the said gear-wheel on the sleeve, a screw-rod operated by the said second gear-wheel, a threaded block held to slide on the said disk and screwing on the said screw-rod, a wrist-pin engaging the said disk and operated on by the said threaded block, and a crank-arm on which the said wrist-pin is held to slide radially, said crank-arm being secured to the axle, substantially as shown and described.

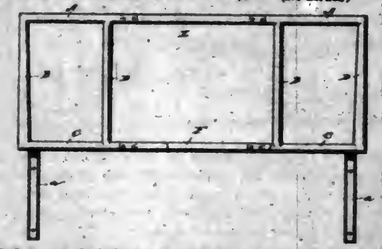
11. In a car-starter, the combination, with the axle and a sleeve connected with the said axle and provided with a gear-wheel, of a coiled spring secured by one end to the said sleeve, a disk on which the other end of the said spring is secured, a second gear-wheel meshing into the said gear-wheel on the sleeve, a screw-rod operated by the said second gear-wheel, a threaded block held to slide on the said disk and screwing on the said screw-rod, a wrist-pin engaging the said disk and operated on by the said threaded block, a crank-arm carrying the said wrist-pin and in which it is held to slide radially, said crank-arm being secured to the axle, a spring secured to the said crank-arm and supporting the said wrist-pin, and a lever having a ring adapted to operate on the said spring, substantially as shown and described.

397,328. SHINGLE-SAWING MACHINE. EDWIN ANDERSON, Tryon City, N. C. Filed May 23, 1888. Serial No. 274,773. (No model.)

Claim.—1. The combination of the driving-shaft, the belts F C extending therefrom, the saw-shaft journaled in the frame, provided with the saw D at its upper end and operated by the belt C, the shaft G, journaled upon the frame A, operated by the belt F, and provided with a pinion, H, the shaft K, journaled upon the frame A and provided with the wheel I to mesh with the pinion H, the clutch J, placed upon the shaft K, for locking the wheel I to the shaft, the lever M, pivoted in the frame N and connected to the clutch at one end, the spring O, connected to the other end of the lever, the operating-lever P, extending endwise of the frame A and connected to the lever M, and suitable notches, Q, upon the ends of the frame for locking the lever in place while the clutch is out of gear, substantially as shown.

2. In a sawing-machine, the combination of the saw and the reciprocating carriage with the shaft K, journaled in the frame A, and means for operating said shaft, the cam L, secured to its lower end, the guide R, secured upon the frame, the slide S, placed in the guide R and provided with the projections T, between which the cam revolves, the connecting-rods U V, the lever W, provided with a series of perforations and placed in a vertical position on the frame, perforated plate X, secured to one end of the frame, and the pivot which passes through the plate and lever, and which pivot is adapted to be changed from one hole to another, so as to vary the distance the carriage shall move, substantially as described.

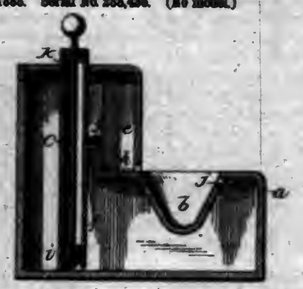
3. The combination of the carriage provided with a stationary dog, the movable dog provided with the projections D', the guide E, through which the projections pass, the guides B', secured to the carriage and between which the dogs A' move, the lever F, pivoted upon the carriage and made to catch over one of the projections D' at its inner end, the spring C', the pivoted lever G', which catches over one of the projections upon the sliding dog at its inner end, and the inclined plate secured to the frame for moving the lever G' and the movable dog, so as to drop the block, substantially as described.



4. The combination of the supporting-frame J', located at one end of the frame A, the tilting frames pivoted at their outer ends to the supporting-frames, the slotted plates M, attached to the free ends of the tilting frames, the screws a^2, for holding the plates in position, and the set-screws N', which pass through the frames and bear against the edges of the plates, substantially as set forth.

5. The combination of the supporting-frame J', the guides I', adjusting-screws, and the saw with the carriage for reciprocating the block back and forth over the saw, and the mechanism for holding the block, whereby the supporting-frame with its attachments can be adjusted in relation to the saw as the saw becomes worn away, substantially as described.

6. The combination of the supporting-frame J', the tilting frames attached thereto, the vertically-adjustable slotted plates M', attached to their free ends, screws a^2, for securing them in position, and the set-screws O', which pass through the tilting frames, the shaft Q', provided with cams R', and a mechanism operated by the carriage for causing the shaft to revolve at each forward movement of the carriage, substantially as shown.



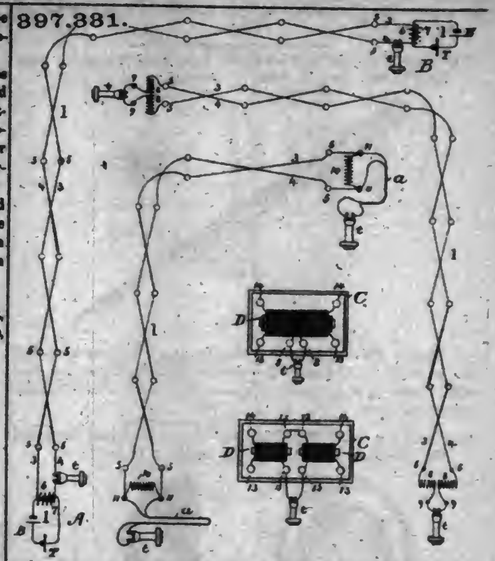
7. The combination of the cam-shaft, the supporting-frame, and the tilting frames pivoted thereto, the ratchet rigidly secured to the end of the shaft, the frame U', carrying a pawl loosely placed upon the shaft, the carriage, and the arm which projects downward from the carriage and operates the frame, substantially as described.

397,329. DASH-BOARD FOR VEHICLES. CLAYTON I. BAKER, Englewood, assignor of one-half to the Abbott Buggy Company, Chicago, Ill. Filed Mar. 26, 1888. Serial No. 268,466. (No model.)

Claim.—A dash-frame for wheeled vehicles of cast malleable metal, comprising end sections of rectangular form having at the outer corners thereof integral attaching shanks or feet provided with bolt-holes, whereby to adapt the frame to be secured to the vehicle-body, and connecting-bars whereby to secure the end sections together, substantially as described.

397,330. INKSTAND. STEPHEN G. BALDWIN, Marion, Ind. Filed Oct. 18, 1888. Serial No. 288,426. (No model.)

Claim.—1. An inkstand comprising a hollow body forming a normally-closed supply-reservoir, an ink-well in the upper portion of the same, and a pump or elevator in the body to raise the ink from the reservoir to the well, substantially as set forth.



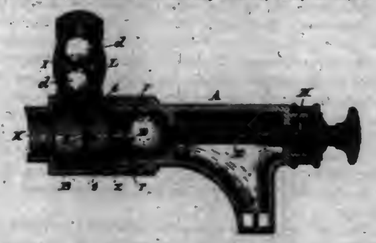
2. An inkstand comprising a hollow body to form an ink-supply reservoir, an ink-well depending from the top wall of the same into its interior, and a pump or elevator to raise the liquid from the reservoir to the well, comprising a vertical tube opening into the reservoir and extending up through the body and provided with a discharge-mouth to discharge onto a channel exteading to the well, and a piston in the tube provided with an operating-rod above the body, as set forth.

3. An inkstand comprising a body having an internal ink-supply reservoir, an ink-well in the body depending into the reservoir and provided with one or more apertures in its upper portion to allow the overflow from the well to pass back into the reservoir, and means for raising the ink from the reservoir to the well when and in quantities as desired.

397,331. TELEPHONE CIRCUIT AND APPARATUS. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the American Telephone and Telegraph Company, of New York. Filed May 9, 1888. Serial No. 273,204. (No model.)

Claim.—1. The combination, with a telephonic circuit, of a transmitter having the secondary or line circuit of its induction-coil divided into two substantially equal parts, and a receiving-telephone connected to line between the parts of said coil, as set forth.

2. The combination, with a telephonic circuit, of a telephone-transmitter, an induction-coil, whereby the electrical changes produced by the action of said transmitter are propagated through said circuit, and a telephone-receiver connected in approximately the middle of the secondary or line helix of said induction-coil, said helix being the source of electrical energy for said circuit, substantially as described.

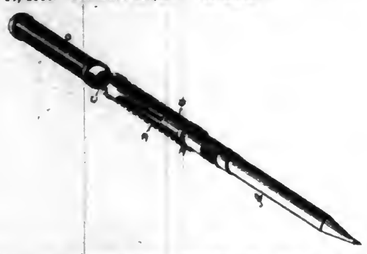


3. The combination, with a telephonic circuit, of a telephone-transmitter, an induction-coil therefor, having its secondary or line helix, which constitutes the source of energy in said circuit, divided at or about its center of resistance, and a receiving-telephone looped or connected to the severed terminals, substantially as described.

4. The combination of a metallic or double conductor telephone-circuit having its two sides cross-connected or transposed at one or more points with a transmitter induction-coil having its secondary helix included in the said circuit and divided at its center, and a receiving-telephone interposed between the two halves of the said coil, substantially as and for the purposes specified.

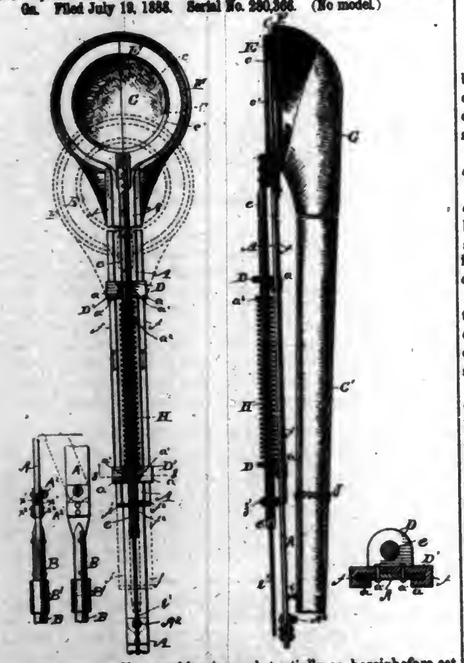
5. A metallic or double wire telephone-circuit having its two conductors cross-connected or transposed at any number of suitable points, a receiving-telephone at the stations thereof included in the said circuit, and a transmitter, also at the said stations, the secondary helix of the induction-coil whereof is also included in the said circuit on both sides of the said receiving-telephone helix, substantially as specified, whereby the two conductors are equalized and a balance between them maintained.

397,332. STOP-COCK. HERBERT R. BEAUVALET and LÉON C. BEAUVALET, Paris, France. Filed Sept. 21, 1888. Serial No. 286,054. (No model.) Patented in France May 24, 1887, No. 183,750; in Belgium Dec. 9, 1887, No. 73,838; in Spain Dec. 12, 1887, No. 12,376; in England Dec. 15, 1887, No. 17,276, and in Italy Dec. 23, 1887, No. 22,747.



Claim.—1. In a stop-cock or valve, and in combination with the pusher and the rubber ball, the ball-chamber having on its inlet side a hollow plug or closing-piece, in which are backwardly-inclined inlet-holes, substantially as described.

2. In a stop-cock or valve, and in combination with the rubber ball and pusher, the ball-chamber having the end away from the ball-seat formed by a hollow plug with backwardly-inclined holes in the side walls of the central chamber in said plug, and a central hole from said central chamber into the ball-chamber, the said plug being also

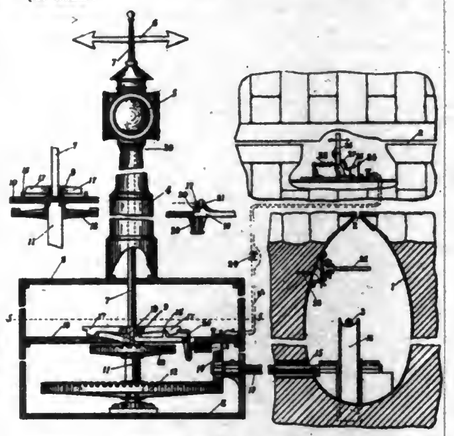


provided with grooves extending from said central hole, substantially as described.

397,333. ENVELOPE-OPENER. JOHN BIRD, Warren, Ill. Filed Oct. 17, 1888. Serial No. 288,361. (No model.)

Claim.—The combination of a metallic cap, which is to be applied to a pencil or pen, and which is cut away or flattened upon one side, with a cutter or blade, which is secured rigidly to the cap, substantially as set forth.

397,334. FRUIT-GATHERER. WESLEY S. BROOKS, Bainbridge, Ga. Filed July 19, 1888. Serial No. 280,366. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the frame, the annular cutting-jaw secured thereto, the annular reciprocating cutting-jaw, and the bag-holder and bag connected with the reciprocating jaw and moving coincidently therewith.

2. The combination, substantially as hereinbefore set forth, of the frame, the handle-sections therefor, the annular cutting-jaw secured to the frame, the annular reciprocating cutting-jaw, the stem of the reciprocating jaw, the guideways on the frame in which the stem moves, the spring secured to the stem of the cutting-jaw for returning it to its normal position, the bag-holder, the bag secured thereto, the chute leading from the bag, and connections between the bag-holder and the reciprocating jaw, whereby they are caused to move coincidently.

3. The combination, substantially as hereinbefore set forth, of the frame A, the annular cutting-jaw C, secured thereto, the annular reciprocating cutting-jaw E, adjacent to the cutting-jaw C, the stem *e* of the cutting-jaw E, the guides secured to the frame, through which the stem extends, the spring for returning the reciprocating cutting-jaw E to its normal position, the annular frame F, the bag G, secured thereto, the chute G', secured to the bag, the arms *f*, secured to the frame F, the guides *a* on the frame A, through which the arms *f* extend, and connections between the lower ends of the arms and the stem *e*.

397,335. SIGNALING DEVICE FOR CABLE RAILWAYS. WILLIAM M. BULKLEY, St. Louis, Mo. Filed Mar. 5, 1888. Serial No. 266,254. (No model.)

Claim.—1. A signaling device for cable railways, consisting of a body interposed within the conduit in the path of the travel of the cars, a cross-road, a rotary signal at said cross-road, and electrical connections, whereby when said body is operated upon by a car a signal is given, for the purpose set forth.

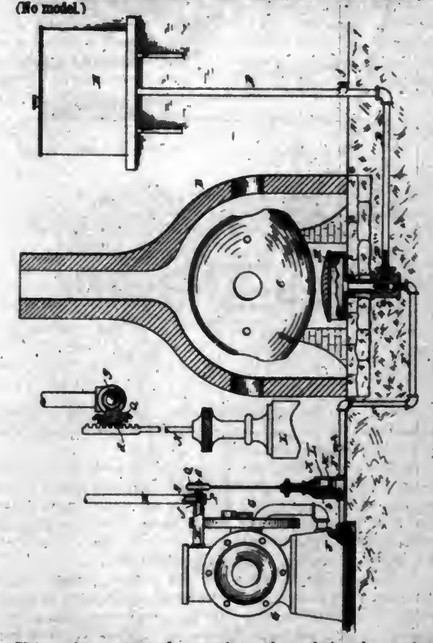
2. A cable-railway system having a signal connected with and operated from one of the cable-pulleys, for the purpose described.

3. A signaling device for cable railways at crossings, consisting of a body arranged within the path of the cars, a signal at a crossing, a system of gearing connected with the cable-supporting wheel at said signal, and a coupler controlled by the aforementioned body for temporarily connecting the signal to the system of gearing to operate said signal.

4. The combination, as hereinbefore set forth, of the signal 5 6, the shaft 7, operating said signal, the pawls carried thereby, a system of gearing operated by the cable, a body interposed in the path of the cars and within the conduit, and a lever controlled by said body and supporting one of said pawls, as and for the purpose described.

5. The combination, as hereinbefore set forth, of the signal 5 6, the post 4, the shaft 7, controlling said signal, the box 8 beneath the level of the way, a system of gearing rotated by the cable and within said box, a series of pawls pivotally secured to the signal-shaft 7, the rim 18 upon a platform, 10, within said box and having a cut-away part, as described, an inclined nose, 19, extending from said rim, the stop 21, an armature-lever, 20, for holding one of said pawls from action, a circuit and source of electrical supply, and a lever arranged in the path of the cars to control said circuit, for the purpose described.

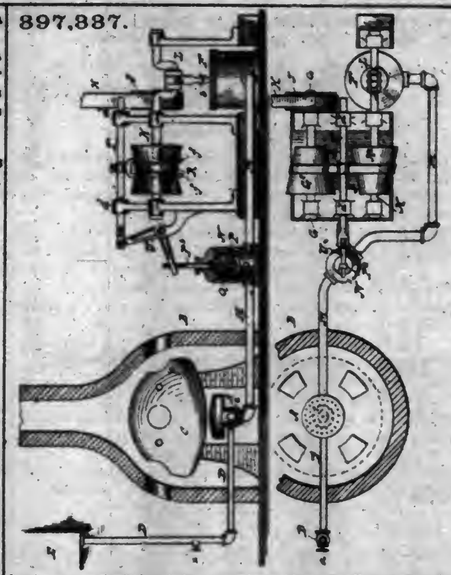
6. The combination of a lever in the path of the cars and arranged within the conduit of a cable railway at one side of an intercepting railway, a second lever arranged similar to the first, but upon the opposite side of said intercepting railway, a rotary signal at the crossing, and electrical connections between the first and second levers and the signaling device, whereby said signal is operated upon the approach and departure of a car.



7. The combination of a body arranged within the path of the cars traveling upon a cable railway and arranged within the conduit at one side of a cross-road, a second body similarly arranged upon the other side of said cross-road, a return-track having two bodies arranged within the path of the cars and similarly disposed as the foregoing, rotary signaling devices at said crossing, and electrical connections between the aforementioned bodies and the signaling devices, whereby a signal is given and withdrawn when a car approaches and recedes from the crossing on the main track in either direction.

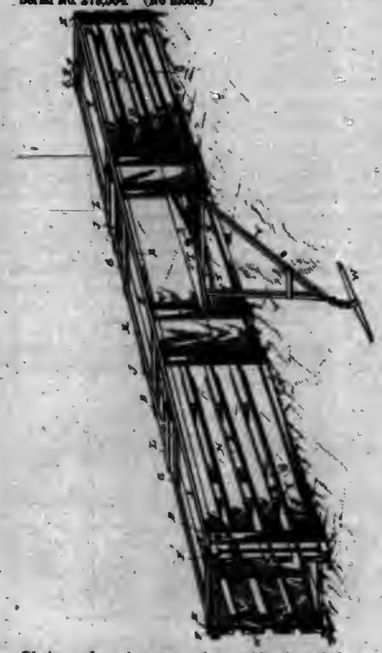
8. A signaling device for a double-track cable railway, consisting of two signals, substantially as 5 6 and 5' 6', a shaft controlling the former signal, a hollow shaft surrounding the aforesaid shaft and controlling the latter signal, couplers for connecting either signal to a constantly-rotating gearing controlled by the cable, levers and stops governing said couplers, and bodies arranged within the path of a direct and return track for actuating said levers.

9. The combination of the signals 5 6 and 5' 6', the shafts 7 and 7', the pawls 17 and 17', pivotally affixed to said shafts, the rims 18 and 18', having downwardly-projecting noses 19 and 19', the ratchets 13 and 13', geared to the cable, armature-levers 20 and 20' and stops, the electro-magnets, a double track, and circuit-controlling levers arranged within the conduits of said double tracks upon each side of a cross-road near the signaling devices.



10. The combination, with a cable railway and cross-road, of a rotary signal at said cross-road, gearing rotated by the cable, a coupler intermediate of the latter and the signal, and electrical connections on each side of said cross-road arranged within the path of the cars controlling said coupler, for the purpose described.

397,336. APPARATUS FOR BURNING HYDROCARBONS. JAMES H. BULLARD, Springfield, Mass. Filed Dec. 21, 1887. Serial No. 258,579. (No model.)



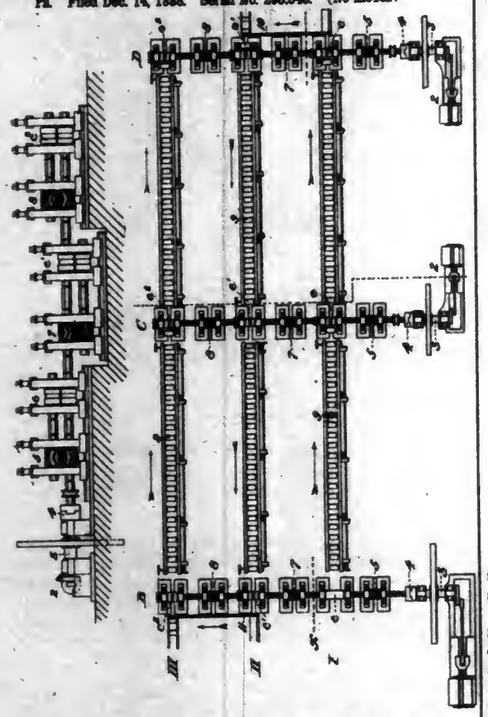
Claim.—An apparatus for securing and regulating the combustion of liquid fuel in glass-melting and analogous furnaces, consisting of a burner, a liquid-fuel tank, a pipe connecting said fuel-tank and burner, an air-compressor having a steam-pipe for conveying steam thereto for driving the same provided with a valve, a pipe connecting said air-compressor and said burner, a regulator connected to and actuated by the pressure in said air-pipe, and a connection between a movable part of said regulator and said steam-valve, whereby the feeding of steam to said air-compressor is regulated and a consequent regulation of the air-pressure to the burner is secured, substantially as and for the purpose described.

397,337.

having a cone-pulley, a belt connecting said cone-pulleys, and a shaft, T, capable of sliding longitudinally, provided with the belt embracing and shifting arms *f f*, a pipe connecting said air-pump and burner, and a regulator in communication with said air-pipe, having a reciprocating piston-rod, P³, and a pivoted bell-crank lever by its one end engaging said regulator piston-rod and by its other end engaging said sliding shaft T, substantially as and for the purpose described.

397,338. HAY-PRESS. WILLIAM S. CHAMPION, Goliad, assignor of one-half to Barton Peck, Goliad County, Tex. Filed July 10, 1888. Serial No. 279,504. (No model.)

Claim.—In a hay-press, the combination of the two feed and baling chambers, the reciprocating plunger-beam provided with a plunger-head at each end, the pivoted segment provided with a lever, and the cables connected to the inner ends of the segment and passing in opposite directions parallel to the length of the plunger and connected to the opposite ends of the plunger, as and for the purposes set forth.



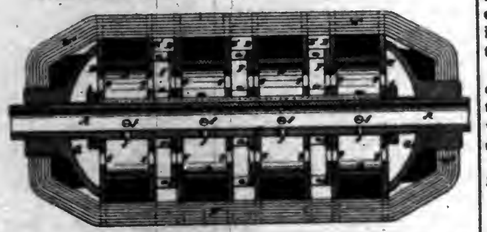
397,337. APPARATUS FOR BURNING HYDROCARBONS. JAMES H. BULLARD, Springfield, Mass. Filed Dec. 21, 1887. Serial No. 258,580. (No model.)

Claim.—1. An apparatus for securing and regulating the combustion of liquid fuel, comprising a hydrocarbon-burner, a liquid-fuel tank, a pipe connecting said tank and burner, an air-pump, a driving-shaft, and intervening movable driving-connections between said driving-shaft and said air-pump capable of variable speed, a pipe connecting said air-pump and burner, and a regulator in communication with said air-pipe having a reciprocating piston-rod, and a connection between said regulator piston-rod and said movable driving-connections between said driving-shaft and air-pump, substantially as and for the purpose described.

2. An apparatus for securing and regulating the combustion of liquid fuel, comprising a hydrocarbon-burner, a liquid-fuel tank, a pipe connecting said tank and burner, an air-pump, a driving-shaft provided with a cone-pulley, a counter-shaft connected with said air-pump, having a cone-pulley, a belt connecting said cone-pulleys, a pipe connecting said air-pump and burner, and a regulator in communication with said air-pipe, having a reciprocating piston-rod, and a connection between said regulator piston-rod and the belt connecting said cone-pulleys, substantially as and for the purpose described.

3. An apparatus for securing and regulating the combustion of liquid fuel, comprising a hydrocarbon-burner, a liquid-fuel tank, a pipe connecting said tank and burner, an air-pump, a driving-shaft provided with a cone-pulley, a counter-shaft connected with said air-pump,

397,339. ROLLING-MILL PLANT. EDWARD L. CLARK, Pittsburg, Pa. Filed Dec. 14, 1888. Serial No. 293,542. (No model.)

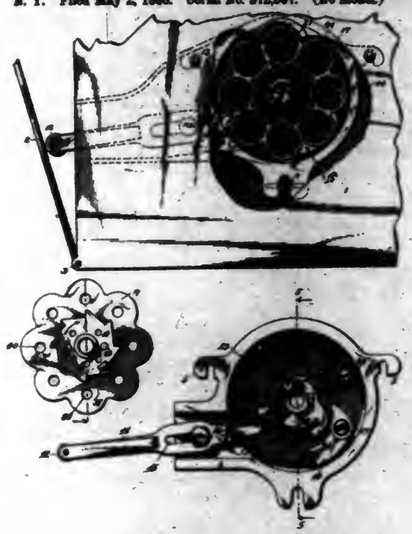


Claim.—1. A continuous reversing rolling-mill plant comprising sets of rolls arranged in lines extending side by side and acting in opposite directions, substantially as and for the purposes described.

2. A continuous reversing rolling-mill plant comprising sets of rolls arranged in substantially parallel lines, the adjacent sets of rolls of the different lines being connected with the same driving-engine, and being geared to rotate in opposite directions, substantially as and for the purposes described.

3. A continuous reversing rolling-mill plant comprising sets of rolls arranged in lines extending side by side and acting in opposite directions, and driven feed-rollers arranged between the sets of rolls in each line, substantially as and for the purposes described.

4. A continuous reversing rolling-mill plant comprising sets of rolls arranged in lines extending side by side and acting in opposite directions, and transfer devices arranged at the end or ends of the lines to shift the metal from one line to the next in order of use, substantially as and for the purposes described.



397,340. DYNAMO. ROBERT L. COHEN, Camden, N. J., assignor of one-half to William F. Anderson, Philadelphia, Pa. Filed Sept. 27, 1888. Serial No. 286,556. (No model.)

Claim.—1. The combination of the shaft of an armature with the shell comprising hollow bobbins and interposed spacing-pieces, each hollow bobbin consisting of opposite end disks and an interposed tubular shell, all substantially as specified.

2. The combination of the hollow perforated shaft, the hollow perforated bobbins, and the interposed filling-pieces forming chambers between the bobbins, through which air entering the hollow shaft and bobbins can escape outwardly, all substantially as specified.

397,341. LETTER-BOX INDICATOR. GEORGE A. COLTON, Phœnix, N. Y. Filed May 2, 1888. Serial No. 272,597. (No model.)

Claim.—1. The combination, with a box and its cover, of a ratcheted dial carrying a lug, an interposed ratchet-operating lever, and a reversing-plate, substantially as specified.

2. The combination, with a box and its cover or door, of a ratcheted dial provided with a circular series of apertures, a ratchet-operating lever extending from the dial to the door or cover, a screw adapted to fit any hole in the circular series, a reversing-plate, and means, substantially as described, for giving the dial and reversing-plate backward rotation, substantially as specified.

3. The combination, with a box and its door or cover, of a reciprocating lever, a ratcheted dial connected with its pivot by a spring and provided with a reversing-plate-operating lug or screw, a reversing-plate having a pawl-releasing cam, and a pivoted pawl arranged to co-operate with the ratchet of the dial, substantially as specified.

4. In an indicator of the class described, the combination, with a dial having a ratchet provided with a lug, of a reversing-plate having a pawl-operating cam and a projecting lever-disengaging lug, a gravity-pawl, and a ratchet-operating lever, substantially as specified.

5. In an indicator of the class described, a case for the operating parts, extended to cover the operating-lever thereof and provided with slots or notches adapted to take upon the bodies of screws, one of said screws being provided with a thumb-nut, substantially as specified.

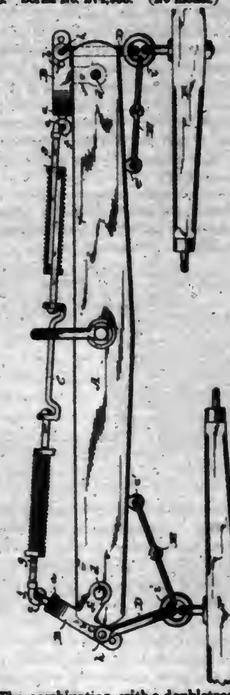
6. In an indicator of the class described, a dial having a series of circular recesses for sub-dials, as 41, a central recess for a spring and the head of the dial-pivot, and having on its rear side a ratchet, and through the body of the dial a series of holes communicating with the dial-recesses, and an inner series of holes for a removable reversing-plate-operating screw or lug, substantially as specified.

7. In an indicator of the class described, a case provided with notched suspension-lugs, and having a main annular recess for the reception and operation of the movable parts of the indicator, and an interior lug, as 36, serving as a stop for a reversing-plate, substantially as specified.

8. In an indicator of the class described, the combination of a case carrying a rigid pivot, as $10^{\times}$, a reciprocating lever mounted thereon and notched, as at 35, a pivot-bolt, as 10, a dial, 17, and reversing-plate 26, mounted thereon, a pawl, 18, and a detent, 28, substantially as specified.

9. The reversing-plate 26, provided with a pawl-operating cam, 31, the lugs 32 33, and the tooth 34, substantially as specified.

397,342. HARROW AND ROLLER. ALBERT H. DAVIS and JOHN H. DAVIS, Loveland, Colo. Filed May 23, 1888. Serial No. 274,706. (No model.)



Claim.—1. The combination of the frame A, the roller B, journaled therein and provided with sprocket-wheels C, the revolving cultivator G, the axle of which is provided with the sprocket-wheels E, the sprocket-chains D, for transmitting the rotary motion of the roller to the harrow, adjustable boxes in which the harrow or cultivator is journaled, and the arched connecting-rod L, secured to the frame A at its rear end, and connected to the axle N at its front end by means of a ball-and-socket joint, substantially as shown and described.

2. The combination of the frame A and the curved connecting-rod L, having the seat P secured thereto, and having its front end formed into a ball, with the axle N, supported upon the wheels O, and having a socket to receive the ball, whereby the axle can be turned independently of the frame, substantially as set forth.

397,342.

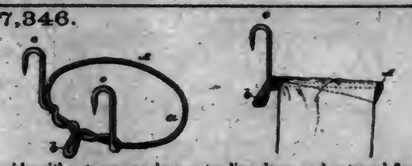
397,343. DRAFT-EQUALIZER. JOHN R. DAVIS, Racine, Wis. Filed May 24, 1888. Serial No. 274,935. (No model.)

Claim.—1. The combination, with a doubletree and clevis having a yielding connection therewith, of a singletree, a link connecting it with the doubletree-clevis, and a guard-link connecting it with the doubletree at a point nearer the center of the doubletree than the clevis-pivot, substantially as described.

2. The combination, with the clevises, of a yielding connection between them, a singletree, and draft and guard links, substantially as set forth.

397,344. WITHDRAWN.

397,345. TRUSS-PAD. OWEN BOBBET, Hickory Run, Pa. Filed Apr. 12, 1887. Serial No. 234,509. (No model.)

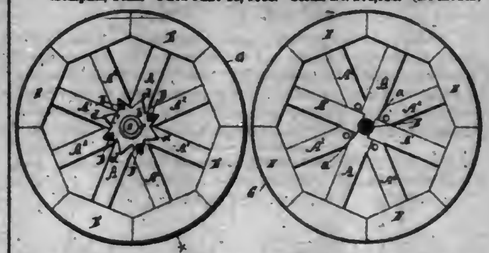


Claim.—An improved pad for a truss, consisting of a closed hollow body the top, bottom, and side walls of which are of rubber and integral, the side walls being of sufficient thickness to distend the body and having V-shaped recesses allowing said sides to yield without bulging, substantially as described.

397,346. BAG-HOLDER. BENJAMIN F. BELL, Wayne, Ill. Filed July 19, 1888. Serial No. 280,205. (No model.)

Claim.—1. A bag-holder consisting of a band or hoop provided

397,346.

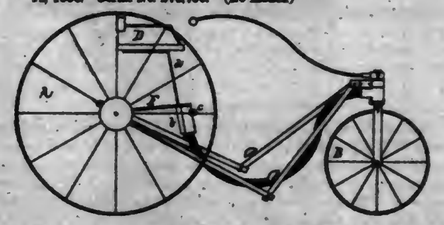


at one side with a tongue or loop extending down and outward from the hoop and having on either side of said tongue vertical shanks, each terminating at top in a hook, substantially as described.

2. A bag-holder consisting of a band or hoop provided at one side with a tongue extending down and outward from the hoop and having on either side of said tongue a vertical shank terminating in a sharp-pointed hook, substantially as described.

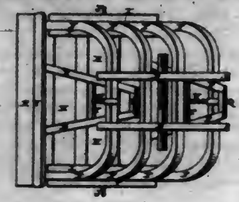
3. A bag-holder constructed of a single length of metal and consisting of a hoop provided at one side with a tongue extending down and outward and having on either side of said tongue a vertical shank terminating at top in a hook, substantially as described.

4. A bag-holder constructed of a single blank of metal bent to form the hoop *a* and the doubled tongue *b*, projecting down and outward from the hoop, the end of the blank being coiled around the hoop at each side of the tongue and terminating in vertical shanks having hooks at their upper ends, substantially as described.



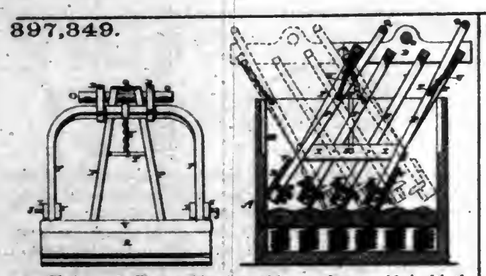
397,347. WHEELBARROW-WHEEL. CHARLES P. FARNSWORTH, Memphis, Tenn. Filed June 13, 1888. Serial No. 276,963. (No model.)

Claim.—1. In a wheelbarrow-wheel, the combination of the spokes A A, having notches *a a* in their inner ends, spokes A′ A′, having square inner ends fitting in the said notches of the first spokes, and the spokes A^2 A^2, having their inner ends formed to fit into the angles between the other spokes, substantially as and for the purpose herein set forth.



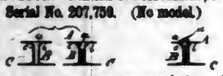
2. In combination with the spokes A A′ A^2 and spindle B, the iron flanges C C, having hollow extensions *b b*, and tubular bearings *c c*, fitting around the spindle, and formed with peripheral projections *d d*, and the bolts D D, passed through the said projections *d d* and the spokes, substantially as and for the purpose herein specified.

397,348. TRICYCLE. WINSLOW L. FAY, Elyria, Ohio. Filed June 11, 1888. Serial No. 276,766. (No model.)



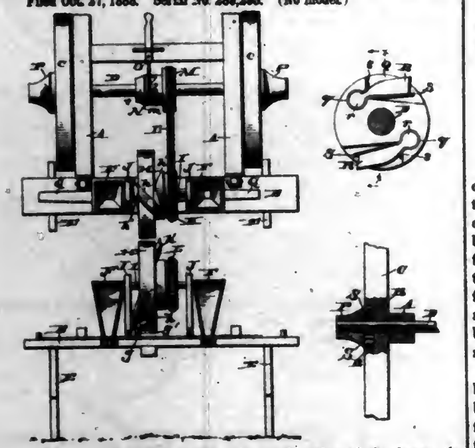
Claim.—In a tricycle, the upright spring *a*, supporting the seat, in combination with the circular spring F and reach *d*, all for the purposes above set forth, and substantially as described.

397,349. WASHING-MACHINE. ISAAC F. FIELD, Sandy Lake, Pa. Filed Apr. 16, 1888. Serial No. 271,261. (Model.)



397,349.

Claim.—1. The combination, with a washer provided with the bent rods F, having the rubbing-boards secured to their lower ends, of the levers P, provided with the boards R, and the springs U, substantially as set forth.

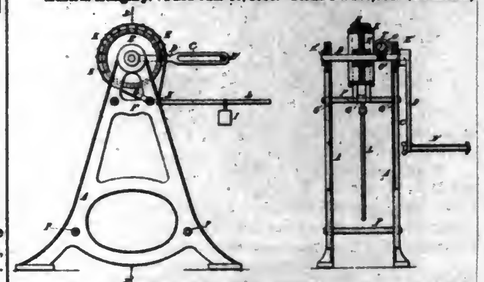


2. The combination of the parallel journals or bearings D, provided with a handle, the bent rods F, journaled in the bearings, the boards secured to the lower ends of the rods F, the connecting-strips carrying journals upon which the washers turn, the levers P, provided with the boards R, and the springs U, substantially as specified.

397,350. BUTTON. DANIEL P. FITZGERALD, Newark, N. J. Filed July 12, 1888. Serial No. 207,750. (No model.)

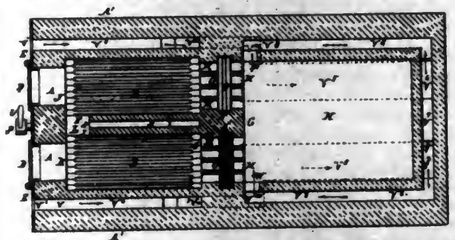
Claim.—A collar or sleeve button consisting of a single piece of metal wire having the head and an enlargement at the junction of the head and post both made integral with the post and upset from the same wire blank, a socket or cavity in the said head and enlargement to receive a precious stone, and a perforation transversely to the said socket or cavity to admit light underneath the said stone.

397,351. CORN-PLANTER. JASPER D. FITZGERALD, Eldon, Iowa. Filed Oct. 27, 1888. Serial No. 289,268. (No model.)



Claim.—1. In a corn-planter, the combination of the frame, the driving-axle, the sprocket-wheel on the said axle, the shaft I, driven from the sprocket-wheel on the axle, the cam-wheel having oblique grooves across its periphery and lateral projections, as *k'*, having their front ends inclined outwardly and forming a prolongation of the rear walls of the said oblique grooves, the seed-slide, and the arm projecting from the seed-slide and adapted to be engaged by the said projections *k'* and carried through the oblique grooves, substantially as and for the purpose described.

2. In a corn-planter, the combination, with the seed-slide having an arm, as *g*, of the wheel H, having oblique grooves *k* and lateral projections *k'*, which have their front ends inclined outwardly and forming a prolongation of the rear walls of the said grooves *k*, substantially as and for the purpose described.

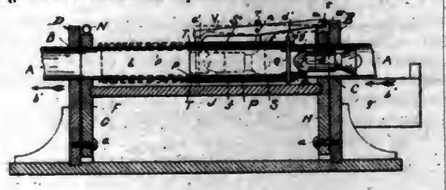


3. In a planter, the combination, with the frame, the seed-slide, the cam-wheel for operating the seed-slide, the axle, and the wheels loosely mounted on the axle and having recesses in their sides, of the hubs keyed to the axle, and having their ends fitted in the said recesses in the wheels, and having recesses Q and circular depressions *q*, the pawls R, having circular heads *r*, and the springs S, having their ends *e* fitted about the circular heads *r* of the said pawls, substantially as described, for the purpose specified.

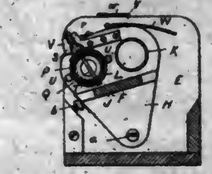
397,352. EXERCISING-MACHINE. GUSTAVUS GAERTNER, Vienna, Austria-Hungary. Filed Jan. 16, 1888. Serial No. 260,901. (No model.)

Claim.—The combination, with the frame A, the bars P and P, holding the two sides of said frame together, the shaft B, journaled at E' E' in said frame, the wheel E, mounted on said shaft B, and the winch D, attached to said shaft B, having adjustable handle D', and slot C, of the band-brake H, attached by one end to the said frame at N and by the other to the collar G, the blocks K K, attached to said band-brake and bearing upon the face of said wheel, the revolvable bar F, mounted on said frame A, the collar G, mounted on said bar F, the lever L, attached to said bar, and the movable weight I, adapted to be moved along the graduations of the lever L, all substantially as and for the purpose set forth.

397,353. SMOKE-CONSUMING FURNACE. JAMES GILBERT, Omaha, Nebr., assignor of one-half to Charles R. Lee, same place. Filed Mar. 24, 1888. Serial No. 268,384. (No model.)



Claim.—1. In a smoke-consuming furnace, the combination, with connected fuel-chambers by an opening in the partition-wall between them and an alternate connected combustion-chamber with said fuel-chamber for passing the hot gases from the fresh-supplied fuel-chamber over the bright fire of the other fuel-chamber, of an upward air-flue, X, from a portion below the grates supplying additional oxygen to said hot gases while passing the bright fire, and also providing air-flues V in the side walls of the furnace delivering air by natural draft at the rear of the bridge-wall for furnishing heated air into the combustion-chamber to said gases, substantially for promoting combustion and the heat of the furnace, as herein set forth.

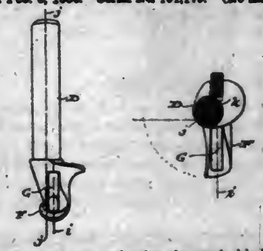


2. In a smoke-consuming furnace, the combination, with its combustion-chamber H and alternate connected and supplied fuel-chambers, of the hot-air flue X for the fuel-chambers supplied independent from a portion of the furnace below its grates, and the air-flues V in the furnace-walls, supplied, as set forth, and delivering beyond the bridge-wall into the combustion-chamber H, and the dampers O, arranged to slide between the front and rear of the double-walled bridge-wall, all combined and within the walls of the furnace.

397,354. PNEUMATIC CASH-CARRIER APPARATUS. JOHN L. GIVEN, Melrose, Mass. Filed Nov. 7, 1888. Serial No. 290,238. (No model.)

Claim.—1. The combination, with a pneumatic tube for the transmission therethrough of a carrier or other article, of intermediate sectional tubes suitably supported and arranged to be moved transversely back and forth for each of said intermediate tubes to be placed in or out of line with the main tube, one of said intermediate tubes being arranged to be locked or held in position when in line with the main tube,

397,354.



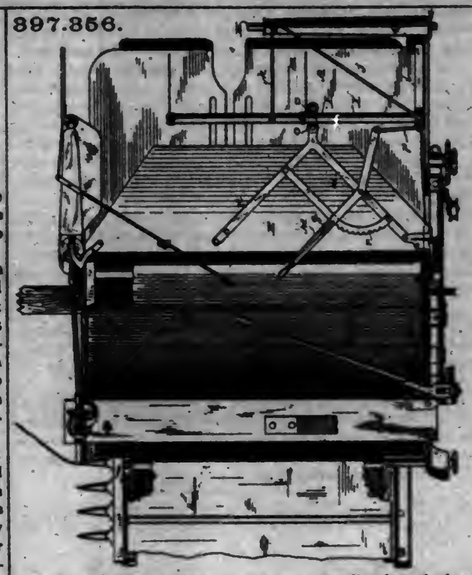
and having a slide arranged to move therein and to be moved as the carrier makes connection therewith in its transmission through the tube to release or unlock said intermediate slide-tube for its return to its normal position, for the purpose specified.

2. The combination, with a pneumatic tube for the transmission therethrough of a carrier or other article, of intermediate sectional tubes suitably supported and arranged to be moved transversely back and forth for each of said intermediate tubes to be placed in or out of line with the main tube, one of said intermediate tubes being arranged to be locked or held in position by a latch when in line with the main tube, and having a slide arranged to move therein and to be moved as the carrier makes connection therewith in its transmission through the tube to unfasten said latch for said intermediate slide-tube to return to its normal position, for the purpose specified.

3. The combination, with a pneumatic tube for the transmission therethrough of a carrier or other article, of intermediate sectional tubes, one provided with a slide arranged to move back and forth therein and adapted to receive the carrier, said intermediate tubes being carried by a frame or support arranged to move transversely back and forth for each of said intermediate tubes to be placed in or out of line with the main tube, said intermediate slide-tube being provided with a latch or locking device arranged to engage with the frame or support when in line with the main tube and in position to be operated by the slide when moved into proper position therefor as the carrier makes connection therewith to release or unlock said locking device, for the purpose specified.

4. The combination, with a pneumatic tube for the transmission therethrough of a carrier or other article, of intermediate sectional tubes secured in a frame pivoted to a suitable support provided with a spring and arranged to be moved transversely back and forth to place either one or the other of said intermediate tubes in or out of line with and between the two contiguous ends of the main tube, one of said intermediate tubes having a pivoted spring-latch or locking device arranged to engage with a stop or shoulder on said support when said intermediate tube is in line with the main tube, and said intermediate tube having an internal slide with which the carrier engages in its transmission through the tube to be moved therewith, and provided with a pin or projection to operate said latch, for the purpose specified.

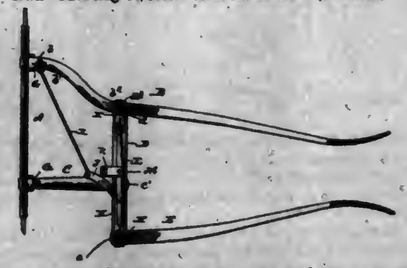
397,355. KNOT-TYER FOR GRAIN-BINDERS. JAMES A. GRAHAM, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed Feb. 8, 1886. Serial No. 191,179. (No model.)



Claim.—In a knotting mechanism for grain-binders, a knotter having the lower jaw of its bill arranged with relation to the shank so that a longitudinal line drawn through the center of this jaw forms a tangent to a circle struck from the axis of the knotter and the working side of said jaw is offset from the adjacent side of said shank a distance approximately equal to that between the longitudinal line and axis, substantially as and for the purpose set forth.

397,356. BINDER-SHIFTING MECHANISM. JAMES A. GRAHAM, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed Nov. 14, 1887. Serial No. 255,090. (No model.)

Claim.—1. The combination, with the binder-frame and deck, of the elevator-frame, and braces extending therefrom over the binder-deck and forming a bearing, a guide-bar braced to the binder-frame and adapted to slide in said bearing, and a lever pivoted on the harvester and connecting it with the binder-frame, substantially as described.



2. The combination, with the binder-frame and deck, of a hood

397,356.

extending from the elevator-frame, braces extending from the hood and forming a bearing, a guide-bar braced to the binder-frame and adapted to slide in said bearing, and a shifting-lever pivoted to the hood and connecting it with the binder-frame, substantially as described.

397,357. THILL FOR VEHICLES. ELIJAH J. HAGAN, Bayard, Iowa. Filed Aug. 18, 1888. Serial No. 283,066. (No model.)

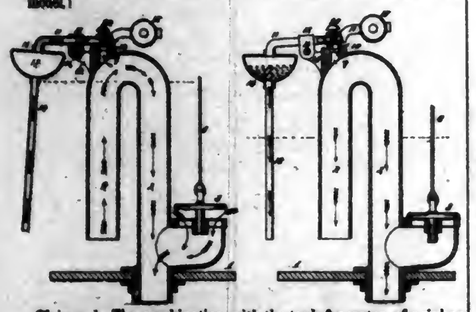
Claim.—The combination of the curved thill, the cross-piece, the curved heel secured to the cross-piece at a point near its center, the equalizing-lever having one end pivoted to the cross-piece and at its other end formed into a loop, a singletree pivoted in the said lever, a link pivoted to the lever at a point intermediate its length, and a brace-rod secured to the link and to a lip on the curved thill, substantially as and for the purpose described.

397,358. DOUBLE-DECK HARROW. WILLIAM H. HALL, Tiffin, Ohio. Filed Sept. 15, 1888. Serial No. 285,544. (No model.)

Claim.—1. In a double-deck harrow, the upper deck divided longitudinally into independent sections removably supported over the lower deck, for the purpose set forth.

2. In a double-deck harrow, the upper deck divided longitudinally into independent swinging sections arranged to swing, respectively, to

opposite sides of the barrow, whereby said sections may be brought into position to conjointly form a completed upper deck or swung out of the way, so as to leave an unobstructed space over the lower deck.



3. The combination, substantially as hereinbefore set forth, with the body-frame adapted to afford a lower deck, of the longitudinally-arranged independent bars *d*, connected with the body-frame by laterally-swinging arms, and stands by which said bars can be supported in position over the lower deck to provide a completed upper deck.

4. The combination, substantially as hereinbefore set forth, with the body-frame adapted to afford a lower deck, of the longitudinally-arranged independent bars *d*, connected with the body-frame by laterally-swinging arms, and stands or legs adapted for supporting said bars in position over the lower deck to provide a completed upper deck, said swinging arms being pivoted at points that are farther toward the sides of the barrow than the points whereat the stands are positioned, for the purpose described.

5. The combination, substantially as hereinbefore set forth, with the lower body-frame adapted to afford a lower deck, of the stands F, arranged at the front and rear ends of said body-frame, and the independent lateral bars *d*, removably supported upon said stands, for the purpose described.

6. The combination, substantially as hereinbefore set forth, with the wheel-supported frame A, of the upper deck divided longitudinally into independent sections, and the swinging arms E, secured to said sections of the upper deck and pivotally attached to the end cross-bars of the wheel-supported frame.

397,359. SIPHON-VALVE FOR WATER-CLOSETS. CHARLES H. HARKINS, St. Louis, Mo. Filed Sept. 17, 1888. Serial No. 285,835. (No model.)

Claim.—1. The combination, with the tank for water, of a siphon having an air-passage leading thereinto, a movable chamber communicating with the water in said tank and with said siphon, and a valve for controlling said air-passage connected to said movable chamber, substantially as set forth.

2. In combination with a water-tank and a siphon having a port, a valve controlling said port, and a chamber having communication with the siphon and with the water in the tank and connected to said valve, whereby the action of the siphon exhausts the air from said chamber, and the latter is loaded with water to operate said valve, substantially as and for the purposes set forth.

3. The combination of the tank, the siphon having a port, a pivoted valve controlling said port, a chamber having communication with said siphon and connected to said valve for operating it, and a pipe connected to the chamber and extending into the tank, substantially as and for the purposes set forth.

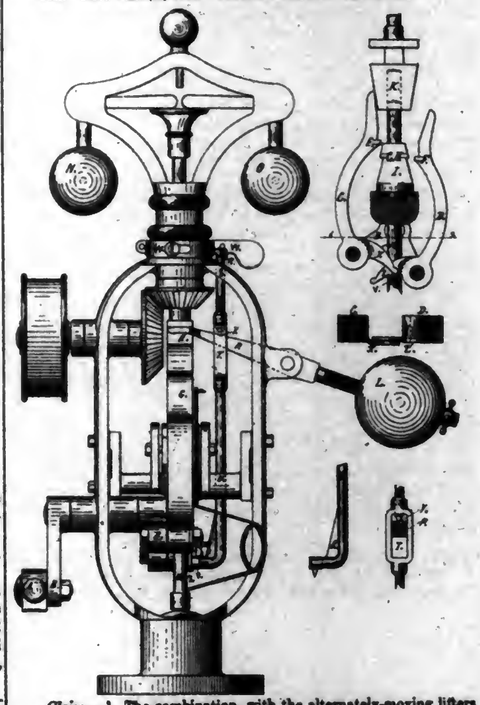
4. The combination of a tank, a siphon having a perforation, a valve controlling the perforation of the siphon, a hollow pivoted lever to which the valve is secured, a chamber on the lever, and a pipe secured to the chamber and extending into the tank, substantially as set forth.

5. The combination of a tank, a siphon having a perforation, a valve controlling the perforation of the siphon, a weighted pivoted lever to which the valve is secured, a chamber communicating with said siphon secured to the lever, and a pipe secured to said chamber, substantially as and for the purpose set forth.

6. The combination, with a tank, of a siphon having a perforation, a hollow valve controlling the perforation of the siphon, a hollow pivoted and weighted lever, a chamber communicating with the hollow lever, a pipe communicating with the chamber and extending into the tank, and a regulating-valve, all substantially as and for the purpose set forth.

397,360. MINDING SHEET-MUSIC. ELBRIDGE HARRIS, Boston, Mass. Filed July 13, 1888. Serial No. 307,792. (Model.)

Claim.—1. The combination, with folded leaves and a leaf of sheet-music or other sheet material disposed between the folded leaves, of a longitudinally-folded strip of suitable flexible sheet material secured



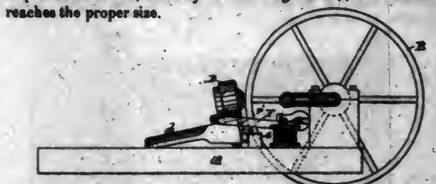
397,360.

by one fold to the inside and at the fold of one of said folded leaves, and by the other fold of said strip to the intermediate leaf, by paste or other suitable adhesive material, for the purpose specified.

2. The combination, with two sets of folded leaves of sheet-music or other sheet material, of a longitudinally-folded strip of suitable flexible sheet material secured to said leaves at their folded edges by paste or other suitable adhesive material, one set of such folded leaves within the other set of folded leaves, and each set of folded leaves secured to a separate fold of the strip, for the purpose specified.

397,361. CUT-OFF AND GOVERNOR. EMIL HARTUNG, Denver, Colo. Filed June 26, 1888. Serial No. 278,233. (No model.)

Claim.—1. The combination, with the alternately-moving lifters C and D and lifting-block I, of levers or thumbs connected with said lifters and means automatically brought into play on derangement of governor or belting to act on said levers to throw the lifters away from the beater, so as not to engage therewith in the movement of the stem carrying the beater, substantially as and for the purposes set forth.



2. The combination, with the alternately-moving lifters C and D and lifting-block I, of levers or thumbs X and Z, connected with said lifters, a reciprocating rod constructed to engage with said levers or thumbs, and means for automatically moving said rod on derangement of governor or belting to engage with said levers to throw the lifters away from the beater, so as not to engage therewith in the movement of the stem carrying the beater, substantially as and for the purposes set forth.

3. The combination, with the alternately-moving lifters C and D and lifting-block I, of levers or thumbs X and Z, connected with said lifters, a reciprocating rod constructed to engage with said levers or thumbs, means for holding said rod out of engagement with said levers or thumbs, and means for automatically moving said rod on derangement of governor or belting to engage with said levers to throw the lifters away from the beater, so as not to engage therewith in the movement of the stem carrying the beater, substantially as and for the purposes set forth.

4. The combination, with the beater I, lifters C D, and lever P, of the levers or thumbs X and Z, connected with said lifters, a rod constructed to engage with said levers or thumbs, when moved in line therewith, to throw said lifters out of line with said beater, and adapted to have said lever P engaged with it to bring it to bear against said thumbs, and a locking device, W, to hold said rod out of engagement with said thumbs while the engine is being started, said rod being free to be moved by said lever P after the engine is started, whereby the engine may be automatically stopped should the necessity therefor arise, substantially as set forth.

397,362. MACHINE FOR WINDING BALLS. HARRISON HARWOOD, Natick, Mass. Filed Mar. 2, 1885. Serial No. 157,663. (No model.)

Brief.—The invention is an improvement upon that class of machines for winding balls in which the ball is held against the winding-wheel by a conical or bell-shaped cup. In this case the cup has a spherical interior, whereby the winding is stopped when the ball reaches the proper size.

Claim.—In a ball-winding machine, a ball-winding wheel, B, and cup D, having a spherical interior, arranged and operating substantially as set forth.

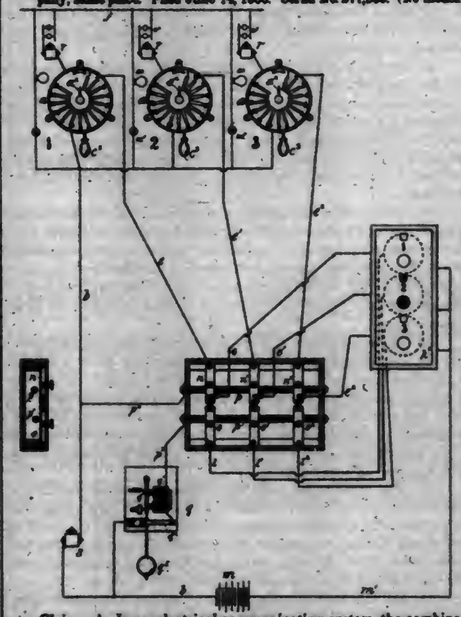
397,363. SPARK EXTINGUISHER AND ARRESTER. CLINTON J. HOKE, Yorkville, assignor to himself, William J. Herron, Winnsborough, and J. Robert Lindsay and Samuel L. Miller, both of Yorkville, S. C. Filed Aug. 13, 1888. Serial No. 282,608. (No model.)

Claim.—1. The herein-described method of extinguishing and arresting incandescent particles carried along with the products of combustion through the smoke-stack of a steam-engine, which consists in injecting jets of steam into the base of the stack from points on a circle concentric with the axis of said stack and on lines tangential to the said circle and imparting a gyratory motion to said jets, substantially as and for the purposes specified.

2. The herein-described method of extinguishing and arresting incandescent particles carried along with the products of combustion through the smoke-stack of a steam-engine, which consists in injecting jets of steam at an inclination to a vertical into the base of the stack from points on a circle concentric with the axis of said stack and on lines tangential to the said circle and imparting a gyratory motion to said jets, substantially as and for the purposes specified.

3. The herein-described method of extinguishing and arresting incandescent particles carried along with the products of combustion through the smoke-stack of a steam-engine, which consists in injecting jets of steam in the form of sheets into the base of the stack from points on a circle concentric with the axis of said stack and on lines tangential to the said circle, substantially as and for the purposes specified.

4. The herein-described method of extinguishing and arresting incandescent particles carried along with the products of combustion through the smoke-stack of a steam-engine, which consists in injecting jets of steam in the form of sheets increasing in volume or density in a radial direction into the base of the stack from points on a circle concentric with the axis of said stack and on lines tangential to the said circle, substantially as and for the purposes specified.



5. The herein-described method of extinguishing and arresting incandescent particles carried along with the products of combustion through the smoke-stack of a steam-engine, which consists in injecting jets of steam in the form of sheets into the base of the stack from points on a circle concentric with the axis of said stack and on lines tangential to the said circle and imparting a gyratory motion to the jets, substantially as and for the purposes specified.

6. The herein-described method of extinguishing and arresting incandescent particles carried along with the products of combustion through the smoke-stack of a steam-engine, which consists in injecting jets of steam in the form of a sheet and at an inclination to the vertical into the base of the stack from points on a circle concentric with the axis of said stack and on lines tangential to the said circle, substantially as and for the purposes specified.

7. The herein-described method of extinguishing and arresting incandescent particles carried along with the products of combustion through the smoke-stack of a steam-engine, which consists in injecting jets of steam at an inclination to a vertical and in the form of a sheet increasing in volume or density in a radial direction into the base of the stack from points on a circle concentric with the axis of the stack and on lines tangential to the said circle, substantially as and for the purposes specified.

8. The herein-described method of extinguishing and arresting incandescent particles carried along with the products of combustion, through the smoke-stack of a steam-engine, which consists in injecting jets of steam at an inclination to a vertical and in the form of a sheet increasing in volume or density in a radial direction into the base of the stack from points on a circle concentric with the axis of said stack and on lines tangential to the said circle and imparting a gyratory motion to the jets, substantially as and for the purposes specified.

397,364. ELECTRIC COMMUNICATING SYSTEM. ALFRED G. HOLCOMBE, New York, N. Y., assignor to the Equitable Electric Company, same place. Filed June 14, 1888. Serial No. 277,069. (No model.)

Claim.—1. In an electrical communicating system, the combination, with a source of electric energy, signaling devices located at a central and sub stations, and circuit-connections uniting said stations, of electric lamps located in branch lines at the sub-stations and having suitable circuit-closing devices, whereby they may be lighted at the will of the operators at the sub-stations, substantially as set forth.

2. The combination, substantially as set forth, with the all-around battery-wire, of the collective wire, the sub-station signaling devices located between said wires, the individual lines leading from said signaling devices to the central station, and an electric lamp and its switch at each sub-station placed in a shunt around the signaling devices.

3. In an electrical communicating system, the combination, with the sub-stations, the individual lines, and the step-by-step indicators of each line, of a sub-circuit for each indicator including the operating-magnet thereof, an automatic rheotome or vibrator, and a circuit-completing switch or key, whereby, after a signal is registered upon the indicator, it may be automatically returned to zero by closing the vibrator-circuit, substantially as set forth.

4. The combination of the central and sub stations, the individual lines leading from the sub-stations to the keys $n\ n'\ n^2$ at the central station, through which they are normally closed through the magnets of their respective indicators, sub-circuits also including said magnets, a rheotome and normally-open keys, $o\ o'\ o^2$, and connecting bars or devices between the keys $n\ n'\ n^2$ and $o\ o'\ o^2$, whereby, when the latter keys are operated to close the sub-circuits to bring the indicator to zero the normally-closed individual lines are opened at the former keys, substantially as set forth.

5. The combination, with a battery located at the central station, of an all-around battery-wire connected therewith and leading to all the sub-stations, individual lines running from said stations to the central station, where each one passes through its indicator to the opposite pole of the battery, and a normally-open sub-circuit for each indicator connected with one pole of said battery and including an automatically-acting rheotome and connected through the indicator with the opposite pole of said battery, substantially as set forth.

6. The combination of the indicator-disk marked to correspond with the predetermined signals to be received, and also having portions of its face differently marked to indicate when it is at zero and when not, (as, for instance, a white spot to indicate zero and the remainder black,) of a face-plate having two apertures—one through which the received signal is read and another through which the face of the disk is seen—to indicate conspicuously when the disk has been moved from zero, substantially as and for the purpose set forth.

7. The combination of the indicator or annunciator, its individual line in which its actuating-magnet is included, a sub-circuit normally open at two points, contacts operated by the movement of the indicator which automatically close said sub-circuit at one point when the indicator is moved from the zero-point, a circuit opener or insulator which opens said contacts at the same point when the indicator is returned to zero, and a circuit-closing key or switch for closing the circuit at the other point at will to return the indicator to zero, substantially as set forth.

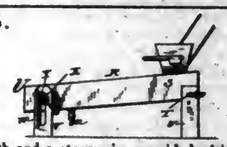
8. The combination of the indicator-disk, its actuating-magnet, ratchet and pawl, its individual line in which the magnet is included, the sub-circuit containing the automatically-acting rheotome and also including said actuating-magnet, the contacts l^2 l^3 l^4, included in the sub-circuit, and the insulator which opens said contacts when the indicator-disk is at zero, and a circuit-closing key or switch for closing said sub-circuit at will to return the indicator to zero, substantially as set forth.

9. The combination, with the rotating indicator-disk, its driving-ratchet, actuating-magnet, and armature-lever, of the pivoted lever j^3, having a stop located out of a line drawn from its pivot perpendicular to the armature and against which the armature-lever strikes when retracted to force the end of the lever j^3 between the teeth of the ratchet and rectify the position of the disk, substantially as set forth.

10. The combination, with the rotating indicator-disk, its driving-ratchet, actuating-magnet, and armature-lever and pawl, of the pivoted elbow-lever normally drawn by its spring against the driving-ratchet to prevent its false movement and a stop carried by the elbow-lever and located out of a line drawn from the pivot of said lever perpendicular to the armature, against which the armature-lever falls when retracted to operate the elbow and rectify the position of the disk, substantially as set forth.

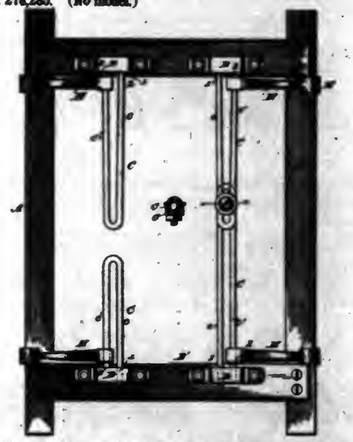
11. The combination, with the indicator-actuating magnet and the sub-circuit in which it is included, of an automatically-acting rheotome consisting of an electro-magnet, its vibrating armature-lever, an independent circuit-completer operated by the armature-lever and loosely connected therewith, and a key for closing said circuit, substantially as and for the purpose set forth.

12. In a call-box, the combination of the rotating spindle carrying the pointer and the notched circuit-making wheel, the winding-sleeve, the movable contact-arm d, contacts d' d^2, the insulated stop on the winding-sleeve which normally holds said arm on one of said contacts, the lever a^4, connected with the other of said stops and operated by the notched circuit-making wheel, and locking devices interposed between the spindle and winding-sleeve, whereby when the pointer is set and the sleeve released the required signal is transmitted, substantially as set forth.



13. The combination, with the spindle carrying the notched signaling-wheel and pointer, of the winding-sleeve, the notched flange thereon, the catch or dog a^7, the stop or pin a^6 on the wheel, and the stop a^5, against which it works, whereby the pointer and notched signaling-wheel may be freely rotated in either direction, but are carried around when the sleeve is released in transmitting a signal.

14. The combination of the collective wire f, the stop d', with which it is connected, the contact-arm d, connected with the individual line and normally resting against said stop, the stop d^2, connected with the all-around battery-wire, against which the arm d rests when a signal is being transmitted, the notched transmitting-wheel and its spindle, the winding-sleeve and drum, and the locking devices between the sleeve and signal-transmitting devices, consisting of the pawl a^7, for engaging the sleeve, and the stops a^6 a^5, substantially as set forth.

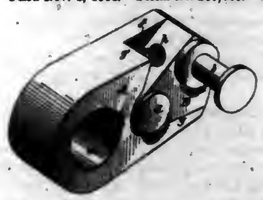


397,365. APPARATUS FOR CONVERTING CAST-IRON. LEOPOLD LANER, Louisville, Ky. Filed Nov. 19, 1887. Serial No. 255,623. (No model.)

Claim.—The apparatus for converting iron or steel, consisting of the inclined trough or receiver having a series of uniform steps traversing its length and a steam-pipe provided with a series of branch pipes or arms rising vertically through said steps, one at each riser of a step, and having their discharging ends stopping a short distance below the higher steps and a short distance above the lower steps, substantially as shown.

397,365.

397,366. VEHICLE-SPRING. EDWIN JARRELL, Harper, Kans., assignor to Harry W. McMunn, same place. Filed June 26, 1888. Serial No. 278,285. (No model.)

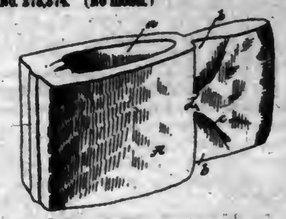


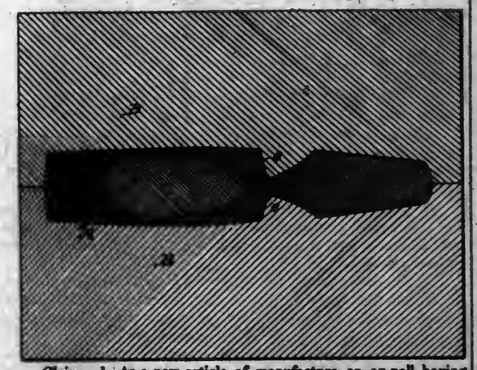
Claim.—1. The combination of the framing, the clip or bracket secured to said framing, and the torsion-spring, consisting of a plurality of arms united or joined together, the free end of one arm being rigidly clamped in the clip or bracket, and the free end of the other arm being journaled in the bracket, the latter arm being provided close to the bracket and between the same and its juncture with the other arm with the connecting-arm, substantially as set forth.

2. A vehicle-spring formed of a plurality of arms united together at one end, one of such arms being bent outward near its free end to form a connecting-rod, and provided beyond such connecting-rod with a trunnion-like extension, substantially as set forth.

3. The combination of the framing, the torsion-springs arranged at the opposite sides of the ends thereof, secured to the framing and projected inwardly toward each other, the front and rear springs on the same side being lapped together at their inner ends, and connections for uniting the inner lapped ends of said springs, substantially as set forth.

397,367. CRANK FOR MACHINERY. WILLIAM H. KAYE, Wenonah, N. J. Filed Nov. 1, 1888. Serial No. 289,705. (No model.)



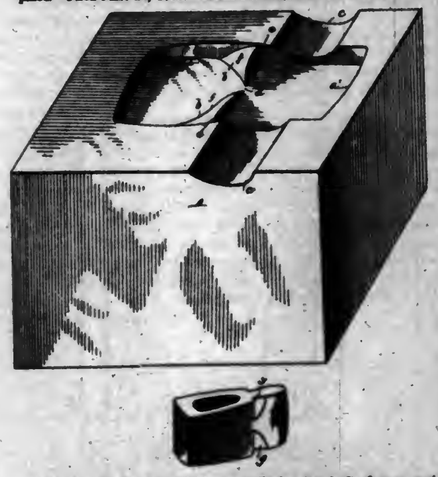


Claim.—1. The combination of the crank, the crank-pin carried by a block pivoted to the crank at a point offset in respect to a line between the centers of the crank-shaft opening and crank-pin, and a spring acting upon the block to preserve it in its normal position, all substantially as specified.

2. The combination of the crank-arm, the crank-pin carried by a block pivoted to the crank-arm at a point offset in respect to a line between the centers of the crank-shaft opening and crank-pin, and a spring interposed between said pivoted block and a bearing on the crank-arm, all substantially as specified.

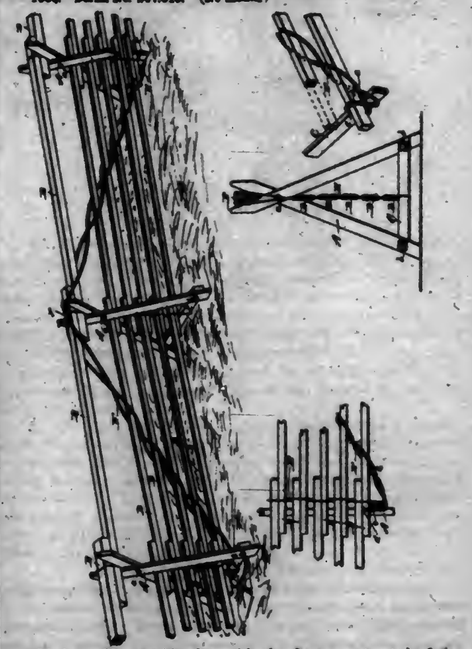
3. The combination of the crank-arm having a recessed face, a block carrying the crank-pin and pivoted in said recess at a point offset in respect to a line between the centers of the crank-shaft opening and crank-pin, and a spring interposed between said block and a shoulder on the crank-arm, all substantially as specified.

397,368. AX-POLL. WILLIAM C. KELLY, Louisville, Ky., assignor to the Kelly Axe Manufacturing Company, same place. Filed June 27, 1888. Serial No. 278,374. (No model.)



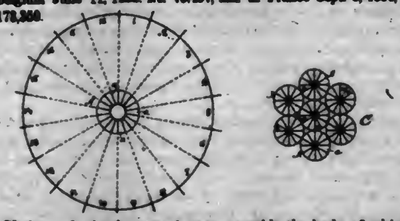
Claim.—1. As a new article of manufacture, an ax-poll having in each side thereof two corresponding recesses or depressions slightly beveled inwardly or toward each other and diverging in a taper in the direction of the corners of the thinnest portion of the poll, substantially as described.

2. As a new article of manufacture, an ax-poll having the eye slightly tapering in direction of its length, the same having in each side thereof two corresponding recesses or depressions slightly beveled inwardly or toward each other and diverging in a taper in the direction of the corners of the thinnest portion of the poll, substantially as described.



397,369. DIE FOR MAKING AX-POLLS. WILLIAM C. KELLY, Louisville, Ky., assignor to the Kelly Axe Manufacturing Company, same place. Filed June 27, 1888. Serial No. 278,375. (No model.)

Claim.—1. A die for making ax-polls, having in its face a cavity or recess and formed with the projections b b, substantially as described.

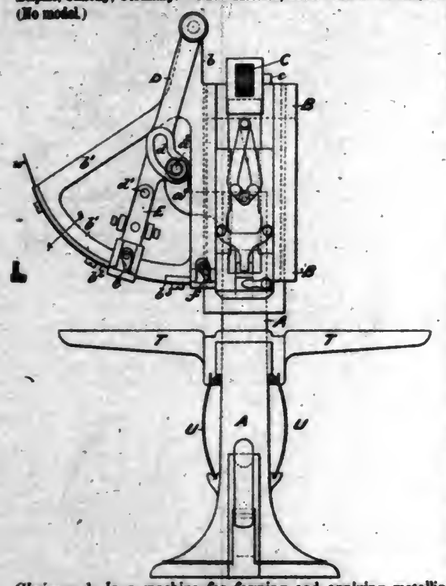


2. A die for making ax-polls, having in its face the cavity slightly curved between the points a a' and formed with the projections b b, the boundary lines of which intersect each other in curvilineal angles, substantially as described.

397,370. FENCE. JACOB C. KEEP, Tiffin, Ohio. Filed Mar. 30, 1888. Serial No. 267,815. (No model.)

Claim.—The combination, with the fence constructed of the crossed supporting-stakes A, the cross-bars C, secured to the said stakes near their lower ends, the overlapping rider-rails, the overlapping fence-rails, and a tie-wire, E, securing the overlapped ends of the said rails together, of a double wire brace, F, having formed in one end a loop, c, looped over the projecting end of the lower fence-rail, the two portions of the brace being passed down under the cross-rail C and crossed again at c, and then up diagonally across the panel and again crossed at f directly over the overlapped ends of the rider-rails, the two portions of the wire being then passed down diagonally across the adjacent panel and under another cross-rail C and looped up over the end of the lower fence-rail, the two wires of the brace being drawn taut and intertwined between the rails of both panels, substantially as and for the purpose set forth.

397,371. WIRE ROPE OR CABLE. WILLIAM H. LAIDLAW and THOMAS LAIDLAW, Maiden House, No. 9 Leopold Street, Burdett Road, Bow, County of Middlesex, England. Filed Dec. 9, 1886. Serial No. 221,022. (No model.) Patented in England May 9, 1885, No. 5,755; in Belgium June 11, 1886, No. 73,457, and in France Sept. 6, 1886, No. 178,360.



Claim.—1. A wire strand, rope, or cable the body of which is composed of a number of twisted sectoral wires disposed around a common center with their radial faces abutting, said sectoral wires extending inward approximately to the center of the strand, rope, or cable, substantially as described.

2. A wire strand, rope, or cable the body of which is composed of a number of twisted truncated sectoral wires disposed around a common center, with their radial faces abutting, said sectoral wires extending inwardly approximately to the center of the strand, rope, or cable, substantially as described.

3. A wire rope or cable composed of a number of strands twisted together, the body of each strand being composed of a number of twisted sectoral wires disposed around a common center, with their radial faces abutting, said wires extending inward approximately to said center, substantially as described.

397,372. WIRE-STITCHING MACHINE. CARL L. LASCH, Reudnitz, Leipsic, Saxony, Germany. Filed Mar. 16, 1887. Serial No. 231,167. (No model.)

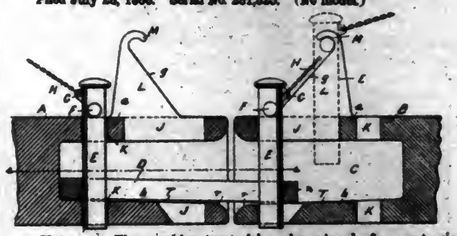
Claim.—1. In a machine for forming and applying metallic staples, the combination, with the main frame or machine stand, of a feed-lever, D, having a movable gripping-piece, E, a slide, B, carrying a guide, *b'*, and pawl *f* for the wire, as well as the fulcrum-support *b* and the stops *b² b²* for the lever D, mechanism, substantially as described, for producing a pivotal motion of the lever D by the up-and-down motion of the slide B, operating-lever C, adapted to press the slide B downward until the lever D has completed its travel, and means for automatically replacing the lever C into its starting position.

2. In a machine for forming and applying metallic staples, mechanism for operating the cutting-slide J in unison with the staple-driver H, said mechanism comprising a double knee-joint formed by links K K' L L', a pair of lateral guides, N N', provided with recesses *n n'*, and a pair of friction-rollers adapted to slide along the said guides, substantially as described.

3. The combination of the base-plate M, with bending-slide or staple-driver H, cutting-slide J, links K K' L L', pivots *k k' l*, guide-plates N N', having recesses *n n'*, and brake mechanism R S, the whole constructed and adapted to operate substantially as described.

397,373. MANUFACTURE OF CEMENT. ROBERT W. LESLEY, Philadelphia, Pa. Filed June 30, 1888. Serial No. 278,009. (No specimens.)

Claim.—1. In the manufacture of cement from slags, the method of incorporating with the slag lime or other ingredients in the proportions necessary to bring the slag to a composition of Portland cement, which consists in injecting into slag heated to fluid condition the lime or other ingredients in finely-divided condition and at a high heat, substantially as specified.



2. The described process of making Portland cement, which consists in taking the molten slag drawn off from iron-furnaces, injecting into the slag while still fluid highly-heated and finely-divided lime or other ingredients, the mass being maintained at the temperature at which said heated ingredients will chemically combine or unite with the slag, then running this fluid product or mixture into water or sprinkling it with water, so as to bring it to granular condition, and finally reducing this granular material to a powder, substantially as hereinbefore set forth.

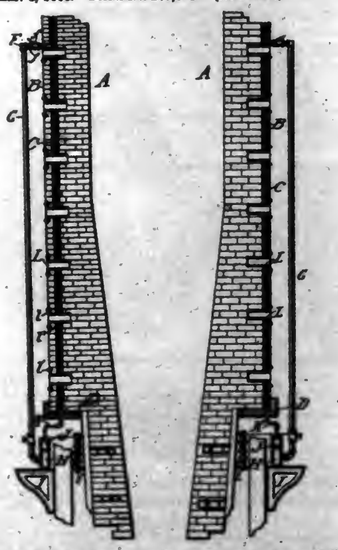
397,374. FAUCET. CHARLES O. MADDOX, Belle View, Fla. Filed July 12, 1888. Serial No. 279,778. (No model.)

Claim.—The combination, with the cylinder B, adapted to be screwed into the head of a cask, of the integrally-formed guard-cup C, adapted to rest against the wall of the cask and to lie entirely within the plane of the ends of the staves, the tube D, sliding in said cylinder and provided at each end with a screw-thread for engagement therewith, the valve H in the outer end of said tube, the handle J, lying wholly within the cup, and the stop M, for securing simultaneous rotation of the handle and tube when the former is turned beyond a certain limit in either direction.

397,375. CAR-COUPLING. HORACE H. MANSFIELD, Boston, Mass. Filed July 26, 1888. Serial No. 281,225. (No model.)

Claim.—1. The combination, with a draw-head of a car having an opening, C, a socket, J, and inclined edges *g* at the sides of said socket, of a pin, E, provided with cross-arms F, for the purpose specified.

2. The combination, with a draw-head of a car having an opening, C, a socket, J, inclined edges *g*, and a stop or hook, M, at the sides of said socket, of a pin, E, provided with cross-arms F, for the purpose specified.



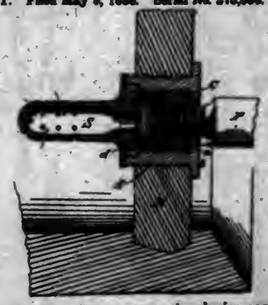
3. The combination, with a draw-head of a car having an opening, C, a socket, J, and inclined edges *g* at the sides of said socket, of a pin, E, provided with cross-arms F and connected by chains or cords H Q R to the end of the car, for the purpose specified.

4. The combination, with a draw-head of a car having an opening, C, a socket, J, inclined edges *g* at the sides of said socket, and a socket, K, of a pin, E, provided with cross-arms F, for the purpose specified.

5. The combination, with a draw-head of a car having an opening, C, an inclined bottom surface, T, socket J, inclined edges *g*, and stops or hooks M at the sides of said socket, of a pin, E, provided with cross-arms F, for the purpose specified.

6. The combination, with a draw-head of a car having an opening, C, an inclined bottom surface, T, socket J, inclined edges *g*, stops or hooks M, and socket K, of a pin, E, provided with cross-arms F, for the purpose specified.

397,376. DEVICE FOR PROTECTING FURNACES OR LIKE STRUCTURES. SAMUEL MCCLURE and CHARLES F. PHILLIPS, Sharon, Pa. Filed Mar. 1, 1888. Serial No. 265,873. (No model.)

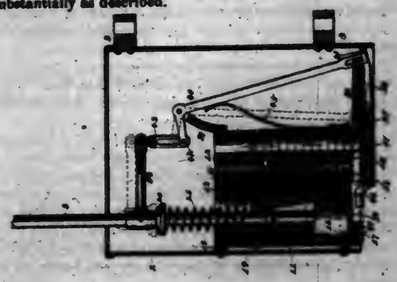


Claim.—1. In a furnace having a space in its wall filled with gravel or like material, a horizontal water-pipe embedded in said filling and perforated on its lower side, an external supply-pipe, as H, to contain water under pressure, and vertical pipes, as G, to supply water to the said horizontal water-pipe to fill said space by percolation, substantially as described.

2. In a furnace having a space in its wall filled with gravel or similar material, a horizontal water-pipe composed of disconnected sections having closed ends, said pipe being embedded in said filling and perforated, a supply-pipe, as H, and a series of external vertical pipes connecting said pipe H to each section of the horizontal water-pipe, substantially as described.

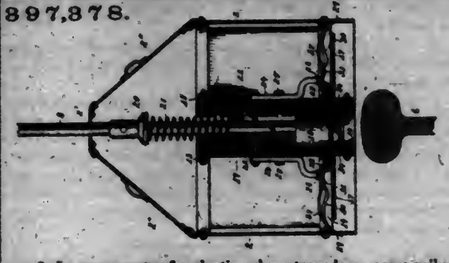
3. In a furnace having a space in the wall filled with gravel or like material, and also having a water-pipe embedded in said filling for supplying water thereto by percolation, a series of observation-boxes in the furnace-wall open at their outer ends and having a slot registering with the filled space in the wall, substantially as and for the purpose set forth.

397,377. TAPPING-BUSH FOR BARRELS. JOHN MCKENZIE, West Troy, N. Y. Filed May 9, 1888. Serial No. 273,330. (No model.)



Claim.—1. A tapping or connecting device consisting of an internally-threaded bushing with valve-seats at its inner and outer ends and a double-ended valve fitted to screw in said bushing, and having a socket in its outer end communicating with ports in said valve between the ends thereof, said socket having a thread of opposite character to that of the valve, whereby the screwing of a faucet fitting into said socket or out of same acts to seat or unseat one of the other of the valves.

2. The tapping or connecting device consisting of the internally-threaded bushing A, having the two internal valve-seats *a* and *d* wholly within said bushing, and the valve-piece C, threaded internally and externally, and having at its ends the respective valve-faces *v* and *v'*, and intermediate ports, *e*, communicating with the outer end of valve-piece C, the said valve-piece being shorter than the interior of the bushing and adapted to move back and forth therein.

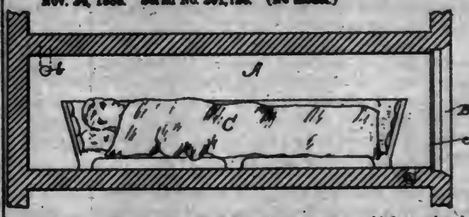


3. The tapping or connecting device consisting of the internally-threaded bushing A, having seat *a*, plug or strainer S, having counter-ported seat *d* and externally-threaded valve-piece C, having the valve-faces *v* and *v'* and intermediate ports, *e*, and constructed at its outer end with the socket D, reaching to said ports *e* and having an internal thread of opposite character to that in the bushing, substantially as described.

397,378. APPARATUS FOR DEPOSITING TORPEDOES UPON RAILWAY-TRACKS. JAMES P. MCLAUGHLIN, Philadelphia, Pa. Filed Nov. 15, 1888. Serial No. 290,912. (No model.)

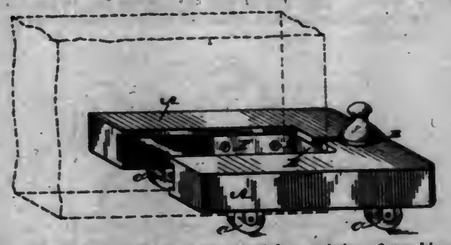
Claim.—1. In an apparatus for planting alarm-torpedoes upon a railway-track from a moving train, the combination of a hopper containing suitably-shaped torpedoes, a discharging-cylinder parallel with the hopper, and a plunger for transferring a torpedo from the hopper into the discharge-cylinder, with a piston for expelling the torpedo from the discharge-cylinder, and pivoted arms actuated by the piston or piston-rod for fastening the discharged torpedo to the head of the rail, substantially as described.

397,378.



2. In an apparatus for planting alarm-torpedoes upon a railway-track from a moving train, the combination of a torpedo-hopper secured behind the rear wheels of a railway-car, and a discharge-cylinder parallel with said hopper extending within close proximity of a rail of the track, with a piston fitted into the discharge-cylinder for expelling torpedoes therefrom, spring-supported binding-arms pivoted to diametrically-opposite sides of the discharge-cylinder, and reciprocating rods carried by the piston-rod for actuating the binding-arms to secure the discharged torpedo to the head of the rail, substantially as described.

3. In an apparatus for planting alarm-torpedoes upon a railway-track from a moving train, the combination of a torpedo-hopper and a discharge-cylinder parallel therewith and in close proximity to one rail of the track, with mechanism for transferring the torpedoes one by one from the hopper to the discharge-cylinder, and mechanism, substantially as described, actuated from the car to expel the transferred torpedoes from the discharge-cylinder and to bind them to the head of the rail, substantially as described.



4. In an apparatus for planting alarm-torpedoes upon a railway-track from a moving train, the combination of a torpedo-hopper and a discharge-cylinder parallel therewith, both being cut away near their lower ends, whereby communication is established between the same, with a plunger for transferring torpedoes from the hopper into the discharge-cylinder, springs for supporting the torpedo during the transfer and sustaining the same in the discharge-cylinder, and means, as described, for actuating the plunger and for expelling the torpedoes from the discharge-cylinder, substantially as described.

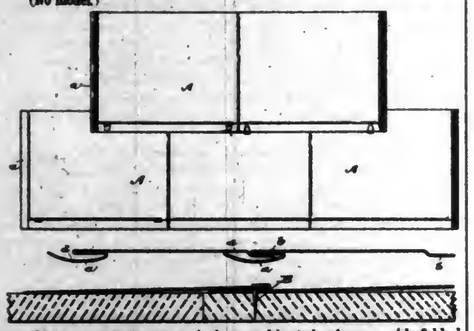
397,379. PRESERVING CORPSES. JOHN G. MEYERS, Washington, D. C., assignor to the New Mausoleum Company, Alexandria, Va. Filed Nov. 24, 1888. Serial No. 291,736. (No model.)

Claim.—The process of desiccating a corpse, which consists in placing the same in a vault or cell of a mausoleum, hermetically sealing the same, except as to inlet and outlet passages for air, then passing through the cell a current of dried or atmospheric air, substantially as and for the purpose set forth.

397,380. DOOR-CHECK. BENJAMIN A. MITCHELL, Jr., Philadelphia, Pa. Filed Oct. 27, 1888. Serial No. 289,282. (No model.)

Claim.—1. A door check or weight consisting of two hinged jaws forming a separating-yoke adapted to embrace a door, substantially in the manner and for the purpose described.

2. A door check or weight consisting of two hinged jaws and a spring having its ends connected to the jaws for causing the same to



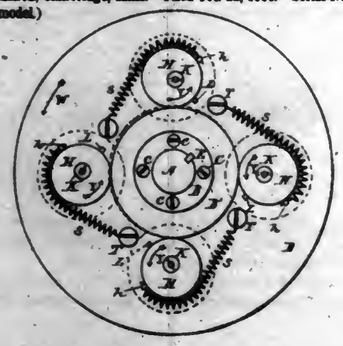
close against the door, substantially in the manner and for the purpose described.

3. A door check or weight consisting of jaws for embracing the door and a wedge for binding against the lower edge thereof, substantially as described.

4. A door check or weight consisting of two hinged jaws, a spring carried by said jaws for causing the same to close against the door, and a wedge carried by the check for binding against the lower edge of the door, substantially in the manner and for the purpose described.

5. A door check or weight consisting of two hinged doors, and means carried by and connected with the jaws for causing them to close inward against the door, substantially in the manner and for the purpose described.

397,381. METALLIC ROOFING OR SIDING. LEVI H. MONTROSS, Toronto, Ontario, Canada. Filed Sept. 12, 1888. Serial No. 285,173. (No model.)

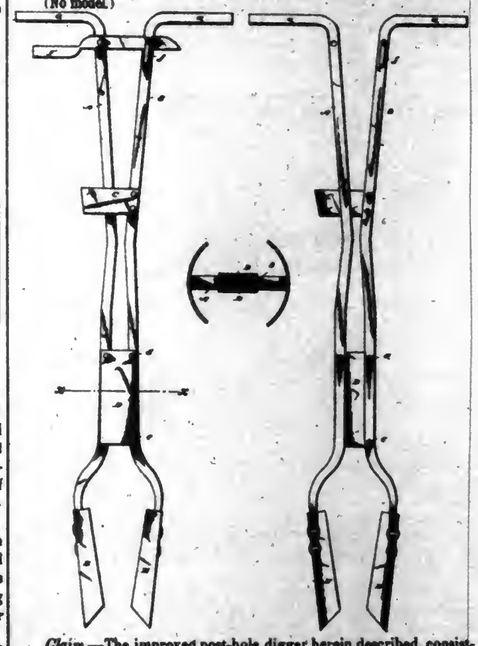


Claim.—1. A sheet-metal plate or shingle having one side folded to form a pocket below the level of its bottom surface, the portion of the said plate or shingle extending beyond the fold being bent upwardly toward the bottom surface of the adjoining plate, the edge of which fits into the pocket, substantially as and for the purpose specified.

2. A sheet-metal plate or shingle having one side folded to form a pocket below the level of its bottom surface, the portion of the said plate or shingle extending beyond the fold being depressed and its edge upwardly curved toward the bottom surface of the adjoining plate, the edge of which fits into the pocket, substantially as and for the purpose specified.

3. A series of sheet-metal plates or shingles having a joint formed by the upper plate or shingle overlapping the bottom plate or shingle, the two being secured together and to the roof or structure by pins having one end only inserted in the structure to which the shingles are secured and the other end bent parallel with the body of the shingle, so as to clasp and secure in position the said plates or shingles, substantially as and for the purpose specified.

4. A series of plates or shingles having the vertical joints connecting them formed by folding one side to form a pocket below the level of its bottom surface, the portion of the said plate or shingle extending beyond the fold being depressed and its edge upwardly curved toward the bottom surface of the adjoining plate, the edge of which fits into the pocket, and the horizontal joints formed by the upper plate or shingle overlapping the bottom plate or shingle, the two being secured together and to the roof or structure by pins bent so as to clasp and secure in position the said plates or shingles, substantially as and for the purpose specified.



397,382. GRIP DEVICE FOR ELEVATORS, &c. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Oct. 22, 1888. Serial No. 288,803. (No model.)

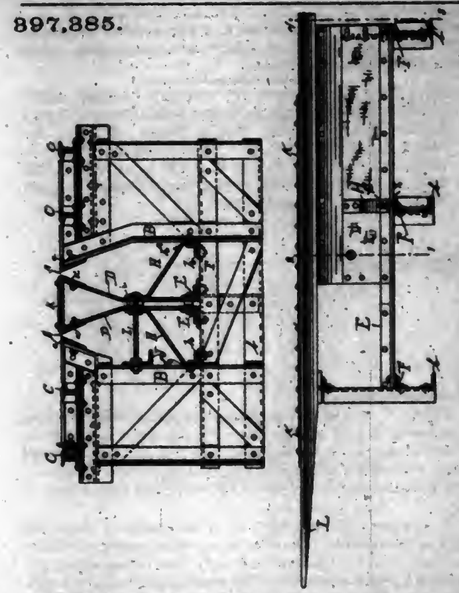
Claim.—1. In a grip device, the combination of the shaft A and bushing B, having cams B' B', with the eccentric-pawls H and drum D, all operating together substantially as described, and for the purpose set forth.

2. In a grip device, the combination of the shaft A and bushing B, having cams B' B', with the eccentric-pawls H, check-lugs L, springs S, and drum D, all operating together substantially as described, and for the purpose set forth.

397,388. POST-HOLE MACHINE. WILLIAM W. NIVISON and GEORGE F. NIVISON, Lester, Mich. Filed Sept. 3, 1888. Serial No. 284,443. (No model.)

Claim.—The improved post-hole digger herein described, consisting, essentially, of the two angular levers A B, having their upper ends bent laterally to form handles, and their lower ends curved outwardly and inwardly to receive pods, the loop C, secured to one of the levers and receiving through it the other lever, the long plates D, pivoted at their upper corners to the respective levers, and also pivoted at their lower corners to the lever B only, whereby stability will be rendered in the operation, the pivoted gravitating lever F, having a notch, as shown, and the stud on the lever B, adapted to receive the said notch, substantially as specified.

397,384. METALLIC SEAL. ANDREW J. PHELPS, Syracuse, N. Y. Filed June 11, 1888. Serial No. 276,714. (No model.)



Claim.—The improved seal consisting of a soft-metal case having opposite open ends and an aperture in its top, the binder passing through the case at the open ends thereof, and a separate soft-metal plate inserted into the case over the binder and forming with the top of the case two thicknesses of metal over the binder, substantially as described and shown.

397,385. CABLE OR ELECTRIC STREET-RAILWAY. WILLIAM S. PHELPS, San Francisco, Cal. Filed Aug. 4, 1888. Serial No. 282,003. (No model.)

Claim.—1. In street-railways having subways for the passage of the mechanism of the car—such as the grip in a cable road or collector in an electric road—the substructure of the points which are bounded on each side by the diverging slots of either cross or branch lines, as herein described, consisting, essentially, of a vertical plate-iron point-support secured to the yoke-frames, braced in a perpendicular position by diagonal braces and being adjustable horizontally and vertically, substantially as and for the purpose herein set forth and described.

397,385.

2. The point-support herein described, consisting of a vertical plate, D, bars E and F, braces H, and rod I, in combination with the yoke-frames B, the whole arranged and connected substantially as and for the purpose described.

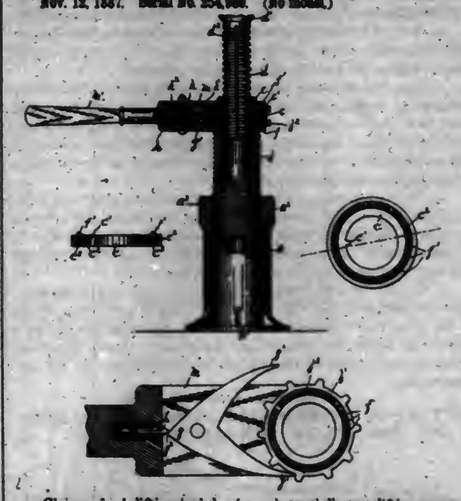
397,386. EXERCISING APPARATUS. ROBERT REACH, Philadelphia, Pa. Filed Oct. 30, 1888. Serial No. 289,537. (No model.)

Claim.—1. In combination, the oar, the bracket pivotally supporting said oar, a support for the bracket, and a pivotal connection between said support and the bracket, adapted to permit tilting movement of the bracket, substantially as described.

2. In combination, the oar, the bracket pivotally supporting said oar, a support for the bracket, projecting ears on the support and bracket, and a connecting-rod for the two passing through the ears, substantially as described.

3. In combination, the oar, the bracket pivotally supporting said oar, a support for the bracket, a spring acting upon the bracket, and a pivotal connection between said support and the bracket, substantially as described.

4. In combination with an oar, a friction ring or plate, wearing-shoes adapted for contact with the friction-ring, a clutch-connection between the oar and friction-ring, a bracket for supporting these parts, a support, B, and a pivoted connection between said bracket and support B, arranged to permit said bracket to have a tilting movement, substantially as described.

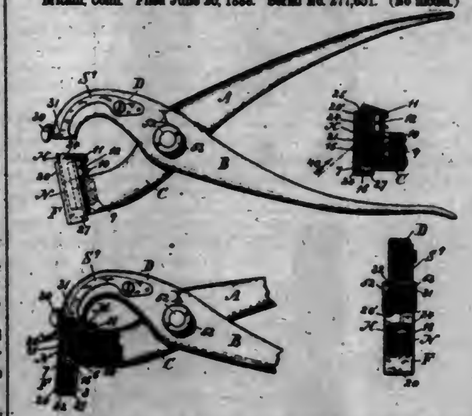


5. In combination, a supporting-bracket, the vertically-arranged friction-ring, the curved wearing-shoes adapted to the outer periphery thereof, the oar, and a clutch-connection between the oar and the friction-ring, substantially as described.

6. In combination, the supporting-bracket having vertical flanges, the vertically-arranged friction-ring, the wearing-shoes fixed to the outer periphery, the adjusting-screws extending through the flanges, the oar, and a clutch-connection between the oar and the friction-ring, substantially as described.

7. In combination, the bracket, the friction-ring, the oar casting having the socket, and the clutch-piece held loosely therein and provided with a stud for engaging the ring, substantially as described.

8. In combination, the bracket, the friction-ring, the oar casting having the socket, the clutch-piece held loosely therein, and the spring, substantially as described.



397,387. JACK-SCREW. MICHAEL REICH, Buffalo, N. Y. Filed Nov. 12, 1887. Serial No. 254,969. (No model.)

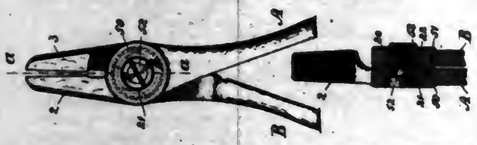
Claim.—1. A lifting-jack having substantially two lifting-screws, *b d*, separate and independent of each other, each screw having an independent ratchet-wheel, *b' e*, adapted to be operated by plates having separate pawls *g' k'*, an intervening washer, *c*, and two series of balls, *f f'*, running in grooves above and below the washer *c*, inclosed in a common casing, *m*, and a single lever-handle, *m'*, substantially as shown and described.

2. In a lifting-jack, the combination, with the screw *b*, having integral ratchet-wheel *b'*, adapted to be moved up and down in the tubular standard *a*, the screw *d*, adapted to be moved up and down in the screw *b*, the ratchet-wheel *e*, engaged therewith, and the washer *c*, engaging with the vertical slot in the screw *d*, of the double spring-pressed dogs and plates having pawls *k'* and *g'*, engaging independently with each ratchet-wheel, the series of balls *f*, playing between the annular groove c^2 of the washer and annular groove b^2 of the ratchet-wheel *b'*, and the series of balls *f'*, playing between the annular groove c^3 of the washer and annular groove *d'* of the ratchet-wheel *e*, substantially as shown and described.

397,388. BUTTON-SETTING IMPLEMENT. FRANCIS H. RICHARDS, Hartford, assignor to The American Button Fastener Company, New Britain, Conn. Filed June 20, 1888. Serial No. 277,651. (No model.)

Claim.—1. In a button-setting instrument, the combination, with the jaw C, formed substantially as described, to receive the presser-slide and the laterally-movable driver, of the slide comprising two fixed members or plates with a driver-channel between them, and having an opening in the front plate or member, through which to insert a fastener into said channel, and the laterally-movable driver arranged to be pushed back at the top by said fastener and to drive the fastener through said channel, substantially as described.

2. In a button-setting instrument, the combination, with the fastener-driving member thereof, of the slide comprising two fixed plates or members with a driver-channel between them carried on said driving member, and the driver pivoted at its lower end to said member and laterally movable at its upper end, all substantially as described.

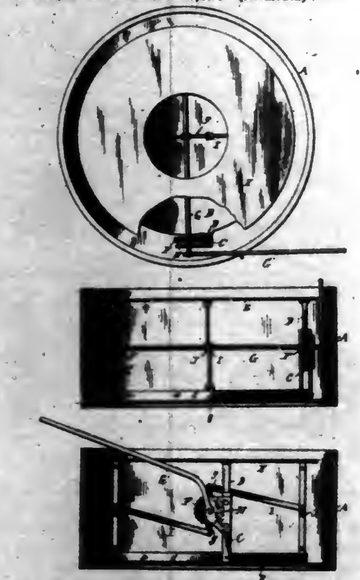


3. In a button-setting instrument, the combination, with the pivotally-supported driver having the arm 16, of the spring-actuated slide F, having the pin 27, substantially as described.

4. In a button-setting instrument, the combination, with the fastener-driving member thereof and with the slide having the longer front plate, 20, the shorter back plate, 24, and the opening 21, formed in said plate 20, of the driver pivoted to said slide and constructed and arranged to have a lateral movement under said shorter plate, substantially as described.

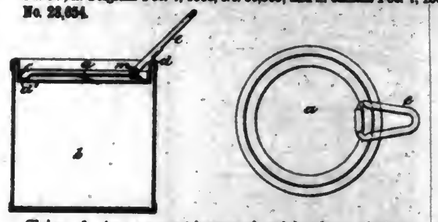
5. In a button-setting instrument, the combination, with the member C, grooved to carry the slide F and having the chamber or recess 9, and with the slide F, having guides 3 and 5 and having the arm 11, of the spring 10, set in said recess and actuating said slide through said arm, substantially as shown and described.

6. In a button-setting instrument, the combination, with the member C, grooved to receive spring-actuated slide F and having slot 6, of the slide F, constructed substantially as described and having a stop-pin, 27, below said member, and the driver N, pivoted in said slot 6 and having the arm 16, substantially as described, and for the purpose specified.



397,389. IMPLEMENT-JOINT. FRANCIS H. RICHARDS, Hartford, Conn. Filed July 6, 1888. Serial No. 279,237. (No model.)

Claim.—1. The implement-joint herein described, consisting of two members pivotally connected and having a central bolt uniting them together, one member having a groove and the other member a raised track fitting into said groove, the groove and track being circular and concentric to said bolt, all substantially as described.

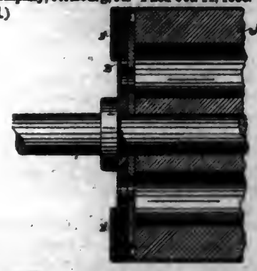


2. The implement-joint herein described, consisting of the members A B, having, respectively, the groove 50 and track 51 and bored to receive the bolt 52, combined with the bolt 52, turning freely in the one member and screwed into the other, and having the check-nut, all substantially as shown and described.

397,390. TIRE APPARATUS. PETER SCHLOSSER, Defiance, Ohio. Filed June 28, 1888. Serial No. 278,464. (No model.)

Claim.—The combination, in a tire apparatus, of the table E, having racks D, the base B, having hollow posts C, receiving the racks D, and the toggle-joints connected to the base and table, with the shaft G, mounted on the posts C, and having the pinions F, crank-arms *g*, and lever G', and the connection between the toggle-joints and the arms *g*, substantially as described.

397,391. LID OR COVER FOR METALLIC OR OTHER RECEPTACLES. WILLIAM T. SEYMOUR, Stockton-on-Tees, County of Durham, England. Filed Mar. 24, 1888. Serial No. 268,445. (No model.) Patented in England Feb. 7, 1887, No. 1,876; in France Aug. 12, 1887, No. 185,201; in Germany Aug. 26, 1887, No. 43,733; in India Jan. 10, 1888, No. 97; in Belgium Feb. 7, 1888, No. 80,565, and in Canada Feb. 7, 1888, No. 23,654.



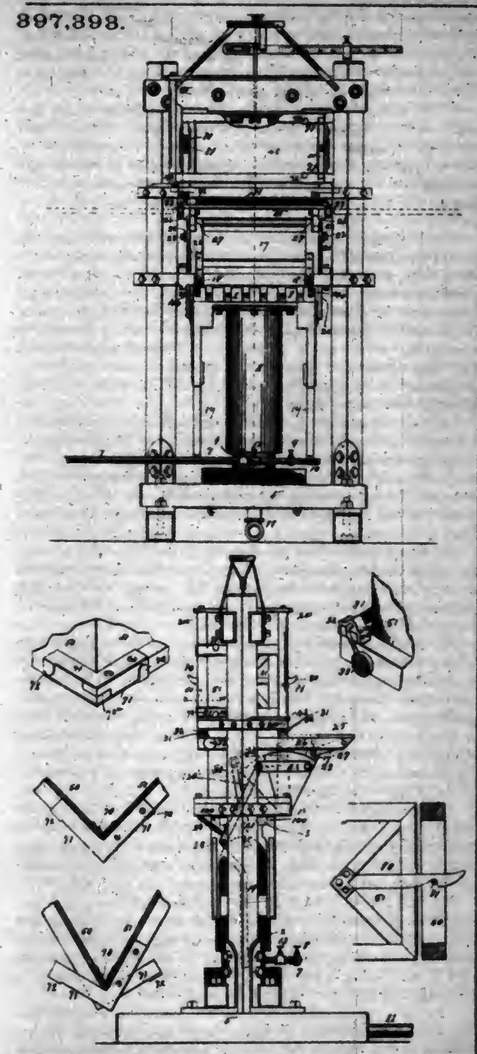
Claim.—1. As a new and improved article of manufacture, a can or box having its sides continued above its top, a seat formed in the top thereof, and a cover resting therein provided with a lever pivoted thereto, whereby the said continued portion of the sides of the said can or box acts as a fulcrum for the said lever in the operation of the same.

2. As a new and improved article of manufacture, a can or box having its sides continued above its top and strengthened, a conically-shaped seat formed in the top thereof, and a cover resting therein provided with a lever attached thereto and bearing upon the said strengthened portion of the sides, whereby the cover may be withdrawn from its seat.

3. The combination, in a cover, of a flange, *a'*, extending over the outer periphery thereof, a bar pivoted to the cover, the outer end of the said bar being held by the said flange, and a lever pivotally attached to said bar, as and for the purpose described.

4. The combination of a cover having a flange, *a'*, extending over the outer periphery thereof, a bar pivoted thereto, the outer end of the said bar being held by the said flange, a can having its sides continued above its top and strengthened, a seat formed in the top of the said can in which the said cover rests, and a lever pivotally attached to the said bar and adapted to raise the cover, as and for the purpose described.

397,392. ARMATURE FOR DYNAMO-ELECTRIC MACHINES. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Oct. 11, 1888. Serial No. 287,845. (No model.)



Claim.—1. The combination of an armature-core, two sets of winding-clips for receiving the two sets of coils, one set of clips being secured to the body of the armature, and a plate at each end of the armature to which the other sets of winding-clips are secured.

2. In an armature for electric machines, a cylindrical core of soft iron, a set of armature-coils wound along the face and down upon the ends of the core, overhanging clips for retaining the coils in position secured to the ends of the armature, plates covering the clips and the wire upon the ends of the armature, a second set of armature-coils wound upon the face of the armature in the spaces left vacant by the first set, and down upon the outer surfaces of the respective insulating-plates, and winding-clips secured to the respective plates for retaining the second set of coils in position.

397,393. BALING-PRESS. HIRAM H. SHADER, Little Rock, Ark. Filed June 14, 1888. Serial No. 277,043. (No model.)

Claim.—1. In a baling-press, the combination of the platen, the outer movable cylinder to which the platen is secured, the inner stationary cylinder, a fixed piston located on the stationary cylinder within the movable cylinder, a pipe for admitting steam or compressed air into the chamber of the movable cylinder between the platen and

397,393.

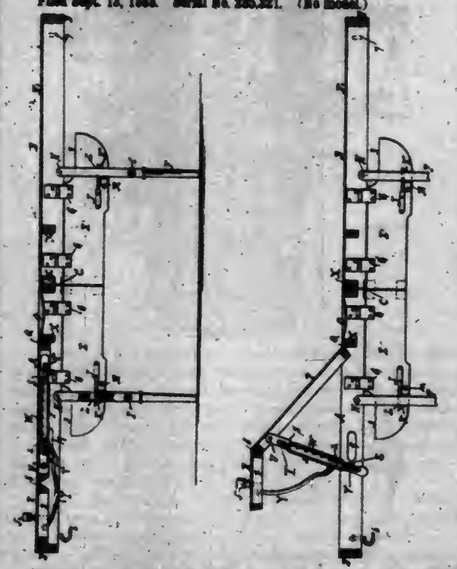
piston, and a receiving and baling chamber over the platen, substantially as and for the purpose set forth.

2. In a baling-press, the combination of a platen, movable cylinder to which the platen is secured, and a fixed piston, a pipe for admitting steam or compressed air into the chamber between the platen and piston, a receiving and baling chamber over the platen, and a tube for supporting the piston, and which forms a chamber for the compressed air, substantially as and for the purpose set forth.

3. In a baling-press, the combination of a platen secured to a movable cylinder, a receiving-chamber over the platen, a hinged door to the receiving-chamber, a cam on the cylinder, and mechanism located between the cam and door, whereby the latter is automatically closed as the platen rises, substantially as and for the purpose set forth.

4. In a baling-press, the combination of the platen, a movable cylinder to which the platen is secured, a receiving-chamber over the platen, a hinged door to the chamber, and means for automatically closing the door, consisting of a cam on the cylinder, a pivoted spring-lever, against the lower end of which the cam bears, and a link connecting the upper end of the lever to the door, substantially as and for the purpose set forth.

5. In a baling-press, the combination of a platen secured to an operating-cylinder, the receiving-chamber over the platen, hinged door to the receiving-chamber, means, substantially as described, for closing the door as the platen rises, a sliding table, and links connecting the table to the door, whereby the table is moved in and out as the door is closed and opened, substantially as and for the purpose set forth.



6. In a baling-press, the combination of the platen, receiving-chamber over the platen, and baling-chamber over the receiving-chamber, consisting of sides having ends secured thereto and hinged to the frame so as to be swung out or opened horizontally to expose the baling-chamber, substantially as and for the purpose set forth.

7. In a baling-press, a baling-chamber composed of sides hinged to the frame of the press so as to be opened out horizontally to expose both sides of the baling-chamber, and ends hinged to the sides, substantially as and for the purpose set forth.

8. In a baling-press, the baling-chamber composed of sides hinged to the frame of the press, ends hinged to the sides, and plates 71, having lugs 72 secured to the sides and ends, substantially as and for the purpose set forth.

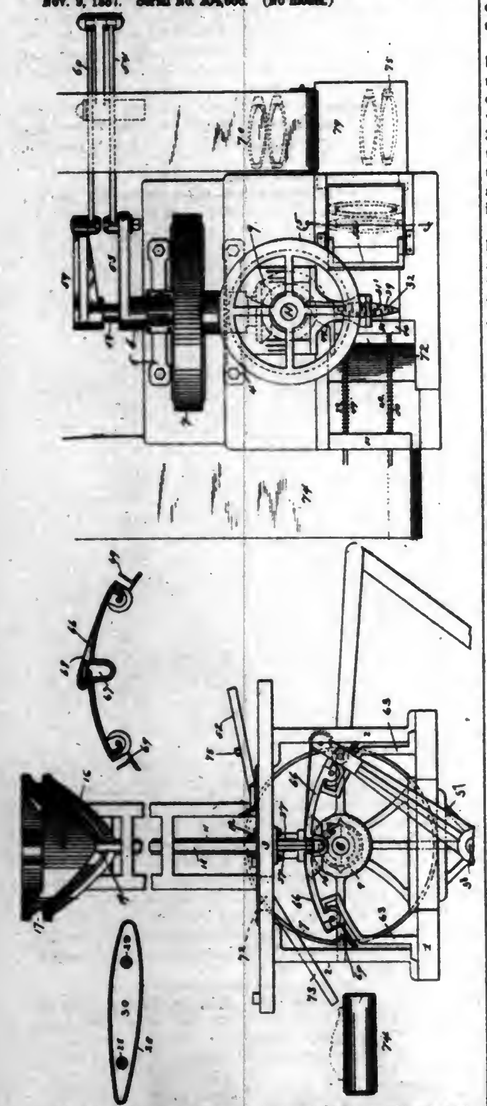
9. In a baling-press, a baling-chamber composed of sides hinged to the frame of the press and ends hinged to the sides, the ends being provided with hooks 80 to engage pins 81 on the sides, substantially as and for the purpose set forth.

397,394. EMBALMING-BOARD. LEVI K. SWEET, New York, N. Y. Filed Sept. 13, 1888. Serial No. 285,221. (No model.)

Claim.—1. The divided embalming-board A B, and the folding legs F, pivoted to the main frame D and adapted to be folded up within the frame, in combination with the folding divided side rails, E E', hinged to the frame D and provided with recesses 3 3 and spring-catches J, substantially as shown and described.

2. The combination, with an embalming-board and its frame, of the adjustable hinged back P, the swinging ratchet-frame T, pivoted to the back and having ratchets S and W, the stationary detent V, secured to the frame of the board, the adjustable hinged head-piece R on the back, and the detent Y, pivoted to the head-piece, substantially as described.

397,395. SPEED-INDICATOR. EUGENE C. SMITH, St. Louis, Mo., assignor of one-half to Clifton C. Scudder, same place. Filed Feb. 13, 1888. Serial No. 263,856. (No model.)



Claim.—1. A speed-indicator having a rotary portion, and a soft friction-surface at the outer end of said rotary portion adapted for application to the object whose speed is to be determined, said friction-surface being transverse to the axis of rotation of said object, substantially as set forth.

2. A speed-indicator having a rotary portion, a retreating pin whose point is on the axis of rotation of said rotary portion, and a

soft friction-surface at the end of the rotary portion through which the retreating pin passes, substantially as set forth.

3. The combination of the piece 8, having a socket, 7, containing a spring and giving bearing to a center pin, against which the outer end of the spring bears, and a soft friction-disk surrounding the center pin, substantially as and for the purpose set forth.

397,396. **MACHINE FOR BUNCHING CIGARS.** JAMES E. SMITH, New York, N. Y., assignor, by direct and mesne assignments, of two-thirds to Adolph Moncels and Benjamin Lichtenstein, same place. Filed Nov. 9, 1887. Serial No. 254,606. (No model.)

Claim.—1. In a cigar-bunching machine, the combination of a main table having an opening therein, as 32, a reciprocating carriage sliding on the table and remaining normally at rest while in juxtaposition to the opening therein, an open mold independent of the carriage and adapted to be fed thereto while the carriage is at rest, so that the mold aligns with the opening in the table, said mold being detachably connected to the carriage to be automatically discharged therefrom at the limit of movement of the carriage away from the opening, a vertically-reciprocating plunger adapted to pass through the mold and opening, and mechanism for moving the carriage and mold away from the opening to discharge the mold from the carriage, substantially as described.

2. In a cigar-bunching machine, the combination of a table having an opening therein, as 32, a reciprocating carriage working on said table, a feeding-table, an open mold adapted to slide on the feeding-table and rest on the carriage in line with the opening in the table, and mechanism for moving the carriage to convey the mold away from the opening, substantially as described.

3. In a cigar-bunching machine, the combination of a table having an opening, 32, and a discharge-opening, 72, at one side of said opening 32, a reciprocating carriage, an open mold normally held by the carriage over the opening 32, a plunger adapted to pass through the mold and opening 32, and mechanism for moving the carriage to convey the mold to the discharge-opening 72, substantially as described.

4. In a cigar-bunching machine, the combination of a main table having an opening, 32, therein, a reciprocating carriage sliding on the main table, an independent open mold adapted to be placed in the carriage, a rolling-table beneath the main table and having a transverse pocket or depression therein arranged in line with the opening 32, an apron connected to the rolling-table, a rocking arm having the pressure-rollers, and a hollow plunger adapted to pass through the aligned mold and opening to receive the contents of the mold and deposit the same on the apron within the depression of the rolling-table, substantially as described.

5. In a cigar-bunching machine, the combination of a main table having an opening, 32, a reciprocating carriage sliding on the table, an independent open mold adapted to be fed to the carriage when the latter is at rest, devices on the carriage for detachably holding the mold thereon, a plunger, and mechanism for moving the carriage away from the opening 32 to discharge the mold at its limit of movement away from said opening, substantially as described.

6. In a cigar-bunching machine, the combination of a carriage having the retaining-springs on the opposing edges of the sides thereof, an open mold adapted to be placed in the carriage and be held in position therein by the springs, a plunger, and devices for reciprocating the carriage, substantially as described.

7. In a cigar-bunching machine, the combination of a main table having an opening, 32, and a discharge-opening at one side thereof, a reciprocating carriage sliding on the table and having the retaining-springs arranged to receive a mold between the same, an independent open mold adapted to be fed to the carriage when the latter is at rest and to be held in line with the opening 32 by the retaining-springs, and devices for forcing the carriage away from the opening 32 to discharge the mold into the discharge-opening, into which it drops by gravity, substantially as described.

8. In a cigar-bunching machine, the combination of a table having an opening therein, a plate fixed to the table over the opening and having the projecting stops 33 and 34 at one side thereof, a carriage, a mold adapted to be placed in the carriage, a plunger, and mechanism for reciprocating the carriage, substantially as described.

9. In a cigar-bunching machine, the combination of a table having an opening therein, a carriage fitted to slide on the table, an open mold, devices for holding the mold in the carriage and in line with the opening in the table, the yielding stops 33 and 34, arranged at one side of the opening in the table to prevent retrograde movement of the mold, and a plunger, substantially as described.

10. In a cigar-bunching machine, the combination of a table having an opening therein, a carriage, a mold, a reciprocating plunger adapted to pass through the mold and opening in the table, and the spring-fingers supported below the table and arranged across the opening therein to enter the plunger as it descends and force the filler therein, substantially as described.

11. In a cigar-bunching machine, the combination of a table having an opening therein, a carriage, an open mold, a reciprocating plunger having an open-bottom shell at its lower end, and a series of fingers supported on the table below the opening therein and arranged across the latter in the path of the plunger, the two series of fingers being alternately arranged with respect to each other and carried by independent supports on opposite sides of the opening, substantially as described.

12. In a cigar-bunching machine, the combination of a table having an opening therein, a carriage, an open mold, a reciprocating plunger provided at its lower end with a shell having vertical incisions around its edges, and a series of fingers arranged across the opening in the table and adapted to enter the incisions in the shell as the plunger descends, substantially as described.

13. In a cigar-bunching machine, a reciprocating plunger having a shell at its lower end, said shell being shaped to conform substantially to the longitudinal contour of a bunch and having the vertical incisions at its lower edge, substantially as described.

14. In a cigar-bunching machine, a reciprocating plunger having an open-bottom shell formed with vertical incisions which extend upwardly from the open end thereof, substantially as described.

15. In a cigar-bunching machine, the combination of a table having an opening therein, the depending slotted guides fixed to the table on opposite sides of said opening, the spring-fingers fitting in the slots of said guides and extending across the opening, a carriage, an open mold, and a plunger, substantially as described.

16. In a cigar-bunching machine, the combination of a table having an opening, 32, and a discharge-opening, 72, at one side thereof, a reciprocating carriage, an open mold adapted to be held in the carriage, an inclined feeding-table at one side of the opening 32, upon which the molds are placed, a discharge table or chute, 73, on the opposite side of said opening and below the discharge-opening, and mechanism for reciprocating the carriage, substantially as described.

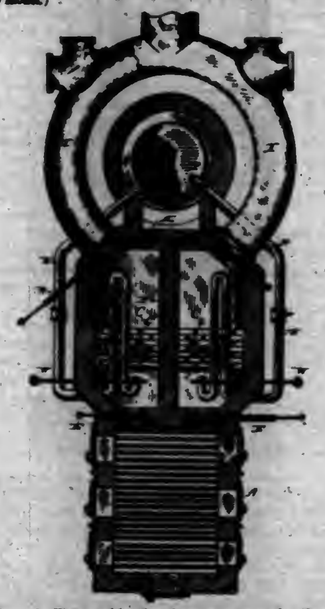
17. In a cigar-bunching machine, the combination of a table having the openings 32 and 72, a reciprocating carriage having a laterally-extended projection at one side, an open mold adapted to enter the carriage, a vertical shaft having a cam, 12, for striking the projection on the carriage to force the latter away from the opening 32, a plunger operated by a cam at the upper end of the vertical shaft, and springs for returning the carriage in juxtaposition to the opening 32 after the empty mold has been discharged through the opening 72, substantially as described.

18. In a cigar-bunching machine, the combination of a table having the openings 32 72 arranged in different vertical planes, an open mold, a carriage having the side pieces between which the mold is fitted when in line with the opening 32, a plunger, devices impinging against the mold and connected to the carriage for holding the mold in position therein while being conveyed from the opening 32 to the discharge-opening 72, and devices for moving the carriage and mold over the discharge-opening 72, through which opening the empty mold falls by gravity when in line therewith, substantially as described.

19. In a cigar-bunching machine, the combination of a main table having an opening, 32, therein, a stationary rolling-table beneath the main table and having a transverse depression or pocket arranged in line with the opening, a reciprocating carriage having an open mold, an apron connected to the rolling-table, a rocking arm having two spaced pressure-rollers, over which the apron passes, a hollow plunger adapted to pass through the mold and opening 32 to receive the contents of the mold, and a movable platen housed within the hollow plunger and adapted to positively eject the contents of the plunger when the latter enters the transverse depression of the rolling-table, substantially as described.

20. In a cigar-bunching machine, the combination, with the main table having an opening therein, the rolling-table having an apron, a carriage carrying an open mold, and a rocking arm provided with the pressure-rollers, of a hollow reciprocating plunger, a movable platen housed within the plunger, and a rod connected to the platen and controlled by suitable devices to depress the platen as the plunger rises and positively eject the contents of the same, substantially as described.

21. In a cigar-bunching machine, the combination of the main and rolling tables, the main table having a vertical opening therein, a carriage having an open mold on the main table, an apron on the rolling-table, a rocking arm having pressure-rollers, and a hollow plunger having a movable follower or platen therein for positively ejecting the filler therefrom upon the rolling-apron, substantially as described.



22. In a cigar-bunching machine, the combination, with a main table having an opening therein, a carriage, an open mold, a rolling-table provided with an apron, and a rocking arm having the spaced pressure-rollers, of a hollow plunger having a series of vertical incisions in its lower edge, a series of fingers arranged below the opening in the main table in the path of the plunger and adapted to enter the incisions as the plunger descends, a movable platen normally housed with the plunger at a point above the termination of the incisions thereof, a rod connected to the platen, and devices for retarding the upward movement of the rod and platen when the plunger is elevated to thereby depress the platen upon the tobacco below the same and positively eject it from the plunger, substantially as described.

23. In a cigar-bunching machine, the combination of a hollow reciprocating plunger having an open lower end, a fixed guide in the plunger, a movable platen housed therein, a rod connected to the platen, and a spring-cap secured to the machine and normally pressing on the rod to retard the upward movement thereof and depress the platen in the plunger as the latter begins its upward movement, substantially as described.

24. In a cigar-bunching machine, the combination of a table, 3, having an opening therein, a rolling-table provided with a transverse depression in line with the opening, an apron connected at its ends to the rolling-table, a rocking arm carrying a pair of spaced pressure-rolls which are adapted to ride on the rolling-table beneath the apron, and a plunger, substantially as described.

25. In a cigar-bunching machine, the combination of the main and rolling tables, the main table having a vertical opening therein, a carriage, an open mold, an apron connected to the rolling-table, a plunger, a rock-shaft journaled beneath the rolling-table and carrying a swinging arm, a main driving-shaft, and devices intermediate the main driving-shaft and rock-shaft for transmitting and conveying the motion of the main shaft to the rock-shaft, substantially as described.

397,397. **APPARATUS FOR THE MANUFACTURE OF GAS.** ROLAND H. SMITH, Pittsburg, Pa. Filed Dec. 15, 1887. Serial No. 258,609. (No model.)

Claim.—1. The combination, in a gas-generating furnace, of the furnace, the horizontal generating-chambers, and the exhaust-pipe leading to the holder, the said generating-chambers being provided with valve-passages leading from the fuel-chamber and to the smoke-stack, and the exhaust-pipe being provided with suitable valves, whereby the generating-chambers may be alternately heated and alternately employed for the generation of the gas in an uninterrupted volume, substantially as specified.

2. In a gas apparatus, the combination of a furnace, the horizontal generating-chambers communicating by valved passages with the fuel-chamber of the said furnace and the smoke-stack, the exhaust-pipe communicating with the generating-chambers by means of valved passages, and the tubular sections B and H and their covers, these tubular sections leading into the furnace and generating-chambers, substantially as and for the purpose set forth.

3. In a gas-generating apparatus, the combination of a furnace, the generating-chambers communicating with the said furnace by means of valved passages, the exhaust-pipe communicating with the respective generating-chambers by means of valved passages, the smoke-stack communicating with the generating-chambers by means of valved passages, the steam-boiler in the smoke-stack, and the steam-pipe R, leading from the boiler to the respective generating-chambers, substantially as described.

4. The combination of a furnace, gas-generating chambers communicating with the furnace by means of valved passages, the exhaust-pipe communicating with the generating-chambers by means of valved passages, the smoke-stack communicating with the generating-chambers by means of valved passages, a steam-generator, and steam-pipes leading from the generator into the respective generating-chambers, the portions of the pipes within the generating-chambers being coiled back and forth, substantially as described.

5. The combination of a furnace, independent gas-generating chambers communicating with the furnace by means of valved passages, an exhaust-pipe communicating with the generating-chambers by means of valved passages, a smoke-stack also communicating with the generating-chambers by means of valved passages, the said generating-chambers each being provided with outlet-passages for the refuse, and slanting hearths leading to the passages, substantially as described.

397,398. **AUTOMATON.** WILLIAM G. STRONG, New York, N. Y., assignor to James William Patterson, same place. Filed Feb. 16, 1888. Serial No. 264,225. (No model.)

397,398.

Claim.—1. An automaton having a pivoted arm carrying a box, dice in said box, and a projecting operating-arm connected to the upper part of said pivoted arm for oscillating the same, whereby the dice are thrown from said box, said parts being combined substantially as described.

2. An automaton having a pivoted forearm carrying a box containing dice, and a rod connected to said forearm for imparting an oscillating motion thereto, so as to shake said dice within said box, said parts being combined substantially as described.

3. An automaton having a pivoted arm with a forearm pivoted therein, the forearm carrying a box containing dice, a projecting operating-arm connected to the upper part of said arm for oscillating the same, and a rod connected to said forearm, said parts being combined substantially as described.

4. An automaton having a pivoted arm carrying a box containing magnetic dice, a projecting arm attached to the upper part of said pivoted arm for oscillating the same, a table with a piece of magnetic material therein, and an electro-magnet for magnetizing said magnetic material, said parts being combined substantially as described.

5. An automaton having a pivoted arm carrying a box containing magnetic dice, a projecting arm connected to the upper part of said pivoted arm for oscillating the same, a table with a piece of magnetic material therein, an electric battery and circuit including an electro-magnet, a wheel with a contact-spring, and electric contact-surfaces having an insulated space, said parts being combined substantially as described.

6. An automaton having an arm with a forearm pivoted therein and carrying dice, a projecting arm for oscillating said arm and a rod for oscillating said forearm, a pivoted arm with a magnetic hand, and an electric battery in circuit with an electro-magnet for energizing said magnetic hand, said parts being combined substantially as described.

7. An automaton having a starting mechanism consisting of a tube adapted to receive a coin, a pocket, a chute leading from said pocket, a split pocket, a weighted lever to which said split pocket is attached, and an upright carrying an electrical contact-maker secured to said lever, said parts being combined substantially as described.

8. An automaton having a starting mechanism consisting of a pocket, a coin-retaining lever in said pocket, a chute leading from said pocket, a weighted lever with a split pocket at one end, and provided with an upright having an electric contact-maker, said parts being combined substantially as described.

9. An automaton having a starting mechanism consisting of a pocket with a coin-retaining lever, a chute, a weighted lever with standard thereon, a split pocket having a lug on its pivoted part, the fixed part of said pocket being secured to said weighted lever, a spring connected to said standard and lug, and an upright on said lever having an electrical contact-maker, said parts being combined substantially as described.

10. An automaton having a tube, a pocket with chute leading therefrom, a split pocket with the lug 16, a starting-lever to which said split pocket is attached, the electrical contact-maker 1, secured to said starting-lever, the star-wheel K, a train of gearing, and the wheel 10, having on its upper face concentric cams, a pivoted arm with forearm carrying box with dice, and rods, arms, cords, and levers connected to said arm and operated by said cams for oscillating the arm, substantially as described.

11. An automaton having a starting mechanism consisting of a tube, a pocket with coin-retaining lever F therein, a chute, the split pocket E E', the pivoted starting-lever D, having the part E of the split pocket secured thereto, and part E' being pivoted to part E and having the lug 16, the standard 18, secured to the lever D, spring 17, connected to standard 18 and lug 16, and the springs 20 and 21, bearing against the lever F, said parts being combined substantially as described.

12. In an automaton, a tube with pocket, a chute leading therefrom, a starting-lever with split pocket having the lug 16 secured thereto, the contact-maker 1, secured to said starting-lever, the standard 8^a, with contact-maker 2, electric batteries and connecting-wires, and the star-wheel K, said parts being combined substantially as described.

13. In an automaton, a starting-lever with split pocket having the lug 16, the contact-maker 1, secured to said starting-lever, a standard with contact-point 2, an electric motor, the star-wheel K, the magnet M, with armature-lever A', and battery B A, with circuit, said parts being combined substantially as described.

14. The combination of the rotary wheel K, the train of gearing 7, 8, and 9, the cog-wheel 10, with concentric cams thereon, pivoted levers operated by said cams, and the arms O O', operated by said levers, said parts being combined substantially as described.

15. In an automaton, the pivoted arm O, having a box carrying dice, the arm 31, connected to said arm O, a cord and a rod connected to said arm 31 and to a pivoted lever, and the wheel 10, having on its upper face a cam adapted to operate said pivoted lever, said parts being combined substantially as described.

16. The pivoted arm O, having the forearm 29 pivoted thereon and carrying the hand H, with the cup having dice therein connected to said arm 29, the rod 32, pivotally connected to said arm 30, the pivoted lever 26, the rod *b*, connected to said lever and to pivoted lever *b'*, the wheel 10, having on its upper face a cam adapted to operate the lever *b'*, and a motor for operating said wheel 10, said parts being combined substantially as described.

17. The pivoted arm O', with metallic hand H', in combination with the lever R, secured to said arm O', and a cord, *y*, the rod *d*, secured to cord *y* and to pivoted lever *d'*, and the wheel 10, with cam thereon adapted to operate said wheels, said parts being combined substantially as described.

18. The combination of the arm O', having the metallic hand H', with the cord *f*, secured to said arm, the rod *e*, attached to said cord, and a pivoted lever adapted to impart a rising motion to said rod *e*, whereby the said arm is oscillated, substantially as and for the purpose set forth.

19. The wheel 10, having concentric electric surfaces a^4 a^5, with an insulated space between the same, a motor for said wheel, a pivoted arm with a box carrying dice, arms, levers, and rods connected to said pivoted arm and operated by cams on said wheel, a table with a piece of magnetic material located therein, and a magnet for magnetizing said magnetic material, said parts being combined substantially as described.

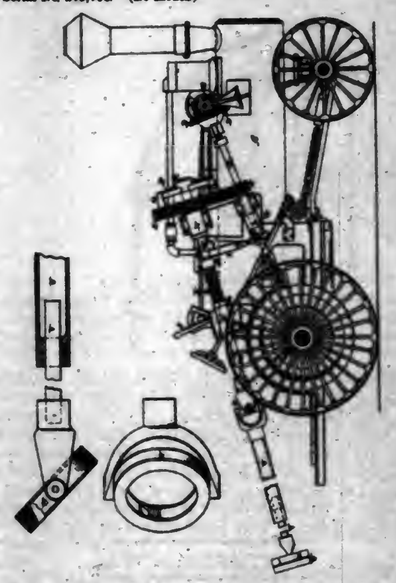
20. An automaton having a head connected to the rod L, the coiled spring V, with bearing 35, attached to the frame N, the arm 34, attached to the rod L, the cord Z, running over a pulley and attached to the pivoted lever *e*, the wheel 10, with cam on upper surface thereof, adapted to actuate said lever *e*, and a motor for said wheel, said parts being combined substantially as described.

21. An automaton with arm having a forearm pivoted therein, a box carried by said forearm and containing dice, a rod connected to said forearm for oscillating the same, and the spring 25, secured to the forearm and to the frame of the automaton, said parts being combined substantially as described.

22. An automaton having a starting and stopping mechanism controlled by the weight of a coin, arms pivotally connected to a frame, one of said arms having a pivoted forearm carrying a box with dice and the other arm having a magnetic hand for restoring said dice to the box, levers, cords, and rods connected to said arms, pivoted levers operating said rods, a wheel with cams operating said pivoted levers, a motor for operating said wheel, a table with a piece of iron therein on which dice is thrown, and a magnet for magnetizing said piece of iron at predetermined periods, said parts being combined substantially as described.

23. An automaton having a pivoted arm with a forearm pivoted therein and carrying a box containing dice, a projecting arm for oscillating said arm and a rod for oscillating said forearm, a pivoted arm with a magnetic hand, an electric battery, wires and magnet for energizing said magnetic hand, and rods, cords, and levers for operating said magnetic hand, said parts being combined substantially as and for the purpose set forth.

397,399. LATCH FOR MATCH-FLASKS. MARTIN R. SPRINGER, Indianapolis, Ind. Filed Nov. 15, 1888. Serial No. 290,904. (No model.)



Claim.—1. The combination, with the hinged frames of a match-flask, of the plates on the one side of each frame, having apertured angularly-bent ends, and carrying spring-actuated latches, and the plates on the adjacent sides of said frames, having similarly-bent ends carrying catches, as and for the purpose set forth.

2. The combination, with the hinged frames of a match-flask, of the plates on two adjacent sides thereof, having abutting angularly-bent ends, one of which has an aperture and the other a catch adapted to pass through said aperture, and the oppositely-situated spring-actuated latches, substantially as described.

3. The combination, with the hinged frames of a match-flask, of the plates on one side thereof, having angularly-bent ends with apertures therein and ears at the rear ends thereof, the spring-actuated latches adapted to be forced against one of said ears, and the plates on adjacent sides of the frames, having similarly-bent ends abutting against the bent ends of the aforesaid plates, and having catches passing through the apertures in the latter plates, substantially as described.

4. A latch or holder for match-flasks, comprising a plate having an outer bent end with a catch, and an adjacently-situated plate having a spring-latch and an outward-bent end with an aperture therein, through which the said catch passes, adapted to abut against the aforesaid plate and form a miter therewith, substantially as described.

397,400. STEAM-POWER APPARATUS FOR SCREWING PIPES TOGETHER. LEWIS A. STANFORD, Bradford, Pa. Filed June 1, 1888. Serial No. 275,788. (No model.)

Claim.—1. The combination, with an engine, of a driving-shaft secured thereto and provided with a driving-pinion, the driven shaft provided with a wheel to gear with the said pinion, and a cap or clutching device which is to be applied to the pipe or pipe-coupling, and which is loosely connected to the driven shaft, substantially as shown.

2. The combination of a traction-engine with the shaft E, which is made in two parts and provided with the collar G, a clutch, and a lever for moving the clutch, with a pinion, a driven shaft, a wheel applied to the said shaft, and a cap or clutching device loosely connected to the said driven shaft, the shaft E being adapted to both propel the engine and to operate the driven shaft, substantially as described.

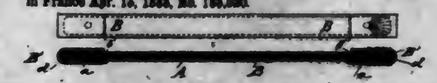
3. The combination, with the engine, of the shaft E, applied thereto and provided with a pinion, the driven shaft provided with arms at one end, and which is adapted to have an endwise movement, the wheel applied to this driven shaft and provided with projections to engage with the arms, and a cap or clutching device which is loosely connected to said shaft, substantially as set forth.

4. The combination of the engine, the shaft E, provided with a pinion, H, the wheel which meshes with the pinion, and the driven shaft which has an endwise movement through its boxes and the wheel placed thereon, the projections secured to the wheel, the arms upon the end of the shaft, the collar upon the shaft, the spring for returning the shaft to position after having been moved, and the cap or clutching device which is loosely connected to the shaft, substantially as specified.

5. The combination of the shaft M and its operating mechanism, the universal joint T, the shaft U, the extension-rod V, and the clutching device connected to its lower end, substantially as shown.

6. The combination of a clutching device, W, connected by a universal joint with the rod V, and a revolving shaft connected with the rod V for causing the clutch to revolve, substantially as described.

7. The combination of the shaft M, the universal joint T, the hollow shaft U, the extension-rod V, a universal joint at the lower end of the rod V, and a clutching device that passes over the end of a pipe or pipe-coupling, substantially as set forth.



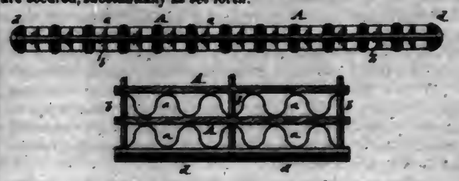
8. The combination of the clutching device W, provided with dogs which engage with the pipe or coupling, the extension-rod V, and a universal joint between the rod and the clutch, substantially as specified.

9. The combination of the shaft M, a universal joint, T, the shaft U, a connecting-rod which loosely makes connection with the shaft U and which slides back and forth in the shaft, a universal joint at the end of the rod, and the clutching device, substantially as shown.

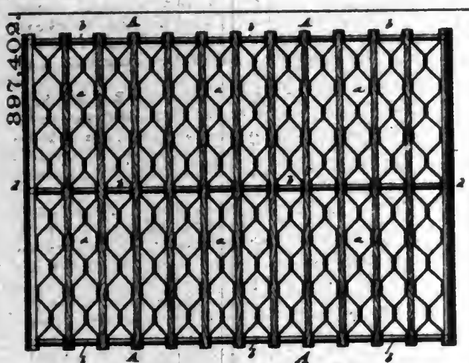
10. The combination of the clutching device W, provided with recesses Y on its inner side, the automatically-acting ratchets A', the operating-rod for causing the clutching device to revolve, and the universal joint between the clutching device and the rod, substantially as described.

11. The combination of the driving-shaft E, a pinion applied thereto, the shaft M, provided with the wheel L, for meshing with the pinion, a universal joint, T, the shaft U, the rod P, clutch W, provided with ratchets A', and a universal joint between the rod V and the clutch, substantially as set forth.

397,401. CORSET-STAY. REINHOLD TREILER, Lucerne, Switzerland. Filed Aug. 13, 1888. Serial No. 283,008. (No model.) Patented in France Apr. 13, 1888, No. 186,580.

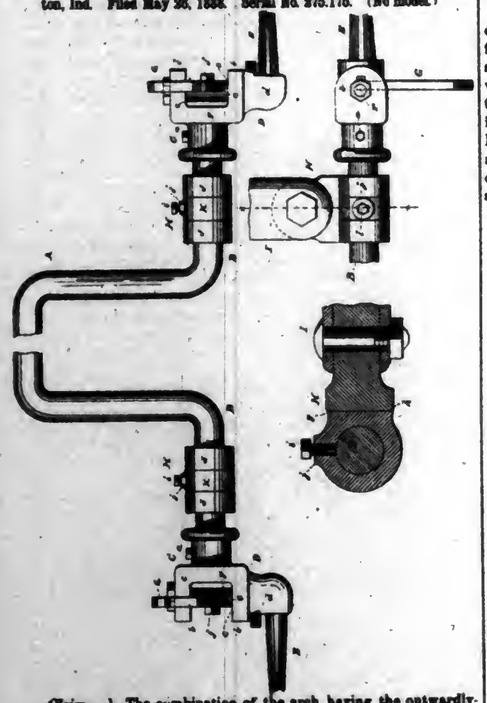


Claim.—1. The herein-described stay for corsets, consisting of a stiffener of suitable material having a covering of textile fabric upon both faces, the ends of which covering extend beyond and fold over the ends of the stiffener in two thicknesses, substantially as and for the purpose set forth.



2. In a corset-stay, the combination, with the stiffener having apertures at each end, of a covering of textile fabric provided at its ends with transverse slits, through which the apertured ends of the stiffener extend, the ends of which covering extend beyond and fold over the ends of the stiffener in two thicknesses, substantially as and for the purpose specified.

397,402. DOOR-MAT. SIMON TOPPLER, New York, N. Y. Filed Oct. 1, 1887. Serial No. 251,191. (No model.)



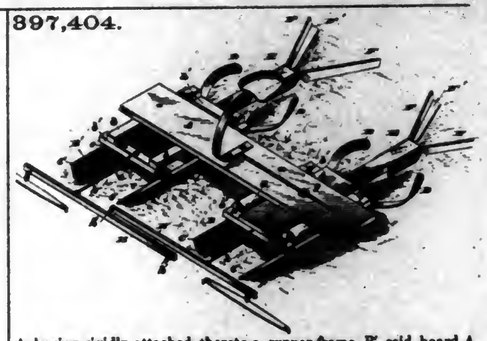
Claim.—A door-mat composed of a series of bent strips of hoop-iron, wooden strips alternating therewith, said strips projecting beyond the edges of the iron strips, connecting-rods passed through holes of the iron and wooden strips, and end bars to which the connecting-rods are secured, substantially as set forth.

397,402.

397,403. CULTIVATOR ATTACHMENT. BENTON WAGNER, Milton, Ind. Filed May 26, 1888. Serial No. 275,175. (No model.)

Claim.—1. The combination of the arch having the outwardly-turned ends B, the spindle-head D, having the lugs provided with the vertical aligned openings, the sockets C on said spindle-heads engaging the outwardly-turned ends B, and the set-screw, substantially as specified.

2. The combination, with the arch, of the wheel-spindle having the enlarged head and the socket, the journal-bolt passing through vertical aligned openings in the spindle-head and having the recess *e*, and the draft-bar having its rear squared end seated in said recess and secured by a set-screw, substantially as specified.



397,404. CULTIVATOR. THOMAS S. WARNER, Frankfort, Kans. Filed Nov. 1, 1888. Serial No. 289,769. (No model.)

Claim.—1. In a lister-cultivator, the combination, substantially as described, of a platform, a runner-frame, B', rigidly secured to one end of said platform, a runner-frame, B, provided at top with longitudinal rollers to support the other end of the platform, and means for connecting the frame B loosely to the platform to permit of the automatic lateral movement of said frame with relation to frame B'.

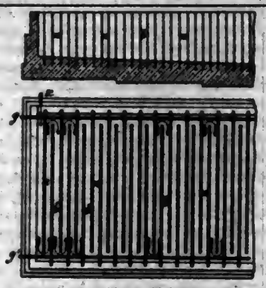
2. In a lister-cultivator, the combination, with the frame, runners adjustably secured thereto so that they will incline inwardly, blades D D, secured to the rear ends of the runners, and a rearwardly-extending beam carrying diverging blades F', substantially as shown, and for the purpose set forth.

3. The combination, in a lister-cultivator, of a board or platform,

397,404.

A, having rigidly attached thereto a runner-frame, B', said board A being provided with a slot for adjustably securing a runner-frame, B, thereto, said runner-frame having rollers G G, substantially as shown, and for the purpose set forth.

4. In a lister-cultivator, the runner-supporting frames B and B', one of said frames being adjustably secured to a slotted board or platform, A, said frames being provided with runners C, the rear ends of said runners having attached thereto blades D, the front edges of which adjacent to the runners are bent downwardly to enter the soil, the rear ends of said blades being curved upwardly to throw the soil inwardly, and rearwardly-extending beams F, carrying runner-blades F F', the rear portions of which are bent so as to provide horizontal and vertical portions, said blades diverging rearwardly from each other and the whiffletree attachments, the parts being organized substantially as shown, and for the purpose set forth.



397,405. PROCESS OF FORMING BACKBONES AND REAR FORKS OF BICYCLES FROM A SINGLE BLANK. GEORGE T. WARWICK, Springfield, Mass., assignor to the Warwick Cycle Manufacturing Company, same place. Filed Mar. 23, 1888. Serial No. 268,297. (No model.)

Claim.—The within-described process for making the backbone and the rear-wheel fork of a bicycle from a single piece of sheet metal, which consists in cutting a blank of proper form from said sheet metal, having a part to form said backbone and parts to form the two legs of said fork, and then imparting a cylindrical tubular form to said backbone part and rigidly uniting the meeting edges thereof, and imparting a curved form in cross-section to said fork parts, and finally perforating the fork-legs to receive an axle and shaping and finishing the sheet-metal piece so made, substantially as set forth.

397,406. WITHDRAWN.

397,407. APPARATUS FOR PURIFYING SEWAGE BY ELECTRICITY. WILLIAM WEBSTER, Jr., Lee Park, Lee, County of Kent, England. Filed Apr. 18, 1888. Serial No. 271,104. (No model.) Patented in England Jan. 27, 1887, No. 1,383; in France Dec. 9, 1887, No. 187,497; in Cape of Good Hope Jan. 26, 1888, No. 426; in Natal Feb. 2, 1888; in Victoria Feb. 8, 1888, No. 5,615; in New South Wales Feb. 10, 1888, No. 466; in South Australia Feb. 10, 1888, No. 961; in Tasmania Feb. 12, 1888, No. 640/10; in New Zealand Feb. 20, 1888, No. 2,817, and in India Apr. 12/38, 1888, No. 16/522.

397,407.

Claim.—1. An apparatus for purifying sewage, consisting of a tank forming a channel of considerable length for the passage of the sewage, and comprising oxidizable positive and negative electrodes of iron, connected, respectively, with the poles of an electrical generator, substantially as and for the purposes described.

2. An apparatus for purifying sewage, consisting of a tank forming a channel of considerable length for the passage of the sewage, and comprising positive electrodes and oxidizable electrodes of iron, said electrodes connected, respectively, with the poles of an electrical generator, substantially as and for the purposes described.

3. An apparatus for purifying sewage, consisting of a tank and positive and negative electrodes located therein and constituting partitions which form a channel of considerable length for the passage of the sewage, the negative electrodes being of iron and oxidizable, and said positive and negative electrodes connected, respectively, with the poles of an electrical generator, substantially as and for the purposes described.

4. An apparatus for purifying sewage, consisting of a tank and oxidizable positive and negative electrodes composed of iron plates arranged alternately, as set forth, to form a channel of considerable length for the passage of the sewage, said positive and negative electrodes connected, respectively, with the poles of an electrical generator, substantially as and for the purposes described.

397,408. KNITTING-MACHINE. FRANK WILCOMB, Providence, R. I., assignor to the Wilcomb Manufacturing Company, San Francisco, Cal. Filed Feb. 20, 1888. Serial No. 265,723. (No model.)

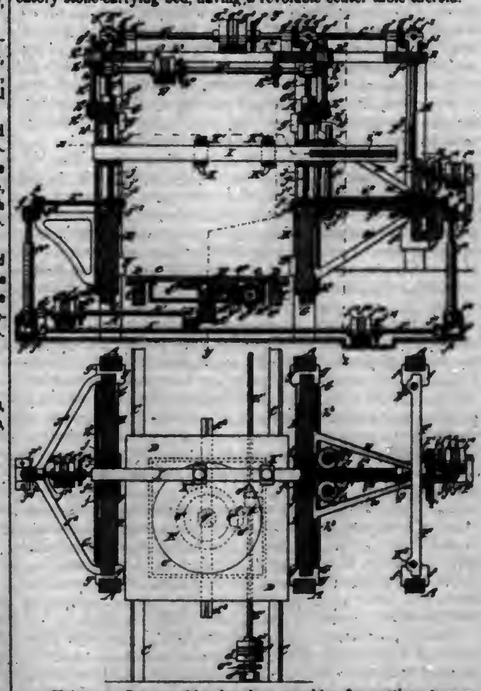
Claim.—1. The combination, with latch-needles, of movable sinkers for measuring off the yarn for the new loops, and movable knock-over bits for casting off the old loops from the needles, and means for operating the sinkers and knock-over bits, substantially as described.

2. The combination, with latch-needles, of movable sinkers for measuring off the yarn to form the new loops, operating means for giving said sinkers independent and successive action, knock-over bits for casting off the old loops, and operating means therefor to move them independently and successively, substantially as described.

3. The combination, with latch-needles, of movable sinkers for measuring off the yarn to form the new loops, operating means for said sinkers to retract them from their normal position, knock-over bits for casting off the old loops, and means for retracting said bits, whereby the needles and loops are left properly exposed to allow the operation of fashioning the fabric to be performed, substantially as described.

4. The combination, with latch-needles, of the sinkers for measuring off the yarn, and movable knock-over bits for casting off the old loops, and means for operating the sinkers and knock-over bits, the said bits being supported in an inclined position, substantially as described.

5. In combination with latch-needles, the movable sinkers, and the movable knock-over bits provided with inclined faces, and means for operating said sinkers and knock-over bits, substantially as described.



397,409. METHOD OF TREATING FIBERS OR YARNS. WILLIAM J. WILLIAMS, Camden, N. J. Filed May 24, 1888. Serial No. 274,260. (No specimens.)

Claim.—1. The mode herein described of keeping fibers or yarns moist in textile manufactures, said mode consisting in subjecting the fibers or yarns to the action of a solution of phosphate of soda, substantially as set forth.

2. The mode herein described of keeping fibers or yarns moist in textile manufactures, said mode consisting in subjecting the fibers or yarns to the action of a solution of trisodium phosphate, substantially as described.

397,410. MACHINE FOR CUTTING STONE. HUGH YOUNG, New York, N. Y. Filed July 5, 1888. Serial No. 278,080. (No model.)

Brief.—Reciprocating cutter-carrying bar is carried by two simultaneously-rotating heads, H, toward and from whose center the bar may move radially, and around which center it revolves with the heads, and in which it (carrying the cutters) reciprocates over the reciprocatory stone-carrying bed, having a revoluble center table therein.

Claim.—1. The combination, in a machine for cutting stone or other substance, of a rotary cutter-bar support, a cutter-bar revolving laterally around the axis of said support and operatively movable upon said support in a path parallel to said axis, and a tool adjustable upon said bar, substantially as described.

2. The combination, in a machine for cutting stone or other substance, of a rotary cutter-bar support, a cutter-bar revolving laterally around the axis of said support, said bar being operatively movable upon said support in the line of its own length and operatively and laterally movable nearer to and farther from the said axis, and a tool adjustable upon said bar, said tool being set radially to the axis of said support, substantially as herein described.

3. The combination, in a machine for cutting stone or other substance, of a rotary cutter-bar support, a cutter-bar operatively revolving laterally around the axis of said support, said bar being also operatively movable upon said support in the line of its own length and operatively and laterally movable nearer to or farther from the said axis, and a tool adjustable upon said bar, said tool being set at an angle to a radial line drawn to the axis of said support, substantially as herein described.

4. The combination, in a machine for cutting stone or other substance, of a rotary cutter-bar support, a cutter-bar revolving laterally around the axis of said support, said bar being operatively movable upon said support in the line of its own length and operatively and laterally movable nearer to or farther from the said axis, and a tool adjustable upon said bar, said tool being set at an angle to the length line of said bar, substantially as herein described.

5. The combination, in a machine for cutting stone or other substance, of a rotary cutter-bar support, a cutter-bar revolving laterally around the axis of said support, said bar being operatively movable upon said support in the line of its own length and operatively and laterally movable nearer to or farther from the said axis, and a tool adjustable upon said bar, said tool being set inward toward the axis of said rotary support, substantially as herein described

6. The combination, in a machine for cutting stone or other substance, of a rotary cutter-bar carrier and a cutter-bar movable within said carrier in the direction of its own length in lines parallel to the axis of rotation of said carrier, and a cutter adjustable on the said cutter-bar, substantially as described.

7. The combination, in a machine for cutting stone or other substance, of a rotary cutter-bar carrier, a frame in which the said carrier is contained and within which it rotates, and a cutter-bar movable within said carrier in the direction of its own length in lines parallel to the axis of rotation of said carrier, and a tool adjustable on the said cutter-bar, substantially as described.

8. The combination, in a machine for cutting stone or other substance, of a horizontally-movable bed or table, mechanism for moving the same in the line of its own length, a cutter-bar having a lateral revolving movement and a movement toward and from the axis of said revolving mechanism for producing the rotary movement of the cutter-bar, and mechanism for producing the movement of the cutter-bar toward and from the axis of rotation, the three said mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

9. The combination, in a machine for cutting stone or other substance, of a horizontally-movable bed or table, mechanism for moving the same horizontally in the line of its own length, a cutter-bar having a lateral revolving movement, and also having a lateral vertical movement, mechanism for producing the lateral revolving movement, and mechanism for producing the lateral vertical movement, all the three said mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

10. The combination, in a machine for cutting stone or other substance, of a horizontally-movable bed or table, mechanism for moving the same horizontally in the line of its own length, a cutter-bar having a lateral revolving movement and a horizontal movement in the line of its own length and parallel with the axis of its revolution, mechanism for producing the rotary movement of the cutter-bar, and mechanism for moving the cutter-bar in the line of its own length, all the three said mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

11. The combination, in a machine for cutting stone or other substance, of a horizontally-movable bed or table, mechanism for moving the same horizontally in the line of its own length, a rotary bed or table, mechanism for rotating the rotary table, a cutter-bar, and mechanism for laterally revolving said cutter-bar, all the three said mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

12. The combination, in a machine for cutting stone or other substance, of a horizontally-movable bed or table, mechanism for moving the same horizontally in the line of its own length, a cutter-bar having a vertical movement, a lateral revolving movement, and a movement toward and from the center of its revolution in any direction, mechanism for producing the said vertical movement of the cutter-bar, mechanism for producing the said revolving movement of the cutter-bar, and mechanism for producing the movement of the cutter-bar toward and from the center of its revolution, all the said mechanisms being so organized that any three may be subordinated, while the other maintains a primacy, substantially as described.

13. The combination, in a machine for cutting stone or other substance, of a horizontally-movable bed or table, mechanism for moving the same horizontally in the line of its own length, a cutter-bar having a lateral revolving movement, a horizontal movement in the line of its own length, and a movement toward and from the center of its revolution, mechanism for producing the said revolving movement of the cutter-bar, mechanism for producing the movement in the direction of the length of the cutter-bar, and mechanism for producing the movement of the cutter-bar toward and from the center of its revolution, all the said mechanisms being so organized that any three may be subordinated, while the other maintains primacy, substantially as described.

14. The combination, in a machine for cutting stone or other substance, of a horizontally-movable bed or table, mechanism for moving the same horizontally in the line of its own length, a rotary table, mechanism for rotating the table, a cutter-bar having a lateral revolving movement and a movement toward and from the center of its revolution, mechanism for producing said revolving movement of the cutter-bar, and mechanism for producing the movement of the cutter-bar toward and from the center of its revolution, all the said mechanisms being so organized that any three may be subordinated, while the other maintains a primacy, substantially as described.

15. The combination, in a machine for cutting stone or other substance, of a horizontally-movable bed or table, mechanism for moving the same horizontally in the line of its own length, a cutter-bar having a lateral vertical movement and a movement horizontally in the line of its own length, mechanism for producing the lateral vertical movement of the cutter-bar, and mechanism for producing the movement of the cutter-bar in the line of its own length, all the said three mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

16. The combination, in a machine for cutting stone or other substance, of a horizontally-movable bed or table, mechanism for moving the same horizontally in the line of its own length, a rotary table, mechanism for imparting a rotary movement to this table, a cutter-bar laterally movable in a vertical direction, and mechanism for producing said movement of the cutter-bar, all the said three mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

17. The combination, in a machine for cutting stone or other substance, of a cutter-bar having a lateral revolving movement, a movement toward and from the center of its revolution, and a vertical movement, mechanism for producing the revolving movement, mechanism for producing the movement toward and from the center of revolution, and mechanism for producing the vertical movement, all the said three mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

18. The combination, in a machine for cutting stone or other substance, of a cutter-bar having a lateral revolving movement, a movement toward and from the center of its revolution, and a movement in the direction of its own length and parallel with the axis of its revolution, mechanism for producing the rotary movement, mechanism for producing the movement toward and from the center of its revolution, and mechanism for producing a movement of the cutter-bar in the line of its own length, all the said three mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

19. The combination, in a machine for cutting stone or other substance, of a cutter-bar having a lateral revolving movement and a movement toward and from the center of its revolution, mechanism for producing the said revolving movement, mechanism for producing the movement toward and from the center of its revolution, a rotary table, and mechanism for producing the movement of this table, all the said three mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

20. The combination, in a machine for cutting stone or other substance, of a cutter-bar having a lateral revolving movement, a lateral vertical movement, and a movement horizontally in the line of its own length parallel with the axis of its revolution, mechanism for producing the lateral revolving movement, mechanism for producing the lateral vertical movement, and mechanism for producing said horizontal movement of the cutter-bar in the line of its own length parallel with the axis of its revolution, all the said three mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

21. The combination, in a machine for cutting stone or other substance, of a cutter-bar having a lateral revolving movement and a lateral vertical movement, mechanism for producing the lateral revolving movement, mechanism for producing the lateral vertical movement, a rotary table, and mechanism for rotating the table, all the said three mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

22. The combination, in a machine for cutting stone or other substance, of a cutter-bar having a lateral revolving movement and a horizontal movement in the line of its own length parallel with the axis of its revolution, mechanism for producing the lateral revolving movement, mechanism for producing said horizontal movement, a rotary table, and mechanism for rotating the table, all the said three mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

23. The combination, in a machine for cutting stone or other substance, of a cutter-bar having a lateral vertical movement and a movement horizontally in the line of its own length, mechanism for producing the lateral vertical movement, mechanism for producing the horizontal movement, a rotary table, and mechanism for rotating the table, all the said three mechanisms being so organized that any two may be subordinated, while the other maintains a primacy, substantially as described.

24. The combination, in a machine for cutting stone or other substance, of a bed or table for supporting the work, a rotary cutter-bar carrier, a frame in which the said carrier is contained and within which it rotates, and the cutter-bar movable within said carrier in the direction of its own length and parallel with the axis of rotation of the said carrier, and a cutter adjustable on said bar, substantially as described.

25. The combination, in a machine for cutting stone or other substance, of a bed or table for supporting the work, a rotary cutter-bar carrier, a frame in which the said carrier is contained and within which it rotates, and a cutter-bar laterally movable within the said carrier toward and from the center thereof, and a cutter adjustable on said bar, substantially as described.

26. The combination, in a machine for cutting stone or other substance, of a bed or table for supporting the work, a rotary cutter-bar carrier, a frame in which the said carrier is contained and within which it rotates, and a cutter-bar movable within said carrier in the direction of its own length and laterally in a direction radial to the axis of said carrier, and a cutter adjustable on said bar, substantially as and for the purpose herein described.

27. The combination, in a machine for cutting stone or other substance, of a bed or table for supporting the work, a reciprocating carriage, a rotary cutter-bar carrier fitted to rotate within the said reciprocating carriage, and a laterally-revolving cutter-bar fitted to move operatively in the direction of its own length within said rotary carrier in lines parallel to the axis of said carrier, substantially as described.

28. The combination, in a machine for cutting stone or other substance, of a bed or table for the work, a reciprocating carriage, a rotary cutter-bar carrier fitted to rotate within the said carriage, and a laterally-revolving cutter-bar fitted to move operatively within the said rotary carrier in a direction radial to the axis thereof, and a tool adjustable on said bar, substantially as herein set forth.

29. The combination, in a machine for cutting stone or other substance, of a bed or table for supporting the work, a reciprocating carriage, a rotary cutter-bar carrier fitted to rotate within the said carriage, and a laterally-revolving cutter-bar fitted to said rotary carrier to move operatively therein in the direction of its own length in lines parallel to the axis of said carrier and laterally in a direction radial to said axis, and a tool adjustable on said cutter-bar, substantially as herein set forth.

30. The combination, in a machine for cutting stone or other substance, of a reciprocating table or bed for carrying the work, a carriage movable in a direction perpendicular to the reciprocating movement of the said bed, and a laterally-revolving cutter-bar operatively movable in the direction of its own length and parallel with the axis of its revolution within said carriage and in a direction toward and from the reciprocating table or bed, and a tool adjustable on said bar, substantially as described.

31. The combination, in a machine for cutting stone or other substance, of a rotary table for carrying the work, a carriage movable in a direction perpendicular to the plane of rotation of said table, and a laterally-revolving cutter-bar operatively movable in the direction of its own length parallel with the axis of its revolution within said carriage, and a tool adjustable on said bar, substantially as described.

32. The combination, in a machine for cutting stone or other substance, of a reciprocating bed for carrying the work, a carriage movable in a direction perpendicular to the reciprocating movement of the said bed, a rotary cutter-bar carrier fitted to rotate within said carriage, and a laterally-revolving cutter-bar operatively movable in the direction of its own length within said rotary cutter-bar carrier, substantially as herein set forth.

33. The combination, in a machine for cutting stone or other substance, of a reciprocating bed for carrying the work, a carriage movable in a direction perpendicular to the movement of the said bed, a rotary cutter-bar carrier fitted to rotate within said carriage, and a laterally-revolving cutter-bar operatively movable within said rotary cutter-bar carrier toward and from the center thereof, substantially as described.

34. The combination, in a machine for cutting stone or other substance, of a reciprocating bed for carrying the work, a carriage movable in a direction perpendicular to the reciprocating movement of the said bed, a rotary cutter-bar carrier fitted to rotate within said carriage, and a cutter-bar operatively movable within said rotary carriage both in the direction of its own length and in a direction radial to the axis of said rotary carrier, substantially as described.

35. The combination, in a machine for cutting stone or other substance, of a reciprocating-moving supporting-bed, a table fitted to the said bed to rotate therein, a carriage movable vertically toward and from said bed, and a laterally-revolving cutter-bar operatively movable within said carriage in the direction of its own length, substantially as described.

36. The combination, with the reciprocating bed D and the rotary table E contained therein, of the driving-shaft E', the bevel-gear e, fitted to slide on but to turn with the said shaft and fitted to turn in a bearing, e^2, on the said bed, the bevel-gears e', carried by said bed and gearing with that, e, on the shaft, the bevel-gear e^3, secured to e', and the bevel-gear e^4 on the bed, gearing with e^3, all substantially as herein described, for driving the table E in all positions of the bed D, as herein set forth.

37. The combination, with the reciprocating carriage G G F and the rotary cutter-bar carrier H H, fitted to rotate in said carriage, of the driving-shaft H', furnished with bevel-gears h, the bevel-gears h', having fixed bearings and gearing with h, the shafts h^2, fitted to and longitudinally confined in bearings on said reciprocating carriage and sliding through but turning said bevel-gears h', and the bevel-gears h^3 on the rotary cutter-bar carrier, gearing with said bevel-gears h^2, all substantially as herein described, for driving the rotary cutter-bar carrier in all positions of the vertically-moving carriage, as herein set forth.

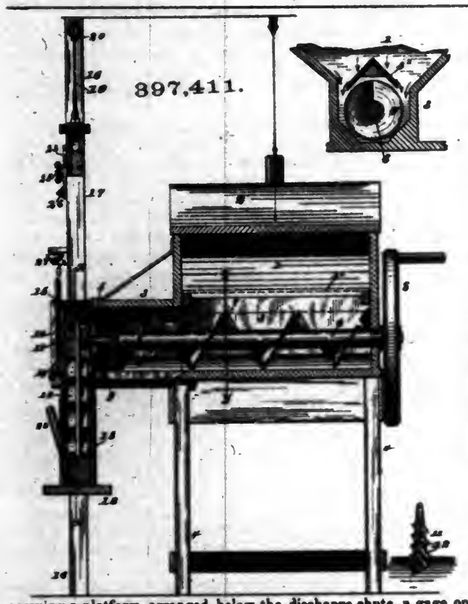
38. The combination, with the reciprocating carriage G G F, the rotary cutter-bar carrier H H contained therein, the sliding cutter-bar boxes J, movable within the cutter-bar carrier to and from the center thereof, and the cutter-bar I, having a longitudinal movement within said boxes, of the driving-shaft I', arranged in bearings movable with the said carriage, of the shaft i^2, working in bearings carried by the cutter-bar carrier H H, geared with said driving-shaft I', and furnished with an endless screw, i^4, and the shafts i^5, working in bearings on the cutter-bar carrier H H and furnished with worm-gears i^6, gearing with the endless screw i^4, and with spur-gears i^3, gearing with a rack, i^{10}, on the cutter-bar, the said gears i^3 being movable with the cutter-bar boxes and capable of sliding on the shafts i^5, all substantially as herein described, for driving the cutter-bar in all its positions relatively to the cutter-bar carrier H and in positions of the said carrier and carriage, as herein set forth.

39. The combination, with the reciprocating carriage G G F, the rotary cutter-bar carrier H H contained therein, the sliding cutter-bar boxes movable within the said carrier H H toward and from the center thereof, and the screws j', fitted to said carrier H and boxes J, of the driving-shaft J', working in fixed bearings, telescopic shafts j^6 j^{6a}, geared with the said driving-shaft by bevel-gears j^5 j^5, and having each a fixed bearing near one end and a bearing near the other end and carried by the reciprocating carriage, and the shafts j^7 j^{7a}, geared with said shafts j^6 j^{6a} by bevel-gears j^8 j^8, and being furnished with endless screws j^9, gearing with worm-gears j^{10} on the said screws j', all substantially as herein described, for producing the said movement of the boxes J in all positions of the reciprocating carriage and rotary cutter-bar carrier, as herein set forth.

40. The combination, with the rotary cutter-bar carrier H H and the sliding cutter-bar boxes J and reciprocating cutter-bar working therein, of the shaft j^7 and its gearing for producing the movements of the said boxes, and the shaft i^2 and its gearing for producing the longitudinal movement of the cutter-bar, both having bearings in and concentric with the said carrier, and the said shaft j^7 passing centrally through the shaft i^2, substantially as herein described.

397,411. MACHINE FOR PACKING FLOUR. SAXTON T. AYERS, Philadelphia, Pa. Filed May 3, 1888. Serial No. 272,652. (No model.)

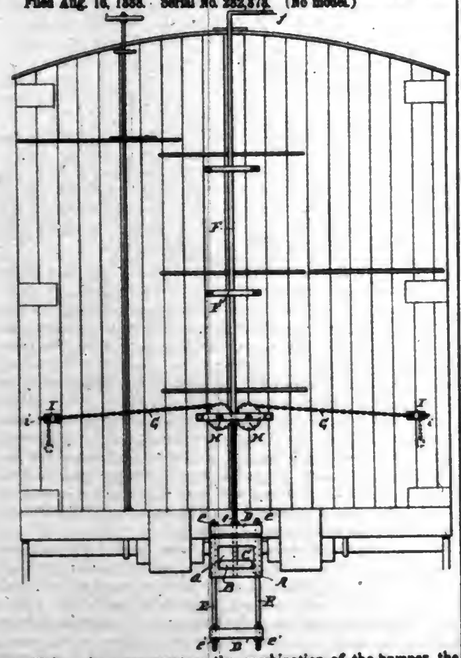
Claim.—1 In a flour-packing machine, the combination of a hopper, a conveyer-box with a conveyer therein, and having in its discharge end a sifter or screen, a brush carried by the said conveyer and rotating against said screen, a packer connected with the conveyer-shaft, and a discharge-chute in which said packer operates, substantially as and for the purpose set forth.



2. In a flour-packing machine, a frame having a hopper with conveyer-box, a conveyer in said box, a screen at the discharge end of said box, a discharge-chute, a reciprocating packer in said discharge-chute, standards with pulleys connected therewith, cords connected to said frame and passing over said pulleys, and a box with weights therein secured to said cords, said parts being combined substantially as and for the purpose set forth.

3. In a flour-packing machine, the combination of the conveyer-box having a sifter or screen in the discharge end thereof, a discharge-chute communicating with said end, a conveyer arranged in the conveyer-box, and a packer on the conveyer-shaft arranged and operating in the discharge-chute, substantially in the manner and for the purpose described.

4. In a flour-packing machine, a conveyer-box with a rotary conveyer therein, a chamber at the end of said box, provided with a discharge-chute, a rising and falling packer connected to said conveyer in said chamber and operating in said discharge-chute, and a rising and falling frame, said parts being combined substantially as and for the purpose set forth.

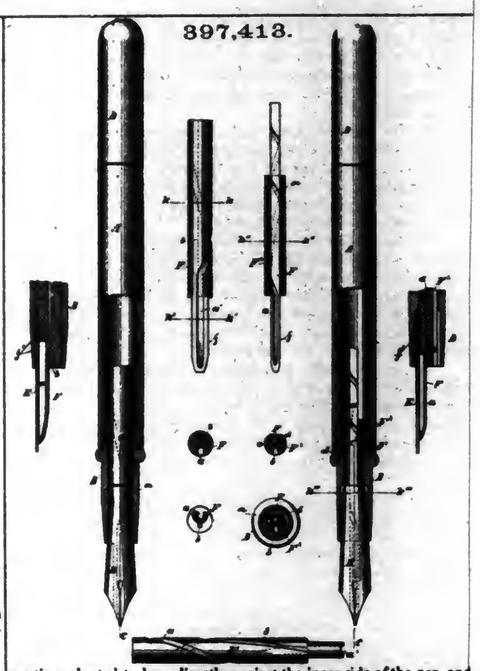


5. In a flour-packing machine, the combination of the conveyer-box, a shield or guard arranged above said box, a conveyer in said box, a discharge-chute communicating with the conveyer-box, a packer on the shaft of the conveyer arranged in the discharge-chute, a frame

397,411.

carrying a platform arranged below the discharge-chute, a gage on the frame, and a bell adapted to be sounded by the gage, substantially in the manner and for the purpose described.

397,412. CAR-COUPLING. DEWITT C. BARNETT, Woonsocket, Dak. Filed Aug. 16, 1888. Serial No. 282,573. (No model.)



Claim.—In a car-coupling, the combination of the bumper, the vertical guide-rods working in the sides of the said bumper, the upper and lower cross-bars connected to said guide-rods, the coupling-pin attached to and depending from the upper one of said cross-bars, the stud *g*, projecting from said pin, the chains connected at their inner ends to said stud, and the rod secured to the upper end of said pin, substantially as described.

397,413. FOUNTAIN-PEN. THEODORE F. BOURET, Clifton, assignor to Ann L. Shipman's Sons, New York, N. Y. Filed Sept. 1, 1888. Serial No. 284,369. (No model.)

Claim.—1. An ink-feeder for a fountain-pen having the flattened

397,413.

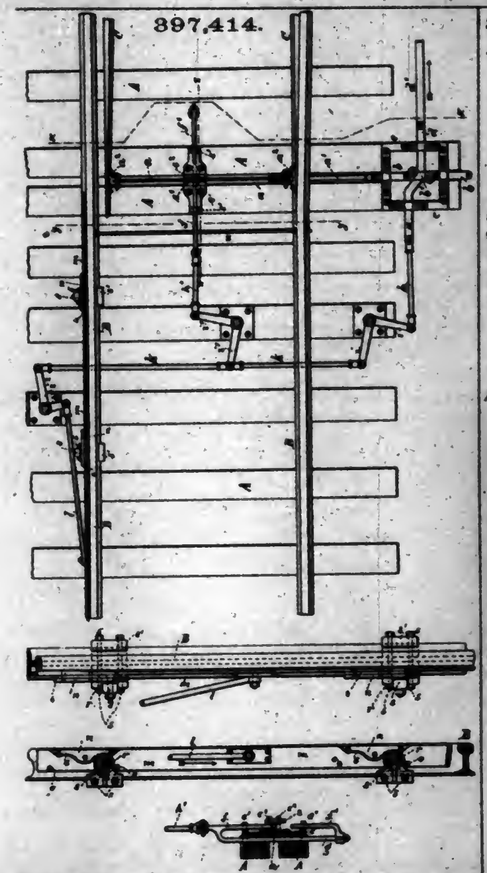
portion adapted to bear directly against the inner side of the pen, and the groove or channel made spirally around the feeder and extending to the flattened portion thereof, and thereby adapted to feed ink to the pen, substantially as described.

2. An ink-feeder having the extended arm, against which the pen is adapted to press, and the groove or channel made spirally around the feeder and extending longitudinally on the arm on the side next the pen, and the longitudinal air-inlet aperture extending through the feeder and communicating with the interior of the barrel, substantially as described.

3. In a fountain-pen, the combination of the barrel or reservoir, the neck or tube therein at one end, the feeder extending through and fitting in the neck or tube and entering the barrel, said feeder having the exterior spiral groove and channel, and the pen clamped in a recess in one side of the feeder between the latter and the neck, and having its inner side communicating with the groove or channel, substantially as described.

4. In a fountain-pen, the combination, with a barrel and pen, of a feeder carried by said barrel and consisting of a bar having a groove that is straight on the side next to the pen and that extends from thence in a spiral along the bar toward the ink, substantially as described.

5. In a fountain-pen, the barrel A, having tube B and the independent and removable pen E, combined with a separate feeder-bar, F, having a spiral groove or channel for conducting ink from the barrel to the pen, said groove or channel lying close against the inner walls of its support, substantially as described.



6. An ink-feeder for a fountain-pen consisting of a bar having a groove that is straight at the part that is beneath the pen and that extends in a spiral along the bar toward the ink, substantially as described.

397,414. DEVICE FOR OPERATING AND LOCKING SWITCHES. THOMAS W. BURLEY, Long Island City, N. Y. Filed July 16, 1888. Serial No. 280,065. (No model.)

Claim.—1. The combination, with a switch and a locking device and a detection-bar, of a frame composed of a top and bottom plate, and pairs of rollers between the plates at the central portion of each side, the bar *b* from the switch passing through the frame and between two pairs of its rollers, and having a top plate, *b'*, and rollers, the bar *d*, having bends or inclines and passing through said frame and between the other two pairs of its rollers and at right angles to the bar *d* and beneath the top plate, *b'*, and between the rollers on said bar *b*, and adapted to operate said bar *b* by its movement, the arms *k*, *k'*, and *l*, the bell-crank levers *i*, *i'*, and *i''*, and the cross-bar *k*, passing beneath the rails of the track and connecting the bell-crank levers, substantially as set forth.

2. The combination, with the switch, of the detection-bar *m*, com-

397,414.

pound curved inclines or plates *n*, secured to the same, flanged rollers *r*, and supporting-frames *s s'* for the same, and devices, substantially as set forth, for moving the same, substantially as specified.

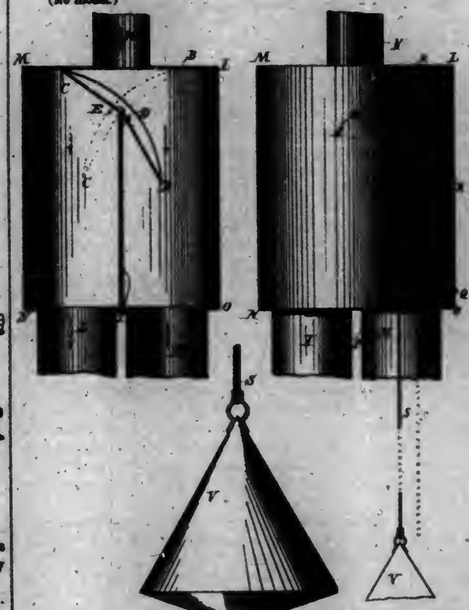
3. The combination, with the switch, of the detection-bar *m*, compound curved inclines or plates *n*, secured to the same, flanged rollers *r*, and supporting-frames *s s'* for the same, the pins *o* upon the inner surface of the detection-bar, to prevent its being raised off of the rollers, the frames *s s'* having projecting edges adapted to grasp the lower edges of the rail, and bolts 5, which pass through the parts *s s'*, to clamp the same to the rail, and devices, substantially as set forth, for moving the detection-bar, substantially as specified.

4. The combination, with the switch-rails and the bar *a*, connecting the same, of the locking device having perforated uprights between which the rod *a* passes, the locking-bars passing through the frame of the locking device at right angles to the bar *a*, and mechanism, substantially as specified, for operating the locking-bars to lock the switch, substantially as set forth.

5. The combination, with the switch-rails and the bar *a*, connecting the same, of the frame *c*, having perforated uprights *c' c''*, a central pin, 2, the locking-bars *f f'*, passing through said frame, the rod *g*, formed with and connected to the locking-bars *f f'*, and mechanism, substantially as specified, for operating the locking-bars *f f'* so that they alternately lock the switch in its various positions, substantially as set forth.

397,415. MOLD-BOARD OR BREAKING PLOW. MARVIN S. CADWELL and EDWARD L. CADWELL, Lansing, Mich. Filed Jan. 28, 1888. Serial No. 261,573. (No model.)

Claim.—1. The share B, having a supplemental thin self-sharpening point, D, adjustably secured on the upper face of said part B, and a thin self-sharpening supplemental share, C, secured on the under face of said part B, substantially as specified.



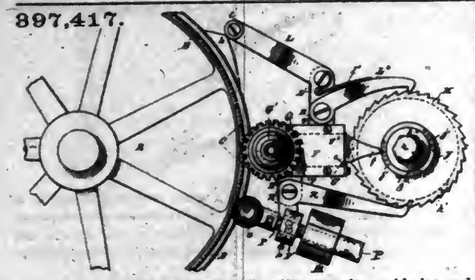
2. The combination, with a mold-board plow, of a cast share, B, having a thin supplemental self-sharpening share, C, and a thin supplemental self-sharpening point, D, both secured to said share B, substantially as specified.

397,415.

3. The combination, with a mold-board plow and its part B, of a slightly twisted or curved thin plate-steel reversible and adjustable supplemental point, D, secured on the top face of said part B, said point D having two cutting-edges lying in different planes, substantially as specified.

397,416. AUTOMATIC CUT-OFF FOR CISTERN-PIPES. EDWARD CAWTHORNE, Darlington, Wis. Filed Aug. 11, 1887. Serial No. 246,735. (No model.)

Claim.—In an automatic cut-off, the combination, with the receptacle provided with the central vertical partial partition, T, the inlet-pipe opening centrally in the top thereof, the outlet-pipes opening into the bottom of the receptacle on opposite sides of the partition T, the shaft A, journaled in the sides of the receptacle at the top of said partition and provided with the crank-arm E outside of the receptacle, and the deflector-plate provided with the transverse re-entrant angle E and side flanges, D, and secured to said shaft within said angle, of the float V, having a conical form and provided with a small aperture in its bottom, the rod S, pivoted at its upper end to the end of the crank-arm K, and the horizontally-extended guard rail or staple P Q, preventing the rod S from leaving the receptacle and bending or breaking its pivot, yet not obstructing the free motion of the parts, substantially as specified.



397,417. CIRCULAR-KNITTING MACHINE. GEORGE COOPER, Bennington, Vt., assignor of one-half to Charles Cooper, same place. Filed Jan. 13, 1888. Serial No. 260,670. (No model.)

Brief.—The object of the invention is to produce an improved attachment for circular-knitting machines for making the tuck-stitch and slack course, and consists in the construction of the pressers and of the means for moving the stitch and presser wheels to and from the needles.

Claim.—1. The combination of two pressers arranged one above the other, one of said pressers having an unexposed oblong slot formed in its inner contacting face, and the other presser having an oblong stud secured thereon adapted to work in said slot, as set forth.

2. The combination of two pressers having their inner contacting faces recessed and provided with removable linings, one of said linings having an unexposed oblong or radial slot therein and the other an

397,417.

oblong stud secured thereto of smaller diameter than said slot and adapted to work therein, as set forth.

3. The combination, with two pressers having their inner contacting faces recessed, of removable linings in said recesses, one of said linings having an unexposed oblong slot and the other having a pivoted stud therein working in said slot, as set forth.

4. The combination, with a needle-cylinder, a ratchet-wheel, a lever and pawl, spring-actuated presser-slides, and pressers one above the other having inner contacting faces, of a removable collar having a series of slots formed therein on different planes registering with the slides for controlling the movement of the pressers, as set forth.

5. The combination, with a needle-cylinder, a lever and pawl, a ratchet-wheel, and a revolving slotted collar, of spring-actuated presser-slides having cam-shaped fingers alternately working in the slots of said collar, a post on the under slide working through an opening in the upper slide, an upper presser carried by said post, a collar on the upper slide, and a lower presser carried by said collar, as set forth.

6. The combination, with a pawl and ratchet, a slotted collar, and means for actuating the pawl, of spring-actuated slides one above the other, a vertical collar on the upper slide, a vertical post on the under slide of less diameter than the opening in the collar and extending through the same, a presser secured on the post, and a presser mounted on the collar, whereby an independent longitudinal movement of the pressers is permitted, as set forth.

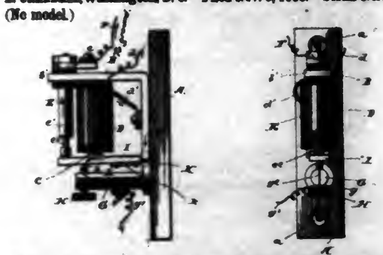
7. The combination, with a needle-cylinder having a cam projection thereon, of a horizontal ratchet-wheel and a lever and pawl for rotating the same, a removable circular collar having elongated slots formed therein secured to said wheel, spring-actuated slides coming in contact with said collar, and independently-moving pressers secured to the upper sides of said slides and located above the same, as set forth.

8. The combination, with a needle-cylinder having a cam projection thereon, of a bed-piece with a flanged arm projecting therefrom, independent spring-actuated slides on the arm between the flanges, a removable cap-plate, pressers mounted on said slides and located above the same, a ratchet-wheel having a removable collar secured thereto, with slots formed therein on different planes, and a pawl and lever for actuating said wheel, as set forth.

9. The combination, with a needle-cylinder having a cam projection thereon, of a bed-piece provided with an inwardly-extending slotted arm having flanges formed on its upper side, spring-actuated slides between the flanges, a cap-plate secured to the flanges of the arm, a ratchet-wheel secured to said bed-piece having a removable slotted collar attached thereto, a lever and pawl for actuating said ratchet, and pressers, as set forth.

10. The combination, with a needle-cylinder having a cam projection thereon, of a horizontally-arranged ratchet-wheel provided with a cam-block, a lever and pawl for actuating said wheel, a bell-crank lever, a stitch-wheel connected therewith, said bell-crank lever coming in contact with the cam on the ratchet-wheel and operating the stitch-wheel, and a spring secured on said bell-crank lever for forcing back the stitch-wheel, as set forth.

11. The combination, with a needle-cylinder having a cam projection thereon, of an inwardly-projecting bed-piece formed with a flanged top, a ratchet-wheel having a hub projection, a slotted collar arranged on said hub, spring-actuated presser-bearing slides secured between the flanges having cam-shaped fingers working independently in the slots of said collar, shoulders formed on said slides, and a projection on the bed-piece limiting the movement of the slides, and a lever and pawl for actuating said ratchet-wheel, as set forth.



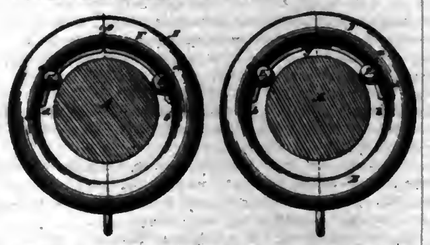
12. The combination, with a needle-cylinder having a cam projection thereon, of an inwardly-extending arm formed with a slotted bottom and flanges on its upper side, and having an arm projecting out from its side supporting a pawl-actuating lever, spring-actuated slides having pressers thereon secured between said flanges, said slides having pins extending downwardly through and working in the slot of the said inwardly-extending arm, a horizontally-arranged ratchet-wheel having a hub projection, a grooved collar secured to said hub, and a lever and pawl for actuating said ratchet-wheel, as set forth.

13. The combination, with a needle-cylinder having a cam projection thereon, of a bed-piece having an inwardly-extending arm formed with a slot in its lower side and flanges on its upper side, spring-actuated slides having pressers thereon secured between said flanges, the lower slide having a slot therein and a downwardly-projecting pin, and the upper slide having a pin projecting downwardly and through the slot in the lower slide, both of said pins working in and extending through the slot in the arm of the bed-piece, and having springs connected therewith for moving the slides, a bell-crank lever secured to the side of said bed-piece, a pawl connected to said lever, a spring coiled on a post on said lever having its ends placed against the bed-piece and the pawl, and a ratchet-wheel having a slotted collar thereon, as set forth.

14. The combination, with a ratchet-wheel, pawl, a slotted collar, and means for actuating the pawl, of a pair of longitudinally-movable slides having downwardly-extending pins, a vertical post formed on one of the slides and a vertical collar formed on the other slide, pressers situated on said collar and post, and springs acting against the pins for forcing the slides back, as set forth.

15. The combination, with a ratchet having a cam thereon and a pawl, of a bell-crank lever having a slot in its short arm, a collar having a downwardly-extending pivot-pin in said slot, a spindle having a stitch-wheel on its end extended through and secured in said collar, and means for actuating the pawl, as set forth.

397,418. PROTECTOR FOR ELECTRICAL INSTRUMENTS. JOSEPH R. CRANDALL, Washington, D. C. Filed Nov. 6, 1888. Serial No. 290,109. (No model.)

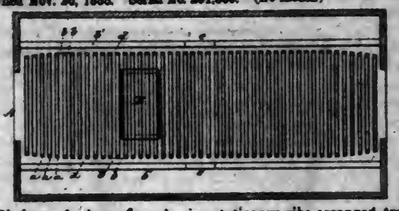


Claim.—1. In a protector for electrical instruments, the combination of the bent plate, one limb of which supports an electro-magnet and to the other limb of which is attached the armature, and contacts arranged on each side of the armature, one connected to the main and the other to the ground line, substantially as described.

2. In a protector for electrical instruments, the combination of a bent bar, one limb of which supports a magnet and the other limb of which supports an armature, contacts arranged on each side of the armature, and a connector between the armature and bar biased to tend to hold the armature in equilibrium between the contacts, substantially as described.

3. In a protector for electrical instruments, the combination of a bent iron bar, one limb of which supports a magnet and the other limb of which supports an armature, a standard attached to but insulated from the bar and connected to the ground-circuit, and another standard connected to the main circuit and arranged in normal electric contact with the armature, substantially as described.

4. A protector for electrical instruments, consisting, essentially, of an insulating-base, a bent iron bar secured thereto, one arm of which extends laterally and supports an electro-magnet and an adjustable contact connected with the ground, and the other arm of which is electrically connected to the armature, and a standard having a contact-piece normally supporting the armature when in operative position, substantially as described.

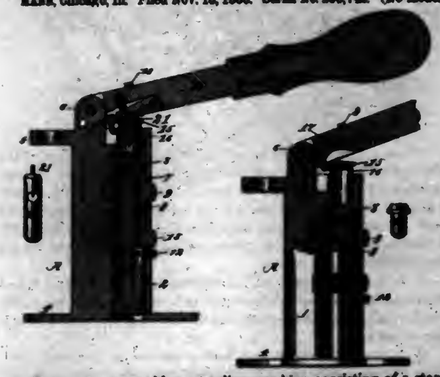


397,419. CURTAIN-RING. JOHN DAY, New York, N.Y. Filed Oct. 17, 1888. Serial No. 288,236. (No model.)

Claim.—1. The curtain-ring B, having recesses *a* and holes *d*, combined with the curved wire F and with the rollers E, through which said wire passes, said rollers being aligned with the recesses *a*, the free ends of the wire F being sprung into the holes *d* in the ring B, the middle portion of the wire F being rigidly held to the ring B, substantially as described.

2. The ring B, having recesses *a*, holes *d*, and slot *f* on its inner side, combined with the curved wire F, said wire having the eye or bead *e*, that enters the slot *f*, the free ends of the wire F being sprung into the holes *d*, and with the rollers E, through which the wire F passes, said rollers being aligned with the recesses *a* and held upon the ring B by the wire F, substantially as described.

397,420. CAR-FLOOR. WILLIAM L. EVERITT, New Haven, Conn. Filed Nov. 26, 1888. Serial No. 291,869. (No model.)

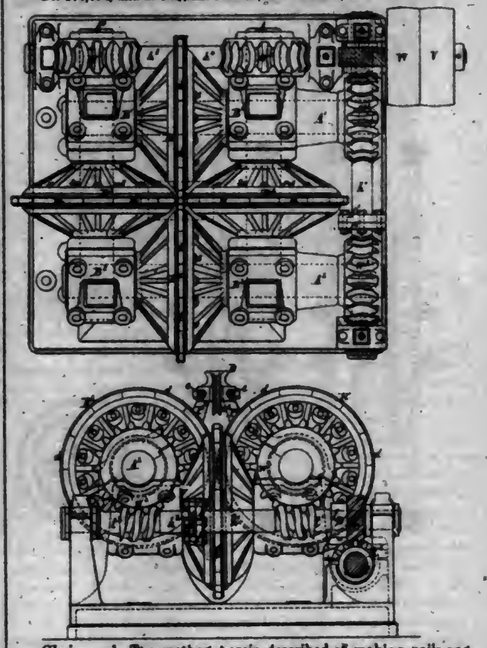


Claim.—1. A car-floor having stationary ribs arranged transversely thereon and distant from each other, so as to form grooves on the floor-level between the said ribs, the said ribs terminating short of the width of the floor of the car and so as to leave clear longitudinal spaces at the ends of the ribs, substantially as described.

2. A car-floor provided with stationary transverse ribs forming transverse grooves on the floor, the said ribs stopping short of the full width of the floor and so as to leave a clear longitudinal space, *d*, at the ends of the ribs, the said longitudinal space recessed to form a channel inclining from each end of the car downward toward the center, combined with a trap at the center through which said channels may discharge, substantially as and for the purpose described.

3. In a car-floor having ribs arranged transversely across it and so as to form transverse grooves between said ribs, the said ribs stopping short of the full width of the floor, so as to leave a clear longitudinal space at each side, the floor constructed with an opening through to the trucks beneath, a cover, B, provided for said opening, the said cover having ribs on its upper surface corresponding to the ribs of the floor, and the said opening provided with a packing, substantially as described.

397,421. CARTRIDGE-RELOADING IMPLEMENT. HENRY PUEHMANN, Chicago, Ill. Filed Nov. 13, 1888. Serial No. 290,742. (No model.)



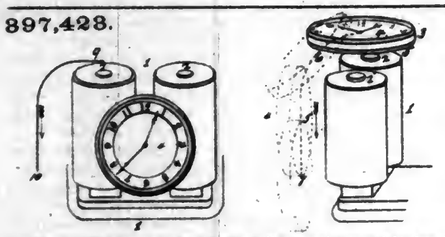
Claim.—1. A cartridge-reloading machine consisting of a standard tubular frame bored for a bullet-supporting stem and for a cartridge-shell-contracting tube surrounding the supporting-stem, both vertically adjustable inside of such standard tube by separate screw-nuts, in combination with a lever pivoted to such standard frame and provided with a cartridge-extracting hook, all substantially as described, to operate as specified.

2. A cartridge-reloading machine consisting of a standard tubular frame bored for a bullet-supporting stem and for a cartridge-shell-contracting tube surrounding the supporting-stem, and of an eyed flange to one side of such standard frame to hold a cartridge-shell for seating the primer, in combination with a lever pivotally connected with the standard frame centrally between the tube and eyed flange thereof, and provided at one side with a cartridge-extracting hook and on its other side with a concaved die for seating the primer, all substantially as set forth, to operate as specified.

3. A cartridge-reloading machine consisting of a standard tubular frame bored for a bullet-supporting stem and for a cartridge-shell-contracting tube surrounding the supporting-stem, both vertically adjustable in the tubular frame by separate screw-nuts, and of a lever pivoted to such standard frame and provided with a cartridge-extracting hook, in combination with a plug to be seated in such tube to rest upon such bullet-supporting stem and entering the cartridge-shell, and provided with a projecting pin for displacing the exploded primer, all substantially as described, to operate as specified.

4. A cartridge-reloading machine consisting of a standard tubular frame bored for a bullet-supporting stem, vertically adjustable in the tubular frame by a screw-nut, and of a lever pivoted to such standard frame and provided with a cartridge-extracting hook, in combination with a conical plug to be seated in such standard tube upon such bullet-supporting stem for expanding the cartridge-shell previously to reloading the same, all substantially as set forth, to operate as specified.

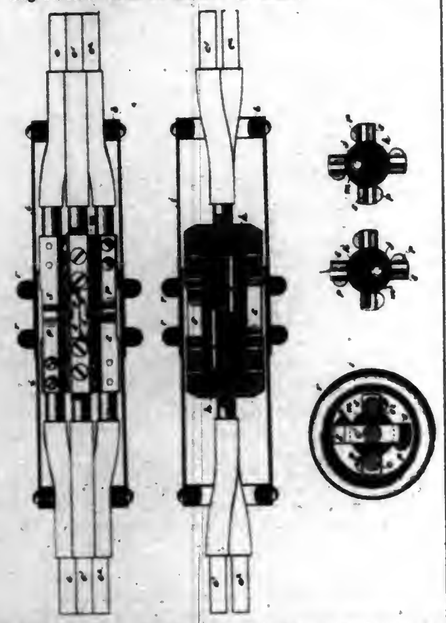
397,422. METHOD OF ROLLING NAILS. HIRAM E. FULLER, London, England. Filed Jan. 5, 1888. Serial No. 259,909. (No model.) Patented in England July 5, 1887, No. 9,513; in France Dec. 30, 1887, No. 187,894, and in Belgium Dec. 30, 1887. No. 80,115.



Claim.—1. The method herein described of making nails and similar articles from a continuous length of wire or rod, which consists in passing the continuous wire or rod between die-rollers, forming the primary blank by such rollers, holding and advancing the said blank to a pair of finishing-die rollers, entering the blank between and engaging it with the dies of the finishing-die rollers prior to releasing said blank from the primary blank-forming-die rollers, squeezing the blank in the finishing-die rollers in a direction transverse to that in which it was squeezed by the primary blank-forming-die rollers, and finishing and severing the nail from the wire or rod by the finishing-rollers, as set forth.

2. The method herein described of making nails and like articles, which consists in passing a continuous wire or rod between traveling primary blank-forming dies, and while each blank is held by said dies advancing it between and grasping it by traveling finishing-dies, pressing it in a direction transverse to that in which it was first pressed, and finishing and severing the nail from the wire or rod by the finishing-dies, as set forth.

3. The method herein described of making nails and like articles, which consists in seizing a continuous wire or rod by traveling dies and forming it into primary nail-blanks, holding each separate blank by said dies, and while so held advancing it to and seizing it by traveling finishing-dies, pressing it transversely to the direction in which it was first pressed, and finishing and severing the nail from the wire or rod by the finishing-dies, as set forth.



397,423. METHOD OF DEMAGNETIZING WATCHES, &c. JOHN GREAVES, St. Louis, Mo. Filed May 14, 1888. Serial No. 273,765. (No model.)

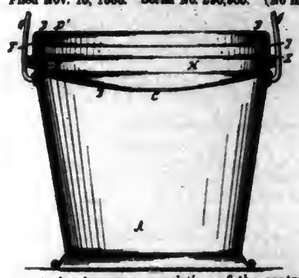
397,428.

Claim.—The improved method of demagnetizing articles herein shown and described, consisting in placing the article in the magnetic field and then passing it through the angles of magnetic force to a neutral point, as specified.

397,424. CONNECTION OF ELECTRICAL CIRCUITS. WILLIAM W. GIBSON, Haverford College, and HENRY N. WELDNER, Philadelphia, assignors to the Electro Dynamic Company, Philadelphia, Pa. Filed Aug. 27, 1888. Serial No. 283,804. (No model.)

Claim.—1. In a connecting device for electric conductors, the combination of two sections of insulating material, each section having located thereon a rigid projecting strip of conducting material with a notch or depression in its surface, a flat spring separated therefrom, but parallel thereto, with a projection upon its surface, the strip and spring of each section forming a complementary contact for the strip and spring of the other section, the rigid strip of one section entering between the strip and spring of the other, whereby both are locked together.

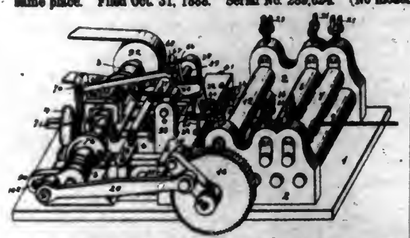
2. In a connecting device for electric conductors, the combination of two sections of insulating material, each section having located thereon a rigid projecting strip of conducting material, a flat spring separated therefrom, but parallel thereto, the strip and spring of each section forming a complementary contact for the strip and spring of the other section, the rigid strip of one section entering between the strip and spring of the other, and means for locking or catching the two sections in such position, substantially as described.



3. The combination, in a connecting device for car or train circuits, of two sections of insulating material, each having fixed thereto the terminals of three circuits, the terminal of the first and second circuits being composed of two projecting strips of conducting material located at diametrically-opposite points, and the terminal of the third circuit composed of two projecting strips of conducting material in two parallel branches located at diametrically-opposite points midway between the terminals of the two first-named circuits.

4. In a connecting device for car or train circuits, the combination of two sections of insulating material, each having fixed thereto the terminals of two or more circuits, the terminals on one section registering with the terminals on the other, a hole, and an insulated pin on the meeting surfaces of each section, the pin of one section entering the hole in the other, whereby erratic junction is rendered impossible.

5. In a car-circuit connector, the combination of a series of fixed registering conducting-terminals in two separate divisions and two cylindrical casings of insulating material united by a lap-joint, whereby dust, dirt, and moisture are excluded.



6. A series of railway-cars, a circuit composed of three wires extending from end to end of each car, and a pair of connectors between each car, each connector having one contact-point for two of the said wires and two parallel contacts for the third wire, all arranged substantially as described.

397,425. SLOP-JAR COVER. FREDERICK HARRIMAN, New York, N. Y. Filed Nov. 15, 1888. Serial No. 290,905. (No model.)

Claim.—A slop-jar cover consisting of the centrally-apertured bottom wall, B, the vertical rim portion H, to closely fit the internal surface of a jar-mouth, the lateral flange E, to rest on the jar, and the vertical rim portion F, having the inwardly-projecting rim D, extended downward to form the internal annular pendent flange, D', overhanging the bottom wall, substantially as described.

397,426. WIRE-NAIL MACHINE. JOHN B. HASTINGS, Jackson, Ohio, assignor of two-thirds to James M. Tripp and James M. Lively, same place. Filed Oct. 31, 1888. Serial No. 289,624. (No model.)

Claim.—1. A wire-nail machine having the combination of the following elements, to wit: straightening-rollers 8, 9, 10, and 11, feeding-rollers 12 and 13, grippers 23 and 24, pointers 25 and 26, cleaner 93 and the header 83, and the cutting mechanism consisting of the crank 60, cutter-stock 61, cutting-blade 62, and rod or pitman 69, all constructed and operating substantially as described, and for the purposes set forth.

2. In a wire-nail machine, a bed-plate having standards 2 2, and the die-seat 5, attached rigidly to the said bed-plate, and the standards 3 3 and 4 and sliding-block seat 6, cast integrally with said bed-plate, as set forth.

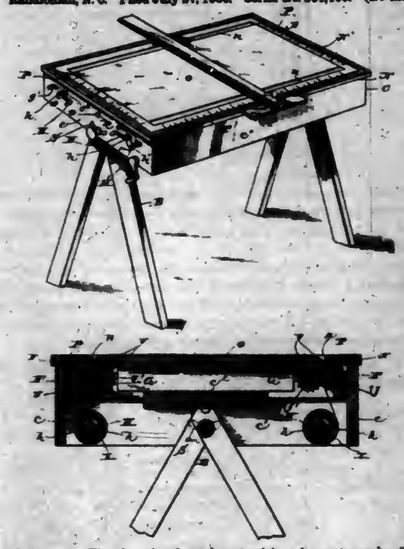
3. In a wire-nail machine, a feeding mechanism consisting of the rollers 12 and 13, to one end of which rollers is attached a cog-wheel, the roller being provided with a cog-wheel, 15, gearing with the aforesaid cog-wheel, a ratchet-wheel, 16, a vibrating arm, 17, loosely fulcruming upon said roller and carrying at its upper end the ratchet 19, and the annular groove 89 upon the roller, for the purposes set forth.

4. In a wire-nail machine, a die-seat, 5, having in its upper surface excavations 31 31, in which rest and operate the grippers 23 and 24, the pointers 25 and 26, the steel blocks 39 and 40, the levers 28 and 29, and the liner 27, the excavated projection 57, in which is inserted the steel anvil or die 30, standards 49 49, cast integrally with the bed-plate, and the set-screws 34, 41, 42, and 48, for taking up the wear of the steel liner, the grippers and the pointer, respectively, and the steel blocks 39 and 40, and the steel die 30, substantially as described, and for the purposes set forth.

5. In a wire-nail machine, the grippers 23 and 24, both having the surfaces 33 33 inclined slightly to a vertical longitudinal plane of the machine, and the lugs 49 and 50, to which are attached the springs 43 and 44, while the gripper 23 is provided with the groove 95, for the purposes set forth:

6. In a wire-nail machine, the pointers 25 and 26, having the inclined surfaces 33 33 parallel with the inclined surfaces of the grippers, and the lugs 55 and 56, to which are attached the springs 45 and 46, said springs being secured to lugs 53 and 54 on the plates 32 32 and operating to keep the pointers within near proximity to the cam-pins upon the levers 28 and 29, for the purposes set forth.

7. In a wire-nail machine, the levers 28 and 29, fulcruming in sockets in the steel blocks 39 and 40, having at one end the friction or wearing pins 35 and 36 and the friction or cam pins 37 and 38, and in the other end the cone-shaped wheels, for the purposes set forth.



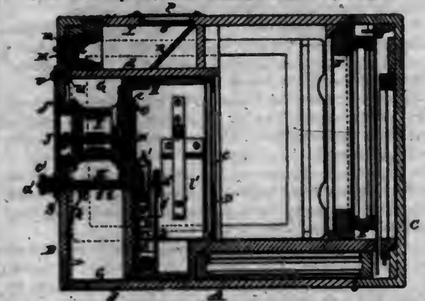
8. In a wire-nail machine, the combination of the following elements, to wit: the header-block 80, sliding in a channel, 79, provided for it in the upper surface of the said sliding-block seat 6, a steel header, 83, in an excavation in the forward part of the said header-block, a plate placed over the header and screwed to the header-block, set-screws 82, 84, and 86, a wedge, 85, liner 81, and the cam-yoke 72, operated by the cam 87 and having the tongue or projection 74, adapted for playing in a tunnel, 88, in the standard 4, and the standard 70, projecting from said tongue, for the purposes set forth.

9. In a wire-nail machine, a cutting or shearing mechanism consisting of a crank, 60, the cutter-stock 61, with the cutting knife or blade 62, the standard 70 of the tongue 71, and the rod or pitman 69, connecting the said standard with the said crank, all operating as described, and for the purposes set forth.

10. In a wire-nail machine, a cutting mechanism having the following means of adjustment: the crank 60, fulcruming upon the shaft 59, (which journals in the standards 58 58,) having the identically-similar arms, (bifurcations,) between whose upper ends is secured a block, 67, which receives a set-screw, 68, and between which arms also slides a movable block, 66, said movable block having the rod or pitman 69 attached thereto, and also receiving the set-screw 66, whereby said sliding block may be raised or lowered, for the purposes set forth.

11. In a wire-nail machine, a cleaner, 93, fulcruming upon a rod, 94, which journals in the standards 58 58, and whose forward end is adapted for playing in the groove 95 in the gripper 23, and to whose rear end is attached the knuckle-joint 96, which is also attached to the cam-yoke 72, so that when the cam-yoke travels rearward the said knuckle-joint will operate to force the rear end of the said cleaner up, thereby causing the forward end to be depressed, and thereby forcing out the nail, as set forth.

397,427. DRAWING BOARD OR TABLE. THOMAS C. HENLEY, Randleman, N. C. Filed July 27, 1888. Serial No. 281,169. (No model.)



Claim.—1. The drawing-board comprising the rectangular frame C, having side and end strips, and the face-board arranged in the said frame and separated at its side edges from the side strips to form slots *n n*, in combination with stationary rollers F, journaled in the end strips beneath the board, the sliding spring-actuated blocks sliding in grooves in the end strips, the rollers G, journaled in the said blocks and normally held in contact with the stationary rollers, and cam-levers H, adapted to engage studs or projections on the sliding blocks to press them back, substantially as specified.

2. The drawing-board provided near its side edges with longitudinal slots *n n*, through which to pass the ends of the drawing-paper, in combination with stationary rollers F, journaled beneath the board parallel with the slots *n*, the sliding spring-actuated blocks D, normally pressed toward the said rollers, the rollers G, mounted in the said blocks and geared to the rollers F, whereby they rotate simultaneously therewith, and cams H, adapted to engage studs or projections on the sliding blocks to press the latter back and disengage the said rollers, substantially as specified.

3. The drawing-board provided near its side edges with slots *n*, in combination with the relatively-adjustable rollers F G, arranged below the said slots and geared together, and the corrugated rubber sleeves V, surrounding the said rollers, substantially as specified.

397,428. PHOTOGRAPHIC CAMERA. JOHN J. HUSSNER, New York, N. Y. Filed Apr. 21, 1888. Serial No. 271,269. (No model.)

Claim.—1. In a photographic camera, the combination, with the sliding focusing-box and its attached lens or lens-tube, of a forwardly exteriorly extending actuating post or rod, operated substantially as shown and described.

2. In a photographic camera, the combination, with the sliding focusing-box and its attached lens or lens-tube, of a forwardly exteriorly extending actuating post or rod having gradations thereon to indicate alterations of focus and operated substantially as shown and described.

3. In a photographic camera, the combination, with the sliding focusing-box and its attached lens or lens-tube, of an actuating post or rod having graduations or grooves for indications of alterations of focus and a click-spring engaging in said graduations to give audible or sensible expression thereof, essentially as described.

4. In a photographic camera, the spindle forming the axis of the shutter and actuating the same, said spindle being also connected with and actuating the sliding lens or focusing-box, as herein shown and described, whereby alteration of the focus and adjustment of the shutter to required position are effected by said spindle, as set forth.

5. In a photographic camera provided with a rotary shutter controlling the lens, the combination of a forwardly-attached shutter spindle or rod attached to said shutter, and a hollow post or tube through which the spindle passes and by which it is supported, substantially as specified.

6. In a photographic camera, the combination, with a sliding focusing-box having an attached lens or lens-tube and rotary shutter controlling said lens, of a forwardly-attached shutter spindle or rod and a hollow post or tube affixed to the sliding box through which the spindle passes and by which it is supported, substantially as described, whereby the same knob or handle of spindle serves to adjust the focus of lens by the movement of lens-box, and also to set the shutter ready for exposure and likewise adjust, as may be desired, the velocity of shutter for less or greater exposure and again enable a change of diaphragms or stops to be made by the withdrawal of lens from inside of box, as set forth.

7. In a photographic camera provided with a finder, the combination, with a slide or cover applied to the exposing-aperture of the lens proper of the camera, of a slide or cover applied to the exposing-aperture of the finder, and a locking mechanism organized to lock the closed cover of the main exposing-aperture when the cover of the finder exposing-aperture is closed, essentially as herein set forth.

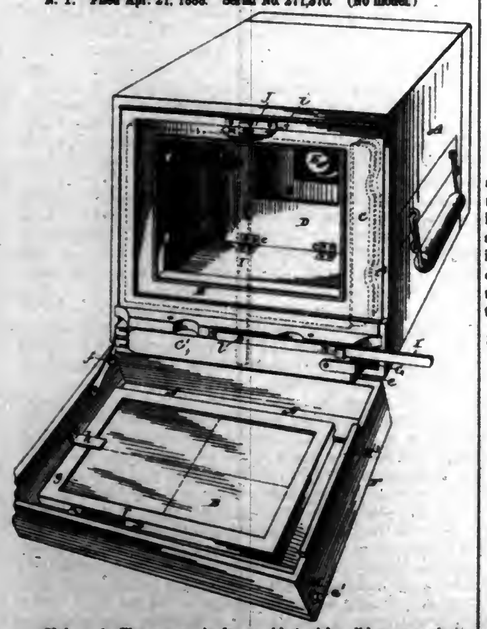
8. In a photographic camera provided with a finder, the combination, with the front or forward cover of the camera-case provided with both focusing and finder exposing apertures, of a sliding focusing-box with attached lens-tube adapted to move in and through said focusing-aperture, the slides or covers applied to both of said apertures, and a locking mechanism organized to lock the closed cover of the focusing-aperture when the cover of the finder exposing-aperture is closed, substantially as specified.

9. The combination, with the front or cover B, having focusing and finder exposing apertures *f m*, of the slides or covers J M, the strip or attachment *s*, secured to the cover M, and the spring-catch *u*, adapted to engage with the cover J, when both slides or covers J M are closed, essentially as described.

10. In a photographic camera provided with a rotary shutter adapted to control the lens tube or opening of the instrument, and which when released is shot or operated by a spring, the rotary shutter, provided with a stop-tooth or projection, *d'*, in combination with a cushioning attachment, R, having a wedge-shaped slot adapted to receive the stop-tooth within it and operating to smoothly and gradually arrest the shutter after it has been shot, substantially as specified.

11. The rotary shutter, constructed with a graduated series of ratchet-teeth or notches, *d'*, additional to and arranged beyond the usual single tooth or notch for holding the shutter on tension, in combination with the lever-catch O, means for setting or adjusting the shutter as desired, and the spring with attached connecting means for actuating the shutter when released, essentially as specified.

12. The combination of the button *k'*, the spring-controlled plate *l'*, the spring-controlled lever-catch O, the rotary shutter N, having ratchet teeth or notches *d'*, the spring P, the cord *g'*, and the pulley *k'*, substantially as shown and described.



13. In combination with the apertured rotary shutter N, the adjustable auxiliary shutter S, having one or more apertures of varying size and shape, and means for holding said auxiliary shutter in position as required, essentially as specified.

14. In a photographic camera, the combination, with the shutter, of a series of springs connected therewith, said springs being arranged to come into successive operation as further rotation or progression of said shutter is made, as set forth.

15. In a photographic camera, the arrangement in conjoined operation, substantially as herein described, of the shutter, its holding device, and driving-spring, so that the velocity of the shutter and the consequent quickness of the exposure of the sensitive plate may be increased or diminished at the will of the operator by the act of setting the shutter and according to the position in which the shutter is placed, all as set forth.

16. In a photographic camera, the combination, with the rotary shutter having a series of teeth or notches and a lever-catch engaging therewith, of a spring composed of a series of leaves of different lengths, which are operated in conjunction with the rotary shutter, substantially as described, whereby on the rotation of the shutter the force of one or more of said springs will be brought to act upon the shutter according to the number of notches or degrees of rotation given to the shutter, as set forth.

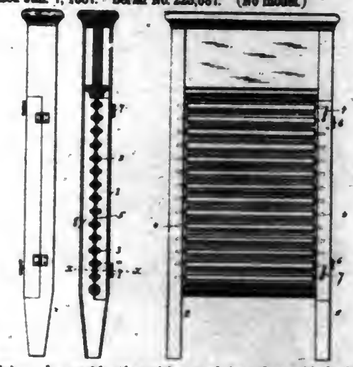
397,429. PHOTOGRAPHIC CAMERA. JOHN J. HIGGINS, New York, N. Y. Filed Apr. 21, 1888. Serial No. 271,370. (No model.)

Claim.—1. The camera-body provided with a lid or cover in its rear and constructed between inner and outer walls with pockets adapted to form storage-chambers for plate-holders out of the field of view of the instrument, substantially as specified.

2. The combination, with the camera-body open in its rear and the hinged lid closing the same, of the plate-holder frame hinged to said body at its back within or under cover of said lid, substantially as specified.

3. The combination, with the body of the camera constructed to open in its rear and the plate-holder-carrying frame hinged to said body in its rear, of pockets forming storage-chambers for plate-holders arranged between inner and outer walls of the camera-body back of said plate-holder-carrying frame, essentially as described.

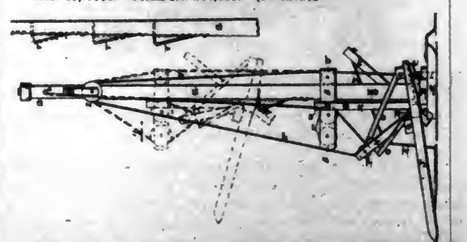
4. The combination, with the camera-body opening in its rear and the plate-holder frame hinged thereto, of the pivoted locking-bar and a locking-plate with which said bar when closed is made to engage, substantially as specified.



5. The combination, with a locking plate or device attached to the camera in its rear, and the locking-bar I, of the hinged lid F, provided with a spring bolt or rod, M, arranged to project through the side of said lid, and having an attached nose-piece adapted to engage with said locking-bar when said lid is closed, essentially as described.

6. The frame *g* of the focusing ground glass, provided with a catch or bolt, in combination with the hinged or swinging plate-holder-carrying frame, and a locking-plate attached thereto, with which said catch or bolt is made to engage, essentially as described.

7. The combination, with the body of the camera constructed to open in its rear, of the hinged plate-holder-carrying frame H, having an attached locking-plate, J, provided with slots *m s*, the pivoted locking-bar I, the rear hinged lid, F, the spring-bolt M, and the focusing ground glass having its frame provided with a catch or bolt, substantially as specified.

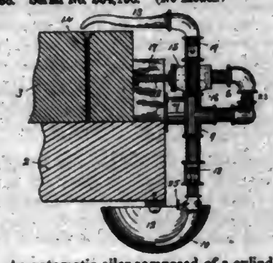


8. The combination, with the camera having one or more side pockets, G, adapted to carry plate-holders, of a spring within either pocket arranged to bear on the inserted plate-holder, substantially as and for the purpose specified.

397,430. WASH-BOARD. ALONZO B. KIBBE, New Richmond, Wis. Filed Jan. 7, 1887. Serial No. 223,687. (No model.)

Claim.—In combination with a wash-board provided with rollers, a movable portion, 5, coextensive with the rollers, whereby the removal and replacement of the rollers is facilitated, hinges 6, connecting the portion 5 at the side to the wash-board so that it may be swung to one side of the wash-board, and thumb-screws 7, screwing into portion 5 and the wash-board, and adapted to adjust the tension of the portion 5 on the rollers, and whereby the rollers may be permitted to rotate at different degrees of speed or be rigidly secured to the wash-board, substantially as shown and described.

397,431. HAY-STACKER. OBED H. KING, Houghton, Iowa. Filed Mar. 13, 1888. Serial No. 267,103. (No model.)



Claim.—1. The combination of a single standard, G, the vertically-moving fork, a single elevating-rope for operating the fork, a support fastened to the side of the standard, a lever pivoted upon the fork for operating in connection with the support, and a cord, X, for operating the lever, substantially as shown.

2. The combination of the standard, a vertically-moving fork placed thereon, the elevating-rope F, a spring-support, V, secured to the side of the standard, the lever W, pivoted upon the fork, and the cord X, fastened at one end of the lever and at the other to one of the teeth of the fork, substantially as described.

3. The combination of the standard G, the elevating-rope F, pulleys I, over which the rope passes, the fork J, placed upon and adapted to move vertically upon the standard, the post N, provided with guiding-pulleys P, the guide S, supported above the fork by the support Q, and pulleys T in the guide, the fork being pivoted to the support R, so that it can be freely tilted without interfering with the guide, substantially as set forth.

397,432. AUTOMATIC OILER. ARIEL KINNEY, Lowell, Mass. Filed Aug. 30, 1888. Serial No. 284,160. (No model.)

Claim.—1. An automatic oiler composed of a cylinder, a plunger which reciprocates therein, an air-pipe extending from said cylinder to the feed-pipe, and a feed-pipe having two valves working oppositely to each other and arranged on opposite sides of the point of junction of said air-pipe with the feed-pipe, combined with an oil-reservoir which receives one end of said feed-pipe, the other end being directed to the spot where the oil is to be applied, and a cross-head or other moving part of the machine, which actuates the plunger, substantially as set forth.

2. In combination with a plunger, 16, operated by the reciprocations of the machine to be lubricated, its inclosing-cylinder 15, and pipe 23 therefrom, the feed-pipe 9, and its valves 19 18, the valve 18 operating to close the passage to the oil-reservoir upon inward travel of the plunger and its rod for discharge of the lubricant, as herein specified.

3. The plunger 16, operated intermittently by its actuating-spring 28, the inclosing-cylinder 15, and pipe 23 therefrom to the feed-pipe, combined with the oil-reservoir 12, the feed-pipe 9, and its valves 18 19, the valve 19 operating to close upon outward movement of said plunger and its rod to fill the oiler with lubricating-fluid, substantially as described.

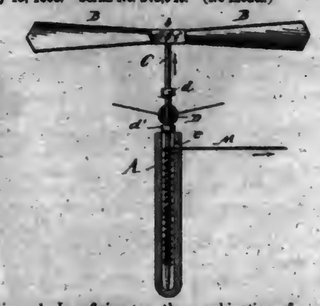
397,433. EAR-RING. LOUIS KRUS, Brooklyn, N. Y. Filed Mar. 16, 1886. Serial No. 195,727. (No model.)

Claim.—1. An article of jewelry consisting of a loop or base having a knife-edge, C, and a suspended setting, B, having a knife-edge, D, extending across and bearing on the other knife-edge, substantially as described.

2. The combination, with the loop A, the eye *c* thereon, and the knife-edge C in said eye, of the setting B, the eye or staple thereof, and the knife-edge D in said eye or staple, which bears on the knife-edge of the eye *c*, substantially as shown and described.

3. The combination, with a loop or base and a setting, of the interlocking eyes provided with knife-edges in contact at right angles, one eye being secured to the loop or base and one to the setting, substantially as shown and described.

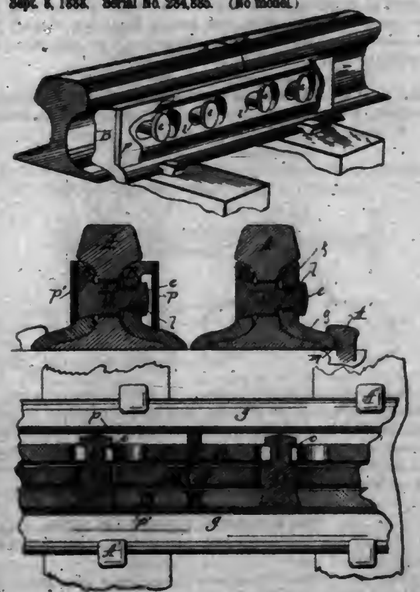
397,434. SETTING FOR JEWELRY. LOUIS KRUS, New York, N.Y. Filed May 1, 1886. Serial No. 200,832. (No model.)



Claim.—1. A suspension device in which the parts capable of relative movement are formed or provided, where they come into contact, with knife-edges, substantially as and for the purpose hereinbefore set forth.

2. In a suspension device in which the parts in contact are formed or provided with knife-edges, the formation of one or both of such edges in curves, substantially as hereinbefore set forth.

3. In a suspension device for jewelry, composed of two links or rings, the internal portions of which present angles or edges at the locality of contact between the two rings, the combination, with the gold or other metal of which such parts are usually manufactured, of plates of steel or other harder and more durable material than that composing said rings inserted at the localities of the bearing portions of the two rings and reduced to knife-edges at their adjacent portions, all substantially as and for the purposes hereinbefore set forth.

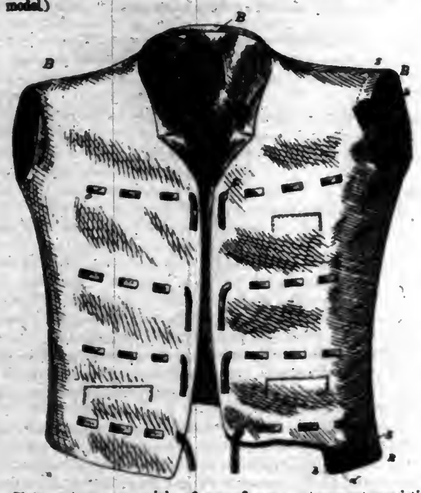


397,435. FLYING TOY. FREDERICK J. LUTZ, Brooklyn, N.Y. Filed May 15, 1888. Serial No. 273,940. (No model.)

Claim.—1. In a flying toy, the combination of a socket-shaped handle having a guide-eye at its upper end, a spindle loosely inserted in said handle, propeller-blades fixed to the upper end of said spindle, two collars on the spindle, and a steadying-body on the spindle between the collars and adapted to turn loosely in a plane at right angles to the spindle.

2. In a flying toy, the combination of a socket-shaped handle having a guide-eye at its upper end, a spindle loosely inserted in said handle, propeller-blades fixed to the upper end of said spindle, two collars on the spindle, and a steadying-body on the spindle between the collars and adapted to turn loosely in a plane at right angles to the spindle, said steadying-body having upwardly-inclined wings.

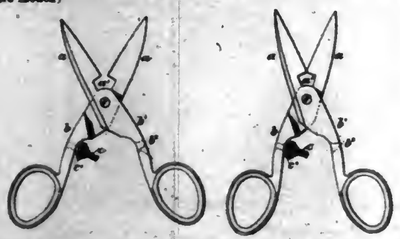
397,436. NUT-LOCK. JAMES C. MORRHEAD, Greencastle, Pa. Filed Sept. 8, 1888. Serial No. 284,885. (No model.)



Claim.—1. In combination with rail ends having holes for the bolts, bolts having heads fitted to pass through these holes, a splice-piece formed with a web, and a flange adapted to bear on the tie or ties, with holes in the web fitted to the heads of the bolts, and slots

fitted to the necks of the bolts, and with holes or notches in the flange, whereby it may be spiked to lock the piece, all substantially as described.

2. In combination with the rail ends having holes for the bolts, bolts having tapering heads fitted to tapering holes in a splice-piece, and heads adapted to pass through the holes in the rail ends, a locking splice-piece with holes fitted to the heads of the bolts, and slots fitted to the necks of the bolts, the locking splice-piece being made hollowed or covered, substantially as described.

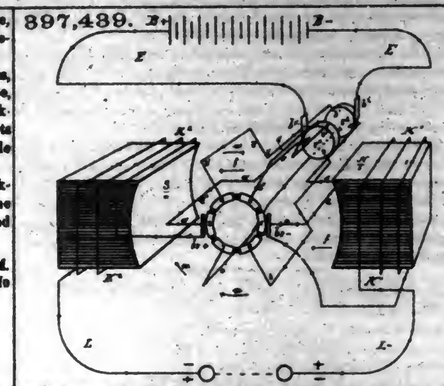


3. In combination with the rail ends and with the bolts and locking splice-piece, a splice-piece, B, having tapering holes fitted to the tapering bolts, and with a covering-piece for the tapered bolts, secured to the splice-piece B, substantially as described.

397,437. PAPER GARMENT. RICHARD C. MUDGE and EDGAR M. WARREN, Detroit, Mich. Filed July 2, 1888. Serial No. 278,877. (No model.)

Claim.—As a new article of manufacture, a garment consisting of layers of cloth and flexible sized paper, having its outer edges inclosing a binding-tape, and stitched as described, and provided with approximately-horizontal rows of perforations, and tapes secured to the garment at or near the perforations of each row farthest from the front opening of the garment, and passing alternately through the said series of perforations, whereby the said tapes are adapted to act as gathering ends, substantially as described.

397,438. BUTTON-HOLE CUTTER. ERNEST HOWELL, West Dulwich, County of Surrey, England. Filed Oct. 31, 1888. Serial No. 289,998. (No model.)



Claim.—In button-hole scissors, the employment of a nut, *d*, formed with a bore of two different diameters, the smaller diameter being threaded to work upon a screwed spindle, *c*, projecting from the inner side of one of the shanks *b* and passing into a hole or recess, *b*⁴, in the shank *b'*, all constructed and arranged in manner substantially as herein shown and described, and for the purpose stated.

397,439. DYNAMO-ELECTRIC MACHINE AND MOTOR. FRANCIS J. PATTEN, New York, N. Y. Filed July 13, 1888. Serial No. 279,861. (No model.)

Claim.—1. A motor provided with a reversing-commutator, the circuit in the motor reversed by said commutator being broken at a point between its terminals and provided with an external loop-circuit, the ends of the loop being in continuous electrical connection with the two sides of the break.

2. A motor provided with an armature-circuit open at an intermediate point between its terminals and in continuous electrical connection with an external loop in which suitable electrical devices may be inserted, and a commutator for reversing current in said armature-circuit.

3. A dynamo-electric machine or motor having connected field-magnet and armature circuits and provided with an external loop in addition to the main external circuit, said loop being connected at its ends, through continuous rubbing contacts, to a break in the internal circuit of the machine, said machine being provided with a reversing-commutator.

4. A dynamo-electric machine or motor provided with a segmental commutator for producing current changes in its internal circuits, the commuted circuit having connected in series with it at a point intermediate of its terminals an external loop, in which the same changes of current will be produced as occur in the commuted circuit.

5. A dynamo-electric machine or motor provided with a commutator for producing a suitable magnetic relation between its field-magnet and armature and having each of its armature-coils connected to two sets of terminals, one set being the reversing-commutator referred to and the other a pair of insulated rings, whereby if a source of alternating current or a source of direct current be connected between one set of terminals and the other set closed the machine will operate as a motor, and whereby alternating or direct currents may be taken from one set or the other of said terminals when the machine is driven as a generator.

6. In a dynamo-electric machine or motor, an armature having its coil or coils provided with two sets of terminals that form parts of a single continuous circuit, one pair connected to insulated ring-contacts and the other pair to the opposite diametral segments of a reversing-commutator, the armature-circuit being closed through two independent external circuits connected to brushes that bear upon the separate pairs of terminals.

7. In a dynamo-electric machine or motor having a number of open armature-coils connected to two sets of terminals that are in continuous circuit, one such set being insulated rings and the other set the opposite segments of a reversing-commutator, both pairs of terminals connected through separate brushes to separate external circuits.

8. In a dynamo-electric machine or motor, the armature construction described, comprising an armature-coil the terminals of which are connected to the opposite diametral segments of a reversing-commutator, the circuit of said armature-coil being open at a point midway between said terminals, the open extremities connected to separate insulated ring-contacts, separate brushes bearing on said rings, and the armature-circuit closed through an external loop connected to said brushes.

9. In a dynamo-electric machine or motor, separate independent armature-coils, each having its terminals connected to the same pair of insulated ring-contacts, each coil open at a point midway between said terminals, the open extremities in each coil connected to a separate independent pair of segments of a reversing-commutator, the separate armature-circuits closed successively and in rotation through an external field-circuit as the opposite pair of commutator-segments for each separate armature-coil comes under the brushes bearing thereon, and to which the external field-circuit is connected.

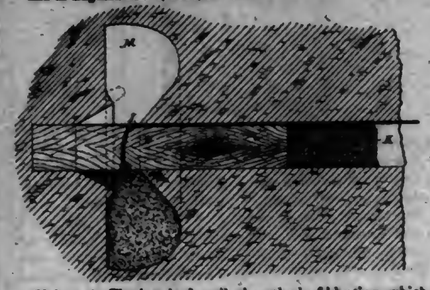
10. In a dynamo-electric machine or motor, an armature-circuit having its terminals connected to separate insulated ring-contacts and midway between said terminals to the opposite diametral segments of a reversing-commutator, a source of direct current connected in the external circuit attached to the brushes bearing on the insulated rings, whereby a current of one direction is maintained in the armature-circuit proper, and an alternating or reversed current is maintained in an external circuit connected to the brushes bearing upon the segments of said reversing-commutator.

11. In a dynamo-electric machine or motor, an armature-coil having its terminals connected to separate insulated ring-contacts, brushes bearing on said ring-contacts that are connected to the poles of a source of direct current, said armature-coils being open at a point midway between the ring-terminals, the midway terminal points of said armature-circuit being connected to the opposite segments of a reversing-commutator, brushes bearing on said commutator, and an external loop-circuit connected to said brushes and including between its terminals the field-coils, whereby the current in said coils and the magnetism of the field are reversed alternately at each half-revolution of said armature.

12. In a dynamo-electric machine or motor, the construction described, comprising an armature-circuit provided with a number of open coils connected all to the same pair of insulated ring-contacts, like ends or terminals of each in reverse order successively, all of said coils open at a point midway between the aforesaid terminals and connected there to the opposite segments of a reversing-commutator, each coil closed in succession as the armature turns through an external field-circuit connected to brushes bearing on said commutator, whereby the field-circuit is supplied with an alternating current when the armature is supplied with a direct current through brushes bearing on the insulated rings and the circuit connected thereto.

13. In a dynamo-electric machine or motor, a ring-armature provided with a number of coils all connected in a single continuous series and a corresponding number of field coils or circuits, also connected with a single series, and all included in an external loop of said armature-circuit included between its two halves and joined thereto through the segments of a reversing-commutator and brushes bearing thereon, the armature-circuit being connected to a pair of insulated ring-contacts.

14. In a dynamo-electric machine or motor, a ring-armature provided with an even number of coils, all connected in a single circuit, the main terminals of said armature-circuit connected to two insulated ring-contacts, and the armature-circuit led from these two ring-contacts through alternate coils of the ring to a pair of midway terminals, the even-numbered coils all joined in a continuous series in one set, and the odd-numbered coils all in series in another set, the remaining terminal of one such set of coils being connected to all the even and that of the other to all the odd numbered divisions of a segmental commutator having as many segments as there are coils on the armature.



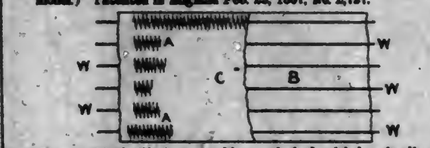
15. In a dynamo-electric machine, an even number of field-poles of alternate polarity arranged radially upon an axis of revolution, the field-coils of one polarity all connected in one series and those of the opposite polarity in a second series, each such series or circuit being connected to a separate insulated ring-contact at one end, and one of said circuits to all the even and the other to all the odd numbered divisions of a segmental commutator at the other end, the two forming a single continuous series circuit and connected to each other through a continuous armature-circuit, the terminals of which are connected to a pair of brushes bearing upon opposite points of the segmental commutator, the alternate even-numbered coils of said armature-circuit being connected to one brush and the odd-numbered coils in series to the other brush, the remaining terminals of said armature-circuit being connected through an external alternating-current circuit, and the two brushes bearing on the insulated ring-contacts being connected to each other through an external direct-current circuit.

16. A dynamo-electric machine or motor having its armature-circuit connected to two continuous ring-contacts, the even-numbered coils all connected in one series and the odd-numbered coils in another, said armature-circuit being broken at a midway point, so as to form intermediate terminals, and the field-coils of said machine similarly connected in two alternating series and connected through a reversing-commutator to the midway terminals of said armature-circuit.

17. In a dynamo-electric machine or motor, an open armature-circuit connected at main terminals to insulated ring-contacts, and a field-circuit included between the two halves of said armature-circuit and connected thereto through fixed brushes bearing upon the opposite segments of a reversing-commutator, to all the alternate segments of which the inner terminal of one half the armature-coils is connected, the terminal of the other half of said armature-coils being connected to all the remaining segments of said commutator.

18. A dynamo-electric machine or motor having an open point in its field-magnet or armature-circuit and a fixed external loop-circuit connected thereto, a series of fixed consequent poles in one of its elements, and a commutator for producing alternate polarity in the other element and electrically connected with another external circuit, whereby when the machine is operating alternating currents will circulate in one external circuit and direct currents in the other.

397,440. METHOD OF BLASTING. LEOPOLD PLOM, Rotinne, and JULIEN D'ANDREMONT, Liege, Belgium. Filed Jan. 26, 1887. Serial No. 225,486. (No model.) Patented in Belgium Dec. 23, 1886, No. 5,616; in France Jan. 3, 1887, No. 167,827; in Luxemburg Jan. 3, 1887, No. 703, and in England Jan. 4, 1887, No. 120.



Claim.—1. The herein-described method of blasting, which consists in forming a cavity having an outlet of smaller diameter, charging the cavity, and then fitting a plug in the outlet, extending through the cavity, whereby the force of explosion cannot be exerted longitudinally of the plug, as fully explained.

2. The herein-described method of blasting, which consists in boring a hole forming an enlarged cavity communicating with but not so deep as the bore-hole, charging the cavity, and inserting a plug into the bore-hole extending a distance in front and behind the cavity, so that the force of explosion will not be exerted longitudinally on the plug, as explained.

3. The herein-described method of blasting, which consists in forming an enlargement in the cavity and extending the bore-hole beyond said enlargement, charging the cavity, and then inserting a tamping carrying a fuse, said tamping extending into the prolongation beyond the enlargement, as herein explained.

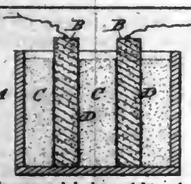
4. The herein-described method of blasting, which consists in boring a hole, forming an enlargement, *M*, around said bore-hole, charging said enlargement, inserting a plug, *N*, carrying a fuse and extending in front and behind the enlargement, and applying a tamping, *K*, over the plug, all substantially as explained.

397,441. FOUNDATION OF CARD-CLOTHING. SOUTER ROBERTS, Cleckheaton, County of York, England, assignor of one-half to John Vesper Curry, same place. Filed Jan. 13, 1888. Serial No. 261,133. (No model.) Patented in England Feb. 23, 1887, No. 2,727.

Claim.—Cloth-filleting of rubber and cloth with longitudinal metallic wires between the layers and with card teeth or dents passing through this filleting, substantially as described.

397,442. MICROMETER-GAGE. CHARLES H. REMSEN, Springfield, Ill. Filed June 25, 1888. Serial No. 278,190. (No model.)

Claim.—1. An expansible adjusting-nut for micrometers, lying wholly within the micrometer-tube, having its upper end tapered and in its opposite sides longitudinal slits, substantially as shown and described, and for the purpose stated.



2. The combination, in a micrometer, of the micrometer-screw having its upper end tapered and fitting into a corresponding tapering hole in the top of the outer shell, with the tube sliding within said shell and the micrometer-frame, substantially as shown and described, and for the purpose stated.

3. The combination, in a micrometer, of an independent slotted expansible adjusting-nut and a conical screw-thimble, with the shell, the tube, the frame, and the micrometer-screw, substantially as shown and described, and for the purpose stated.

397,443. SECONDARY BATTERY. WILLIAM A. SHAW, Brooklyn, assignor to The Electrical Accumulator Company, New York, N. Y. Original application filed Apr. 14, 1882, Serial No. 58,313. Divided and this application filed Sept. 22, 1882. Serial No. 72,901. (No model.)

Claim.—1. The method of making electrodes for secondary batteries by melting or softening by heat a suitable metal or metallic com-

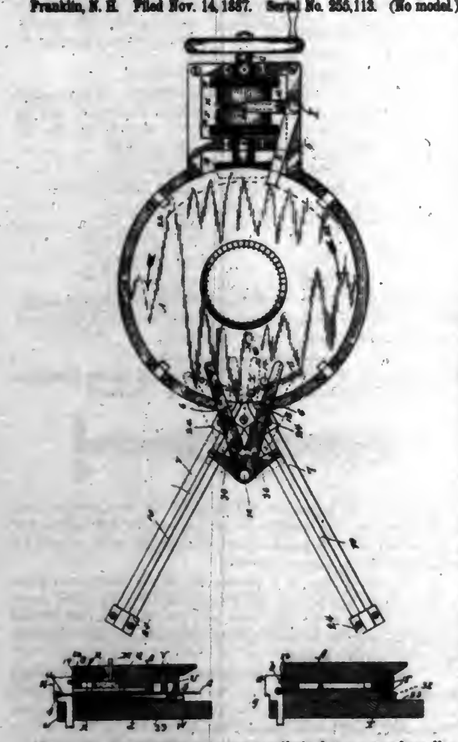
397,443.

pound, mixing active material therewith, and allowing the mass to harden, substantially as described.

2. The method of making electrodes for secondary batteries by mixing active material with molten or plastic metal or metallic compound and casting the mixture, substantially as described.

3. The method of making electrodes for secondary batteries by mixing active material with molten or plastic metal or metallic compound, casting the mixture into the form of an electrode, and applying to the surface thereof a coating of a suitable active material, substantially as described.

4. The method of making electrodes for secondary batteries by melting or softening by heat a suitable metal or metallic compound, combining active material therewith, and allowing the mass to harden.



5. An electrode for secondary batteries having a conducting-support containing galena, substantially as described.

6. An electrode for secondary batteries, consisting of lead, combined with galena, and having active material distributed throughout its mass, substantially as described.

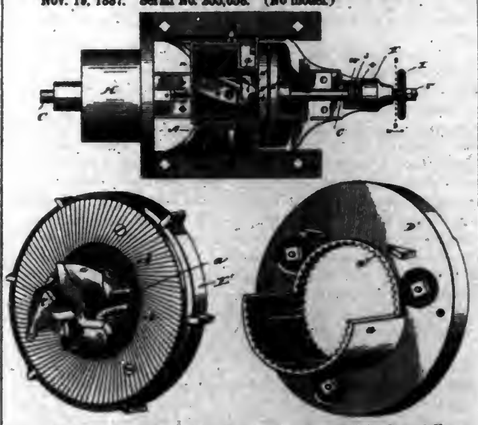
7. An electrode for secondary batteries, comprising a suitable conducting-support and an active coating containing a chromium compound, substantially as described.

8. An element or electrode for secondary batteries, comprising a conducting-support, such as described, and an active coating comprising a mixture of chromate of lead and bichromate of potash, substantially as described.

397,444. CIRCULAR-KNITTING MACHINE. WALTER H. STEWART, Franklin, N. H. Filed Nov. 14, 1887. Serial No. 255,113. (No model.)

Claim.—1. A rotary cam-plate, a needle-bed, two sets of needles, *a b*, the former set provided with extensions or tails, a movable chain supported by the bed and adapted to form a support for the tails of said needles, means for moving the chain, a grooved or slotted slide attached to the said chain to engage the tails of said needles to lower or depress the same, and a bracket provided with a support or way upon which said chain may be moved and by which it may be guided from the bed, combined and arranged substantially as hereinbefore set forth.

2. The combination, with the rotary cam-plate, the grooved needle-bed, and two sets of needles, *a b*, the former needles provided with tails *c*, of chains S and attached grooved slides T, supported and movable in ways in the bed, said slides being adapted to engage the tails of said needles *a* to raise and lower the same in their grooves in the bed, ways or brackets 7, in which said chains are adapted to move, rack-bars movable in and guided by said brackets, a two-armed pawl on each of said chains adapted to be engaged by said rack-bars, and means for reciprocating said rack-bars, as set forth.



3. The combination, with the needle-bed, the needles *a b*, slides T, and attached chains S, bearing the two-armed pawls 9, of brackets 7, rack-bars 10, lever 30, pivoted at its ends to said rack-bars, two-armed lever 13, connected with the fulcrum of said lever 30, and the rotary cam-plate provided with the pin 14, as set forth.

4. The combination, with the needle-bed, needles, and rotary cam-plate, of a rotary arbor, C, a gear connecting said arbor with said cam-plate, pulleys D E, loose on said arbor, clutch-collar F, splined on said arbor to be moved longitudinally thereon, but to rotate therewith, levers G K and their fulcrum-pin I, and pin L, removably secured to the cam-plate, as set forth.

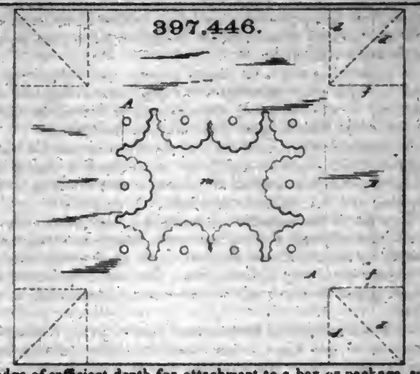
5. The combination, with the needles *a*, provided with the tails *c*, of the rotary cam-plate, the needle-bed provided with grooves in which said needles operate, said grooves being deeper at their outer or rear than their inner or forward ends, chain S, on which the tails of said needles are adapted to rest, slide T, provided with a groove, 25, adapted to engage the tails of said needles, said slide being attached to said chain, a bracket provided with a support or way upon which said chain may be moved and by which it may be guided from the bed, and means for moving said chain, as set forth.

6. The combination, with the rotary cam-plate, needle-bed, needles, slide T, and chain S, of the roller 6 on the needle-bed, block S, and two-armed pawls 9, attached to the chain, bracket 7, reciprocating rack-bar 10, and means for reciprocating said rack-bar, as set forth.

397,445. GRINDING-MILL. HERBERT F. STONE, Appleton, Wis., assignor to the Appleton Manufacturing Company, same place. Filed Nov. 19, 1887. Serial No. 255,658. (No model.)

Claim.—In grinding-mills, the combination of disks D and E, rotatable hub *a*, provided with plates *b*, stationary plates *d d'*, conveyer-flanges *c*, and knives *e*, all arranged to operate substantially in the manner set forth.

397,446. LACE FOR CONFECTIONERS' USE. JOHN R. STOUT, Brooklyn, N. Y. Filed Mar. 24, 1887. Serial No. 232,236. (No specimens.)

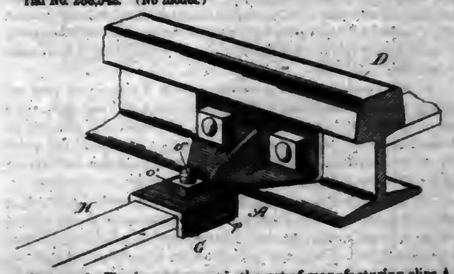


Claim.—1. The combination, with a box or package, of a combined continuous lace and liner, and an auxiliary protecting-sheet of paper or other material, arranged within said box or package, substantially as and for the purpose described.

2. As a new article of manufacture, a combined continuous lace and liner, substantially as herein shown and described, made without break or open joint from a single piece of paper or other suitable material, and adapted for use in boxes or packages that are packed from the bottom, as set forth.

3. A liner for boxes in one piece, having a central opening bordered with lace-work, substantially as described.

4. The combination, with a box or package, of a sheet of lace in one piece with central opening, and being continuous with a border



397,446.

or edge of sufficient depth for attachment to a box or package, substantially as set forth.

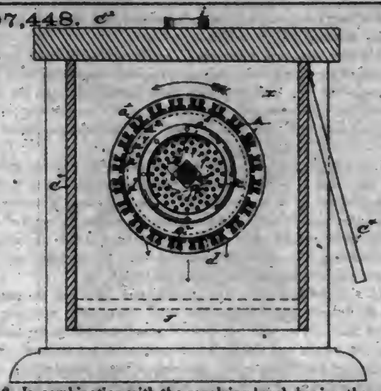
5. The combination, with a box or package, of a combined continuous lace and liner whose central opening is bordered by the lace portion, and whose liner portion is of sufficient depth to wholly or partially line a box or package, substantially as set forth.

397,447. MANUFACTURE OF CLIPS FOR CONNECTING TIE-BARS WITH SWITCH-RAILS. AXEL A. STROM, Austin, assignor to the Strom Manufacturing Company, Chicago, Ill. Filed Oct. 19, 1886. Serial No. 288,542. (No model.)

Claim.—1. The improvement in the art of manufacturing clips A, which consists in forming a sheet-metal blank, B, with a head and a cross-piece, r^3, then bending the head to fit against a rail and the cross-piece to form a socket, substantially as described.

2. The improvement in the art of manufacturing clips A, which consists in forming a sheet metal blank, B, with a head, C, comprising the parts r and r', and with a cross-piece, r^3, then bending the parts r, r', and r^3, respectively, into a head, E, to fit against the web of a rail, a neck, F, to fit upon the rail-flange, and a socket, G, to receive a tie-bar, substantially as described.

3. The improvement in the art of manufacturing clips A, which consists in forming a sheet-metal blank, B, with a head, C, comprising the part r and tapering part r', and with a cross-piece, r^3, then bending the parts r, r', and r^3, respectively, into a head, E, to fit against the web of a rail, a neck, F, to fit upon the rail-flange, and a socket, G, and striking up a ridge, *n*, on the head and neck portions, substantially as described.

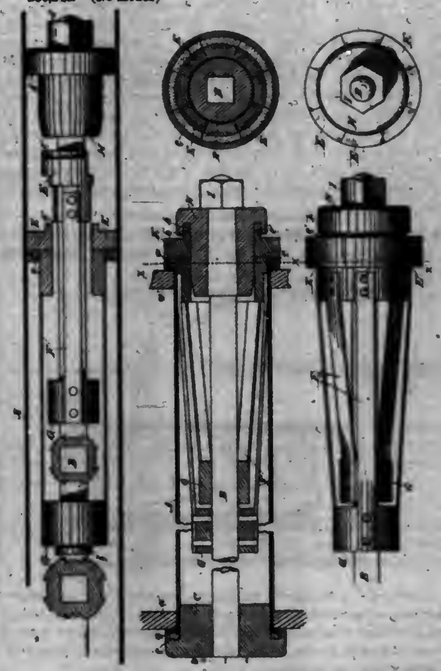


397,448. MACHINE FOR DELINTING COTTON-SEED. THOMAS P. SULLIVAN, St. Louis, Mo. Filed Mar. 2, 1888. Serial No. 265,937. (No model.)

Brief.—The lint is removed from the machine by an exhaust fan, the air being drawn in at both ends of the revolving brush and passing out radially between its lags and through the surrounding net-work. The air-current thus moves in a favorable direction for stripping the brush and is evenly distributed throughout the length of the brush.

Claim.—1. The combination of the revolving brush having the air inlets and outlets, as described, the perforated concave, the casing having the inlet for the lint-bearing seed and the outlet for the denuded seed, and the exhaust-fan, substantially as described.

397,448.



2. In combination with the revolving brush having the air inlets and outlets, as described, the casing having the inlets for the lint-bearing seed and the air-current and the outlets for the lint and the denuded seed, the packer, the perforated concave, and the exhaust fan, substantially as described.

397,449. BOTTLE-STOPPER. JUSTUS A. TRAUT, New Britain, Conn. Filed Nov. 17, 1888. Serial No. 291,067. (No model.)

Claim.—The combination of the upper section, 4, having a lower conical face, 12, the rod 5, cam 6, perforated cylindrical block of soft rubber, and the nut 9, screw-threaded upon the lower end of the rod 5 and having a flat upper face, substantially as described, and for the purpose specified.

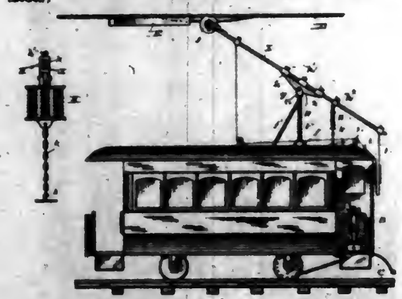
397,450. BOILER-TUBE PLUG. EDWIN W. TUCKER, San Francisco, Cal. Filed Mar. 26, 1887. Renewed July 17, 1888. Serial No. 280,240. (No model.)

Claim.—1. A boiler-tube plug comprising an expansible and contractible ring or band composed of independent sections connected with independent spring-arms adapted to pass through the tube and to expand upon emerging from its inner end and embrace and cover

the bead of said tube, and a core fitting within said ring and holding it to place, substantially as herein described.

2. A boiler-tube plug comprising a sectional ring or band, spring-arms attached to sliding hubs and carrying and supporting each section, whereby the ring is contractible while passing through the tube and expansible upon emerging from its end, and a core fitting within the ring or band and holding it to place, substantially as herein described.

3. In a boiler-tube plug, the combination of a rod for passing through the tube, a sectional ring or band connected with spring-arms and adapted to be contracted as it passes through the tube and to be expanded upon emerging from its end to cover the bead of said tube, and a core carried upon said rod and fitting within the ring or band and holding it to place, said core having a lip engaging tongues on the sections, substantially as herein described.



4. In a boiler-tube plug, the combination of a rod for passing through the tube, a sectional ring or band, spring-arms carrying the sections of said ring or band, whereby it is contractible or expansible, a sliding hub on the rod and to which said arms are secured, and a core on the rod for fitting within the ring or band and holding it to its place against the end of the tube, substantially as herein described.

5. In a boiler-tube plug, the combination of a rod for passing through the tube, a ring or band formed of independent sections, and spring-arms for carrying and supporting said sections, independent sliding hubs on said rod, to each of which some of the spring-arms are secured, whereby the ring or band formed by said sections may be broken and contracted to pass through the tube and expanded to a perfect circle upon emerging at the inner end, whereby the bead of said inner end is covered, and a core on said rod for fitting within the ring or band and holding it to place, substantially as herein described.

6. In a boiler-tube plug, the combination of a rod for passing through the tube, a ring or band formed of independent sections, and spring-arms for carrying and supporting said sections, independent sliding hubs on said rod, to each of which some of the spring-arms are secured, whereby the ring or band formed by said sections may be broken and contracted to pass through the tube and expanded to a perfect circle upon emerging at the inner end, whereby the bead of said inner end is covered, a core on said rod for fitting within the ring or band and holding it to place, a plug on the forward end of the rod for closing the forward end of the tube, and a nut on each end of the rod for tightening up the plugs, substantially as herein described.

7. In a boiler-tube plug, the combination of a rod passing through the tube, a plug with packing upon the forward end of said rod, and a nut for tightening said plug against the forward bead of the tube, a ring or band with packing and composed of independent sections, spring-arms carrying and supporting said sections, and independent hubs sliding on the rod and to which the spring-arms are secured, whereby the plug may be contracted as it passes through the tube and expanded upon emerging therefrom to fit its packing over and against the inner bead of the tube, a core with packing carried by the rod and adapted to fit within the ring and press its packing against its forward edge, and a nut on the inner end of the rod for tightening up the core, all arranged and adapted to operate substantially as herein described.

397,451. OVERHEAD CONTACT AND SWITCH. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Nov. 12, 1888. Serial No. 290,563. (No model.)

Claim.—1. A switch for suspended electric-railway conductors, comprising a box attached to the conductor and formed with two or more branching compartments leading therethrough, one or more of the compartments having a contracted portion adjacent to its extremity, substantially as described.

2. A switching device for electric railways, consisting of an open-bottom metallic box or frame secured to and depending from the under side of a suspended conductor and formed with two or more branching compartments leading therethrough, the extremities of such compartments flaring outwardly toward the conductor to form lateral guides and inwardly to facilitate the passage of the contact device, substantially as described.

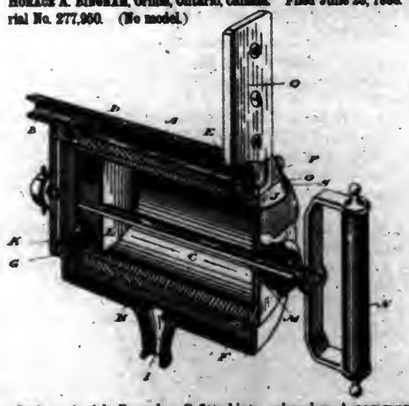
3. A switching device for electric railways, comprising an open-bottom box, conductors connected to the upper portion of the box, and a guide rib or ribs connecting the extremity or extremities of the switch-box with the conductor, substantially as described.

4. A switching device for electric railways, comprising an open-bottom box, conductors leading to the upper closed portion of the box, and a guide-rib connecting the interior of each extremity of the switch-box with the conductor, substantially as described.

5. A switch for suspended electric-railway conductors, comprising a downwardly-open frame or box having passages extending therethrough, the main conductor attached to the upper portion thereof, and a guide rib or strip extending from the inner under side of the box and against the under side of the conductor, substantially as described.

6. A switching device for suspended electric-railway conductors, comprising an open frame or box having branching compartments extending therethrough and suspended from the main conductor, and fixed guides at the extremities of said passages, substantially as described.

7. A switching device for suspended electric conductors, comprising an open-bottom box or frame formed with branching compartments and depending from the conductor, a rib or ridge at the under side of the conductor and extending into the switch-box, and lateral guides on each side of the rib, substantially as described.



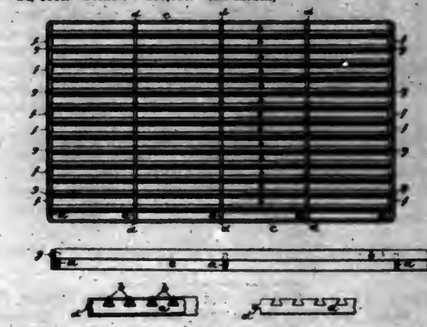
8. In an electric railway, the combination, with the car, of a post extending upward therefrom, a frame hinged and pivoted upon said post, and a longitudinally-adjustable arm secured in said frame and provided at one end with a grooved contact-wheel for engagement with a suspended conductor and at the other with a tension-spring for maintaining the contact-wheel in operative position, substantially as described.

9. The combination of a moving vehicle, a support or post extending upward therefrom, a frame hinged and pivoted therein, an arm longitudinally adjustable in the pivoted frame and provided at its outer end with a contact-wheel arranged to bear against the under side of the conductor, and tension-springs acting against the arm for holding the contact-wheel in position, substantially as described.

10. In an electric railway, the combination, with the car, of a post extending upwardly therefrom, a contact-carrying arm hinged and pivoted upon said post, and a tension-spring adjustably secured to the lower part of said arm and connected with the car, said spring acting to hold the outer extremity of the arm and the contact carried thereby upward against a suspended supply-conductor, substantially as described.

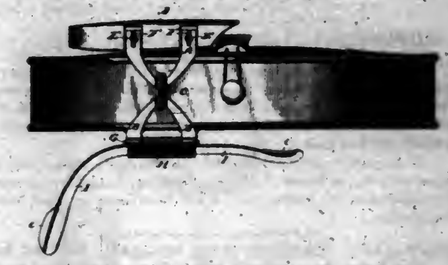
11. In an electric railway, the combination, with a car, of a post extending upwardly therefrom, a contact-carrying arm hinged and pivoted upon said post and provided at one end with a grooved contact-wheel for engagement with the supply-conductor suspended above the line of travel of the car, and a rope or other flexible connection secured near the outer end of said arm and connected with the car, and a rope or flexible connection secured at or near the lower end of said arm, whereby the outer extremity of the arm may be lowered by one rope and the arm moved into the desired position by the other rope, substantially as described.

397,452. LIQUID-MEASURING DEVICE. FRANK WINTERS and HORACE A. BINGHAM, Orillia, Ontario, Canada. Filed June 23, 1888. Serial No. 277,260. (No model.)



Claim.—1. A hollow plug, C, fitted into a chamber, A, communicating with a liquid-reservoir through the passage-way B, and the ports D, E, F, and G and passage-way H, arranged in relation to each other, as specified, in combination with the piston L, connected to the handle N by the piston-rod M, arranged to operate substantially as and for the purpose specified.

2. A hollow plug, C, fitted into a chamber, A, communicating with a liquid-reservoir through the passage-way B, the ports D, E, F, and G and passage-way H, arranged in relation to each other, as specified, and the handle N, designed to revolve the plug C, in combination with the piston L, the cam-plate O, fixed to the plug, and the adjustable frame P, actuated by the cam-plate O, and designed to operate the counter Q, substantially as and for the purpose specified.



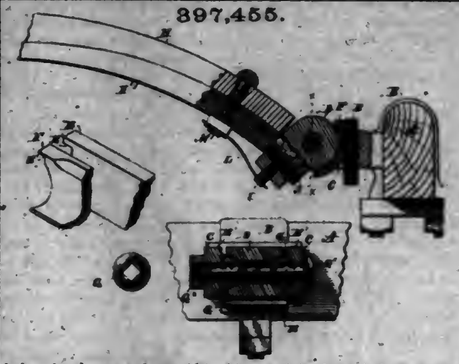
3. A hollow plug, C, fitted into a chamber, A, communicating with a liquid-reservoir through the passage-way B, the ports D, E, F, and G and passage-way H, arranged in relation to each other, as specified, and the piston L, provided with a piston-rod, M, which connects it to the handle N, designed to revolve the plug C, in combination with the cam-plate O, operating between the pins R and S, so as to impart a vertical movement to the frame P, which operates the counter Q, substantially as and for the purpose specified.

397,453. MAT. CLAYTON WOLCOTT, Hartford, Conn. Filed Feb. 24, 1888. Serial No. 265,156. (No model.)

Claim.—The herein-described mat, consisting of a surrounding band, a series of transverse bars having notches which are open at the top and enlarged downwardly, and a series of longitudinal bars or wires with their lower parts shaped in cross-section to the form of said notches, while their upper portions, which project therefrom, are contracted into a longitudinal ridge, substantially as described, and for the purpose specified.

397,454. VIOLIN-REST. JOSEPH BOEHMER, Chicago, Ill. Filed June 6, 1888. Serial No. 276,183. (No model.)

Claim.—1. The combination, with a violin, of an arched strip, as I, the ends of which are adapted to rest upon the shoulder and chest, respectively, of the player.



2. The combination, with a violin, of an arched strip, as I, attached pivotally thereto, and adapted when turned down to rest upon the chest and shoulder of the player, and having a curvature corresponding approximately to that of the ribs of the violin, so that when folded up it may permit the violin to go into an ordinary case.

3. The combination, with clamp-frame of a violin chin-rest, of an arched strip, as I, the ends of which are adapted to rest upon the shoulder and chest, respectively, of the player.

4. The combination, with the clamp A and chin-rest D, of screws E E and slots F F, whereby the rest D may be adjusted, as described.

397,455. THILL-COUPLING. WILLIAM H. BOWMAN, South Salem, Ohio, assignor to Alexander B. Lukens, Charles T. Bowers, and C. P. Pancake, all of same place. Filed Apr. 26, 1888. Serial No. 271,951. (No model.)

Claim.—1. In a thill-coupling, the combination, with the axle-clip having jaws, of a bolt mounted therein, tapering bushings on the bolt, a head mounted on said bushings and having a hole to receive the shaft-iron, and anti-rattling devices interposed between the clip and the said head, and a shaft whose iron is provided with a tenon adapted to fit said hole in the head, and means to secure the tenon therein.

2. In a thill-coupling, the combination, with the axle-clip having jaws, and a rubber cushion and a metallic plate mounted between said jaws, of a bolt mounted in the jaws and having angular portions, tapering bushings fitted upon said bolt and matching said portions, a head mounted on the said bushings and having a hole to receive the shaft or pole iron and provided with a set-screw, and a shaft or pole-iron adapted to fit said hole and to be engaged by said screw.

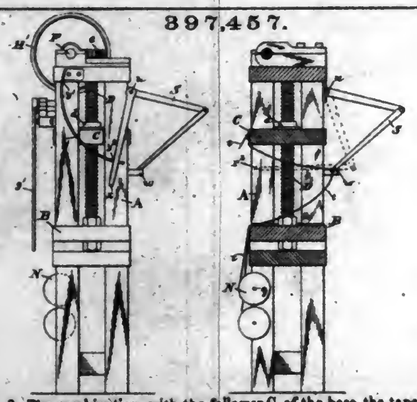
3. A thill-coupling containing the following instrumentalities: an axle-clip having jaws, an india-rubber block and a curved metallic plate fitted between said jaws, a bolt fitted to the jaws and having angular portions, tapering bushings fitted upon said bolt, a head fitted upon said bushings and having an inclined hole, and a shaft or pole iron constructed with a tenon fitting said hole and provided with a transverse pin, a set-screw carried by the head and adapted to engage said tenon, and a locking-spring carried by the shaft or pole and arranged to lock said screw.

4. In a thill-coupling, the combination, with a clip having jaws, of a bolt fitted in said jaws and having angular portions, two bushings having angular holes fitted upon said portions, and a head having two holes therein, one of which is horizontal and mounted upon said bushings and the other of which is adapted to receive the shaft or pole iron.

5. In a thill-coupling, the combination, with the clip having jaws, of a bolt fitted to said jaws, a head having a horizontal hole arranged to turn on the said bolt as its axis, and another hole at right angles to the first-named hole, and a shaft or pole iron constructed with a tenon which fits said latter hole, and devices to hold said tenon therein.

6. In a thill-coupling, the combination, with a head having a hole adapted to receive a shaft or pole iron and a set-screw, of a shaft or pole iron constructed with a tenon adapted to fit said hole and to be engaged by the said screw, and provided with a transverse pin, and a spring-lock carried by the shaft or pole and arranged to lock said screw.

397,456. WHIP. HENRY A. COWLES, Westfield, Mass., assignor to the Bay State Whip Company, same place. Filed June 8, 1888. Serial No. 276,482. (No model.)



Claim.—A whip having a central steel core-piece surrounded by parallel longitudinal strands of catgut or fibrous material, a plaited core-covering, and a surrounding whip-cover of usual material connected to said whip-core, substantially as described.

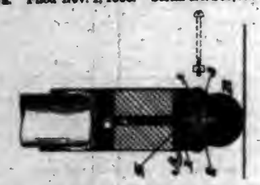
397,457. MACHINE FOR COMPRESSING AND BUNDLING GOODS. WILLIAM O. CRAIG, Baltimore, Md., assignor of two-thirds to Wise Brothers, same place. Filed Aug. 13, 1888. Serial No. 282,671. (No model.)

Claim.—1. The combination, with the press-frame and the curved plate *y*, provided with stop-shoulders y' y^2, of the rock-shaft *x*, jointed arms S, attached thereto and having spring-actuated hooks *r*, the bar *w*, and the lever *x*, substantially as shown and described.

2. The combination, with the base B and the follower C, having clamps *z*, of the tape or cord spools N, mounted on rods *q* below the base, the arms S, and the spring-actuated hooks *r*, pivoted to said arms, substantially as shown and described, and for the purpose set forth.

397,457.

3. The combination, with the follower C, of the base, the tape or cord spools, the tape or cord clamps to hold the tape stretched across the space between the follower and base, a rock-shaft, *u*, a bar, *w*, extending along the machine, jointed arms attached to the rock-shaft and having their free ends resting upon the said bar, and a spring-actuated hook secured to each arm, substantially as set forth.



397,458. TIRE FOR VEHICLE-WHEELS. HOWARD M. DU BOIS, Philadelphia, Pa. Filed Nov. 1, 1888. Serial No. 289,749. (No model.)

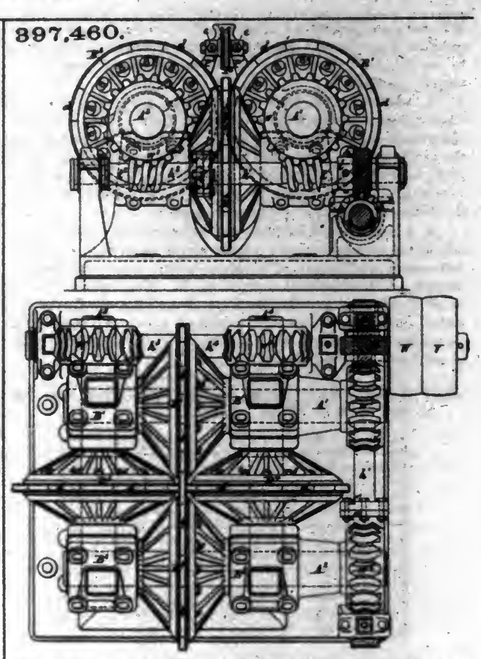
Claim.—1. In a tire, an inner metallic tire and a cushion, in combination with an outer upset tire, substantially as described.

2. A tire consisting of inner metallic tire and outer upset metallic tire with an interposed cushion, the inner tire having side flanges, forming a channel receiving said cushion and outer tire, substantially as described.

397,459. TIRE FOR VEHICLE-WHEELS. HOWARD M. DU BOIS, Philadelphia, Pa. Filed Nov. 1, 1888. Serial No. 289,750. (No model.)

Claim.—1. A metallic tire with side flanges having an elastic tread within the same, a transverse tubular plug passing through said tread and having its ends contiguous to said flanges, and a pin passing through both the plug and side flanges and secured to the latter, said parts being combined substantially as described.

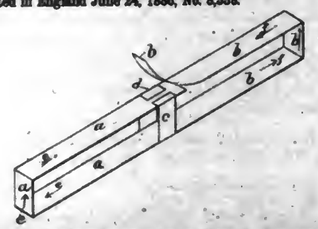
2. An elastic tread having a tubular plug contained therein, in combination with a pin passing through said plug and secured to the sides of the tire, substantially as described.



3. A tread for a tire having therein a plug with a head on the periphery thereof, said plug being adapted to be secured to the said flanges of the tire, substantially as described.

4. A metallic tire having flanges forming a circumferential channel or groove, an elastic tread within said channel, a tubular plug having a peripheral head within said tread and having its ends contiguous to the flanges of the tire, and a pin passing through said tube and flanges, said parts being combined substantially as and for the purpose set forth.

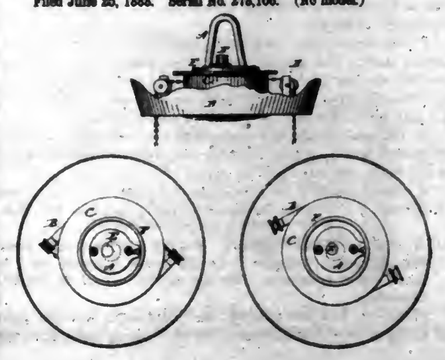
397,460. MACHINE FOR ROLLING NAILS. HIRAM R. FULLER, London, England. Filed Jan. 5, 1888. Serial No. 259,910. (No model.) Patented in England July 5, 1887, No. 9,513; in France Dec. 30, 1887, No. 187,894, and in Belgium Dec. 30, 1887, No. 80,115.



Claim.—In a nail-rolling machine, the combination of two pairs of die-rollers of conical form, so arranged that the axes of the one pair are in a plane a little below the plane of the others and at right angles to them, all the rolls revolving in a vertical plane, and each having a series of dies in their greatest diameter and arranged as described, whereby the bite of the lower rolls is near the bite of the upper rolls to seize the blanks directly therefrom before the blanks have left the

397,460.

dies of the upper rolls, substantially as and for the purpose herein set forth.



397,461. ELECTRIC CONVERTER. LUDWIG GUTMANN, Fort Wayne, Ind. Filed May 16, 1888. Serial No. 274,029. (No model.) Patented in England June 24, 1886, No. 8,338.

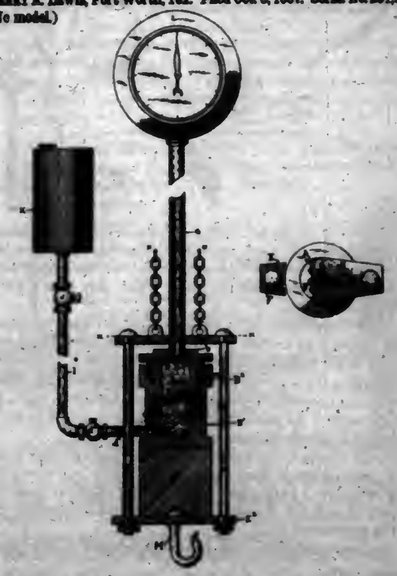
Claim.—1. An electric converter in which the iron core is made of superposed iron cross-shaped sheets whose arms are bent into two rectangular figures at right angles to each other, and the ends of whose arms all lie in the same or substantially the same plane and in contact with one another.

2. An electric converter in which the iron core is made of superposed cross-shaped sheets of iron whose ends are brought into metallic contact with one another, the several sheets being insulated from one another.

397,462. SUSPENSION DEVICE FOR LAMPS. WILLIAM C. HOMAN, Meriden, Conn., assignor to Edward Miller & Company, same place. Filed June 25, 1888. Serial No. 278,106. (No model.)

Claim.—1. The combination of a frame, a stationary hanger, a spindle forming a connection between the frame and hanger, but so as to permit a limited rotation of said frame in a horizontal plane while the hanger remains stationary, a spring-drum arranged in said frame upon said spindle, one or more chains extending from said drum, the drum provided with a flange concentric with said spindle, an eccentric on the spindle between the hanger and frame, and a dog in connection with said eccentric, the nose of the dog being adapted to engage said flange on the drum, substantially as described, and whereby under a rotation of said drum in one direction disengagement between said flange and dog will be produced by the said eccentric, or the frame turned in the opposite direction will produce an engagement between said flange and dog.

2. The combination of the stationary hanger A, the frame B, having a vertical spindle, D, extending therefrom, the upper end of the spindle constructed with an eccentric extension, E, into said hanger, and which eccentric extension forms a pivot in the hanger for the horizontal rotation of the frame, a spring-drum, C, arranged upon said spindle as its axis of revolution, one or more chains extending from said spring-drum, the head of the drum next the hanger constructed with a flange, F, concentric with the spindle, but eccentric to the said extension or pivot E, the hanger constructed with a dog, G, within said flange, the nose of the said dog adapted to engage or disengage said flange on the drum, substantially as and for the purpose described, and whereby under the rotation of the frame in a horizontal plane in one direction the dog and flange of the drum are disengaged, but under a rotation of the frame in the opposite direction the said flange and dog are brought into engagement.

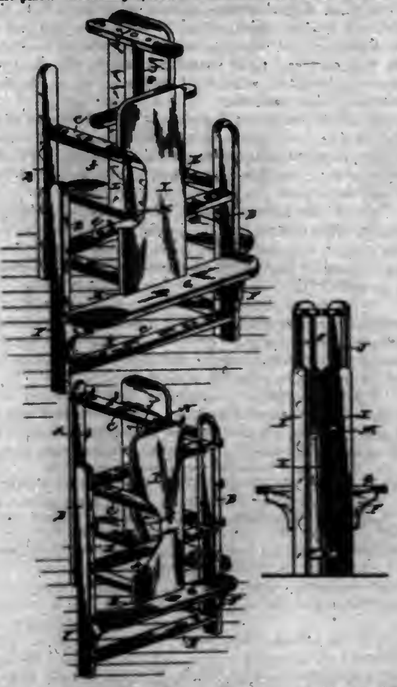


397,463. MANUFACTURING DOLLS AND BUSTS. JOSEF KIENELKA, Vienna, Austria-Hungary. Filed Jan. 12, 1888. Serial No. 260,559. (No model.) Patented in Germany Oct. 1, 1884, No. 31,189; in Austria-Hungary Oct. 6, 1884, No. 20,966 and No. 46,457, and in France Oct. 23, 1884, No. 165,094.

Claim.—1. As a new article of manufacture, a head or bust of hard material, wherein are formed recesses at those places which are intended to be ornamented with hair, substantially as described.

2. A head or bust of hard material provided with a recess, C, in combination with a plastic material filling the said recess, and hair secured in the said plastic material, substantially as described.

397,464. HYDROSTATIC INDICATOR FOR WEIGHING-SCALES. HENRY A. LEWIS, Fort Worth, Tex. Filed Oct. 8, 1887. Serial No. 251,808. (No model.)

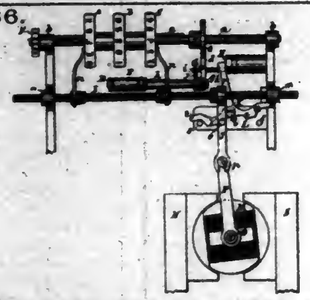


Claim.—1. In a hydrostatic indicator for scales, a hollow inner cylinder, and a second outer cylinder, within which the inner cylinder slides, said inner cylinder being provided with a vertical stand-pipe directly over it, in combination with a registering-dial attached to the top of the stand-pipe, all constructed to operate substantially as and for the purposes specified.

2. In a hydrostatic indicator for scales, a hollow inner cylinder, and a second outer cylinder, within which the inner cylinder slides, a stand-pipe attached to said inner cylinder, and a registering-dial, in combination with a bearing-bar, side rods, and under bar, forming a frame bearing upon the top of said inner cylinder, all constructed to operate substantially as and for the purposes specified.

3. In a hydrostatic indicator for scales, a reservoir, an outer cylinder, a hollow inner cylinder, an attached stand-pipe, and registering-dial, said inner cylinder being surrounded by and sliding within said outer cylinder, said outer cylinder being provided with an attached inlet-pipe communicating with said reservoir, said pipe being provided with two valves, in combination with a bearing-bar, side rods, and under bar, forming a frame bearing upon the inner cylinder, substantially as described.

397,465. COMBINED BULLETIN-BOARD AND BROOM-HOLDER. MICHEL W. MAHAR, Dayton, Ohio, assignor of one-half to George Rembe, same place. Filed May 3, 1888. Serial No. 272,709. (No model.)



Claim.—A combined bulletin-board and broom-holder consisting of two frames hinged together, the cross-pieces of which are apertured to receive the handles of the brooms, a shelf upon the front of each frame, a post secured to the frame, and each post having an apertured cross-piece at its top, vertical bulletin-boards secured to said frames, brackets, and posts, a hook secured in the rear edge of one of the cross-pieces of one of the frames, and an eye secured in the rear edge of the cross-piece of the other frame, and a connecting-rod formed with eyes at each end adapted to engage the hook and the eye of the cross-pieces, substantially as set forth.

397,466. PRINTING-TELEGRAPH. ANDREW T. MCGUT, Boston, Mass., assignor to John Anderson, New York, N. Y. Filed Oct. 17, 1887. Serial No. 252,841. (No model.)

Claim.—1. In an electric printing-machine, three type-wheels having the same axis, one of the wheels provided with type required for printing on either of two parallel lines and each of the other wheels provided with type required for printing on one only of said lines, substantially as set forth.

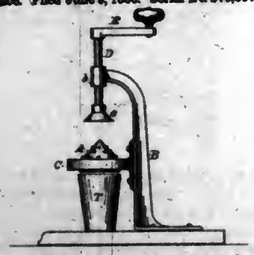
2. In an electric printing-machine, three type-wheels, one provided with type for printing on one of two parallel lines, and each of the others provided with type required for printing on one only of

397,466.

said lines, the wheels being adapted to rotate together, and also to be moved endwise, substantially as and for the purposes set forth.

3. In an electric printing-machine, three type-wheels, one provided with type for printing on one of two parallel lines, and each of the others provided with type required for printing on one only of said lines, the wheels being on the same shaft, which shaft has also a pin or projection, *d*, at the unison-point for each of the type-wheels, substantially as set forth.

4. In an electric printing-machine, three type-wheels, one provided with type for printing on one of two parallel lines, and each of the others provided with type required for printing on one only of said lines, the wheels being located on one shaft, in combination with a device, substantially as the rod I and arms *n*, for moving the type wheels endwise, as specified.



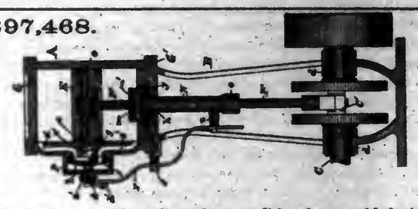
5. In an electric printing-machine, the combination of a type-wheel, a permanent magnet, an armature provided with a helix and adapted to oscillate between the poles of the magnet, and means, substantially as the arm P, rod I, and arms *n* and J, for moving the type-wheel endwise, substantially as set forth.

6. The combination of the press-lever, a pin, *d*, or projection on the type-wheel shaft, a lever, G, pivoted to the press-lever, provided with a pin, *k*, a pivoted arm, H, and a piece, K, which is formed to provide a stop to limit endwise motion of the type-wheel, substantially as specified.

7. The combination, in an electric printing-machine, of a permanent magnet, an armature provided with a helix and adapted to oscillate between the poles of the magnet, an arm, J, adapted for moving the type-wheel endwise, and a pivoted piece, K, to act as a stop for said arm, substantially as set forth.

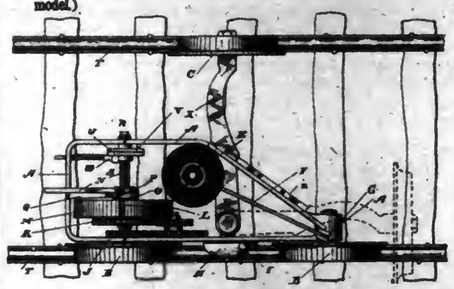
8. In an electric printing-machine, the combination of a permanent magnet, a pivoted armature therefor provided with a helix, an arm, P, an arm, J, a pivoted piece, K, provided with stops *v* and *x*, and an arm, *r*, and arm H, or locking-piece, substantially as specified.

397,467. FRUIT-JUICE EXTRACTOR. JOHN A. NEIGHTER, Akron, Ohio, assignor of two-thirds to Harry R. Loomis and Lewis D. Seward, both of same place. Filed June 9, 1888. Serial No. 276,807. (No model.)



Claim.—The combination, with the perforated cone A, of the standard B, the ring C, attached to the standard, and the shaft D, journaled in said standard and provided with cup *c* and crank E, substantially as described.

397,468. STEAM-ENGINE. GEORGE W. PRICE, Baltimore, Md., assignor to John D. Pinto, same place. Filed Apr. 23, 1888. Serial No. 272,177. (No model.)

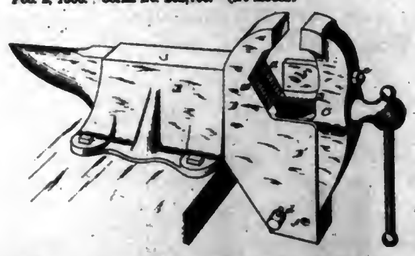


Claim.—1. The combination, with the head of a steam-cylinder, through which the piston-rod works, of a dovetailed slide-block moving in a dovetailed slideway in said head, and the sleeve having a T-shaped head resting in a concave seat in the block and provided with a packing at the lower end, through which the piston-rod works, the sleeve extending through a slot in the piston-head, substantially as specified.

2. A steam-engine having, in combination, the cylinder provided with a piston, and having at one end a slide-block, J, which reciprocates crosswise of the cylinder-head, a disk-valve provided with a crank, *d'*, a sleeve, N, projecting from the slide-block, provided with a pivot-stud, *t*, and capable of vibrating, a main crank, C', a rod connecting the piston and main crank and extending through the said sleeve, and a lever, *r*, having one end attached to the valve-crank, the other end attached to the said pivot-stud, and pivoted at *s* between its ends.

397,468.

397,469. DANGER-SIGNAL FOR RAILWAYS. JEROME PRINCE, Milford, Mass., assignor to William E. Morris, Boston, Mass., and John C. Bates, Aspen, Colo. Filed Apr. 26, 1888. Serial No. 271,934. (No model.)



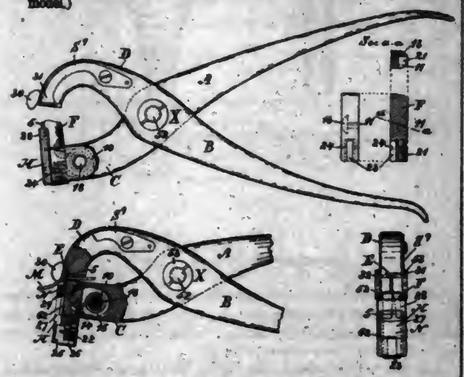
Claim.—1. The car A, wheels B C, with driving spring and gearing suitably connected thereto, in combination with the folding signal apparatus D E F carried on said car, substantially as set forth.

2. The car, the driving spring and gearing, and the gong automatically sounded during movement of the car, in combination with a visible-signal device and with a self-acting stop apparatus, for the purpose set forth.

3. The car A, having one or more driving-wheels, B, and a swinging arm, X, carrying wheel C, in combination with the driving spring and gearing suitably connected to the wheel B, and with fastenings for the arm C, for the purpose set forth.

397,470. VISE. WILLIAM H. REEDER, Cedar Rapids, Iowa. Filed Feb. 2, 1888. Serial No. 262,709. (No model.)

Claim.—1. A vise-jaw having angled and serrated pieces of steel cast integral therewith and below the holding-face of said jaw proper, whereby said pieces of steel are adapted to form the angled face of a pipe-vise, and to strengthen the jaw of which they form a part, substantially as specified.



2. The combination, in a hinged vise, of the fixed jaw B, having pipe-gripping jaws *a a* cast therein between the main holding portion and the screw, and the pivoted jaw C, provided with the removable pipe-gripping jaw *b* between its main holding-jaw and the screw, said jaw *b* having a practically straight inner face, whereby the pipe is forced into the angle of the jaws *a a*, notwithstanding variations in the angle of the jaw C, substantially as set forth.

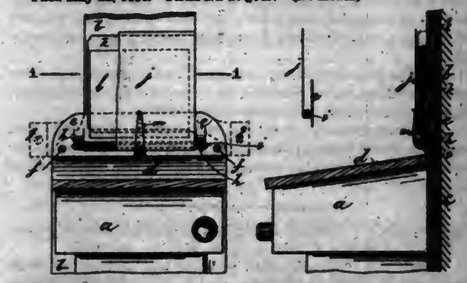
3. In a hinged vise, the combination of the fixed jaw B, having the parallel flanges B' B', connected at the bottom by the web B'', and the pivotal jaw C, having parallel flanges C' C', similarly connected by the web C'', and the pivot-pin *d*, all constructed substantially as and for the purpose set forth.

4. The combination, with an anvil, A, adapted to serve as a support for the vise, of a vise composed of a fixed jaw, B, having angled and serrated pieces of steel *a a* cast into the neck thereof, a hinged jaw, C, having the removable jaw *b*, with a straight inner face, and the pivot-pin *d*, substantially as and for the purpose set forth.

5. In a vise, the combination, with an inner jaw having pipe-gripping jaws *a a*, of an outer jaw, C, having a socket in the neck thereof, and a pipe-gripping jaw, *b*, with a vertically-wide gripping portion, and a reduced shank adapted to be rigidly secured in said socket, whereby said removable jaw may be attached to said jaw C without increasing the outward projection of the upper portion of said jaw C, substantially as specified.

397,471. BUTTON-SETTING IMPLEMENT. FRANCIS H. RICHARDS, Hartford, assignor to the American Button Fastener Company, New Britain, Conn. Filed June 5, 1888. Serial No. 276,000. (No model.)

Claim.—1. In a button-setting instrument, the combination, with the jaw C, formed to receive the presser-slide and the slide-actuating spring, of the slide F, and the coiled spring 10, the slide having a notch for receiving the projecting end of said spring, all substantially as described.



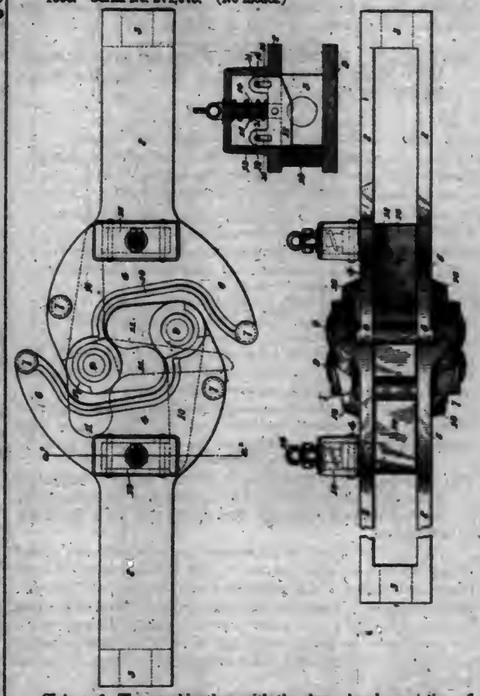
2. In a button-setting instrument, the combination, with the fastener-driving member thereof, of the slide F, passing through said member, and the spring-actuated plate pivoted in said slide and having a projecting arm acted upon by a spring carried by said slide, all substantially as described.

3. In a button-setting instrument, the combination, with the driver having slot 62, of the slide F, having slot 23, and the plate H, having a rib or arm, 25, pivoted to said slide in said slot 23 and adapted to enter said slot 62, substantially as described.

4. In a button-setting instrument, the combination, with the fastener-driving member thereof, of the slide F, having slot 23, and the chamber 21, the plate H, pivoted to said slide and having arm 26, and the push-spring 22, contained in said chamber and acting on said arm, as set forth.

5. The combination of the member C, carrying the slide F, and having the chamber or recess 15, opening to said slide within said member, of the spring 10, connecting with and actuating said slide, and the guide-screw 18, having the head 19, forming a cover for said recess, as set forth.

397,472. TELEPHONE PAPER-PAD HOLDER. JOHN P. SEYMOUR, Jr., St. Louis, Mo., assignor of one-half to Stephen G. Adams, same place. Filed May 23, 1888. Serial No. 274,645. (No model.)

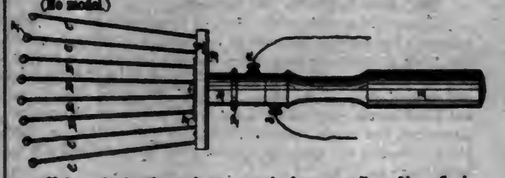


Claim.—1. The combination of a bar or frame, *c*, having lugs *h*, a flap or cover, *j*, hinged to said lugs and having spring wing or clip *k*, carrying paper pad *l*, and spring *m*, with a telephone-box and frame, substantially as shown, and for the purpose described.

2. The combination of a bar or frame, *c*, having lugs *h*, a flap or cover, *j*, hinged to said lugs and having spring wing or clip *k*, carrying paper pad *l*, with a telephone-box and frame, substantially as shown, and for the purpose described.

3. The combination, with a telephone-box, of a frame, *c*, lugs *h*, flap *j*, with paper pad, and a spring arranged so as to normally press the flap against the upright bracket of the telephone-box, substantially as described.

4. The combination, with a telephone-box, of lugs *h*, flap *j*, hinged to said lugs, and spring *m*, the whole arranged so as to carry a pad of paper, and so that the flap will be normally held against the upright bracket of the telephone-box, substantially as described.



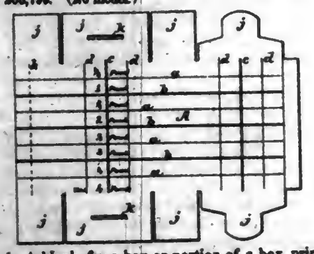
397,473. CAR-COUPLING. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Co., (Limited,) same place. Filed Apr. 26, 1888. Serial No. 271,975. (No model.)

Claim.—1. The combination, with the draw-head consisting of two parallel separated wrought-iron side bars having heads at the ends thereof, said heads being rigidly connected together at a suitable interval, of a locking-tongue pivoted between said heads, a box or case on the head, and a movable spring-actuated latch-block arranged within said box or case and adapted to engage said tongue, substantially as and for the purposes specified.

2. The combination, with the draw-head consisting of two parallel separated wrought-iron plates connected together at a suitable distance apart, of a locking-tongue pivoted between said plates, a box or case on the head, and a vertically-movable spring-actuated latch-block sliding upon pins in said case and adapted to engage the pivoted tongue, substantially as and for the purposes specified.

397,474. THERAPEUTICAL ELECTRODE. LOUIS T. STANLEY, Brooklyn, N. Y., assignor to the Stanley Electric Company, Philadelphia, Pa. Filed Sept. 14, 1887. Renewed Jan. 8, 1888. Serial No. 265,803. (No model.)

Claim.—1. An electrode composed of a row or line of long flexible metallic teeth with blunt or rounded ends secured to a backing or base, and provided with circuit-connections, as set forth.



2. An electrode consisting of the combination, with a handle, of a row or line of flexible metallic teeth formed with rounded knobs at the end and secured to a back or base and provided with circuit-connections, as set forth.

3. The combination, with an insulating-handle having terminals *a b*, of the insulating-plate A, the line or row of flexible teeth, and the metal plates B D, clamped to the plate A, and securing the teeth in position, the said plates being respectively connected electrically with the terminals *a b*, as set forth.

4. The combination, with the line or row of metal teeth, of the clamping-plates B and D, securing said teeth to the insulating-base or plate A upon opposite sides, as described, the back H, ferrule K, and screw G, and the handle provided with the socket M and ferrule N, for making electrical connection with the teeth, as set forth.

5. The combination, with the teeth or electrodes secured in two insulated groups, of the screw G and ferrule K, attached to the plate or back carrying the teeth and forming concentric terminals, of the handle L, formed with corresponding terminals, and the metal disk or button O, insulated on one face, as set forth.

397,475. GRADUATED BLANK FOR PAPER BOXES OR WRAPPERS. WALTON C. TIFFANY, New York, N. Y. Filed Mar. 20, 1888. Serial No. 268,799. (No model.)

Claim.—1. A blank for a box or portion of a box printed with alternate light and heavy numbered parallel lines and light and heavy lines at right angles thereto, as shown and described.

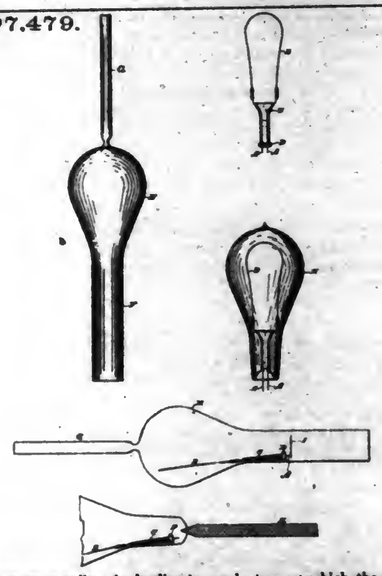
2. A box having the alternate light and heavy parallel lines numbered and printed thereon, with the heavy and light lines at right angles thereto, as shown and described, for the purpose set forth.

397,476. MANUFACTURE OF STEEL. ROBERT J. TILFORD and HENRY M. REDEMANN, Louisville, Ky., assignors to the Redemann-Tilford Steel Company, same place. Filed July 25, 1888. Serial No. 281,018 (Specimens.)

Claim.—The process of converting low-grade steel into refined or high-grade steel, which consists in first heating the metal to be treated to a degree of heat represented by white heat, and then subjecting the metal so heated to a previously-prepared liquid bath, which by contact with the heated metal gives out hydrocarbon gases which are taken up by the heated metal, and allowing the metal to remain in such bath till practically cooled, substantially as hereinbefore set forth.

397,477. MANUFACTURE OF STEEL. ROBERT J. TILFORD and HENRY M. REDEMANN, Louisville, Ky., assignors to the Redemann-Tilford Steel Company, same place. Original application filed July 25, 1888, Serial No. 281,018. Divided and this application filed Nov. 13, 1888. Serial No. 290,737. (No specimens.)

Claim.—The process herein described for converting lower-grade steel into refined or higher-grade steel, which consists in heating the metal to be treated to a white heat, and then submerging the heated metal in a liquid bath of glycerine and water in the proportion of three (3) ounces of the former to one-half (½) gallon of the latter, substantially as hereinbefore set forth.



397,478. MANUFACTURE OF STEEL. ROBERT J. TILFORD and HENRY M. REDEMANN, Louisville, Ky., assignors to the Redemann-Tilford Steel Company, same place. Original application filed July 25, 1888, Serial No. 281,018. Divided and this application filed Nov. 13, 1888. Serial No. 290,738. (No specimens.)

Claim.—The process herein described for converting steel, which consists in first heating the metal to be treated to a white heat, and then while so heated submerging the same in a liquid bath consisting of glycerine and water in the proportion of three ounces of the former and one-half gallon of the latter, combined with spirits of niter, one and a half ounce; aqua-ammonia, one and a half ounce; chloride of ammonium, two ounces; sulphate of zinc, one and a half ounce; sulphate of alumina and ammonia, one and a half ounce, substantially as hereinbefore set forth.

397,479. INCANDESCENT-LAMP MANUFACTURE. JAMES A. VANDERPOEL, Newark, N. J. Filed Nov. 10, 1888. Serial No. 290,443. (No model.)

Claim.—1. The improvement in the art of making incandescent lamps, which consists in introducing into a glass globe the glass base

397,479.

or stem surrounding the leading-in conductors on which the carbon is mounted, then closing the globe or neck, and then perforating the same for the passage of the leading-in conductors and fusing or sealing in the glass base or stem, as set forth.

2. The improvement in the art of making incandescent lamps, which consists in introducing the mounted carbon and its glass base or stem into the globe, then drawing off the neck of the globe and closing the same, then perforating the closed end of the neck and sealing the glass stem over or in such perforation, as set forth.

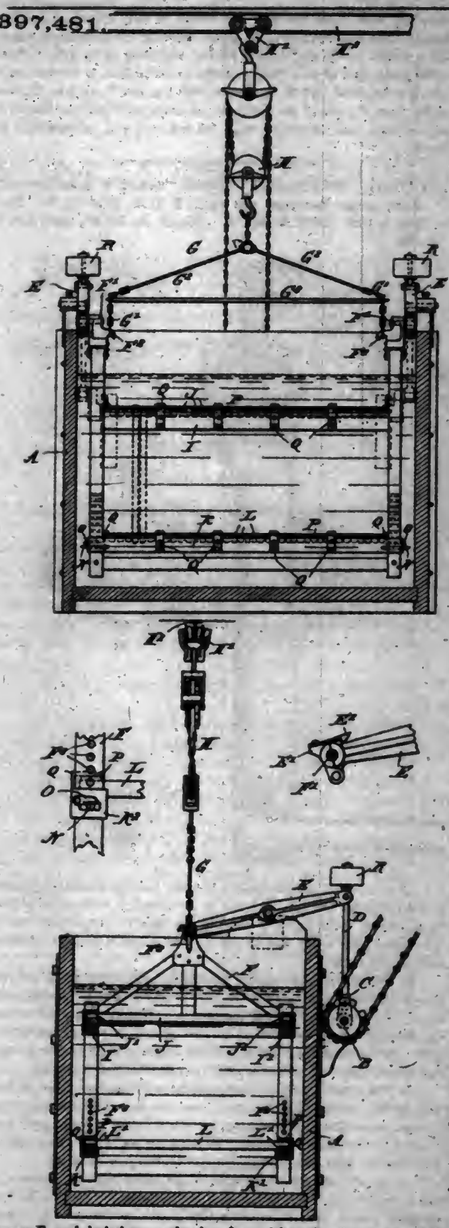
3. The improvement in the art of making incandescent lamps, which consists in introducing the mounted carbon and its glass base or stem into the globe through its open neck, then heating and drawing off the end of the neck and perforating the closed end attached to the globe while out of the gas flame, and then sealing the end of the glass stem to the neck, as set forth.

4. The improvement in the art of making incandescent lamps, which consists in introducing the mounted carbon, with its glass base or stem, into the open neck of the globe, heating the neck and drawing off a portion of its end and rounding off the closed end attached to the globe, perforating the said rounded end, and then sealing the end of the stem over the opening, with the ends of the leading-in wires projecting through the same, as set forth.

5. The improvement in the art of making incandescent lamps, which consists in uniting the glass base or stem surrounding the leading-in wires to the globe or its neck over the inside edges of a contracted opening in the same, through which the ends of the leading-in wires project, as and for the purpose set forth.

397,480. PROCESS OF TONING BLUE PRINTS. HAROLD WHITING, Cambridge, Mass. Filed July 5, 1888. Serial No. 279,108. (No specimens.)

Claim.—1. The process of toning blue prints by treating them with a solution containing two parts of the concentrated ammoniacal solution of nitrate of copper, thirty-two parts of water, and one part of ammonia, in or about the proportions specified, essentially as described.



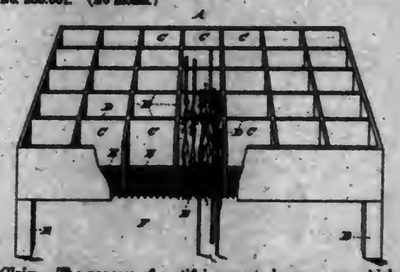
2. The process of toning blue prints by decomposing the ferro-prussiate of iron contained therein by means of a solution of copper containing free alkali, as hereinbefore set forth.

3. The process of toning blue prints by neutralizing the bluish color due to the ferro-prussiates of iron by substituting for a portion of the same a red pigment consisting, essentially, of ferro-prussiate of copper.

397,481. DYEING-MACHINE. THOMAS WOLSTENHOLME, Camden, N. J. Filed Sept. 5, 1888. Serial No. 284,616. (No model.)

Claim.—1. The combination, with the tank and the yarn-stick-supporting frame having opposite trunnions, F', of the vertically-rocking levers E, pivoted between their ends at opposite sides of the tank, and having two-part bearings receiving the said trunnions and provided with latches F^2, the main-shaft pitmen D, operated by the said shaft and connected at their upper ends to the outer ends of the

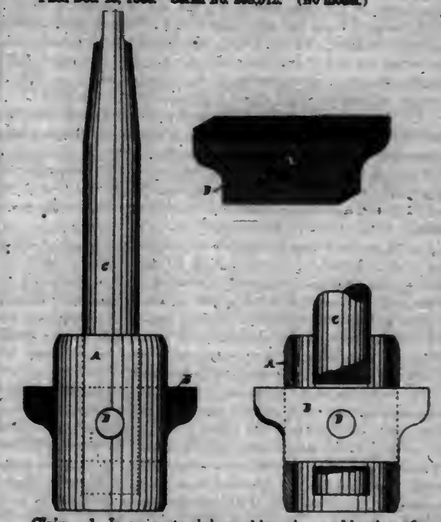
397,481.



levers E, and hoisting mechanism for raising the frame out of the tank when the said bearings are unlatched, substantially as set forth.

2. The combination, with stick-supporting frame F, having the vertical bars provided with apertures F^2, and the upper stick-supporting beams, I I', of the vertically-adjustable beams K K', having sleeves K^2, sliding upon the said vertical bars, pins N, passing through said sleeves into the said apertures, and latches O, holding the pins in place, substantially as set forth.

3. In a dyeing-machine, the combination, with a tank containing the dye-stuffs, of a frame adapted to pass in the said tank and supporting the yarns, a tackle supporting the said frame, and a carriage supporting the said tackle and mounted to travel horizontally, substantially as shown and described.



4. The combination of the rectangular frame F, having upper and lower stick-supporting beams, I F K K', and the angular keepers Q, the horizontal arms of which project upwardly across the upper faces of said beams, the sticks resting at their ends on said upper faces, and the strips P, placed between the said horizontal arms of the keepers and the ends of the sticks, substantially as set forth.

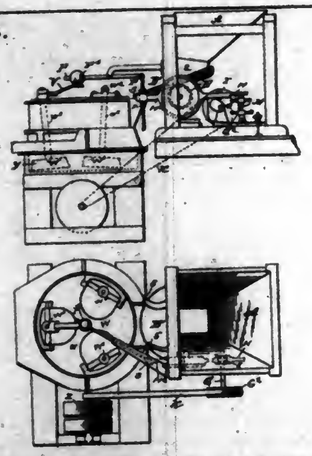
397,482. DEVICE FOR UTILIZING WASTE BROOM-CORN. RADFORD M. YOUMANSON, Amsterdam, N. Y. Filed Nov. 12, 1887. Serial No. 255,001. (No model.)

Claim.—The process of rectifying waste broom-corn, which consists in placing the mixed corn in a vertical position in a suitable receptacle having openings in its bottom, percussing the receptacle to forcibly extract through the said bottom those stems which have their butts directed downward, withdrawing from the receptacle those stems which remain having their butts directed upward, and, finally, disposing the latter with the former, butts to butts, and points to points, substantially as specified.

397,483. COUNTERSINK. ADOLPH LEITNER, Grand Rapids, Mich. Filed Dec. 12, 1888. Serial No. 293,512. (No model.)

Claim.—1. In a countersink-machine, the combination of a cutting-tool or cutter, a spindle, and a cylindrical guide, said cutter passing loosely through the guide and held in position by means of a pin passing through the cutter at right angles thereto, fitting loosely within the cylindrical guide, substantially as described.

2. In a countersink-machine, the combination of a slotted guide and cutter, said cutter passing loosely through the slot in said guide, and both guide and cutter attached by a pin to the revolving mechanism, said cutter adapted to adapt itself to the form of the boiler-head, substantially as described.



3. In a countersink-machine, a cylindrical guide adapted to fit into the hole to be operated upon, in combination with a cutter passing loosely through a slot in said guide, and the tapering pin passing through both guide and cutter at right angles to the cutter, thereby allowing a flexible adjustment for the cutter, substantially as described.

REISSUES.

10,983. ORE-FEEDER. JOSHUA HENDY and JOHN H. HENDY, San Francisco, Cal. Filed Apr. 18, 1888. Serial No. 271,101. Original No. 305,516, dated June 26, 1857.

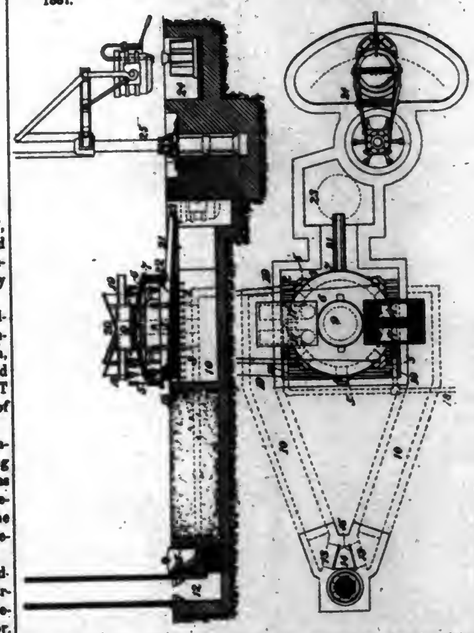
Claim.—1. In an ore-feeder, the combination, with the hopper and feeding cylinder, of the cam-shaft having the cam *g* mounted

10,983.

thereon, a friction-clutch comprising a loose disk having arms H H°, projecting therefrom, the weighted lever P, a connection between said lever and arm H°, a spring attached to the arm H, and an arm connected with said lever, the arm V, and the grinding-wheels of a rotary mill, substantially as set forth.

2. In an ore-feeder, the combination, with the hopper and feeding-cylinder, of the cam-shaft having the cam *g* thereon, a friction-clutch having a loose disk with arms H and H° extending therefrom, a spring connected with one of said arms, the weighted lever P, a rod connecting one end of said lever with the arm H°, the stops S and T on said rod, and an arm attached to the grinding wheels or disks of a rotary mill and operated thereby, substantially as described.

3. In combination with the hopper and its rotary feeder, the cam-shaft having the cam *g* mounted thereon, a friction-clutch comprising a loose disk on the shaft which drives the feeding device, having arms H H°, projecting therefrom, the weighted lever P, a connection between said lever and arm H°, a spring attached to the arm H, the arm V, and the grinding-wheel of a rotary mill, substantially as described.



4. In an ore-feeder, the combination, with the hopper, of a feeding device therefor, an actuating-shaft for said feeder, a clutch carried by said shaft, a continuously-operating shaft, a connection between said shaft and the clutch, a mill, a main driving-shaft therefor, a direct and positive connection between said main driving-shaft and the continuously-operating shaft, an arm, V, connected to the spindle of the grinding-disk, and an operating connection between said arm V and the said clutch, substantially as described.

5. In an ore-feeder, a hopper, a feeding device therefor, a shaft for operating the feeder, a clutch carried by said shaft, means for operating said shaft through the clutch, a mill, grinding-surfaces therefor, an arm, V, connected to the spindle of the grinding-disk, and intermediate operating connections between said arm V and the clutch on the shaft of the feeder, whereby the rotation of the feeder-shaft is automatically controlled by the grinding-surfaces, substantially as described.

6. In an ore-feeder, a hopper, a feeding device therefor, a shaft for operating the feeder, a clutch carried by said shaft, means for operating said shaft through the clutch, a mill, grinding-surfaces therefor, and a controlling connection between the grinding-surfaces and the clutch on the shaft of the feeder, consisting of an arm, V, fixed to the upper end of the spindle of the grinding-disk, a pivoted lever having a weighted end in connection with the arm V, and a connection between the inner end of said lever and the clutch, substantially as described.

7. In an ore-feeder, a hopper, a feeding device therefor, a shaft for operating the feeder, a clutch carried by said shaft, means for operating said shaft through the clutch, a mill, grinding-surfaces therefor, and a controlling connection between the grinding-surfaces and a clutch on the shaft of the feeder, consisting of an arm, V, fixed to the upper end of the spindle of the grinding-disk, a pivoted lever having a weighted end in connection with the arm V, an arm, H', projecting from the rim of the clutch, a connecting-rod between the lever and the arm, and adjustable stops on the said rod, substantially as described.

10,984. OPEN-HEARTH FURNACE. HORACE W. LASH, Pittsburg, HENRY AIKEN, Homestead, and DAVID R. PARK, Pittsburg, Pa. Filed Aug. 6, 1888. Serial No. 282,107. Original No. 365,906, dated July 5, 1887.

Claim.—1. An open-hearth furnace having its charging-doors accessible from the ground-level, in combination with underground flues leading from opposite sides of the furnace downward clear of the walls of the same and converging to a common stack, substantially as set forth.

2. An open-hearth furnace having an underlying pit, 3, suitably proportioned to the diameter of the hearth to provide an open air-space which extends beneath the hearth and up its sides, and having its charging-doors accessible from the ground-level, in combination with underground flues leading from opposite sides of the furnace and converging to a common stack, substantially as set forth.

3. The combination of an open-hearth furnace circular in form and having its tapping-hole at or near the ground-level, a ladle-pit located in convenient proximity to the tapping-hole, a casting-pit located in convenient proximity to the ladle-pit, and a crane located between the ladle and casting pits, substantially as set forth.

4. An open-hearth furnace, in combination with an underlying pit, 3, proportioned to the diameter of the hearth to provide an open air-space which extends beneath the hearth and up its sides, underground flues located on opposite sides of the hearth and converging to a common stack, air-inlets connecting with the flues, and valves arranged to connect the flues alternately with the stack and with the air-inlets, substantially as set forth.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

BATE REFRIGERATING COMPANY *v.* HAMMOND *et al.*

Decided January 21, 1889.

1. BATE—PRESERVING MEATS DURING TRANSPORTATION AND STORAGE.

Letters Patent No. 197,314, granted to John J. Bate November 20, 1877, for the term of 17 years, did not expire with the term of the first Canadian patent obtained for 5 years, but continued in force till the end of the extended term of 15 years—to wit, January 9, 1892—said Canadian patent having never ceased to exist, but having been in force continuously from January 9, 1877.

2. TERM OF PATENT AS AFFECTED BY THE TERM OF A CANADIAN PATENT.

Where the Canadian statute under which the extensions of the Canadian patent were granted was in force when the United States patent was issued, and also when that patent was applied for, and where, by the Canadian statute, the extension of the patent for Canada was a matter entirely of right, at the option of the patentee, on his payment of a required fee, and where the 15 years' term of the Canadian patent has been continuous and without interruption, the United States patent does not expire before the end of the 15 years' duration of the Canadian patent.

3. TERM OF PATENT AS LIMITED BY THE UNITED STATES STATUTES BY REASON OF FOREIGN PATENT PREVIOUSLY OBTAINED.

The provisions of the act of 1870 and of the Revised Statutes mean that the United States patent shall not expire so long as the foreign patent continues to exist, not extending beyond 17 years from the date of the United States patent, but shall continue in force, though not longer than 17 years from its date, so long as the foreign patent continues to exist. Under section 4887, although the United States patent may on its face run for 17 years from its date, it is to be so limited by the courts, as a matter to be adjudicated on evidence *in pais*, as to expire at the same time with the foreign patent, not running in any case more than 17 years; but, subject to the latter limitation, it is to be in force as long as the foreign patent is in force.

4. NOT NECESSARY THAT THE UNITED STATES PATENT SHOULD ON ITS FACE BE LIMITED IN DURATION TO THE DURATION OF THE FOREIGN PATENT.

While it may be proper in a case where the date of a foreign patent issued prior to the granting of a United States patent to the same patentee for the same invention is made known to the Patent Office prior to the granting of the United States patent, to insert in that patent a statement of the limitation of its duration, in accordance with the duration of the foreign patent, it does not affect the validity of the United States patent if such limitation is not contained on its face.

APPEAL from the Circuit Court of the United States for the District of Massachusetts.

Mr. John Lowell, *Mr. Paul H. Bate*, *Mr. R. M. Dyer*, *Mr. William M. Evarts*, and *Mr. C. A. Seward* for the appellant.

Mr. B. F. Thurston, *Mr. G. H. Lothrop*, and *Mr. John R. Bennett* for the appellees.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the District of Massachusetts, December 16, 1886, by the Bate Refrigerating Company, a New York corporation, against George H. Hammond and Company, a Michigan corporation, founded on the alleged infringement of Letters Patent No. 197,314, granted to John J. Bate, November 20, 1877, for the term of 17 years from that day, on an application filed December 1, 1876, for an "improvement in processes for preserving meats during transportation and storage."

The plaintiff is the assignee of the patent. The bill alleges infringement, within the district of Massachusetts and elsewhere in the United States, by the making, using, and vending of the patented process, and alleges that the defendant has been engaged in the business of shipping fresh meat from the port of Boston to ports in Great Britain, by means of the process claimed in the patent. The claim is as follows:

The herein-described process of preserving meat during transportation and storage, by enveloping the same in a covering of fibrous or woven material, and subjecting it when thus enveloped to the continuous action of a current of air of suitably low and regulated temperature, substantially as and for the purpose set forth.

The defendant filed a plea, setting up, among other things, that, on the 9th of January, 1877, Letters Patent of the Dominion of Canada, No. 6,988, for the same invention as that described and claimed in No. 197,314, were granted to the same John J. Bate, for the term of 5 years from the 9th of January, 1877; that, after No. 197,314 had expired, at the end of the term of 5 years for which such Canadian patent was granted, the Circuit Court of the United States for the District of New Jersey, upon being advised of the grant of such Canadian patent, vacated and set aside an injunction which it had theretofore granted, by an interlocutory decree made in a suit in equity founded on No. 197,314, brought by the Bate Refrigerating Company against Benjamin W. Gillett and others; that thereafter Bate and the Bate Refrigerating Company procured the rendition of a judgment by the Superior Court for Lower Canada, declaring the Canadian patent to have been void *ab initio*, and vacating it and setting it aside; that such judgment of the Superior Court for Lower Canada being brought to the attention of the Circuit Court of the United States for the District of New Jersey, that court reinstated said injunction; and that afterward the Superior Court for Lower Canada, in a suit brought by Sir Alexander Campbell, Minister of Justice and Attorney-General for the Dominion of Canada, against Bate and the

Bate Refrigerating Company and others, adjudged that its said prior judgment had been "arrived at through the fraud to the law and collusion" of Bate, the Bate Refrigerating Company, and another person, "deceiving the Attorney-General, the advocates, and the court, employing and paying counsel on both sides, as well, seemingly, against themselves as on their apparent behalf," and revoked and annulled its said prior judgment. The plea concluded by averring that No. 197,314 expired on the 9th of January, 1882, and that the circuit court, sitting as a court of equity, had no jurisdiction to hear and determine an action in equity for the infringement of the patent. The bill was then amended by averring that the application for the Canadian patent was not made until December 19, 1876, while the application for No. 197,314 was made December 1, 1876; and that the Canadian patent was not actually or legally issued until on or about June 26, 1878, on or about which date a model of the invention, as required by law, was filed in the Canadian Patent Office. The amendment to the bill also set forth the two judgments of the Superior Court for Lower Canada, and averred that, by virtue of an act of the Parliament of the Dominion of Canada, assented to May 25, 1883, (46 Victoria, chap. 19,) the original term of the Canadian patent was actually 15 years, instead of 5 years, and it would not terminate before the 9th of January, 1892.

Subsequently the defendant filed an answer to the bill, setting up, among other defenses, want of novelty in the patented invention, but not denying that it had used the invention subsequently to the granting of the patent; and also setting up the granting of the Canadian patent for 5 years from January 9, 1877; that No. 197,314 was void, because it was issued for 17 years, and its term was not limited by the Commissioner of Patents to 5 years from January 9, 1877; that the Canadian application was not made until after the application for No. 197,314 was filed; that Bate did not file a model in the Canadian Patent Office until after the grant of the Canadian patent; and that the Canadian patent was actually patented to Bate on the 9th of January, 1877, and took effect on that date, although not actually delivered to the patentee until after the filing of the model. It also sets forth the two Canadian judgments, and avers that, on the 30th of November, 1881, Bate made a petition to the Commissioner of Patents for Canada, for the extension of No. 6,938, in which he averred that on the 9th of January, 1877, he "obtained a patent for the period of five years from the said date, for new and useful improvements on apparatus and process for ventilation, refrigeration, &c.," and that he was the holder of that patent in trust for the Bate Refrigerating Company, and prayed that it might be extended "for another period of ten years;" that, on the filing of that petition, an extension of the patent was granted, on December 12, 1881, "for a second period of five years" from January 9, 1882; that a further extension of the patent was granted, December 13, 1881, "for a third period of five years" from January 9, 1887; that the plaintiff is thereby estopped from denying the fact that No. 6,938 was legally granted, January 9, 1877, for a period of 5 years; that, by virtue of the act of 46 Victoria, chapter 19, the original term for which No. 6,938 was granted was not 15 years instead of 5 years; that said act can have no effect on the duration of No. 197,314; that, by reason of the prior patenting of the invention by Bate in Canada for 5 years from January 9, 1877, No. 197,314, if valid at all, expired on January 9, 1882; and that, therefore, this court, sitting in equity, has no jurisdiction to hear and determine an action for its infringement.

Without the filing of any replication to this answer, the parties entered into a written stipulation, setting forth as follows:

Whereas the answer of the defendant corporation in this cause sets up, in addition to other defenses, that the patent on which this suit is brought, being number 197,314, granted to John J. Bate, complainant's assignor and president, on the twentieth day of November, A. D. 1877, expired on the ninth day of January, A. D. 1882, by reason of the prior grant to said John J. Bate of a patent in the Dominion of Canada for the same invention, and prays the same benefit of said defense as if the same had been pleaded to the bill of complaint; and whereas both parties desire to have said matter of defense argued and decided without incurring the great expense of taking testimony necessary to present for final hearing all the defenses raised in said answer: It is, therefore, stipulated and agreed by and between the parties, that the defense above named shall be submitted to the court, as on plea set down for argument, upon the following agreed state of facts.

The facts so agreed to were substantially as follows:

(1.) The patent in suit, No. 197,314, was granted to John J. Bate on November 20, 1877, and the application therefor was filed in the United States Patent Office, December 1, 1876; and said patent was assigned to complainant before this suit was brought, the said Bate being a citizen of the United States at the time of said application, and the said invention having been made and reduced to practice by him therein.

(2.) On December 19, 1876, said John J. Bate filed in the Patent Office of the Dominion of Canada an application for a patent for improvements in apparatus and processes for ventilation, refrigeration, &c., including therein, as one feature, the process described and claimed in said Patent No. 197,314.

(3.) In pursuance of said application the Commissioner of Patents for the Dominion of Canada caused Letters Patent of the Dominion of Canada, No. 6,938, for the invention set forth in said application, and granting to said John J. Bate, his executors, administrators, and assigns, the exclusive right, privilege, and liberty of making, constructing, using, and vending to others to be used, the said invention, to be signed and sealed with the seal of the Patent Office on January 9, 1887, and to be registered on January 11, 1887, and that the period of said grant expressed in said patent was 5 years from and after January 9, 1877.

(4.) On January 12, 1877, said Commissioner of Patents called upon said John J. Bate to furnish to the Patent Office a model of his said invention, and such model was furnished by said Bate on June 26, 1878, on which day said Patent No. 6,938 was mailed to said John J. Bate.

(5.) On December 5, 1881, said John J. Bate filed a petition in the Canada Patent Office, setting forth—

that on the 9th day of January, A. D. 1877, your petitioner obtained a patent for the period of five years from the said date, for new and useful improvements on apparatus and process for ventilation, refrigeration, &c.; that he is the holder of the said patent in trust for the "Bate Refrigerating Company," and therefore prays that it may be extended for another period of ten years.

(6.) On December 12, 1881, said Patent No. 6,938 was extended for 5 years from January 9, 1882, under renewal No. 13,812, and, on December 13, 1881, said patent was further extended for 5 years from January 9, 1887, under renewal No. 13,813, in pursuance of the above-named petition.

(7.) On or about July 9, 1883, and June 30, 1886, the Superior Court for Lower Canada rendered two judgments affecting said Canada patent, to the purport set forth in the plea and the answer.

The stipulation further provided, that, if the decision of the circuit court should be in favor of the plaintiff, it should have a reasonable time thereafter to file a replication to the answer, and the cause should proceed in the ordinary manner; that, if the circuit court should decide the cause in favor of the defendant, a decree should be entered dismissing the bill, so that the plaintiff might take an appeal therefrom to the Supreme Court of the United States; and that, if the circuit court should decide the cause in favor of the defendant, and the Supreme Court of the United States should, on appeal, reverse that decision, the defendant should have a right to proceed in the circuit court, under its answer, as to all defenses set up therein, except the one mentioned in the stipulation, as it might have proceeded if the stipulation had not been made.

The cause was heard on the pleadings and stipulation, and the circuit court entered a decree dismissing the bill, from which decree the plaintiff has appealed to this Court. The circuit court gave no opinion on the merits of the case, but in deciding it followed, as it stated, the decision of the Circuit Court of the United States for the District of New Jersey, held by Mr. Justice Bradley, in August, 1887, made in the case of *Bate Refrigerating Co.* v. *Gillett*, (31 Fed. Rep., 809.)

The questions discussed at the bar arise under section 4887 of the Revised Statutes, which is as follows:

No person shall be debarred from receiving a patent for his invention or discovery, nor shall any patent be declared invalid, by reason of its having been first patented or caused to be patented in a foreign country, unless the same has been introduced into public use in the United States for more than two years prior to the application. But every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent, or, if there be more than one, at the same time with the one having the shortest term, and in no case shall it be in force for more than seventeen years.

Two propositions as to the construction of this section are contended for by the appellant: (1) that the words "first patented or caused to be patented in a foreign country" do not mean "first patented or caused to be patented" before the issuing, or granting, or date, of the United States patent, but mean "first patented or caused to be patented" before the date of the application for the United States patent; (2) that the declaration of the section, that "every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent, or, if there be more than one, at the same time with the one having the shortest term," does not mean that the patent so granted shall expire at the same time with the term to which the foreign patent was in fact limited at the time the United States patent was granted; but that it means that it shall expire when the foreign patent expires, without reference to the limitation of the term of such foreign patent in actual force at the time the United States patent was granted. We do not find it necessary to consider the first of these questions, because we are of opinion that the proper construction of section 4887, upon the second question, is, that the patent in the present case does not expire before January 9, 1892, the time when the Canadian patent, No. 6,938, will expire.

The Canadian patent was extended for the two periods of 5 years each, under the provisions of section 17 of the Canadian act assented to June 14, 1872, (35 Victoria, chap. 26,) which was in force when the United States patent, No. 197,314, was applied for and granted, and which read as follows:

17. Patents of invention issued by the Patent Office shall be valid for a period of five, ten, or fifteen years, at the option of the applicant, but at or before the expiration of the said five or ten years the holder thereof may obtain an extension of the patent for another period of five years, and after those second five years may again obtain a further extension for another period of five years, not in any case to exceed a total period of fifteen years in all; and the instrument delivered by the Patent Office for such extension of time shall be in the form which may be from time to time adopted, to be attached, with reference to the patent and under the signature of the Commissioner or of any other member of the Privy Council in the case of absence of the Commissioner.

This statute appears to have been strictly complied with in the present case. The Canadian patent, No. 6,938, ran, on its face, for 5 years from January 9, 1877; and, prior to the expiration of that time, and on the 5th of December, 1881, Bate applied for its extension for 10 years; and it was, before the 5 years expired, and on the 12th of December, 1881, extended for 5 years from January 9, 1882, and, on December 13, 1881, for 5 years from January 9, 1887. The Canadian patent, therefore, has never ceased to exist, but has been in force continuously from January 9, 1877. It was in force when No. 197,314 was issued; and it has, by virtue of a Canadian statute, in force when the application for No. 197,314 was filed, continued to be in force at all times since the latter patent was granted. This is true, although the Canadian patent, No. 6,938, as originally granted, stated on its face that it was granted "for the period of five years" from January 9, 1877; and although the instrument granting the first extension of 5 years states that it is granted "for another period of five years, to commence and be computed on and from the ninth day of January, which will be in the year one thousand eight hundred and eighty-two;" and although the instrument granting the second extension of 5 years states that it is granted "for another period of five years, to commence and be computed on and from the ninth day of January, which will be in the year one thousand eight hundred and eighty-seven." By the language of section 17 of the Canadian act of 1872, what was granted under it was "an extension of the patent"—of the same patent—for a further term. Therefore the Canadian patent does not expire, and it never could have been properly said that it would expire, before January 9, 1892; and hence No. 197,314, if so limited as to expire at the same time with the Canadian patent, cannot expire before January 9, 1892.

Section 6 of the act of March 3, 1839, (5 Stat., 354,) provided that a United States patent for an invention patented in a foreign country more than 6 months prior to the application of the inventor for the United States patent, should be limited to the term of 14 years from the date or publication of the foreign patent. Section 25 of the act of July 8, 1870, (16 Stat., 201,) provided that the United States patent for an invention

"first patented or caused to be patented in a foreign country" should "expire at the same time with the foreign patent, or, if there be more than one, at the same time with the one having the shortest term; but in no case shall it be in force more than 17 years." Section 4887 of the Revised Statutes provides, that "every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent, or, if there be more than one, at the same time with the one having the shortest term, and in no case shall it be in force more than 17 years."

These provisions of the act of 1870 and of the Revised Statutes mean that the United States patent shall not expire so long as the foreign patent continues to exist, not extending beyond 17 years from the date of the United States patent, but shall continue in force, though not longer than 17 years from its date, so long as the foreign patent continues to exist. Under section 4887, although, in the case provided for by it, the United States patent may on its face run for 17 years from its date, it is to be so limited by the courts, as a matter to be adjudicated on evidence *in pais*, as to expire at the same time with the foreign patent, not running in any case more than 17 years; but, subject to the latter limitation, it is to be in force as long as the foreign patent is in force. A contrary view to this has been expressed by several circuit courts of the United States.

In October, 1878, in the Circuit Court for the District of Rhode Island, in *Henry* v. *Providence Tool Co.*, (8 Ban. & Ard., 501,) it was held that the 25th section of the act of July 8, 1870, meant that the United States patent should expire at the same time with the original term of a foreign patent for the same invention, without regard to any prolongation of the foreign patent which the patentee might procure from the foreign government. In that case, the United States patent was granted October 10, 1871. A British patent for the same invention had been granted to the patentee on the 15th of November, 1860, for 14 years, and expired November 15, 1874. Thirteen days after the latter date an order was made for the extension of the British patent for 4 years, the extension bearing date as of the day after the expiration of the original term; but the court held that the United States patent expired on the 15th of November, 1874.

That decision was followed by the Circuit Court for the Southern District of New York, in *Reissner* v. *Sharp*, (16 Blatchf., 383,) in June, 1879, which case arose under section 4887 of the Revised Statutes. In that case, the United States patent, granted October 20, 1874, for 17 years, was held to have expired on the 15th of May, 1878, because a patent was granted in Canada, under the authority of the patentee, for the same invention, on the 15th of May, 1873, for 5 years from that day, although in March, 1878, the Canada patent was extended for 5 years from the 15th of May, 1878, and also for 5 years from the 15th of May, 1883.

In *Bate Refrigerating Co.* v. *Gillett*, (13 Fed. Rep., 553,) in the Circuit Court for the District of New Jersey, in August, 1882, and in the same suit, in the same court, in August, 1887, (31 Fed. Rep., 809,) in regard to the patent in question in the present suit, and on the same facts here presented, it was held, on the strength of the two circuit court cases above referred to, that the United States patent expired when the original term of the Canadian patent expired.

But we are of opinion that, in the present case, where the Canadian statute under which the extensions of the Canadian patent were granted was in force when the United States patent was issued, and also when that patent was applied for, and where, by the Canadian statute, the extension of the patent for Canada was a matter entirely of right, at the option of the patentee, on his payment of a required fee, and where the 15 years' term of the Canadian patent has been continuous and without interruption, the United States patent does not expire before the end of the 15 years' duration of the Canadian patent. This is true, although the United States patent runs, on its face, for 17 years from its date, and is not, on its face, so limited as to expire at the same time with the foreign patent; it not being necessary that the United States patent should, on its face, be limited in duration to the duration of the foreign patent.

In *O'Reilly* v. *Morse*, (15 How., 62,) the patent to Morse was issued June 20, 1840, for 14 years from that day, while section 6 of the act of March 3, 1839, (5 Stat., 354,) was in force, which required that every United States patent for an invention patented in a foreign country should be "limited to the term of 14 years from the date or publication of such foreign Letters Patent." Morse applied for his United States patent April 7, 1838. He obtained a patent in France for his invention October 30, 1838. The objection was taken in the answer that the United States patent was void on its face because not limited to the term of the French patent. The circuit court held that the patent was not void, but that the exclusive right granted by it must be limited to 14 years from October 30, 1838. The same objection was urged in this court, and the same ruling was made. In *Smith* v. *Ely*, (15 How., 137,) which was a suit on the same patent, under the same facts, the same question arose and was decided in the same way. A full and interesting discussion of the question is to be found in *Canan* v. *The Pound Mfg. Co.*, (23 Blatchf., 173,) in regard to section 4887, which contains the same word "limited" found in section 6 of the act of 1839, which word is not found in section 25 of the act of July 8, 1870, from which section 4887 was taken. Under this view, the time of the expiration of the foreign patent may be shown by evidence *in pais*, whether the record of the foreign patent itself, showing its duration, or other proper evidence; and it is no more objectionable to show the time of the expiration of the foreign patent, by giving evidence of extensions such as those in the present case, and thus to show the time when, by virtue of such extensions, the United States patent will expire.

We find in the record in this case, among the papers which it states were submitted to the Court under the stipulation above referred to, a certificate of the Commissioner of Patents, dated July 3, 1883, appended to a certified copy of the United States patent, stating that the term thereof is limited so that it shall expire with the patent obtained by the patentee in Canada, No. 6,938, dated January 9, 1877, for the same invention; that the proper entries and corrections have been made in the files and records of the Patent Office; that it had been shown that the original patent had been lost; and that the certificate is made because that patent was issued without limitation, as required by section 4887 of the Revised Statutes. While it may be proper, in a case where the date of a foreign patent issued prior to the granting of a United States patent to the same patentee for the same invention is made known to the Patent Office prior to the granting of the United States patent, to insert in that patent a statement of the limitation of its duration, in accordance with the duration of the foreign patent, it does not affect the validity of the United States patent if such limitation is not contained on its face.

It results from these views, that the decree of the circuit court must be reversed, and the case be remanded to that court, with a direction to take such further proceedings as shall be in accordance with law and with the stipulation between the parties, above referred to, and not inconsistent with this opinion.

Supreme Court of the United States.

SARGENT *et al.* v. BURGESS.

Decided January 7, 1889.

1. GORHAM—WASH-BOARD FRAMES.

Letters Patent No. 223,838, granted January 6, 1880, to John M. Gorham, for an improvement in wash-board frames, construed and *Held* not to cover a protector which does not have the yielding, elastic, or resilient function described in claim 3, and is not accompanied by a spring or constructed substantially as described in the specification.

2. SAME—INFRINGEMENT.

Said patent is not infringed by a protector constructed in accordance with the description contained in Letters Patent No. 255,555, granted to Charles H. Williams March 28, 1882, having no spring and no elastic or resilient quality, and which does not yield to pressure, and has no capacity of returning automatically to its normal position.

APPEAL from the Circuit Court of the United States for the Eastern District of Pennsylvania.

Mr. George H. Christy and *Mr. J. Snowden Bell* for the appellants.

Mr. James Parsons and *Mr. Furman Sheppard* for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought by the administrators of John H. Gorham, deceased, against Edwin K. Burgess, in the Circuit Court of the United States for the Eastern District of Pennsylvania, to recover for the alleged infringement of Letters Patent No. 223,838, granted to John M. Gorham, January 6, 1880, for an improvement in wash-board frames.

The following is a copy of the specification and drawings of the patent:

To all whom it may concern:

Be it known that I, JOHN M. GORHAM, of Cleveland, in the county of Cuyahoga and State of Ohio, have invented certain new and useful Improvements in Wash-Board Frames; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it pertains to make and use it, reference being had to the accompanying drawings, which form part of this specification.

My invention relates to wash-boards, particularly to the combination, with a wash-board, of a protector constructed to bend or yield to pressure and to return to position when said pressure is removed. This protector is to shield the person of the washer from splashing water or suds.

Protectors have been heretofore employed in connection with wash-boards, and they have been of but two general types—one wherein the protector is rigid and rigidly attached to the wash-board frame. A protector thus constructed and attached is not capable of yielding or moving from its position when the body of the operator presses against it; and it is on this account frequently objected to. The second type is when the protector is attached to the wash-board frame by a joint or pivot, and is allowed a swinging movement; but it possesses no elastic or resilient quality or function, and, when moved by pressure, has no power to return again to normal position when said pressure is removed. My invention is designed to overcome the objections and defects presented in these two old types of protectors; and as said invention broadly comprehends any wash-board protector constructed to bend or yield to pressure and to return to position when said pressure is removed, it is apparent that I am not to be confined to any specific form or mere construction of device, inasmuch as a variety of modified mechanical structures may be adopted in embodying my said invention. I will, however, illustrate and describe one or two effective forms of device according to this invention.

In the drawings, Figure 1 illustrates a wash-board and its protector made according to my invention. This figure is in longitudinal vertical section, and it represents the protector as laid down upon the face of the board as packed for shipment. Fig. 2 is a similar view of the same device, only the protector is shown as freed and sprung out into operative position. Fig. 3 is a front view of the device as shown in Fig. 2. Fig. 4 represents a modified form of my device, wherein the protector, instead of being formed from a rigid piece and elastically pivoted to the frame, as shown in Figs. 1, 2, and 3, is made from a piece of rubber, spring metal, or equivalent material susceptible of itself yielding and returning to position, and this is rigidly fixed to the wash-board frame, as shown. Fig. 5 shows another modified embodiment of my invention, merely illustrating a different spring-coupler, C', from that shown in Figs. 1, 2, and 3.

A is the wash-board frame, which may be of any size, description, or material. B is the rubbing-surface, which may also be of any character.

C is the protector, and C' a spring, which may be either a coupler between the protector and wash-board frame, as shown in Fig. 5 of the drawings, or the protector may be pivoted to the frame and the spring C' act to push or pull the protector into the position illustrated in Figs. 2 and 3.

The construction of the device shown in Fig. 4 I have already sufficiently specified in the preceding explanation of the drawings.

The operation of my device is readily understood. The spring C', or the elastic character of the thing itself, as shown in Fig. 4, serves always to keep the protector in operative position. (See Figs. 2 and 3.) When the body of the operator presses against it, it yields in such a way as at the same time to press snugly against her person, and also to return at all times to position when said pressure is removed. It thus becomes very effective as a protector, while at the same time it is not wearing to the person or clothes of the operator.

Fig. 1.

Fig. 2.

Fig. 3.

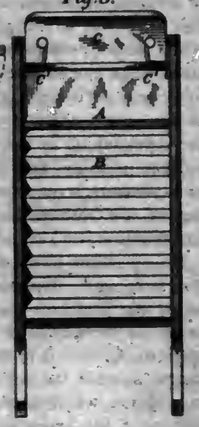

Fig. 4.

Fig. 5.

Another peculiar feature of my wash-board is the flat manner in which it can be packed, as shown in Fig. 1 of the drawings. This is a great convenience and advantage in packing for shipment; and moreover, when thus packed, the protector is itself

protected from injury to which it would otherwise be exposed. This is accomplished by locating the protector, as shown in Figs. 1, 2, and 3 of the drawings, below the crown-piece and between the side pieces of the frame.

The claims of the patent are three in number, as follows:

1. In combination with a wash-board, a protector constructed substantially as described, so as to yield to pressure and to return to position when said pressure is relieved, substantially as and for the purpose shown.
2. The combination, with a wash-board, of a protector and a spring, said spring interposed between the wash-board and protector, and constructed to operate in retaining said protector in its open position and to return it to that position when moved therefrom.
3. In combination with a wash-board, a protector located below the crown-piece and between the side pieces of the wash-board frame, and constructed to fold down into or upon said wash-board even with or below the general plane of said wash-board frame, substantially as and for the purpose shown.

Only claim 3 is alleged to have been infringed.

The defenses set up were want of novelty and non-infringement. Several prior patents were introduced in evidence, as bearing upon the question of the proper construction of claim 3, and upon the question of infringement. They are No. 8,161, to William T. Barnes, June 17, 1851; No. 127,325, to John Epeneter and Bernhardt Grahl, May 28, 1872; No. 146,433, to James A. Cole, January 13, 1874; No. 150,315, to Anna Frike, April 28, 1874; and No. 222,846, to Wyatt M. Stevens, December 23, 1879. The circuit court dismissed the bill and the plaintiffs have appealed.

The specification of the Gorham patent clearly shows that the protector whose combination with a wash-board is the subject of the invention, is a protector constructed to bend or yield to pressure, and to return to its position when such pressure is removed, in contradistinction to a protector which is rigid and is rigidly attached to the wash-board frame; and also in contradistinction to a protector which is attached to the wash-board frame by a joint or pivot, and is allowed a swinging movement, but possesses no elastic or resilient function, and, when moved by pressure, has no power to return again to its normal position, when such pressure is removed. The specification states that the invention of Gorham is designed to overcome the defects presented in those two old types of protectors. The invention does not comprehend a protector which is not constructed so as to bend or yield to pressure, and to return to its position when such pressure is removed. The description and drawings of the Gorham protector are limited to such a construction, and do not show or indicate any other.

The operation of the device is stated in the specification to be such, that the spring, or the elastic character of the protector itself, serves always to keep the protector in operative position, because it yields to pressure against it in such a way as always to press snugly against the person, and to return at all times to position when such pressure is removed. This feature of the protector is not claimed to have been infringed by the defendant. The defendant's protector, constructed in accordance with the description contained in Letters Patent No. 255,555, granted to Charles H. Williams, March 28, 1882, has no spring and no elastic or resilient quality, does not yield to pressure, and has no capacity of returning automatically to its normal position.

In the defendant's structure, the ordinary cap-piece of the wash-board has a rounded exterior surface, and its inner surface performs the function of a protector. Upon the upper edge of such cap-piece is mounted a supplemental protector, the two parts being locked rigidly together by a tongue-and-groove joint. From the ends of the supplemental protector are extended rigid arms, which are slotted and connected to the side pieces of the frame by means of pins, one of which passes through each slot. By removing the supplemental protector from the cap-piece, it can be placed between the side pieces of the frame, so as to stand edgewise therein, by drawing it slightly backward, by then raising it slightly, by then advancing it to the front, and by then dropping it and placing it edgewise within the frame. In this latter position, the structure is adapted for packing. Not only is the defendant's protector without any yielding or resilient function, but it is not pivoted after the manner of the Gorham protector, nor does it fold down in the manner of the Gorham protector, in the sense of the words "fold down," as used in claim 3 of the Gorham patent.

The contention of the plaintiff is, that claim 3 of the patent does not require, as an element of the combination covered by it, that the protector should have any yielding, elastic, or resilient function, or should be accompanied by a spring; but that it is sufficient if, by any mechanism, it can be so disposed of as to be packed away for convenience in shipment, or for other purposes, in a flat manner, in the vacant space in which it is packed; and that, as the defendant's protector is to a large extent packed away in the same vacant space, claim 3 is infringed. It may be questionable whether, if the claim were to be construed thus broadly, it would not be for merely a new use of a device before used in many things besides wash-boards. But, in view of the state of the art, as shown by the patents above referred to, and in view of the course of proceeding in the Patent Office on the application for the Gorham patent, we are of opinion that claim 3 of that patent cannot be so construed as to cover a protector which does not have the yielding, elastic, or resilient function of the Gorham protector, and is not accompanied by a spring or constructed substantially according to the description in the Gorham specification. Gorham evidently had no idea of such a construction as that of the Williams patent, found in the defendant's wash-board; and no person could, by following the description in the Gorham specification, arrive at the defendant's structure.

Claim 3 of the Gorham patent requires that the protector shall be "constructed to fold down," "substantially as" "shown." The defendant's protector is not constructed to fold down in the manner of the Gorham protector, and is not constructed substantially as shown in the Gorham specification.

The decree of the circuit court is affirmed.

Sub-Class Abolished.

(ORDER No. 594.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., February 6, 1889.

It is hereby directed that sub-class 2, Bobbin-winders, in Class 112, Sewing-Machines, Division XXIV, be abolished.

BENTON J. HALL,
Commissioner.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGlehan, No. 155 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Issue of February 12, 1889.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,251.—CORK AND CORK ARTICLES.—*Armstrong, Bro. & Co.*, Pittsburg, Pa. Application filed January 3, 1889. Used since December 14, 1888.

"The letter 'A' inclosed by a circle."

16,252.—CANNED OYSTERS.—*A. Booth Packing Company*, Chicago, Ill.; Baltimore, Md.; St. Paul, Duluth, and Minneapolis, Minn.; St. Louis, Mo.; Louisville, Ky.; Omaha, Nebr.; Indianapolis, Ind.; Bayfield, Wis.; Astoria, Oreg.; Manistique, Mich., and Port Arthur, Canada. Application filed January 7, 1889. Used since 1867.

"The words 'OVAL BRAND' and the representation of an oval band in color."

16,253.—SEDLITZ POWDER.—*Charles Chanteaud*, Paris, France. Application filed December 20, 1888. Used since January 5, 1886.

"The representation of two medallions, one containing a wreath, on the exterior of which are the words 'LA DOSIMÉTRIE S'IMPOSE COMME UN DEVOIR,' and on the interior the words 'CITO TUTO ET JUCUNDE,' and the other medallion containing a representation of the sun with rays radiating therefrom, below which is a representation of the earth or planet floating upon or above clouds."

16,254.—COMPOUNDED SPICES AND HERBS FOR FLAVORING MEATS, PUDDINGS, HEAD-CHEESE, &c.—*James Horner*, Pittsburg, Pa. Application filed December 5, 1888. Used since July 1, 1888.

"The word 'FLAVORWELL.'"

16,255.—PRESERVING-SALT FOR CURING AND PRESERVING MEAT, &c.—*James Horner*, Pittsburg, Pa. Application filed December 5, 1888. Used since May 1, 1888.

"The word 'SAVITSURE.'"

16,256.—ORNAMENTAL JEWELRY.—*Mosbacher & Co.*, New York, N. Y. Application filed December 19, 1888. Used since July 1, 1887.

"The words 'BON MARCHÉ' and a floral design placed in a circle."

16,257.—PATENT MEDICINE FOR CURING GONORRHŒA AND GLEET.—*Charles W. Poole*, St. Louis, Mo. Application filed November 23, 1888. Used since November 1, 1888.

"The word 'MASCOT.'"

16,258.—WHITE LEAD.—*Robert Shoemaker & Co.*, Philadelphia, Pa. Application filed December 13, 1888. Used since February 6, 1880.

"The word 'IMPERIAL.'"

16,259.—READY-MIXED PAINTS.—*Robert Shoemaker & Co.*, Philadelphia, Pa. Application filed December 17, 1888. Used since September 1, 1882.

"The word 'IMPERIAL.'"

16,260.—MEDICINE FOR INFANTS.—*The Southern Company of New York*, New York, N. Y. Application filed December 27, 1888. Used since July 22, 1888.

"The word 'INFANTINA.'"

16,261.—SALVE.—*Henry C. Stewart*, Cincinnati, Ohio. Application filed December 31, 1888. Used since November 1, 1888.

"A dark background and an oblong white spot in the center and a fac-simile of the registrant's signature."

16,262.—LAGER-BEER.—*George Bauernschmidt*, Baltimore, Md. Application filed July 9, 1888. Used since January 1, 1888.

"A letter 'B' of any appropriate design, a dove passing through the upper loop, a bare arm and hand passing through the lower loop, and a ribbon entwined in the letter 'B' and held in the beak of the bird and by the hand."

16,263.—SHOTGUN-CARTRIDGES.—*The Chamberlin Cartridge Company*, Cleveland, Ohio. Application filed December 24, 1888. Used since October 1, 1888.

"The words 'BLACK SWAN' and a representation of a black swan."

16,264.—TONIC BEVERAGE.—*Eureka Manufacturing Company*, Baltimore, Md. Application filed October 24, 1888. Used since September 1, 1888.

"The representation of the head of a bull having the word 'BEEF' across the nose, adjacent to which are arranged a hop-vine and a wisp of barley."

16,265.—CHEWING-GUM.—*Asa M. Fitch*, Seymour, Ind. Application filed September 3, 1888. Used since May 1, 1888.

"The word 'JAVA' on a band arranged diagonally across a rectangular inclosure."

16,266.—BOOTS AND SHOES.—*Irwin N. Horrell*, Latrobe, Pa. Application filed December 29, 1888. Used since October, 1886.

"The word 'LATROBE.'"

16,267.—SPECIAL PREPARATIONS OF EXTRACT OF HAMAMELIS.—*Humphreys Homeopathic Medicine Company*, New York, N. Y. Application filed December 18, 1888. Used since 1874.

"The representation of a girl running with arms held up holding branches which are crossed above her head."

16,268.—HOMEOPATHIC SPECIFICS.—*Humphreys Homeopathic Medicine Company*, New York, N. Y. Application filed December 18, 1888. Used since 1868.

"The representation of a lady seated upon a lion."

16,269.—TYPE, PRINTERS' RULES, PRINTERS' LEADS, AND OTHER PRINTERS' FURNITURE.—*Mather Manufacturing Co.*, Philadelphia, Pa. Application filed September 18, 1888. Used since June 1, 1888.

"'KEYSTONE,' whether expressed pictorially or in word."

16,270.—METAL LINK PUZZLE.—*Maurice Jacobs*, New York, N. Y. Application filed December 13, 1888. Used since November 1, 1888.

"The words 'MISSING LINK PUZZLE,' coupled with the figures of a man and a monkey grasping a puzzle."

16,271.—COPYING-BOOKS.—*Henry E. Pratt*, Lambertville, N. J. Application filed December 20, 1888. Used since January 3, 1887.

"The word 'CHADWICK.'"

16,272.—STOVES AND STOVE WARE AND FURNITURE.—*Quick Meal Stove Company*, St. Louis, Mo. Application filed December 22, 1888. Used since September 15, 1886.

"The representation of a chick leaving the shell and pursuing an insect."

16,273.—SHOE-POLISH.—*C. E. Robinson & Bro.*, Philadelphia, Pa. Application filed December 6, 1888. Used since December 26, 1887.

"The word 'SUNBEAM' and the representation of the sun partially obscured by clouds above and the lower portion shown with radiating beams."

16,274.—PERFUMERY.—*Albert L. Smith*, Palatine, Ill. Application filed November 23, 1888. Used since November 24, 1880.

"The word 'LOVINE.'"

16,275.—WHISKY.—*Charles E. Stults & Co.*, Savannah, Ga. Application filed January 11, 1889. Used since May 1, 1888.

"The words 'OLD OAKEN BUCKET.'"

16,276.—CONFECTIONERY.—*Philip Wunderle*, Philadelphia, Pa. Application filed September 14, 1887. Used since July 1, 1884.

"The words 'THE BEST' in capital letters of white and yellow colors, with a red background."

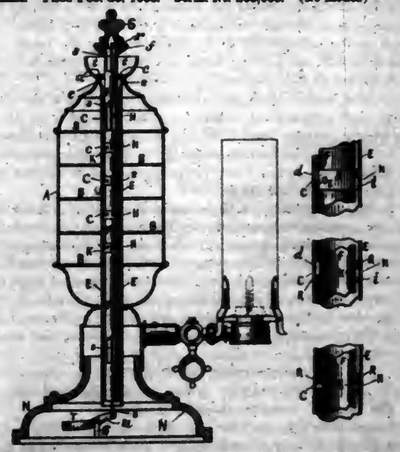
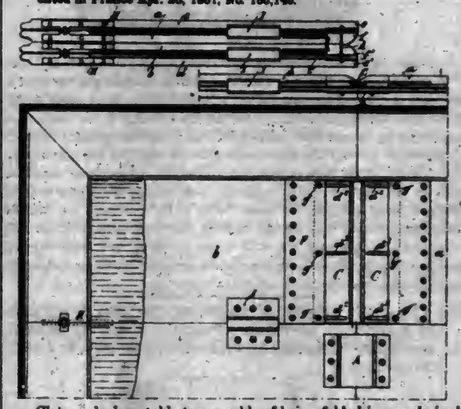
PATENTS

GRANTED FEB. 12, 1889.



397,484. CULTIVATOR. CHARLES B. ATKINSON, Pennsville, N. J. Filed Nov. 2, 1888. Serial No. 289,902. (No model.)

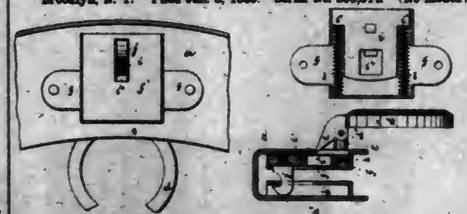
Claim.—1. In a cultivator, the combination of the beam A, the beams R on opposite sides thereof and having their front ends pivotally connected thereto, the clip movable longitudinally on beam A, the links connecting the clip to the rear ends of beams R, the standard G, the clamping-bolt H, pivoting said standard to the beam A, the lever K', pivoted to said standard, the link connected to said lever, and the pivotal clamp-bolt connecting said link to the clip, all arranged and adapted to operate substantially as described.



2. In a cultivator, the combination, with the central beam having the horizontal arm B projecting from its front end, of the inclined colter-arm K, having its upper end bolted to arm B, the standard B', bolted to and depending from the arm B, the circular cutter-wheel journaled at the lower end of the standard, and having its lower edge extending through a slot, M, in the colter-arm, the laterally-adjustable beams R, having their front ends pivoted to the beam A, and the fender-rods having their rear ends pivotally connected to the beams R and their front ends pivoted to the arm K, substantially as described.

397,485. CARBURETING-LAMP. WILLIAM W. AUSTIN, Lowell, Mass. Filed Feb. 29, 1888. Serial No. 265,653. (No model.)

Claim.—A vapor-lamp consisting of a shell, A, having a burner, P, and provided with a series of partitions, B, and having a perforated filling-tube, E, provided with a perforated annular flange, *a*, an inner perforated air-tube, F, having a series of projections or rings, R, which fit within the outer tube and are each provided with holes C and H and openings *d* and *i*, and the top having a screw-plug, S, the said air-tube being provided with an indicating-wire, *s*, connected to the arm of the pivoted balance-cup T, as shown and described.

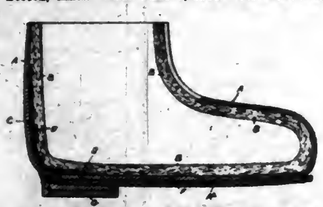


397,486. FOLDING TABLE-TOP. ARMAND C. F. BALEY, Paris, France. Filed Feb. 28, 1888. Serial No. 265,616. (No model.) Patented in France Apr. 23, 1887, No. 183,142.

Claim.—1. In a table-top capable of being folded in any desired number of superposed leaves or sections, the combination of the leaves *c d*, connected on their meeting edges by hinges A, formed in three parts, with the leaves *a b*, the leaf *a* being connected to the leaf *c* by a hinge, I, between the meeting edges of the leaves *a c*, and the leaf *b* being connected to the leaf *d* by a hinge, I, between the meeting edges of the leaves *b d*, the hinges I being formed in three parts, the middle parts of the hinges A being broader than the middle parts of the hinges I, whereby the parts may be folded upon each other, substantially as described.

2. In a table-top capable of being folded in any desired number of superposed leaves or sections, the leaves *c d*, having connecting-hinges A between their meeting edges, said hinges being formed in three parts, combined with the leaves *a b*, the leaf *a* being connected to the leaf *c* by a hinge, I, and the leaf *b* being connected to leaf *d* by a hinge, I, the hinge I being formed in three parts, the middle part of the hinges A being broader than the middle parts of the hinges I, and with an extension-hinge, C, connecting the leaves *a b* between their meeting edges, said hinges having grooves d^9, that receive pins *g*, thereby permitting a sliding movement to the hinge, whereby the parts may be folded successively upon each other, substantially as described.

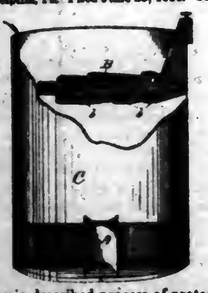
397,487. LOCK FOR SATCHELS, &c. FRANCIS F. BRAILLARD, Brooklyn, N. Y. Filed Jan. 3, 1889. Serial No. 295,314. (No model.)



Claim.—1. The combination of a slotted jaw with a vibrating

pendant that has a nose passing through said slotted jaw, and with a slide carrying the locking-catch and adapted to be engaged by the nose, substantially as specified.

2. The combination of slotted jaw *a* with outwardly-projecting posts *c c*, carrying a swinging pendant, *d*, having nose *e*, and with slide *i*, having catch *j* and slot i^3, the nose *e* passing through slotted jaw *a* and into engagement with slot i^3, substantially as specified.



3. The combination of slotted jaw *a* with outwardly-projecting posts *c*, carrying pendant *d*, that has nose *e*, and with the slide *i*, having shoulders i^2 and slot i^3, and with the catch *j*, secured to the slide, and with the spiral springs *k*, placed between shoulders i^2 and the bottom of the lock-case, substantially as specified.

397,488. METHOD OF MANUFACTURING SHOES. GEORGE W. CARTER, Boston, Mass. Filed June 9, 1888. Serial No. 276,547. (No model.)

Claim.—For the manufacture of shoes having an upper and sole of fibrous material braided, woven, or felted, constituting in itself a complete foot-covering, and having a fleece lining and an inside counter or heel-stiffener separated from the fleece lining by an interposed flexible lining, the method, substantially as herein described, the same consisting in turning the shoe inside out and applying but not attaching thereto at its heel portion a covering of india-rubber or other suitable material, and then applying over this covering the flexible lining, suitably securing the fleece lining to the shoe and the flexible lining, and slitting said linings, turning the shoe right side out and removing through said slit said rubber covering, and inserting the counter or heel-stiffener between the shoe and flexible lining and securing it to the shoe-sole, substantially as described.

397,489. METHOD OF PROTECTING THE NEGATIVE PLATES OF ELECTRICAL BATTERIES. FRANCIS J. CLARKE and JOSEPH G. HENDRICKSON, Philadelphia, Pa. Filed June 23, 1888. Serial No. 278,017. (No specimens.)

Claim.—1. The herein-described process of protecting the negative plate of an electrical battery, which consists in coating the surface of said plates with lead.

2. The herein-described process of protecting the negative plate of an electrical battery, which consists in first subjecting lead to the action of sal-ammoniac, arsenic, and phosphate of lead, and then coating the surface of said negative pole with the lead thus prepared, as set forth.

397,490. LUMBER-PILER. CHARLES D. CLARKE, Merrill, Wis. Filed Sept. 22, 1888. Serial No. 286,119. (No model.)

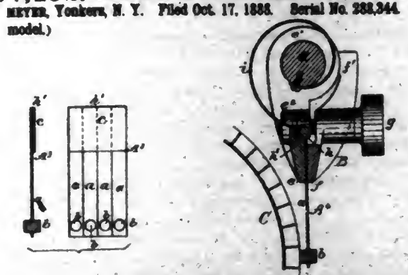
Claim.—1. A device for use in piling lumber, consisting of a base-board, suspending-hooks at the upper end of said board, and a roller supported at the upper end of said board on the front side of the same, as set forth.

2. A device for use in piling lumber, consisting of a base-board, suspension-hooks at the upper end of the same, spurs at the lower end thereof, and a roller supported on the front side of the board at its upper end, as set forth.

3. The combination of the base-board, the brackets E, secured to the front side thereof at the upper end of the same, the supporting-arm F, secured to said brackets, and the roller supported by said arm, as specified.

4. The combination of the standard having the spurs *b* and hooks *d*, the base-board mounted on the standard, and the roller carried by said base-board, as set forth.

397,491. PROCESS OF MANUFACTURING IRON OR STEEL. EUGENE H. COWLES, Cleveland, Ohio. Filed Dec. 24, 1887. Serial No. 258,920. (No specimens.)



Claim.—1. The herein-described step in the process of manufacturing iron and steel, consisting in the admixture with the molten iron or steel of an alloy of silicon and aluminium in about the proportions specified, substantially as set forth.

2. The herein-described step in the process of manufacturing iron and steel, consisting in melting together iron or steel with an alloy of silicon, aluminium, and iron, substantially as set forth.

3. The herein-described step in the process of manufacturing iron and steel, consisting in melting together iron or steel with an alloy of silicon and aluminium.

4. The herein-described step in the process of manufacturing iron and steel, consisting in the admixture with the molten iron or steel of an alloy of silicon, aluminium, and iron, substantially as set forth.

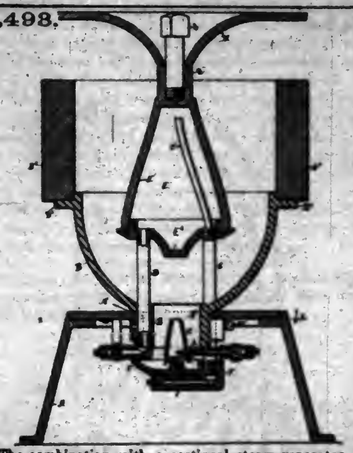
397,492. BRUSH FOR ELECTRIC GENERATORS. RUDOLF EICKEMEYER, Yonkers, N. Y. Filed Oct. 17, 1888. Serial No. 288,344. (No model.)

Claim.—1. In an electric brush, the combination of a conducting-spring and a carbon contact-block integrally united thereto, substantially as described.

2. In an electric brush, the combination of a conducting-spring and a set of carbon contact-blocks arranged in line crosswise of the spring, substantially as described.

3. In an electric brush, the combination of a conducting-spring and one or more carbon contact-blocks projecting from opposite sides of said spring, substantially as described, whereby the brush is rendered reversible, and enabling both ends of said carbons to be alternately applied to duty and used up in service.

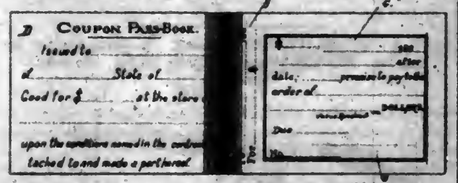
4. In an electric brush, the combination of a series of conducting-springs, each independently resilient and arranged side by side, and each having a carbon block at its free end, substantially as described.



5. In an electric brush, the combination, with a conducting-spring, of a metal-plated carbon block integrally secured to the free end of said spring, substantially as described.

6. The combination, with a commutator-hub, of a brush holder or clamp provided with a brush-adjusting gage and a brush-spring having a carbon contact-block at its free end, and also having a length between its rear end and the center of said block which exactly corresponds with the distance between the brush-adjusting gage in the holder and the commutating-point on said hub, substantially as described, whereby the perfect electric adjustment of the brush is accomplished by merely placing the brush in the holder against the gage and clamping it.

397,493. OIL-BURNER. WILSON R. FACER, Cleveland, Ohio. Filed Nov. 14, 1887. Serial No. 255,151. (No model.)



Claim.—1. The combination, with a steam-generator, a steam-discharging pipe leading therefrom, and a water-supply pipe in open communication therewith, said steam and water pipes forming a rigid support for the generator, of oil-discharging orifice in the line of the steam-jet approximately at right angles thereto, and a lighting-cup located below the burner, said cup having a duct therein out of which the discharge-orifice leads, this duct being in open communication with the steam-pipe, substantially as set forth.

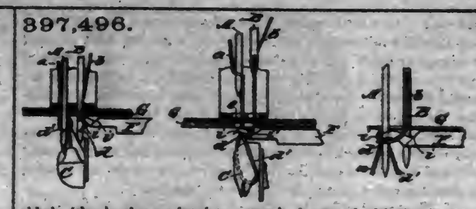
397,498.

2. The combination, with a sectional steam-generator, a water-supply pipe, and a steam-discharge pipe leading in and out of the said generator, of oil-discharging orifice located in line of the steam-jet approximately at right angles thereto, and a lighting-cup attached to and supported by the steam-pipe, said cup having a duct therein in open communication with the steam-pipe and out of which the discharge-orifice leads, substantially as set forth.

397,494. COUPON PASS-BOOK. MARION O. FISHER, Dayton, Ohio, assignor to Samuel C. McClure, same place. Filed Aug. 18, 1887. Serial No. 247,267. (No model.)

Claim.—As a new article of manufacture, a coupon pass-book, a title or certificate, D, a leaf containing a detachable promissory note, G, and a stub, *g*, each provided with blank spaces, as set forth, including the blank space for the insertion of the amount represented by the coupons in the book at the time of delivery of the same to the customer, a contract, F, and the intermediate leaves, each divided into a series of detachable coupons, C, which are inscribed with numerals, figures, or other characters to denote the value and nature of the same, substantially as and for the purpose described.

397,495. METHOD OF STITCHING FABRICS. WILLIAM C. FOSTER, Jersey City, N. J., assignor to Mari A. Cuming, New York, N. Y. Filed Oct. 26, 1887. Serial No. 253,205. (No model.)

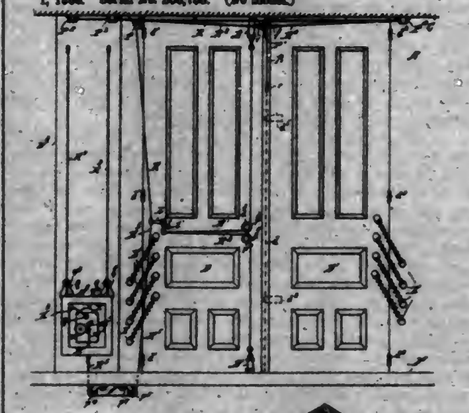


Claim.—The method herein described of forming a seam of two threads in connection with a fabric, which consists, first, in passing two loops of thread through the fabric at a short distance apart, one to be formed into a chain-stitch, the other into a transverse loop, then carrying the transverse loop across the space between the loops at the under surface of the fabric and retaining it there, and then passing a second chain-stitch loop down through the fabric and first through the transverse loop, and then through the previous chain-stitch loop, this operation being repeated to form the seam, the transverse loop occupying a position between the chain-stitch loops and the fabric, substantially as described.

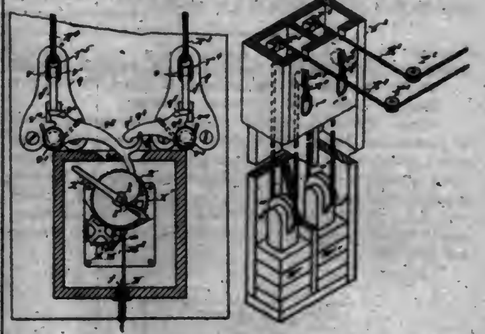
397,496. SEWING-MACHINE. WILLIAM C. FOSTER, Jersey City, N. J., assignor to Mari A. Cuming, New York, N. Y. Filed Apr. 14, 1888. Serial No. 270,633. (No model.)

Claim.—The needle-bar N, provided with two needles, and the cloth-plate G, having the needle-hole or slot *e* for both needles, in combination with stitch-forming hook C, the bar F, placed beneath the cloth-plate in line with the needles, and means, substantially as described, for reciprocating said bar F, the same being formed or provided with a hook or point, *i*, to enter the loop, and with the shoulder i^2, to shift the loop, substantially as described.

397,496.



397,497. COMBINED FEED-TROUGH AND HAY-RACK. CHARLES R. HANNA, Middleburne, Ohio. Filed Sept. 14, 1888. Serial No. 285,289. (No model.)



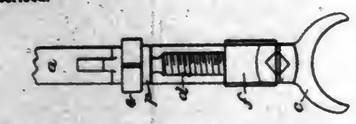
Claim.—1. In combination, the rack, the cleats and buttons having coinciding beveled edges attached to the inner sides of the legs of the rack, the sliding troughs having notches in their edges, and the buttons to engage said notches, as set forth.

2. In combination, the rack, the cleats secured to its legs and having lower beveled edges, the buttons with ends oppositely beveled and of unequal weight—the inner the heavier—the troughs having notches in their ends, and the buttons pivoted to the front of the legs in position to engage the notches or the upper beveled ends of the other buttons, as desired.

397,498. DEVICE FOR OPENING AND CLOSING DOORS. CHARLES F. HERRWAY, Lowell, Mass., assignor, by direct and mesne assignments, of two-thirds to James F. McKissock, same place. Filed July 1, 1886. Serial No. 206,755. (No model.)

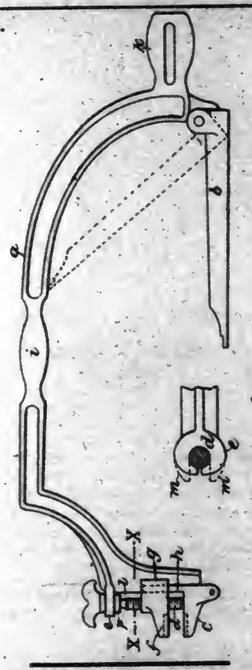
Claim.—1. The combination of a self-closing door, a rope connected at one end to said door, one or more guide-pulleys over which

said rope is carried, a weight sliding freely on said rope, a link or loop attached to the other end of said rope, a pivoted hook adapted to engage said link and to be turned upon its pivot by the draft of said rope to release said link or loop therefrom, a locking-lever arranged in front of the open end of said hook to prevent said hook from turning on its pivot, a spring to turn said lever on its fulcrum, and clock-work arranged to prevent said lever from turning on its fulcrum for a definite time and thereafter to release said lever, whereby said door may be opened by the falling of said weight and allowed to close thereafter, as and for the purpose specified.



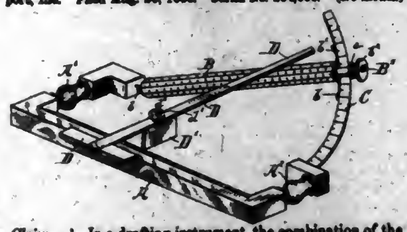
2. The combination of a self-closing door, suitable guide-pulleys, a rope connected at one end to said door, a weight provided with a pulley, said rope passing under said last-named pulley and over said guide-pulley, a link or loop attached to the other end of said rope, a pivoted hook adapted to engage said link and to be turned upon its pivot by the draft of said rope to release said link or loop therefrom, a locking-lever having a short arm adapted when placed in front of the open end of said hook to prevent said hook from turning on its pivot, a spring to turn said lever upon its fulcrum, and a cam provided with a cam-notch and rotated by clock-work, the longer arm of said lever resting upon said cam and holding said short arm in front of said open end of said hook until the free end of said long arm enters said cam-notch, as and for the purpose specified.

3. The combination of two self-closing doors, the inner edge of one of said doors being adapted to overlap the inner edge of the other of said doors when the same are closed, suitable guide-pulleys, two ropes, each connected at one end to one of said doors, two weights, each sliding freely on one of said ropes, two links, one attached to the other end of each rope, two pivoted hooks, each adapted to engage one of said links and to be turned upon its pivot by the drawing of the rope to which said link is attached to release said link therefrom, a locking-lever having a short arm, adapted, when placed in front of the open end of one of said hooks, to prevent said hook from turning on its pivot, a spring to turn said lever upon its fulcrum, a cam provided with a cam-notch and rotated by suitable clock-work, the longer arm of said lever resting upon the periphery of said cam and holding said short arm in front of said open end of said hook until the free end of said long arm enters said cam-notch, and another locking-lever having a short arm adapted to prevent the other of said hooks from turning on its pivot when placed in front of the open end of said last-named hook, the free end of the long arm of said last-named locking-lever resting upon the long arm of said first-named locking-lever or upon a projection which said last-named long arm is provided with and pressed upon the same by a spring, and adapted to release its hook before the other hook is released by said first-named locking-lever to allow one of said doors to close before the other of them, and said last-named spring, as and for the purpose specified.



4. The combination of two self-closing doors, the inner edge of one of said doors being provided with one or more latches to engage with the other of said doors, two ropes, each connected at one end to one of said doors, one or more guide-pulleys over which said ropes are carried; two weights, one of which slides freely on each of said ropes, links or loops attached to the other ends of said ropes, respectively, pivoted hooks adapted to engage said links and to be turned upon their pivots by the draft of said ropes to release said links or loops therefrom, and locking-levers, each arranged in front of the open end of one of said hooks to prevent the same from turning, springs to turn said levers upon their fulcrums, and clock mechanism arranged to prevent said levers from turning on their fulcrums for a definite time and thereafter to release said levers one after the other to allow said ropes to slip through said weights, whereby said doors may be opened by the falling of said weights and allowed to close one after the other, as and for the purpose specified.

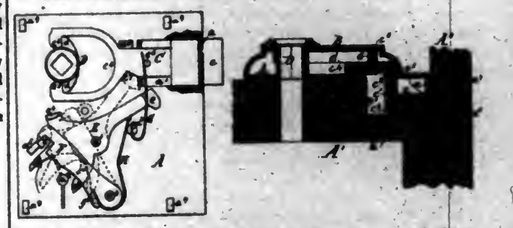
397,499. COMBINED CARRIAGE-JACK, WRENCH, AND BIT-STOCK. FRANKLIN K. HINSON and ROBERT M. LAMBE, New York, N. Y. Filed Apr. 5, 1888. Serial No. 269,889. (No model.)



Claim.—The herein-described compound tool, comprising the cow or goose-neck *a*, the axle-bearing *b*, fulcrumed to one end thereof and having serrations *n* at its forward end, the fixed jaw and bearing portion *c*, arranged at the forward end of the said goose-neck *a*, the screw *d*, permanently held by the collar *e*, the adjustable jaw *f*, provided with ears *g*, the latter engaging with the beads *h*, the cylindrical portion *i* of the said goose-neck, and the handle K, substantially as shown and described.

397,499.

397,500. DRAFTING-INSTRUMENT. SILVESTER HOADLEY, Goshen, Ind. Filed Aug. 28, 1888. Serial No. 284,000. (No model.)

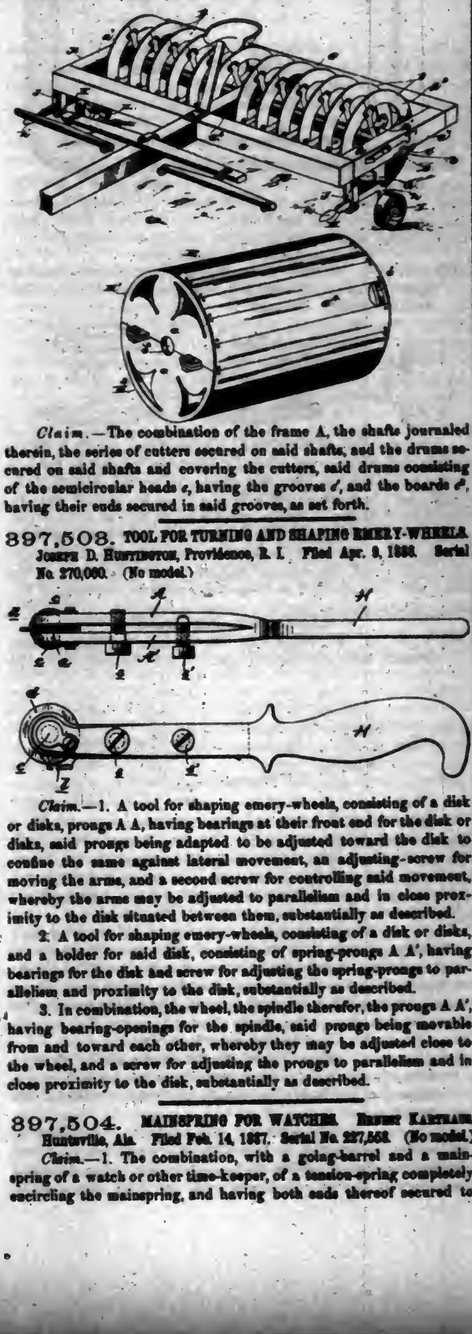


Claim.—1. In a drafting-instrument, the combination of the base A, provided with the arms A' and A², the bar B, hinged to said arm A', the curved arm C, extending out from said arm A², said bar B being mounted to slide thereon, and the draftsman's square D, all arranged and operating substantially as set forth.

2. The combination, in a drafting-instrument, of a base or frame, a curved arm extending out therefrom, and a graduated bar having graduations of different lengths upon several sides hinged to said base or frame and revolvable upon its own axis, whereby either of its sides may be brought into use, substantially as set forth.

3. The combination, in a drafting-instrument, with the main structure thereof, of a draftsman's square extending across it, the blade of which is provided with a wing extending down to the surface on which the instrument rests, said wing being pivoted as described, whereby the markings can be made at an angle with the direction in which the square is moved over the instrument, substantially as set forth.

397,501. LOCK. HILAND A. HOLT, Nashua, N. H. Filed May 25, 1888. Serial No. 275,101. (Model.)



Claim.—1. A door-lock adapted to be placed on either the inner or outer side of a door, comprising a lock-case, A, having an angular chamber, a sliding bolt having an offsetting fastening portion, which is about on a line central with the edge of the door and adapted to engage with an ordinary striker or keeper inserted in the casing or framing of the door, and a locking-tumbler mechanism comprising tumbler E, substantially as and for the purpose described.

2. The combined rim and mortise lock comprising a locking-tumbler mechanism, a sliding latch-bolt, C, having an angular portion, c^3 and a latching-nose, *c*, and a case having a main plate, A, provided with an angular rim-plate portion, *a*, and an angular protecting portion, *a'*, and a locking-tumbler mechanism comprising tumbler E, substantially as and for the purpose described.

3. The combination of the latch-bolt C, having notch c^3, the tumbler E, having branches e^3 e^4 and lug e^5, and the tumbler F, having notch *f* and spring H, substantially as described.

397,502. SOD-CUTTER, STALK-CUTTER, AND ROLLER. THOMAS HORTON and JOSEPH P. WHITEHOUSE, Garrett, Ill. Filed May 9, 1888. Serial No. 273,282. (No model.)

Claim.—The combination of the frame A, the shafts journaled therein, the series of cutters secured on said shafts, and the drums secured on said shafts and covering the cutters, said drums consisting of the semicircular heads *c*, having the grooves *c'*, and the boards c^2, having their ends secured in said grooves, as set forth.

397,503. TOOL FOR TURNING AND SHAPING EMERY-WHEELS. JOSEPH D. HUNTINGTON, Providence, R. I. Filed Apr. 9, 1888. Serial No. 270,060. (No model.)

Claim.—1. A tool for shaping emery-wheels, consisting of a disk or disks, prongs A A, having bearings at their front end for the disk or disks, said prongs being adapted to be adjusted toward the disk to confine the same against lateral movement, an adjusting-screw for moving the arms, and a second screw for controlling said movement, whereby the arms may be adjusted to parallelism and in close proximity to the disk situated between them, substantially as described.

2. A tool for shaping emery-wheels, consisting of a disk or disks, and a holder for said disk, consisting of spring-prongs A A', having bearings for the disk and screw for adjusting the spring-prongs to parallelism and proximity to the disk, substantially as described.

3. In combination, the wheel, the spindle therefor, the prongs A A', having bearing-openings for the spindle, said prongs being movable from and toward each other, whereby they may be adjusted close to the wheel, and a screw for adjusting the prongs to parallelism and in close proximity to the disk, substantially as described.

397,504. MAINSPRING FOR WATCHES. REUBEN KARTHAUS, Huntsville, Ala. Filed Feb. 14, 1887. Serial No. 227,853. (No model.)

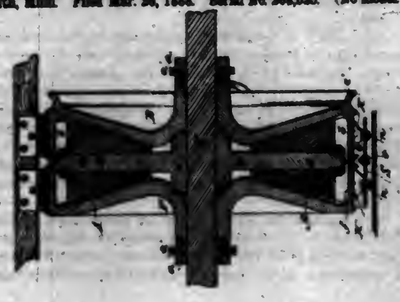
Claim.—1. The combination, with a going-barrel and a mainspring of a watch or other time-keeper, of a tension-spring completely encircling the mainspring, and having both ends thereof secured to

397,504.

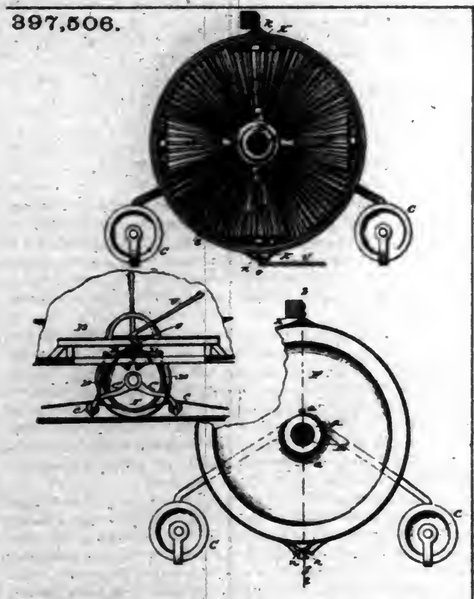
the outer coil of the mainspring and to one another in such a manner as to prevent the ends of the tension-spring from sliding past one another, said tension-spring being fitted tightly in the going-barrel to be held by frictional contact against the inner periphery of the barrel and capable of a radial movement inwardly upon the mainspring by an excessive strain upon the latter, substantially as described, for the purpose set forth.

2. The combination, with a going-barrel and a mainspring, of a tension-spring completely encircling the mainspring and having one end permanently united to the outer coil of the mainspring, the unattached or free end of the tension-spring being detachably connected to the united ends of the tension-spring and mainspring to prevent the ends of the tension-spring from sliding past one another, the coiled friction-spring being capable of a radial movement inwardly upon the mainspring when an excessive strain is exerted upon the latter, substantially as described, for the purpose set forth.

3. The combination, with the going-barrel and a mainspring, of a tension-spring encircling the mainspring, said tension-spring having one end thereof secured to the outer coil of the mainspring by a transverse rivet, which passes through the tension-spring and mainspring at a suitable distance from the ends of the same to form a seat or fork, the unattached or free end of the said tension-spring being fitted in the fork or seat, and thereby held against sliding past the same, substantially as described, for the purpose set forth.



397,505. METHOD OF INSERTING MAINSPRINGS AND REMOVING THE SAME. REUBEN KARTHAUS, Huntsville, Ala. Filed Apr. 25, 1888. Serial No. 271,903. (No model.)



Claim.—1. The herein-described method of inserting mainsprings into the going-barrels of watches and other time-keepers, which consists, first, in placing a non-expansible clasp around the mainspring to be inserted, the interior diameter of said clasp being of corresponding or slightly smaller diameter than the barrel into which the mainspring is to be inserted, and then forcing the mainspring into the barrel and causing the clasp to strike the end of the barrel, whereby the clasp is removed from the mainspring by the operation of forcing the mainspring into the barrel, substantially as described, for the purpose set forth.

2. The herein-described method of inserting and removing mainsprings into and from the going-barrels of watches and other time-keepers, which consists, first, in placing a non-expansible clasp-ring around the mainspring to be inserted, the interior diameter of said clasp-ring being of corresponding or slightly smaller diameter than the barrel into which the mainspring is to be inserted, then partially forcing the mainspring into one end of the barrel and partially forcing another mainspring already fitted in the barrel from the opposite end thereof, and finally forcing the first mainspring completely into the barrel and entirely expelling the second mainspring therefrom, the clasp-ring being removed from the first mainspring, when the latter is forced completely into the barrel, by striking against one end thereof, as and for the purpose described.

397,506. TRANSMITTING POWER. TIMOTHY W. LARIMER, Duluth, Minn. Filed Mar. 26, 1888. Serial No. 268,525. (No model.)

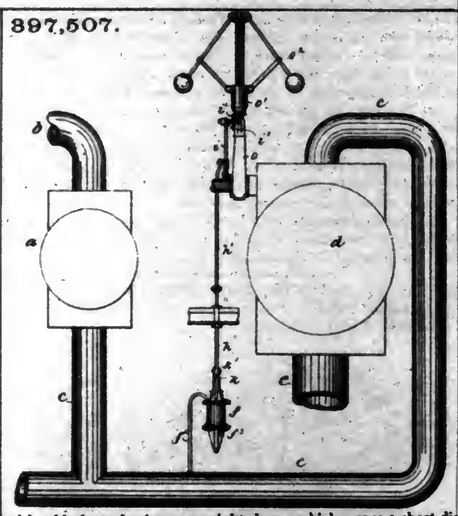
897,506.

Claim.—1. In a device for transmitting a reversible motion to a car from a continuous running cable, the combination, with a shaft journaled below the car-body and having a hub keyed on said shaft provided with radial pivot-bolts D, and beveled gears mounted on said bolts D, of the band-wheels B and F, loosely mounted on said shaft and having internal beveled cogged surfaces, said wheel B adapted to be engaged by the cable, substantially as described.

2. In a device for transmitting a reversible motion from a continuous running cable, the combination, with shaft E and the band-wheels B and F, loosely mounted thereon, of the hub H, having radial arms D and beveled gears A mounted thereon, said hub adapted to be secured to said shaft and disposed between the wheels F and B, substantially as and for the purpose described.

3. In a device for transmitting reversible motion, the combination, with the shaft having radial arms D, carrying beveled gears A, of the band-wheels B and F, having internal beveled cogged surfaces and disposed one at each side of the radial arms D and meshing with the gears A, said wheels B and F having circumferential flanges adapted to receive the brake-bands, substantially as shown and described.

4. In a device, substantially as described, for transmitting a reversible motion, the band-wheel B, provided with an internal beveled cog-surface, a brake-flange, *e*, and a groove, *d'*, adapted to receive the cable, substantially as described, and for the purpose specified.



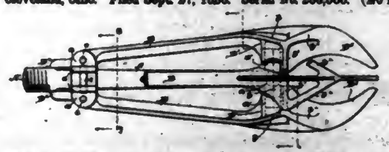
5. In a device for transmitting a reversible motion, the combination, with the shaft E and the hub H, having radial arm D, provided with beveled gears A, of band-wheels B and F, the wheel B adapted to frictional contact with the cable, said wheels having beveled inner cogged surfaces meshing with the gears A, said wheels provided with flanges *e* and *f*, adapted to receive the brake-bands K K', and means for operating said brakes, substantially as described, all arranged as and for the purpose set forth.

897,507. REGULATOR FOR COMPOUND ENGINES. CHARLES T. MAIN, Lawrence, Mass. Filed July 5, 1888. Serial No. 279,056. (No model.)

Claim.—1. A regulator for compound engines, comprising a pressure-gage or pressure-chamber connected with the receiver and having a part movable by changes in the pressure in said receiver, the said moving part of the pressure-gage being connected with the cut-off controller for the valves of the low-pressure engine, and by its movement changing the cut-off for said valves, as set forth, whereby the quantity of steam admitted to the low-pressure engine from the receiver is increased as the pressure in the receiver rises and is diminished as the pressure in the receiver falls, substantially as and for the purpose described.

2. A regulator for compound engines, comprising a cylinder and piston therein, said cylinder communicating with the receiver of the engine, and said piston being connected with the cut-off controller of the low-pressure engine combined with a weighted lever connected with said piston, having one weighted arm which moves a short distance above and below the horizontal position, and a second weighted arm that moves toward and from the vertical position in the stroke of said piston, substantially as and for the purpose described.

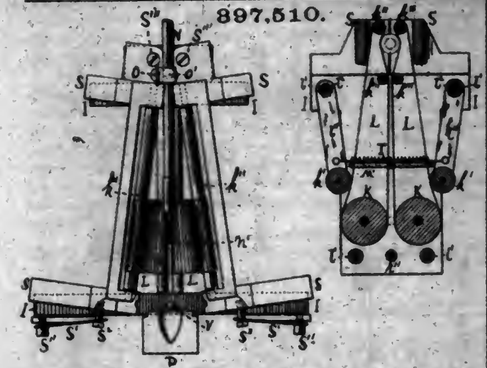
897,507.



897,508. BUTTON. JAMES MCKERSEY, Attleborough, Mass., assignor to Wheaton, Richards & Co., same place. Filed Oct. 15, 1888. Serial No. 288,092. (No model.)

Claim.—The combination of a button-shank having a narrow portion and lateral arms projecting therefrom at its end, which is turned to one side and offset with relation to the main portion of the shank, and a button-head consisting of a cap or top plate, c^3, and bottom plate, c^4, having an opening through which the end of the shank passes, and a holding-plate, *d*, inclosed in said button-head, having an integral tongue, d^3, and projections d^3 d^4, extending from the plane of the plate, said projections d^3 co-operating with the arms of the shank and said projection d^4 co-operating with the extremity of the shank, substantially as and for the purpose described.

897,509. FLUE-CLEANER. JOHN T. MEAD and JOHN THOMSON, Cleveland, Ohio. Filed Sept. 27, 1888. Serial No. 286,500. (No model.)



Claim.—1. In a flue-cleaner, the combination, with a central rod and arms, substantially as indicated, pivoted at their rear ends to said rod and supported upon yielding bearings near the front ends, of ribs extending spirally in opposite directions from each arm, each rib having a scraping-edge adapted to fit a flue of given size, substantially as set forth.

2. In flue-cleaners, the combination, with a central rod having a series of projections on its front end, of arms pivoted at their rear ends to said rod and provided with scraping-ribs extending spirally in opposite directions from each arm, and springs interposed between the projections on the rod and the arms for yieldingly supporting the free ends of the latter, substantially as set forth.

897,510. CIGAR-BUNCH-WRAPPING MACHINE. HENRY C. MYERS, New York, N. Y., assignor to the United States Cigar Machinery Company, of New York. Filed Feb. 21, 1887. Serial No. 228,302. (No model.)

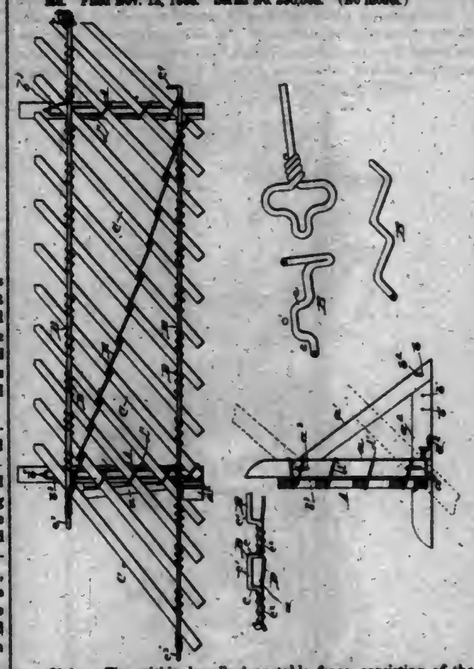
Claim.—1. In a cigar-bunch-wrapping machine, the combination of a holding-pin on which the butt of the cigar-bunch can be pressed, mounted with bearings in the machine in which it revolves, a recessed head-piece for forming and supporting the tip of the cigar movably

897,510.

attached to the machine, so as to be adjustable vertically, an endless traveling apron on each side of the pin and support, rollers to support the aprons, rollers bearing against the aprons to tighten the same, and springs for pressing the tightening-rollers against the aprons, movable jaws pivoted vertically at one end, so as to swing horizontally, and carrying two of the supporting-rollers, guide-rollers on opposite sides of the pin and support, and mechanism for revolving the rollers and operating the jaws, substantially as shown and described.

2. In a cigar-bunch-wrapping machine, the combination of a holding-pin onto which the butt of the cigar-bunch can be pressed, mounted with bearings in the machine in which it revolves, a recessed head-piece for supporting and forming the tip of the cigar movably attached to the machine, so as to be adjustable vertically, two endless traveling aprons, one on each side of the holding devices, rollers to support the aprons, rollers bearing against the aprons to tighten the same, and springs for pressing the tightening-rollers against the aprons, a movable jaw pivoted vertically at one end, so as to swing horizontally, carrying one of the supporting-rollers, guide-rollers on the opposite sides of the pin and head-piece, and mechanism for revolving the rollers and operating the jaw, whereby one of the aprons may be moved toward or from the other apron and opened out from or closed upon the holding devices, substantially as shown and described.

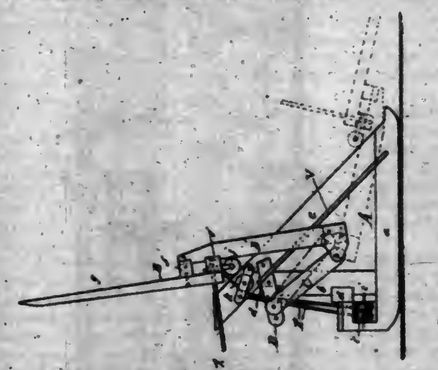
3. In a cigar-bunch-wrapping machine, in combination with devices for holding the cigar-bunch at each of its ends, endless traveling aprons, rollers for supporting the aprons, and devices for tightening the aprons, a jaw pivoted vertically at one end, so as to swing horizontally, and carrying one of the rollers, and guide-rollers on opposite sides of the holding devices, and mechanism for revolving the rollers and operating the jaw, whereby one of the endless aprons can be opened out from the holding devices, substantially as shown and described.



4. In a cigar-bunch-wrapping machine, the combination of a holding-bar for the cigar-bunch, having a revolving sleeve on its end, and a supporting-pin attached to the sleeve, said bar being mounted adjustably in bearings in the machine, two endless traveling aprons, one on each side of the holding-bar, rollers to support and tighten the endless traveling aprons, movable jaws pivoted at one end and carrying the upper supporting-rollers, an adjustable head piece opposite the holding-bar, guide-rollers on opposite sides of the holding-bar and head-piece, a shifting rod and yoke for moving the aprons, and mechanism for revolving the rollers and operating the jaws, substantially as shown and described.

5. In a cigar-bunch-wrapping machine, a device for holding the cigar-bunch during the operation of wrapping, consisting of a long slender pin adapted to penetrate the cigar-bunch to a considerable distance to hold the bunch in place, and suitable means for supporting the pin so that it can revolve, substantially as shown and described.

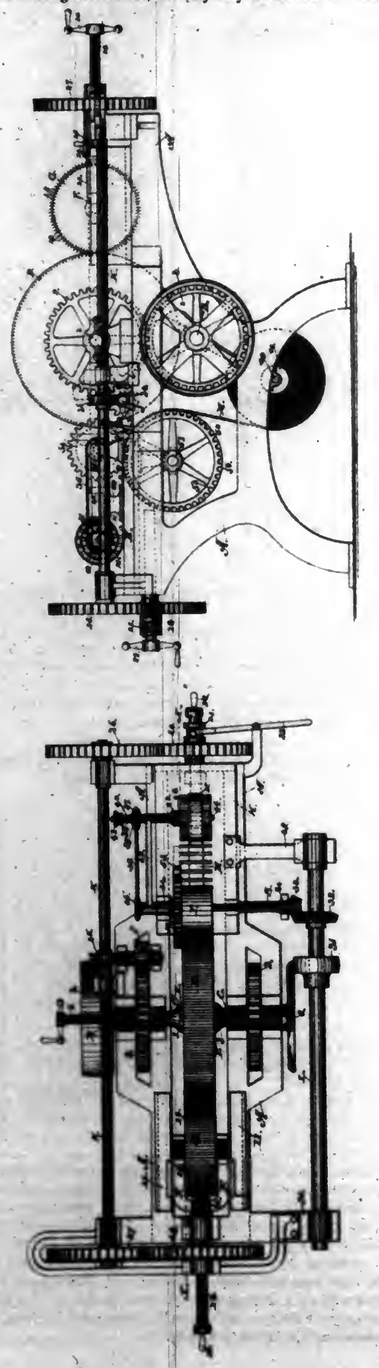
6. In a cigar-bunch-wrapping machine, a device for holding the cigar-bunch during the operation of wrapping, consisting of a holding-bar having a revolving sleeve on its end, and a long slender pin attached to the sleeve and adapted to penetrate the cigar-bunch to a considerable distance, sufficiently to hold the bunch in place, said bar being mounted adjustably in bearings in the machine, substantially as shown and described.



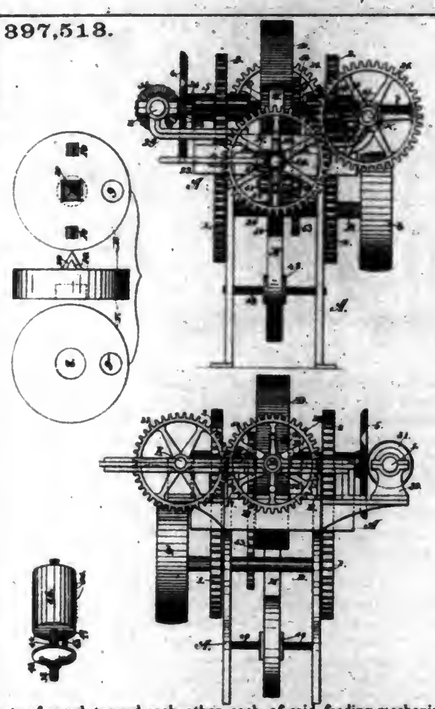
7. In a cigar-bunch-wrapping machine, the combination of a cigar-bunch-holding device mounted in bearings in the machine in which it revolves, and adapted to enter the butt-end of the bunch, a head-piece for supporting the tip of the cigar-bunch, two endless traveling aprons, one on each side of the holding devices, rollers to support and rollers to tighten the endless traveling aprons, movable jaws pivoted at one end and carrying the upper supporting-rollers, guide-rollers on opposite sides of the holding devices, a treadle for operating the jaws, and links, levers, rods, and chains connecting the treadle and the jaws, and springs connected with the jaws to act in the reverse direction to the treadle, and mechanism for revolving the aprons and rollers, substantially as shown and described.

897,511. PORTABLE FENCE. PEARRE M. MEMELAR, Hagerstown, Md. Filed Nov. 12, 1888. Serial No. 290,502. (No model.)

Claim.—The within-described portable fence, consisting of the post composed of three parts—to wit, the vertical portion, inclined bar, and base—all pivoted to one another and capable of being folded, as described, the upper and lower rails having depressions, the palings secured in these depressions by the tie-wire wound around them, the diagonal brace-wire, the wire shield on the face of the post, and the serpentine wire having loops at its lower end to receive a stake, the whole arranged substantially as described.



897,512. HAY-STACKER. JAMES MOREN, Sioux Rapids, Iowa. Filed Jan. 14, 1888. Serial No. 260,778. (No model.)



Claim.—In a hay-stacker, the combination, with the main frame composed of the sills *a a*, vertical posts *b b*, inclined beams *c c*, and the cross-bars *d d*, the fixed projections D D, projecting rearwardly from the upper edge of the beams *c c*, and the connecting-links C, pivoted at their outer ends to the projections D, of the fork B, said fork consisting of the side arms, F, the rear ends thereof pivoted to the inner ends of the links C, the bars *f f'*, tines *g g*, the rods *h h*, friction-rollers *j j*, connected to the rear of the bar *f*, adapted to travel on the beams *c c*, and means for raising and lowering the fork B, substantially as shown and described.

397,513. MACHINE FOR MAKING MATCH-SPLINTS. GEORGE R. HORAN, Troy, assignor of one-half to Alonzo P. Adams, Albany, N. Y. Filed Apr. 28, 1887. Serial No. 236,442. (No model.)

Claim.—1. In a machine for making match-splints from a revolving block, the combination of a scoring-wheel provided with a series of scoring-knives, and a slicing-knife secured to a sliding bed which carries a tape-winding mechanism, the said scoring-wheel being disconnected from the slicing-knife and each being provided with an independent feeding mechanism, whereby they can be fed at a uniform

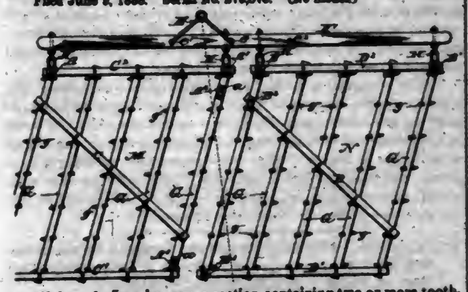
397,518.

rate of speed toward each other, each of said feeding mechanisms being provided with a disengaging device, whereby the feeding movement of either or both can be suspended and resumed, and both having hand-operating appliances by which they can be manipulated during disengagement, as and for the purpose herein specified.

2. In a machine for making match-splints, the combination of a scoring-wheel provided with a series of scoring-knives and fitted to rotate in a carrier moving on guides and a feeding-screw for imparting a positive feeding movement to said carrier, said feeding-screw having a disconnecting attachment, whereby said feeding movement can be suspended and resumed, and also having a hand-operating attachment, whereby said feeding-screw can be manipulated during its disengagement, as and for the purpose herein specified.

3. In a machine for making match-splints, the combination of a scoring-wheel provided with a series of scoring-knives for scoring a revolving block, a slicing-knife for removing the splints from said block, a concave bed directly behind said slicing-knife, and an elastic roller which bears against the splints as they are removed from said block and by which said splints are separated from each other, substantially as and for the purpose herein specified.

4. In a machine for making match-splints from a revolving block, the combination of a scoring-wheel provided with a series of scoring-knives actuated to score a revolving block across its periphery, a slicing-knife for removing the splints from said block, a concave bed directly behind said slicing-knife, an elastic roller arranged to rotate in said concave bed at a greater peripheral speed than the revolving block, and a single tape or web moving directly under said elastic roller, substantially as and for the purpose herein specified.



5. In a machine for making match-splints from a revolving block, the combination of a splint-cutting mechanism, a block-revolving shaft provided with a friction-disk, a sliding shaft provided with a friction-wheel whose periphery bears upon the flat face of said friction-disk to produce a variable speed for the sliding shaft, a transverse shaft geared to said sliding shaft, a single tape or web, and a tape-spool spindle actuated by said transverse shaft and having a variable rate of speed that corresponds to the peripheral speed of the constantly-increasing bundle of splints that is formed on the spool attached to said spindle, substantially as and for the purpose herein specified.

6. In a machine for making match-splints from a revolving block, the combination, with a block-revolving mechanism, a scoring-wheel provided with a series of scoring-knives, a slicing-knife oppositely located to said scoring-wheel, said slicing-knife and scoring-wheel being fed toward each other at the same rate of movement, a concave bed directly behind said slicing-knife, and an elastic roller revolving in the hollow of said concave bed, of a longitudinal shaft having a transverse shaft geared thereto, a single tape or web, and a tape-spool

spindle, said shafts and spindle being rotated at a speed that is variable in respect to time, but uniform in respect to each other, substantially as and for the purpose specified.

7. In a machine for making match-splints, the combination of a splint-cutting mechanism, a concave bed directly behind said cutting mechanism, an elastic roller rotating in said concave bed, a single flat tape or web which moves directly under said elastic roller, and a tape-winding mechanism, the splints being passed directly between the periphery of said elastic roller and the face of the tape and being retained on said tape-winding mechanism by their involvement between the successive convolutions of said tape, as and for the purpose herein specified.

397,514. HARROW. GUSTAVUS A. PADDOCK, Beaver Dam, Wis. Filed June 9, 1888. Serial No. 276,573. (No model.)

Claim.—1. In a harrow, a section containing two or more tooth-bars rigidly secured together, with slanting teeth and semi-reversing attachments, substantially as described.

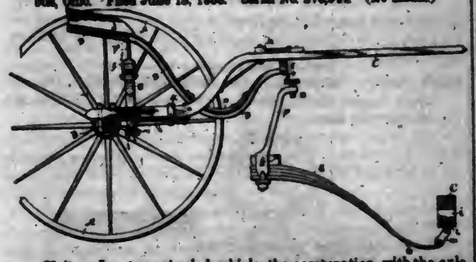
2. In a harrow, two sections with slanting teeth and semi-reversing attachments, substantially as and for the purposes described.

3. In a harrow, two independent sections attached to a draw-bar, the teeth of each slanting directly out from the other, substantially as shown.

4. In a harrow, a draw-bar adjustable to two adjacent sides of a section, said section containing two or more tooth bars rigidly connected, substantially as described.

5. In a harrow, the combination, with a draw-bar, of two sections having slanting teeth and semi-reversing attachments, substantially as described.

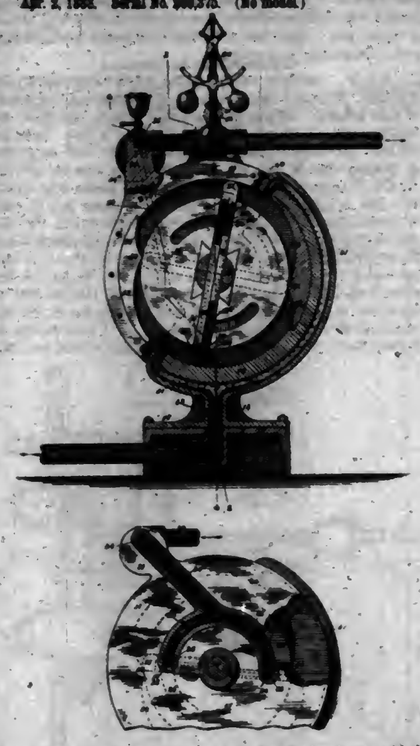
6. In a harrow, the combination, with two sections, M and N, having their teeth slanted outward from each other, of semi-reversing attachments A and B, fronting two adjacent sides, substantially as described.



7. In a harrow, the combination of two sections, M and N, having semi-reversing attachments A and B, with a draw-bar, F, adjustable to two adjacent sides of each section, substantially as described.

8. In a harrow, the combination, with a button, of a link adjustable to said button, the whole forming a drawing attachment, substantially as described.

9. In a harrow, two sections, each containing two or more tooth-bars rigidly connected, with slanting teeth and semi-reversing attachments, substantially as described.



10. In a harrow, two sections, each containing two or more tooth-bars secured together without joints, and each having its teeth slanted outward from the other, and a draw-bar adjustable to two adjacent sides of each section, substantially as described.

397,515. TWO-WHEELED VEHICLE. JOHN G. PARSONS, Columbus, Ohio. Filed June 13, 1888. Serial No. 276,944. (No model.)

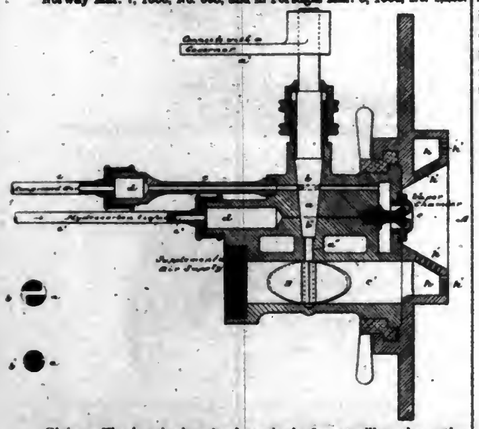
Claim.—In a two-wheeled vehicle, the combination, with the axle, shafts, and seat, of a transverse spring, G, pivotally supported beneath the seat, as described, and the springs *i*, held at their front ends against the under sides of the shaft-bars, and pivotally connected at their remaining ends with the spring G, substantially as and for the purpose specified.

397,516. ROTARY STEAM-ENGINE. DANIEL R. POWERS, New York, N. Y., assignor of one-half to George W. Fuller, same place. Filed Apr. 2, 1888. Serial No. 269,575. (No model.)

Claim.—1. The combination of a cylindrical casing provided with fixed cams and with steam inlet and exhaust ports, a rotary disk concentric with said casing and provided with arc-shaped channels at diametrically-opposite points, which pass the inlet-port during the rotation of the disk, and with a radial slot or slots in communication with said arc-shaped channels, and piston-slides within said radial slots provided with heads having steam-channels, substantially as described.

2. The combination of a cylindrical casing provided with fixed cams, and with steam inlet and exhaust ports, a rotary disk concentric with said casing and provided with arc-shaped channels at diametrically-opposite points which pass the inlet-port during the rotation of the disk, and with a radial slot or slots in communication with said arc-shaped channels, and piston-slides within said radial slots provided with heads having steam-channels, said slides having grooves on their outer faces, substantially as described.

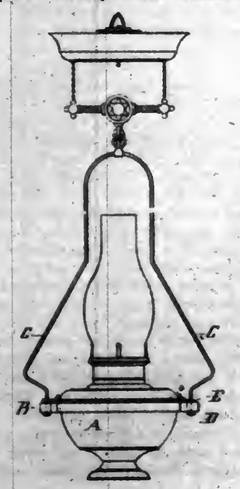
3. The combination of a cylindrical casing provided with fixed cams and with steam-inlet and exhaust ports, a rotary disk concentric with said casing and provided with short arc-shaped channels at diametrically-opposite points which pass the inlet-port during the rotation of the disk, said channels serving to admit and cut off steam, and with a radial slot or slots in communication with said arc-shaped channels, and piston-slides within said radial slots provided with heads having steam-channels, substantially as described.



4. The combination of a cylindrical casing provided with fixed cams, each of which has a short and a long curved face, and with steam inlet and exhaust ports, a rotary disk provided with arc-shaped channels, which pass the inlet-port during the rotation of the disk, and with a radial slot or slots in communication with said arc-shaped channels, and piston-slides within said radial slot provided with heads having steam-channels, substantially as described.

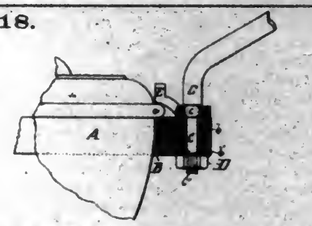
5. The combination of a cylindrical casing provided with interior peripheral fixed cams and with steam inlet and exhaust ports, a rotary disk provided with arc-shaped channels which pass the inlet-port during the rotation of the disk, and with a diametrical slot in communication near its opposite ends with said arc-shaped channel, and overlapping piston-slides within said diametrical slot provided with heads having steam-channels, substantially as described.

6. The combination of a cylindrical casing provided with interior peripheral fixed cams, the heads of said casing being provided with steam inlet ports at diametrically-opposite points, and with an arc-



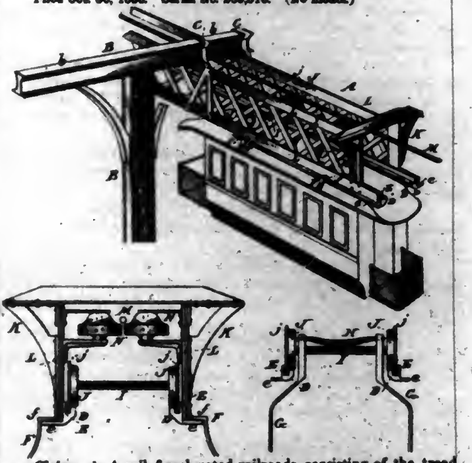
shaped channel connecting said ports, a rotary disk within said casing provided with arc-shaped channels which pass the inlet-ports during the rotation of the disk, and with a radial slot or slots in communication with said arc-shaped channels of the disk, and piston-slides within said radial slots provided with heads having steam-channels, substantially as described.

397,517. METHOD OF WORKING HYDROCARBURETED-AIR ENGINES. WILLIAM D. PRIESTMAN and SAMUEL PRIESTMAN, Hull, County of York, England. Original application filed July 20, 1887, Serial No. 244,808. Divided and this application filed Mar. 9, 1888. Serial No. 266,682. (No model.) Patented in England Dec. 21, 1886, No. 16,779; in Germany June 8, 1887, No. 43,273; in France June 26, 1887, No. 184,434; in Belgium June 28, 1887, No. 77,995; in Sweden July 6, 1887, No. 1,396; in Italy July 7, 1887, No. 421; in Cape Colony July 12, 1887; in Victoria July 19, 1887, No. 5,188; in Queensland July 22, 1887, No. 298; in New Zealand July 27, 1887, No. 2,449; in South Australia July 29, 1887, No. 849; in New South Wales Aug. 2, 1887, No. 37; in Canada Aug. 4, 1887, No. 44,936; in India Aug. 15, 1887, No. 140; in Tasmania Sept. 23, 1887, No. 498; in Brazil Sept. 29, 1887, No. 504; in Spain Nov. 15, 1887, No. 7,137; in Austria-Hungary Dec. 3, 1887, No. 34,061 and No. 56,741; in Argentine Republic Jan. 4, 1888, No. 634; in Norway Mar. 7, 1888, No. 695, and in Portugal Mar. 8, 1888, No. 1,223.



Claim.—The herein-described method of controlling the action of a motor-engine operated by the combustion of inflammable charges composed of air permeated with liquid hydrocarbon and mixed with an additional quantity of air, substantially as described, said method consisting in automatically and simultaneously regulating the aforesaid three separate streams anterior to the vaporizing of the liquid hydrocarbon, whereby the resulting tri-part working charge is, when necessary, attenuated without being diluted with a disproportionate quantity of air.

397,518. SUSPENSION DEVICE FOR LAMPS, &c. FRANK REIND and GEORGE L. COOPER, Meriden, Conn., assignors to Edward Miller & Company, same place. Filed July 24, 1888. Serial No. 280,922. (No model.)

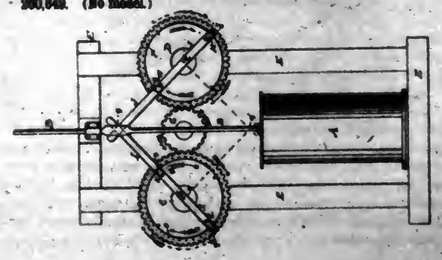


397,518.

Claim.—1. In a suspension device, the combination of a supporting-ring, a harp or frame attached to said ring, and a button pivotally attached to said harp or frame and adapted to engage with the upper surface of a lamp or other article supported in said ring, so as to prevent the disengagement of said article from said ring when in its normal position, and to be turned out of said normal position to permit such disengagement, substantially as described.

2. In a suspension device, the combination of a supporting-ring, a harp or frame, the ends of which pass through openings in lugs of said ring, and a button capable of rotary motion on said harp or frame in a plane parallel with said ring, and adapted to engage with a bead or projection on a lamp or other article suspended in said ring so as to prevent the disengagement of said article from said ring when in its normal position, and to be turned out of said normal position to permit such disengagement, substantially as described.

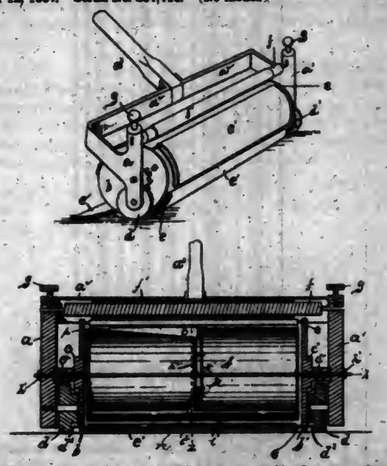
397,519. ELEVATED RAILROAD. ROBERT F. ROBSON, Kansas City, Kans., assignor of one-half to Howard A. Williams, same place. Filed Oct. 30, 1888. Serial No. 289,518. (No model.)



Claim.—1. A rail for elevated railroads, consisting of the tread D, guard-rail E, and flange *e*, to adapt it to be used as described.

2. The combination, with an elevated track having the flanges *e* exteeding on the outside of the rails, of the safety-guards F, having the end flanges, *f*, as and for the purpose set forth.

3. The combination, with an elevated railroad-track, of the braces K and lattice-girders, to prevent the track-rails from spreading apart, as set forth.



4. The combination, with an elevated railway-track, of the car provided with straps F G, the former overlying an outer flange of the track and the latter supported on a superposed axle-spring, as shown and described.

397,520. MECHANISM FOR CONVERTING MOTION. FRANCIS ROURK, London, Ontario, Canada. Filed Jan. 13, 1888. Serial No. 260,649. (No model.)

Claim.—The combination, with a piston, a shaft, and a pinion thereon, of spur-wheels engaging said pinion on opposite sides, arms connected to the piston-rod and pivoted to the spur-wheel centers, and devices carried by said arms to engage and partially rotate each spur-wheel alternately, substantially as described.

397,521. ROTARY MOP. JOHN ROURKE, Norwich, Conn. Filed Dec. 12, 1887. Serial No. 257,718. (No model.)

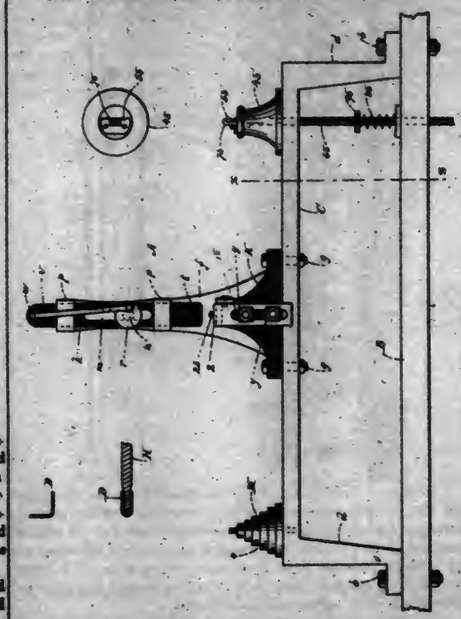
Claim.—1. In combination with the supporting-frames *a a'*, traction-wheels journaled thereto, a cylinder rotatably journaled in said frames and connected with said traction-wheels by gears, as set forth a series of mop-cloths carried by said cylinder, a wringer-roll journaled in said frames in the path of said mop-cloths, and a water-receptacle within said cylinder, said receptacle being fixedly supported by a shaft extending outward through frames *a a'* and secured by nuts at each end, all substantially as and for the purpose specified.

2. In combination with frames *a a'*, traction-wheels journaled thereto, a cylinder rotatably journaled in said frames and connected with said traction-wheels by gears, as set forth, a series of mop-cloths carried by said cylinder, a wringer-roll journaled in said frames in the path of said mop-cloths, a fixed water-receptacle supported within said rotatable cylinder by a shaft extending outward through frames *a a'*, said fixed receptacle being divided by lateral and longitudinal partitions into three compartments, the lowest of which is perforated to discharge the water, as set forth, said discharge-compartment being connected with one of the adjacent compartments by a valve formed of a pivoted plate having a slot, as at *h'*, that may be brought into coincidence with openings leading from one of the upper or storage compartments to said lower or discharge compartment, all being substantially as and for the purpose specified.

397,522. OIL-DISTRIBUTING ROCKET. WILLIAM RUFF, Fort Lee, N. J., and AUGUST GEBE, Brooklyn, N. Y. Filed May 1, 1888. Serial No. 272,496. (No model.)

Claim.—1. The combination of the rocket A with the separate oil-chamber B, carried by said rocket and having one or more discharge-openings, said chamber being constructed to discharge oil continuously during the flight of the rocket, substantially as herein shown and described.

2. The rocket A, combined with a perforated oil-chamber, and with a valve or cover placed over the discharge-opening of said oil-chamber, and with a hood connected with said valve or cover for actuating said valve by the pressure of the air during the flight of the rocket, substantially as specified.



3. The combination, with the rocket A, of the oil-chamber B, having openings *b g*, valves or covers *d h* for said openings, rod *c*, carrying said valves, and hood D on said rod, which hood is actuated by the pressure of the air to open said valves, substantially as described.

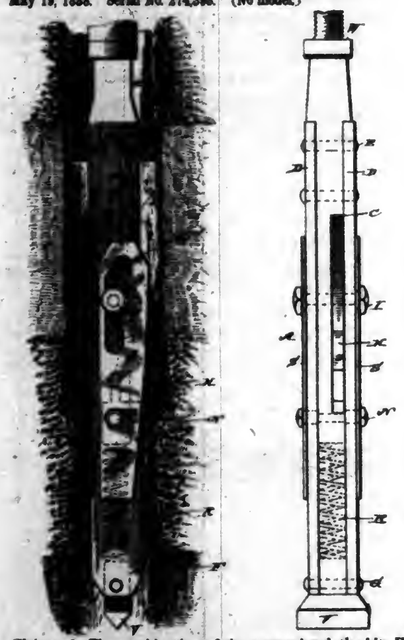
397,523. COMPOUND FOR PREVENTING BOILER INCRUSTATION. ALBERTUS J. SMITHLEY, Beloit, Wis., assignor to William A. Knapp, same place. Filed June 30, 1888. Serial No. 278,701. (No specimens.)

Claim.—1. A compound for clarifying water, composed of flaxseed or flaxseed compounds and glue, substantially as set forth.

2. A compound for preventing and removing incrustation in steam-boilers, composed of flaxseed or flaxseed compounds, glue, and barley-sprouts, in substantially the proportions stated.

397,524. BINDING-MACHINE. LEW K. STRAUB, Haverhill, Mass., assignor to himself and John D. Weldon, same place. Filed Sept. 20, 1883. Serial No. 286,726. (No model.)

Claim.—1. In a device of the character described, the combination of a body, a horizontally-arranged shaft journaled in said body and bearing a driving-pulley at one end and a circular disk on the opposite end, a hammering-plate fitted to slide vertically on said body and provided with a slot for said shaft, a crank-rod pivoted to said disk and the upper end of said plate, and a vertically-adjustable bed-plate secured to said body below said hammering-plate, substantially as set forth.



2. In a device of the character described, the combination of a body comprising two longitudinally-arranged arms, a horizontally-arranged shaft journaled in the upper arm of said body and bearing a disk on its forward end, a hammering-plate fitted to slide vertically on the forward end of said upper arm and provided with a slot for said shaft, a crank-rod pivoted to said disk and plate, a vertically-adjustable bed-plate secured to the forward end of the lower arm of said body in alignment with said hammering-plate, and a guide-roll journaled on said lower arm, substantially as specified.

3. In a device of the character described, the combination of the table B, provided with the stand C, the bed-piece 45, the rod 65, fitted to slide vertically in said stand and provided with the spring 85, the bed-die 55, adapted to receive the edges of the binding-strip D, the V-shaped cutting-die 75 secured to said rod and fitted to slide vertically in said bed-die, and treadle mechanism for operating said rod, substantially as set forth.

4. In a device of the character described, the combination of the body A, having the arms H K, the shaft *h*, journaled in the arm H and bearing the pulley *i* and disk *r*, the hammer-plate *k*, fitted to slide vertically on said arm and provided with the slot *m*, the crank-rod *v*, pivoted to said disk and plate, and the vertically-adjustable bed-plate *z*, secured to the arm K in alignment with the plate *k*, substantially as and for the purpose set forth.

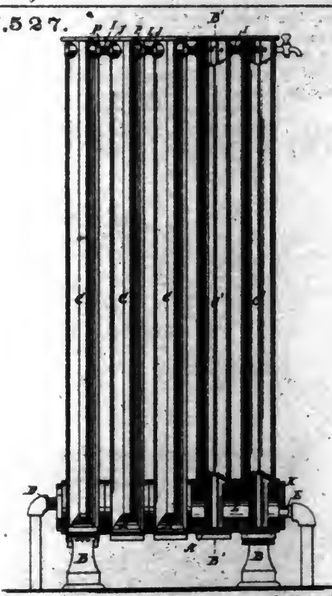
5. In a device of the character described, the combination of the body A, having the arms K H, the stand C, the shaft *h*, journaled in the arm H and bearing the pulley *i* and disk *r*, the plate *k*, fitted to slide vertically in rings *p* on the arm H and provided with the slot *m* and bore *t*, the crank-rod *v*, pivoted to said disk and plate, the vertically-adjustable bed-plate *z*, secured to the arm K in alignment with said hammer-plate, and the guide-roll 26, journaled in said arm K, all being arranged to operate substantially as specified.

397,525. REAMER. WILLIAM W. SWAN, Andover, Dak. Filed May 19, 1888. Serial No. 274,398. (No model.)

Claim.—1. The combination of the reamer-head, the bits H, pivoted therein and adapted to have their lower ends extended laterally therefrom, the spring-actuated follower-block guided in the reamer-head and adapted to lock the bits when the same are extended, and the vertically-movable plates S, pivotally connected to the follower-block and having their upper ends adapted to engage the lower end of the well-tubing, substantially as described.

2. The combination of the reamer-head having the vertical recess B in its lower side, the vertical slots C at the upper end of said recess and having the vertical slots K in its sides, the bits H, arranged in the slots C, the bolt I, extending through the sides of the reamer and through the bits H to pivot the latter in the reamer, the spring-actuated follower-block M, adapted to engage the lower ends of the bits and lock the same in their extended position, said block having bolt N working in the slots K, and the plates S, pivoted on the ends of the bolt N, bearing against opposite sides of the reamer, and having the slots T engaging the ends of bolt I, the upper ends of said slots being inclined in opposite directions, and said plates S being further provided with the inclined upper corners, U', on their outer edges, substantially as described.

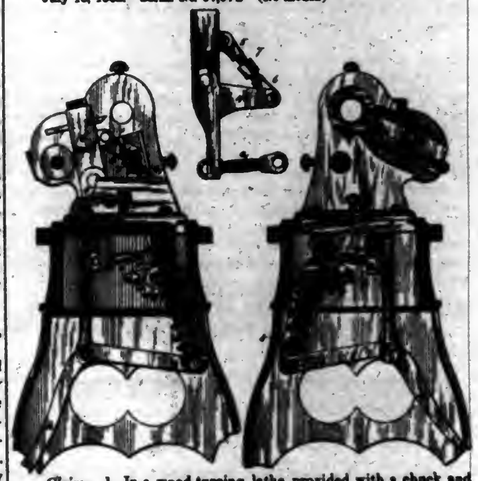
397,526. GALVANIC BATTERY. COLIN M. THOMPSON, Brooklyn, N. Y. Filed Oct. 7, 1887. Serial No. 251,753. (No model.)



Claim.—A galvanic battery the electro-positive electrode of which is immersed in a solution of a suitable chloride, preferably chloride of magnesium, for an exciting-fluid, and the electro-negative electrode of which is immersed in a solution of chromic acid with sulphuric acid, preferably a solution containing twenty per cent. of crystallized chromic acid in fifty per cent. of water, with thirty per cent. of sulphuric acid to diminish the internal resistance and act gradually to decompose the chloride and release chlorine to unite with the zinc for a depolarizing agent, substantially as described.

397,527. STEAM OR HOT-WATER RADIATOR. SAMUEL D. TOMPKINS and THOMAS H. WILLIAMS, Jersey City, N. J. Filed Jan. 16, 1888. Serial No. 260,911. (No model.) Patented in Canada June 14, 1887, No. 26,988.

Claim.—1. A compound radiator composed of interchangeable sections united at their bases by screw-nipples, and having at their tops coincident screw-threaded openings, in combination with corresponding continuous screw-thread nipples, exhibiting a lug which forms a shoulder nearer one end than the other thereof, substantially as described.



2. The combination, with a radiator composed of interchangeable sections, of a removable plug at the inlet end having an eccentric hole above its center and a removable plug at the outlet end having a hole below the center, substantially as described.

397,527.

3. A compound sectional radiator composed of sections having openings of equal sizes at their bases, in combination with nipples extending into the openings of the adjacent sections, the outlet and inlet sections having plugs with eccentric openings, which plugs are of the same size as the nipples, substantially as described.

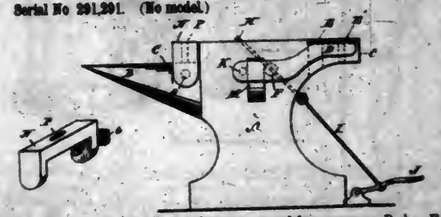
397,528. LATHE. AUGUSTUS D. WAYBOTH, Fitchburg, Mass. Filed July 18, 1882. Serial No. 67,074. (No model.)

Claim.—1. In a wood-turning lathe provided with a chuck and a series of cutting-tools secured to a sliding carriage, the combination, with a pivoted tool-holder supported upon a ledge, of an adjusting-screw whereby the tool may be given more or less lead, substantially as and for the purpose set forth.

2. In a wood-turning lathe provided with a series of cutting-tools operating in combination with a sliding carriage, the combination, with one or more guideways for supporting said carriage, of one or more adjusting-screws adapted to force apart the said ways or guides, substantially as and for the purpose set forth.

3. In a wood-turning lathe, the combination, with a sliding carriage provided with a pivoted supporting-ledge carrying a tool-holder, of an adjusting-screw connecting with said holder and operating through a slot with which the carriage is provided, whereby the rake of the cutting-tool is passed, substantially as and for the purpose set forth.

4. The combination, in a wood-turning lathe, of a pivoted tool-holder, constructed substantially as described, with a clamping device



provided with an overhanging flange or ear adapted to hold the cutting-tool by contact with its side, and an adjusting-screw for changing the position of said tool-holder for regulating the slant of the cutting-tool, substantially as set forth.

5. In a wood-turning lathe provided with a chuck and sliding carriage and a series of cutters, the combination, with a jointed tool-holder capable of adjustment by means of a right-and-left threaded screw, of a connecting rack and pinion, and operating-levers, such as described, whereby the cutting-tool may be adjusted while operating substantially as and for the purpose set forth.

397,529. MATERIAL FOR THE TREATMENT OF WALLS. GEORGE H. WOOSTER, New York, N. Y. Filed May 10, 1888. Serial No. 273,507. (No specimens.)

Claim.—The herein-described composition of matter, comprising a prepared mixture of sand heated or dried, plaster-of-paris, and a carbonate or hydrate of lime, substantially as described.

397,530. ATTACHMENT FOR BLACKSMITHS' ANVILS. HUMPHREY B. YOUNG, Brockville, Ontario, Canada. Filed Nov. 19, 1888. Serial No. 291,291. (No model.)

Claim.—1. An anvil attachment, comprising an arm, D, leg F, finger K, wedge H, and spring M, in combination with an anvil having a horizontal transverse perforation, G, through the body and a hole, L, in the side, as set forth.

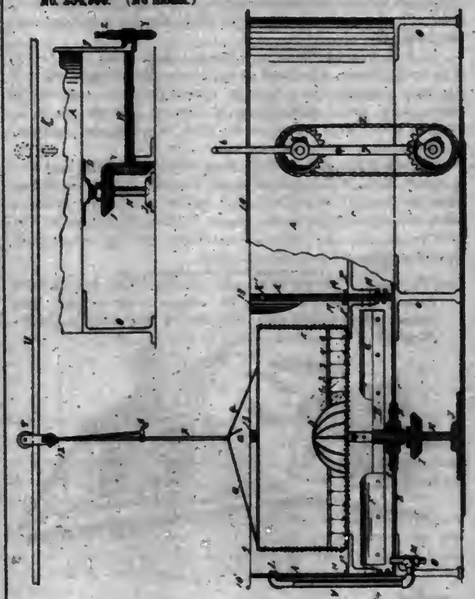
2. The combination, with a blacksmith's anvil having beveled depressions E E' and perforation G through the side, of the arm D, having a leg, F, provided with a longitudinal slot near the end, a wedge-key, H, in said slot and in frictional contact with the side of the anvil, and a spring, M, as set forth.

3. The saddle N, having a flat surface at top flush with the face of the anvil, and provided with a slot, P, and clamping-screw o, in combination with an anvil having a beak or horn, B, provided with a square portion, C, as set forth.

397,531. BLOTTER-BATH. HENRY F. ARNOLD, Manchester, Iowa. Filed Feb. 3, 1888. Serial No. 263,230. (No model.)

Claim.—1. The combination, with a blotter-bath, of a lining or inside covering of an absorbent material above and out of contact with the pads within the bath.

2. The combination, with a blotter-bath, of a piece of absorbent material secured in the lid with one edge passed down one side to the bottom of the pan.



3. The combination, with a blotter-bath, of a frame detachably secured within the cover, and a piece of cloth upon the frame, one edge of which is passed down to the bottom of the pan.

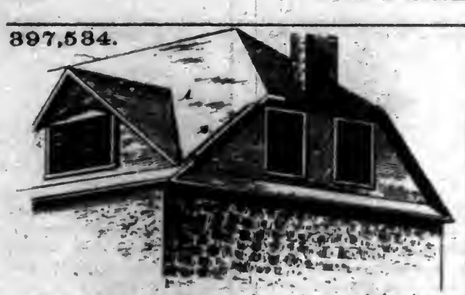
397,532. PUMP-SPOUT. LEO A. BRIGEL, Cincinnati, Ohio. Filed Oct. 15, 1888. Serial No. 288,092. (No model.)

Claim.—A well-curb having a hole therein and a notch adjacent thereto, a pump-spout with a top outside lug, E, smaller than the notch G of the hole F in the curb, and a bottom inside lug, B, larger than the notch G of the said hole F in the curb, both lugs B and E acting, in combination with the receptacle B' and receiver J, to hold the spout firmly in its proper position in the hole F of the curb.

397,533. DISH-WASHER. WILLIAM BUTTS, Chicago, Ill., assignor of one-half to James F. Somes, same place. Filed Apr. 16, 1887. Serial No. 234,999. (No model.)

Claim.—1. In dish-washing machines, the tanks A B A B, provided with the rotating agitators E G F, deflectors 13, and brackets P, in combination with the open wire-work dish-basket K, which is provided with the elevated center support, N, and surrounding partition-wires 1 2 3 4 5, as and for the purpose specified.

2. In a dish-washing machine, the tank A B, provided with a rotating agitator, E G F, deflectors 13, and brackets P, in combination with an open net-work dish-basket, which may be placed in said tank and suitable for the reception of dishes, all substantially as and for the purpose specified.



3. In a dish-washing machine, the combination of a tank having a rotating agitator therein, deflectors arranged to break or change the direction of the current created by the movement of said agitator in the liquid contained in said tub and deflect said liquid or current toward the center of the tub, with an open net-work dish basket or receptacle, in which dishes or other like articles may be placed and alternately exposed to said currents, or removed therefrom and from said tub, as and for the purpose specified.

397,534. GABLE-END FINISH FOR ROOFING. JOHN E. CARROLL, Philadelphia, Pa., assignor to the Cortright Metal Roofing Company, same place. Filed Dec. 22, 1888. Serial No. 294,380. (No model.)

Claim.—1. As a gable-end finish for roofing, a sheet-metal plate bent so as to have a flange, E, adapted to extend over the edge of the roofing-plates, a gutter, D, arranged to extend below the ends of said roofing-plates, and a nailing-flange, C, by which it is secured to the edge of the gable, all substantially as shown and described.

397,534.

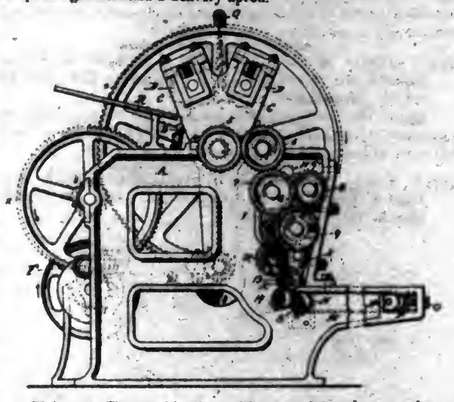
2. As a gable-end finish for roofing, a sheet-metal plate bent so as to have a flange, E, adapted to extend over the edge of the roofing-plates and having a turned-in edge, a gutter, D, arranged to extend below the ends of said roofing-plates, and a nailing-flange, C, by which it is secured to the edge of the gable, all substantially as shown and described.

3. As a gable-end finish for roofing, a sheet-metal plate bent so as to have a flange, E, adapted to extend over the edge of the roofing-plates, a gutter, D, arranged to extend below the ends of said roofing-plates, and a nailing-flange, C, with rib C' formed on it, by which it is secured to the edge of the gable, all substantially as shown and described.

4. As a gable-end finish for roofing, a sheet-metal plate bent so as to have a flange, E, adapted to extend over the edge of the roofing-plates and having a turned-in edge, a gutter, D, arranged to extend below the ends of said roofing-plates, and a nailing-flange, C, with rib C' formed on it, by which it is secured to the edge of the gable, all substantially as shown and described.

397,535. HIP-COVERING AND CORNER-FINISH FOR ROOFING. JOHN E. CARROLL, Philadelphia, Pa., assignor to the Cortright Metal Roofing Company, same place. Filed Dec. 22, 1888. Serial No. 294,381. (No model.)

Claim.—1. As a hip-covering and corner-finish for roofing, a sheet-metal plate bent at C to form the covering sides D D, and again bent on one or both sides at C', so that the edge D' will lie substantially against and on the inside of side D, the said edge or edges D' being prolonged at one end to form a nailing flange or flanges, E, substantially as and for the purpose specified.



2. As a hip-covering and corner-finish for roofing, a sheet-metal plate bent at C to form the covering sides D D, and again bent on one or both sides at C', so that the edge D' will lie substantially against and on the inside of side D, the said edge or edges D' being prolonged at one end to form a nailing flange or flanges, E, and the corner or corners of the upper end being cut away at F, substantially as and for the purpose specified.

3. As a hip-covering and corner-finish for roofing, a sheet-metal plate bent at C to form the covering sides D D, and again bent on one or both sides at C', so that the edge D' will lie substantially against and on the inside of side D, the said edge or edges D' being prolonged at one end to form a nailing flange or flanges, E, the corner or corners of the upper end being cut away at F, and the lower corners of the flanges E cut away at F', substantially as and for the purpose specified.

4. As a hip-covering and corner-finish for roofing, a sheet-metal plate bent at C to form the covering sides D D, and again bent on both sides at C', so that the edge D' will lie substantially against and on the inside of sides D, the said edges D' being prolonged at one end to form nailing-flanges E, substantially as and for the purpose specified.

397,536. MACHINE FOR DECORTICATING FIBROUS PLANTS. ROBERT H. COLLYER, New Orleans, La. Filed Feb. 13, 1888. Serial No. 263,823. (No model.) Patented in England Apr. 6, 1887. No. 5,097.

Brief.—A rotating corrugated drum has a pair of corrugated rollers oscillating upon its upper side and in contact therewith. This mechanism is followed by two pairs of plain rollers, the rollers of each pair having differential speeds, these rollers being followed by a pair of squeezing-rollers and a delivery-apron.

Claim.—1 The combination, with a revolving drum having a series of flat tangential faces across its periphery, of a roller having corresponding faces, mechanism, substantially as described, for giving reciprocating motion to said roller, and a water-supply pipe, substantially as described.

2. The combination, with a rotary beetling device, as the rollers B D, of rollers running at different speeds arranged to act on the fibers as they leave the beetling device, and means for giving said rollers a differential speed, substantially as described.

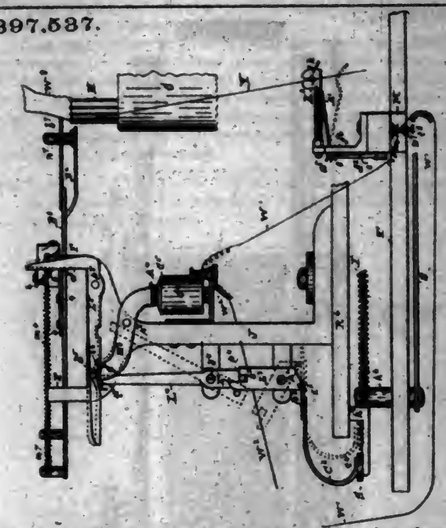
3. The combination, with a rotary beetling device, as the rollers B D, of two sets of differential speed-rollers, one set having the faster roller arranged to act on one side of the stream of fibers and the other set having its faster roller arranged to act on the opposite side of the stream, and means for giving said rollers a differential speed, substantially as described.

4. The combination, with a rotary beetling device, as the rollers B D, of a pair of rollers running at different speeds, and means for giving said rollers at differential speed, and a grip-roller arranged to press on the slower roller to hold the material for the action of the faster roller, substantially as described.

5. The combination, with the roller B and reciprocating rollers D, of the differential speed-rollers G G' and J J', the grip-rollers H I, rubber wringing-rollers K K, and means for giving all of said rollers the motion described, all constructed and arranged substantially as shown and described.

397,537. ELECTRICAL STOP-MOTION MECHANISM FOR KNITTING-MACHINES. EDWARD G. COMER, Valatie, assignor to Tompkins Brothers, Troy, N. Y. Filed Jan. 30, 1885. Serial No. 154,421. (No model.)

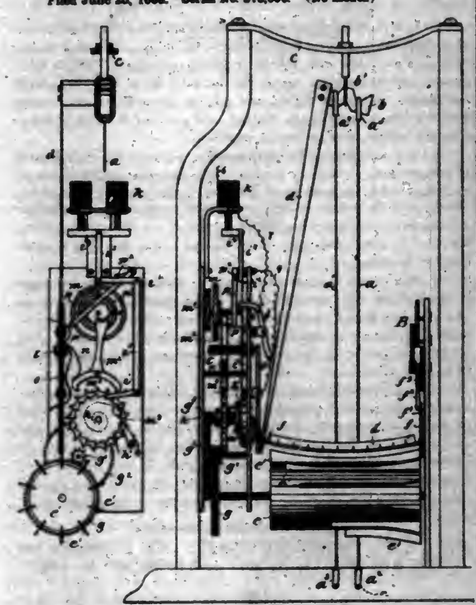
Brief.—The invention has for its object to provide improved electrically-actuated devices for stopping the knitting-machine upon the breaking of a thread.



Claim.—1. The combination of the arm A', the drop-lever A^2, the wire-holders w^6 and w^7, and the circuit-closing plate D, arranged substantially as described, and for the purpose specified.

2. The combination of the bracket M, formed with the inclosure E, the drop-lever A^2, mounted on the bracket and provided with a tappet on its pivotal rod within the said inclosure, the hinged arm A', constructed and arranged to engage with the lever A^2, the wire-holders w^6 w^7, and the plate D, all substantially as described.

3. The combination of the belt-shipping lever S, provided with a catch, C^2, and spring I, the pivoted latch L^2, formed to engage with the catch C^2 at its lower end, and formed with a slot, s^2, in the upper end, the latch L^4, having a pin, p^4, to engage the slot in the latch L^2, the latch L^5, formed to engage with and hold the latch L^4 in vertical position, the pivoted armature A^4, having a lever-arm, N^2, the magnet C^4 C^3, wires in connection with the said magnet, and a circuit-closing mechanism interposed in said wires and arranged to normally hold the circuit broken and to close the circuit when a break occurs in the yarn, substantially as and for the purpose specified.



4. The combination, with the spring-actuated belt-shipping lever, catch C^2, and a latch mechanism, L^2, L^4, and L^5, to hold said lever in

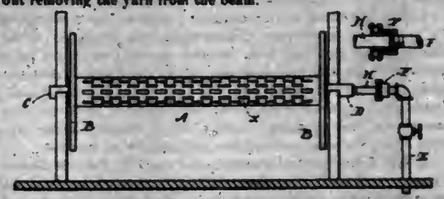
397,537.

position with the belt in place to turn the machine, of an electro-magnet provided with an armature having a lever-arm to engage the latch of the belt-shipping lever in connection with said magnet, and a circuit-closing mechanism interposed in the wires of the circuit and arranged to close said circuit when a break occurs in the yarn, all substantially as described, and for the purpose stated.

397,538. ELECTRIC METER. HENRY H. CUTLER, Newton, Mass. Filed June 25, 1888. Serial No. 278,096. (No model.)

Claim.—1. An electric-current indicator composed of two substantially similar and equal wires, each made fast at one end, and one forming a part of the circuit for the current to be measured, combined with a lever connected with the opposite ends of said wires and a tension device connected with the said lever, which is provided with a pointer that is moved by the contraction or expansion of one of said wires relative to the other, substantially as described.

2. A current-measurer comprising a pointer moved to different positions by currents of different quantity, combined with an indicating-train and an actuating-drum having a uniform time movement provided with projections of different length that co-operate with said pointer to give the same indefinite periods of time a number of movements proportional to the quantity of current indicated by said pointer, which actuates the said indicating-train by said movement, substantially as described.

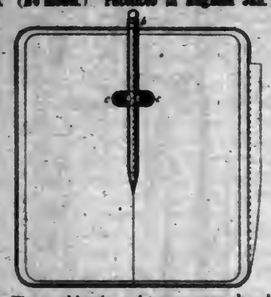


3. The combination of a pointer moved to different positions for currents of different quantity with a train of wheel-work and actuating-magnet therefor, and circuit-closer for said magnet operated by said pointer in going to and leaving its zero position, and a time-measuring regulator actuated by said magnet and spring connecting same with said train of wheel-work, and a circuit-closer for said actuating-magnet controlled by said time-regulator for opening and closing the circuit of said magnet at definite periods of time, substantially as described.

4. The combination of the pointer moved to different positions for currents of different quantity with a train of wheel-work and actuating-magnet therefor, and time-measuring regulator for said wheel-work, provided with a circuit-closer controlling said magnet, a starting-arm for said regulator operated by the armature of said magnet and a support for said starting-arm operated by said pointer, substantially as described.

5. The combination of the pointer moved to different positions for currents of different quantity with a train of wheel-work and actuating-magnet therefor, and time-measuring regulator for said wheel-work, provided with a circuit-closer controlling said magnet, a starting-arm for said regulator forming a portion of the circuit of said magnet when the regulator is at rest, and a circuit-closer in said circuit through the magnet and starting-arm operated by the said pointer, substantially as described.

397,539. YARN BEAM OR SPOOL. ADOLF DAHLBERG, Nashville, Tenn. Filed May 12, 1888. Serial No. 273,673. (No model.)

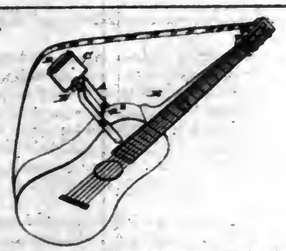


Brief.—The object of the invention is to provide an improved yarn-beam on which the yarn may be steamed, dyed, dried, &c., without removing the yarn from the beam.

Claim.—1. A hollow perforated yarn-beam having closed ends provided with central screw-threaded openings, a solid plug screwed into one end, and a hollow plug screwed into the other end, substantially as described.

2. A hollow perforated yarn-beam having closed ends provided with central screw-threaded openings, a solid plug screwed into one end, and a hollow plug screwed into the other end, said plugs being round at their outer ends to serve as journals, substantially as described.

397,540. NOTE-BOOK. WILLIAM J. DOWNES, Springfield, Burnt Ash Hill, Lee, County of Kent, England. Filed Sept. 19, 1888. Serial No. 285,704. (No model.) Patented in England Jan. 31, 1888, No. 1,456.



Claim.—1. The combination, with a memorandum-book provided with a slot in the center portion of its leaves, of a metallic spring-clip secured to the back of the book within the said slot and adapted to receive a marker, substantially as set forth.

2. The combination, with a memorandum-book provided with a slot in the center of its leaves, of a metallic spring-clip secured to the back of the book within the said slot, and a pencil adapted to engage with said clip and serve as a place-marker, substantially as set forth.

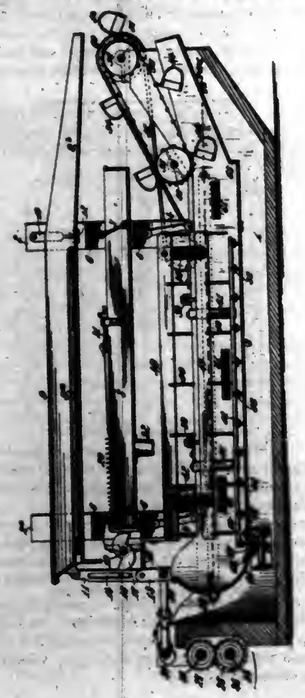
397,541. HARMONICA-HOLDER. AUGUST H. GARTNER, St. Louis, Mo. Filed May 10, 1888. Serial No. 273,380. (No model.)

Claim.—1. A harmonica-holder consisting of a combination of two U-shaped parts, A C, united by a clamp, B, substantially as and for the purpose herein described.

397,541.

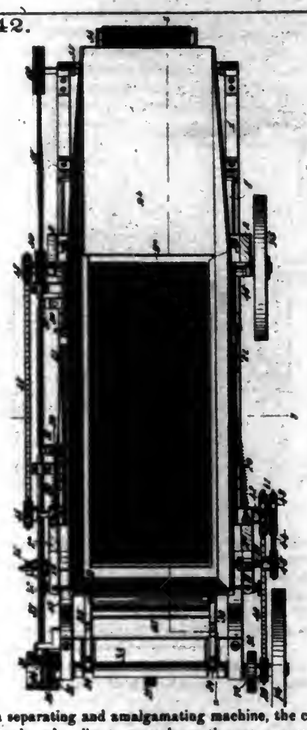
2. The combination of the U-shaped parts A C, the clamp B, and the bolt *b* and nut *b'*, substantially as described.

3. In a harmonica-holder, the combination of the U-shaped part A with the U-shaped part C, said parts being united by a universal joint, for the purpose described.



4. The combination of the U-shaped part A, the bolt a^2, nut a^3, the clamp B, bolt *b*, nut b^2, and the U-shaped part C, substantially as described.

397,542. ORE SEPARATOR AND AMALGAMATOR. EUGENE L. GIROUX, Albina, Oreg. Filed Nov. 11, 1887. Serial No. 254,914. (No model.)



Claim.—1. In a separating and amalgamating machine, the combination of a water-tank, a longitudinally and laterally vibratory amalgamating-pan suspended in the water-tank and provided with screened openings to permit the passage of water and prevent the placer material in the pan from passing into the tank, and a vibratory hopper suspended above the amalgamating-pan, substantially as described.

2. In a separating and amalgamating machine, the combination of a water-tank, a vibratory amalgamating-pan suspended in the water-tank and provided with screened openings, stationary rakes supported by the tank and extending across the amalgamating-pan slightly above its bottom, a number of hoes suspended in the amalgamating-pan, a pair of crank-shafts, and a series of horizontal bars for supporting and actuating said hoes, and a vibratory hopper supported above the amalgamating-pan, substantially as described.

3. In a separating and amalgamating machine, the combination of a water-tank, a vibratory amalgamating-pan suspended in said tank and having lateral screened openings for the passage of water and lateral pipes for conveying water from the tail end of the pan and discharging it into the head of said pan, and a vibratory hopper supported above the amalgamating-pan, substantially as described.

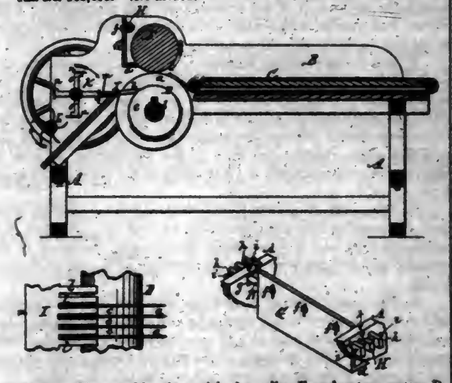
397,542.

4. In a separating and amalgamating machine, the combination of a water-tank and a vibratory amalgamating-pan suspended in said tank and provided with lateral screened openings 61, incline 62, a sunken bottom having a transverse shoulder, 65, at the inner end of said incline, transverse slot 64, and exterior pipes, 63, communicating with the interior of the pan through said slot and through openings near the incline, substantially as described

5. In a separating and amalgamating machine, the combination of a water-tank, a vibratory amalgamating-pan suspended in said tank, stationary rakes supported independently of the pan and transversely therein near its bottom, several sets of hoes suspended in the amalgamating-pan, a vibratory hopper supported above the amalgamating pan, and an elevator located in the tail end of the machine, substantially as described.

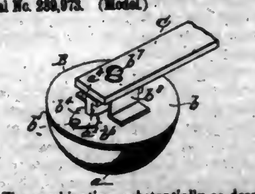
6. In a separating and amalgamating machine, the combination of the tank having standards 2 and 2^a, the vibratory amalgamating-pan 3, the vibratory hopper 8, the vibratory screening-box 9, crank shaft 33, pitman 35, slotted levers 11, adjustable fulcrum-rod 15, shaft 19, cam 18, springs 20, tension-bolts 21, and gearing connecting shafts 33 and 19, substantially as described.

7. In a separating and amalgamating machine, the combination, with a freely-suspended amalgamating-pan, of the longitudinal shaft 37, having eccentrics 38, the hinged levers 39, connecting said shaft with one side of the pan, the transverse shaft 28, the bevel-gears 31 and 36, the eccentrically-placed elliptic gears 30 and 32, the transverse shaft 33, having eccentrics 34, and the hinged pitmen 35, connecting with the head of the amalgamating-pan, substantially as described.



397,543. VENTILATED GARMENT. JOHN S. GOLDSMITH, New York, N. Y. Filed Aug. 29, 1887. Serial No. 248,233. (No model.)

Claim.—1. A body-garment having ventilating-holes at its armpits and provided with imperforate covers for the same fitted externally to the armpits approximately in loose surface contact with the body and sleeves attached thereto at front and rear, and having free lower edges at both extremities on the body and sleeve, respectively, substantially as hereinbefore specified.



2. In combination with a body-garment having ventilating-holes at its armpits, the within-described water-proof cover for each armpit fitted thereto externally, attached to the body and sleeve at front and rear, and provided with a marginal spring-wire which is arched outwardly with reference to the underlying surfaces at those points of the cover which are its lower edges beneath the lowered arm, substantially as hereinbefore specified.

397,544. MACHINE FOR CUTTING TOBACCO. ALEXANDER GORDON and DANIEL DE GARMO, Rochester, N. Y. Filed May 11, 1885. Serial No. 165,055. (No model.)

Claim.—The combination, with the roller E and rotary cutter D, of the slotted guide-plate G, provided with a flange, *d*, the bar H, to which the guide-plate is adjustably attached by bolts, the hopper having elongated slots *g g*, the lugs *h h*, between which the ends of the bar rest, and the set-screws *i i* in the lugs and hopper for adjusting the bar longitudinally of the machine, as set forth.

397,545. TRUSS. HARRIS S. GREENO, St. Louis, Mo. Filed Nov. 5, 1883. Serial No. 289,973. (Model.)

Claim.—1. The combination, substantially as described, of the air-pad and the pad-holder, said air-pad having the rubber shank a^3, integral with the pad, and said pad-holder having the slotted plate *b*.

2. The combination, substantially as described, of the air-pad and the pad-holder, said air-pad having the shank a^3 and flange a^4, and said pad-holder consisting of the plate *b*, slotted at *b' b²*, the bridge b^3, and the pivoted notched catch b^4.

3. The combination, substantially as described, of the air-pad having the convex back and the shank having the flange, with the pad-holder composed of the plate *b*, slotted at *b' b²*, the bridge b^3, and the pivoted notched catch b^4.

4. The combination of the air-pad having the convex back and the shank, the pad-holder having the slotted plate and the bridge, and the clamp-screw, said shank being of rubber and integral with said pad, substantially as described.

5. The combination of the air-pad having the convex back and the shank having a head, the pad-holder composed of the slotted plate, the bridge, and the pivoted notched catch, and the clamp-screw, substantially as described.

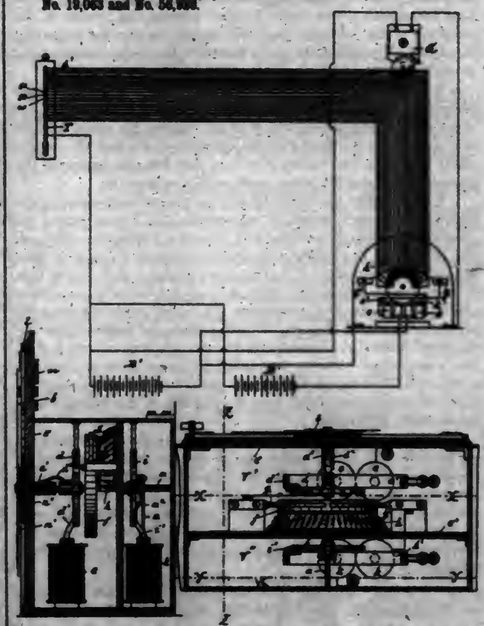
397,546. AUTOMATIC DANGER-SIGNAL. JOHN HANN, New York, N. Y. Filed May 1, 1888. Serial No. 272,462. (No model.)

Claim.—1. The cylinders B, having pistons C and heads I, in combination with the bridge A and a signal, as and for the purpose specified.

2. The cylinder B, provided with means to operate the signal, in combination with the bridge A and said signal, as and for the purpose specified.

3. The cylinder B, having piston C, to operate the lever D, in combination with the bridge A and a signal, as and for the purpose specified.

4. The cylinder B, having piston C, operating the lever D, and cable E, in combination with the bridge A and a signal, as and for the purpose specified.



5. The receptacle B, provided with means to operate the whistle K when in combination with a bridge, as and for the purpose specified.

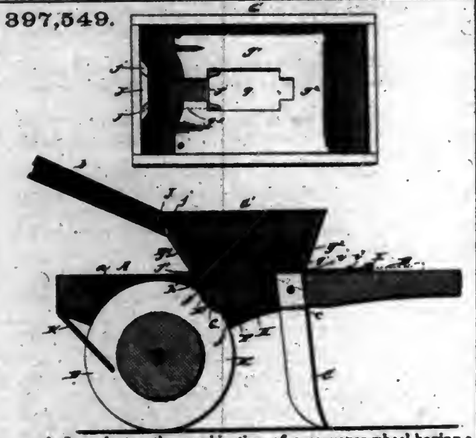
6. The receptacle B, provided with safety-valve J and having piston C, in combination with the bridge A and the signal, as and for the purpose specified.

397,547. INCRUSTATION PREVENTIVE. ROBERT M. HENNEY, Springfield, Ill. Filed May 24, 1883. Serial No. 274,943. (No specimens.)

Claim.—A steam-boiler-purger compound composed of kerosene and walnut-bark juice or extract, as described and set forth.

397,548. TELETHERMOMETER. CARL G. HOFFMANN, Leipsic, Saxony, Germany. Filed Aug. 14, 1886. Serial No. 210,864. (No model.) Patented in Germany June 12, 1886, No. 39,390; in Belgium Sept. 28, 1886, No. 74,600; in France Sept. 30, 1886, No. 178,779; in England Oct. 1, 1886, No. 12,480, and in Austria-Hungary Dec. 2, 1887, No. 19,063 and No. 56,988.

Claim.—1. In combination, with a thermometer, T, connected through wires at various points with metal plates *f'*, attached to a wheel, *f*, fast to a shaft, *a*, the loose wheels *d i*, with means of connecting the same with the shaft *a*, pawls d^2 *i'*, armature-levers *c' k'*, springs c^2 k^2, and electro-magnets *c* and *k*, and indicator-hand *b*, attached to shaft *a*, arranged to operate in combination with batteries B B', in the manner and for the purpose described.



2. In combination with wheel *f*, provided with metal plates *f'* around its circumference, connected through wires with a thermometer, the spring-levers *g g'*, electro-magnets *c k*, and batteries B B', substantially as and for the purpose specified.

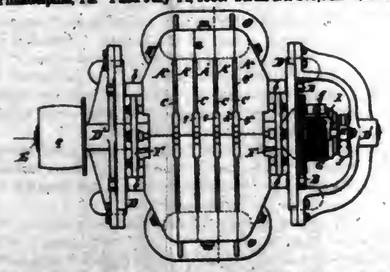
3. The combination of bar *l* and metal plates *m* on the face of the casing, the connecting pins or stops *r*, hand *b*, with spring *n*, in contact with said plates *m*, with an alarm, G, and battery B, substantially as specified.

397,549. PLANTER. DAVID W. HOSKALL, Little Rock, Ark. Filed July 26, 1888. Serial No. 281,017. (No model.)

Claim.—1. In a planter, the combination of a conveyer-wheel having a peripheral groove and a wheel having planting-recesses in its periphery, and with its edge inserted into the groove in the periphery of the conveyer-wheel and bearing therein, so that the said conveyer-wheel rotates the planting-wheel by friction, substantially as specified.

397,549.

2. In a planter, the combination of a conveyer-wheel having a peripheral groove V-shaped in cross-section, a hopper secured to the main frame, and a wheel with its edge entering the groove in the periphery of the conveyer-wheel and rotated thereby, and projecting through a longitudinal slot in the bottom of the hopper, substantially as specified.



3. In a planter, the combination of the conveyer-wheel having the peripheral groove E, V-shaped in cross-section, the hopper G', provided with a longitudinal slot, g, in its bottom, the wheel with its edge entering in the groove of the conveyer-wheel, and the spring-plates H, having the bearing-loops h on their free ends to support the journals of the planting-wheel, substantially as specified.

4. In a planter, the combination of the conveyer-wheel having the peripheral groove V-shaped in cross-section, the hopper having the metal-plate bottom g', provided with the slot g, having the extensions g^2 g^2, the wheel F, provided with the conical recess f and screw-arms H', and the spring-plates H, having bearing-loops h at their free ends to support the journals of the planting-wheel, substantially as specified.

5. In a planter, the combination of a conveyer-wheel having the peripheral groove E, V-shaped in cross-section, the hopper G', having the metal bottom g', provided with the slot g, having extensions g^2 g^2, the feeding-wheel F, having the conical peripheral recesses f and the screw-arms H', the adjustable slides I and J, and the spring-plates H, provided with bearing-loops h for the journals of the feeding-wheel, substantially as specified.

6. The herein-described planter, comprising the main frame having the side rails, a, the furrow-opener with its standard secured to the front portion of said frame, the hopper provided with the slot g, having the extensions g^2 g^2, the conveyer-wheel having the peripheral groove F, the feeding-wheel provided with the recesses f and arms H', the adjusting-slides I and J, and the spring-plates H, having the bearing-loops h at their free ends for the journals of the feeding-wheel, substantially as specified.

397,550. DYNAMO-ELECTRIC MACHINE. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed July 14, 1888. Serial No. 279,942. (No model.)

Claim.—1. In a motor or dynamo-electric machine, the combination of stationary field-magnets, a rotating armature, and internal field-magnets located and secured within the armature, so as to rotate therewith.

2. In a motor or dynamo-electric machine, the combination of stationary field-magnets, a rotating armature, internal field-magnets located and secured within the armature, so as to rotate therewith, and a commutator common to both the armature and internal field-magnets.

3. In a motor or dynamo-electric machine, the combination of stationary field-magnets, a rotating armature, internal field-magnets located and secured within the armature, so as to rotate therewith, and connections between the coils of the armature and internal field-coils, whereby they are coupled in parallel.

4. In a dynamo-electric machine or motor, the combination of a shaft, an armature secured to said shaft, concentric supplemental field-magnets also secured to said shaft and having a fixed mechanical relation with respect to the armature, and electrical connections between the coils of the armature and field-magnets.

5. The combination of a shaft, an armature secured to said shaft, concentric field-magnets also secured to said shaft and having a fixed mechanical relation with respect to the armature, electrical connections between the coils of the armature and field magnets, and a stationary field-magnet independent of the armature, having one or more of its coils in series with the armature.

6. In a dynamo-electric machine or motor, the combination of a ring-armature, a circular supplemental field-magnet core having the same number of magnetizing-coils as the armature, a commutator having as many sections as coils in the field-magnet or armature, and connecting-circuits between the commutator-sections, armature, and said field-coils, whereby the poles of the field-magnet shall be at right angles or substantially at right angles to the poles of the armature.

7. The combination of stationary field-magnets, a rotating armature, and rotating field-magnets concentric with said armature, connecting-circuits, and a commutator for changing the poles of the rotating field-magnets with a speed commensurate to that of its revolution.

8. The combination of a shaft, an armature-core, and internal field-magnets secured to and carried by said shaft, a stationary external field-magnet, and coils on said armature-core and internal field-magnets in which the resistance of the armature-coils is very low and the resistance of the internal field-coils is relatively very high.

9. The combination of a shaft, an armature-core, internal field-magnets secured to and carried by said shaft, a stationary external field-magnet, coils on said armature-core in which the resistance is very low, coils on the internal field-magnets in which the resistance is relatively high, and a commutator having its sections connected each to one of the high and one of the low resistance coils.

10. In a dynamo-electric machine or motor, the combination of a shaft, non-magnetic frames secured to said shaft, an armature-core and a supplemental internal field-core, both secured to and between said non-magnetic frames so as to be rigid with respect to each other, and coils upon each of said cores.

11. The combination of an armature and internal field-magnets built as one structure and rotating at the same speed, in combination with a supporting-shaft, two external field-magnets of the horseshoe type, having their poles arranged toward each other, non-magnetic standards at each end of the machine, having bearings for the shaft, and bolts for uniting the external field-magnets to the standards and in fixed relation to the armature and internal field-magnets.

12. The combination of an armature and internal field fixed thereto and having their coils arranged in parallel, and an external field having a coil also arranged as a shunt with respect to the armature-coils.

13. The combination of an armature and internal field fixed thereto and having their coils arranged in parallel, an external field having a coil also arranged as a shunt with respect to the armature-coils, and a second coil connected in series with the armature.

14. The combination of an armature and internal field fixed thereto and having their coils connected in parallel and the internal field-coil arranged as a short shunt with respect to the armature, an external field having a coil connected in series with the armature, and a second coil connected as a long shunt around the armature and series field-coil.

15. In a dynamo or motor, the field-magnets having two coils, with a third coil of magnetic metal wound upon the field and interposed between said field-coils.

16. In a dynamo or motor, the field-magnets having two coils, with a third coil of magnetic metal wound upon the field and interposed between said field-coils, and a circuit for passing part of the current which energizes the machine through said coil of magnetic metal.

17. In a dynamo or motor, the field-magnets having two coils, with a third coil of magnetic metal wound upon the field and interposed between said field-coils, a circuit for passing part of the current which energizes the machine through said coil of magnetic metal, and a switch to cut said coil out of circuit.

18. In a dynamo or motor, a field-magnet formed of a series of U-shaped sections separated to form air-spaces between them, in combination with an armature and its shaft, end standards having bearings for said armature-shaft, and bolts for clamping said sections together and to the end standards.

19. In a dynamo or motor, a field-magnet formed of a series of U-shaped sections separated by distance-pieces formed integral with them to form air-spaces between them, in combination with an armature and its shaft, end standards having bearings for said armature-shaft, and bolts for clamping said sections together and to the end standards.

20. A field-magnet consisting of the heavy cast sections A' A^3, having the distance-pieces a a', forming ventilating-spaces C, in combination with the bolts B, passing through the polar extensions to unite said sections together.

21. In a dynamo or motor, the combination of two oppositely-arranged horseshoe-shaped magnets brought close together in the central line of the poles of the machine, standards at each end, and long clamping-bolts to unite the magnets rigidly together and to the standards.

22. In a dynamo or motor, the combination of two oppositely-arranged horseshoe-shaped magnets formed of a series of heavy sections and having their polar extensions brought close together in the central lines of the poles of the machine, standards of non-magnetic metal at each end, and long clamping-bolts to unite the magnet-sections rigidly together and to the standards.

23. In a dynamo or motor, the combination of two oppositely-arranged horseshoe-shaped magnets brought close together in the central lines of the poles of the machine, standards at each end, long clamping-bolts to unite the magnets rigidly together and to the standards, an armature, and an armature-shaft journaled in said standards.

24. The combination of two oppositely-arranged horseshoe-shaped magnets having integral polar extensions made long and brought together in a line corresponding to the center of the two poles of the machine and a frame or frames for uniting said field-magnets together to form the armature-space.

25. The combinations of two horseshoe-shaped field-magnets having integral polar extensions and brought together to form continuous or practically continuous north and south poles for the armature, end frames or standards having bearings for the armature-shaft, long bolts which extend through the four polar extensions and unite the standards thereto into a rigid structure, an armature rotating within the space bounded by the polar extensions, and an armature-shaft journaled in the standards.

26. The combination of two horseshoe-shaped field-magnets formed of cast sections divided in the direction of their length and having their polar extensions made integral and brought together to form continuous or practically continuous north and south poles for the armature, end frames or standards having bearings for the armature-shaft, long bolts which extend through the sections of the four polar extensions and unite the standards thereto into a rigid structure, an armature rotating within the space bounded by the polar extensions, and an armature-shaft journaled in the standards.

27. The combination of two oppositely-arranged horseshoe-shaped field-magnets without yoke-joints and formed in sections of ductile magnetizable metal and having their polar extensions made integral and brought together in the central line of the poles of the completed machine, thereby forming a substantially continuous magnetic band around the armature, with two joints diametrically opposite and in line with the centers of the poles of the machine.

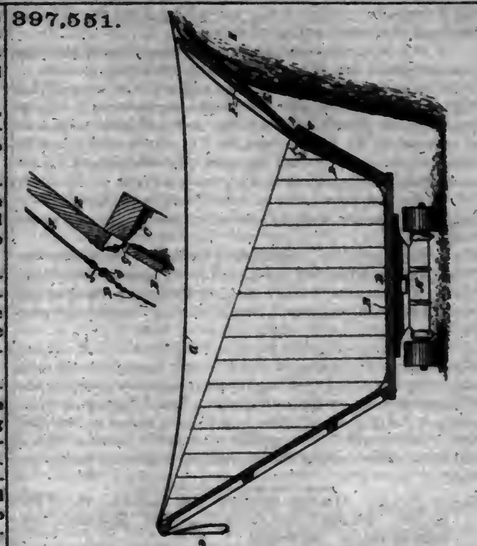
28. A field-magnet section formed of horseshoe shape and of magnetizable metal, with the separating projections a a' and the curved face A^3 to form the armature-space.

29. An integral field-magnet section formed of horseshoe shape and of malleable iron, with the separating projections a a' and the curved face A^3 to form the armature-space.

30. The combination of two horseshoe-shaped field-magnets formed in sections of malleable iron and uniting to form the armature-space, two end standards of non-magnetic material, bolts for holding the sections of the field-magnets and standards rigidly together, and an armature and its shaft journaled in the standards.

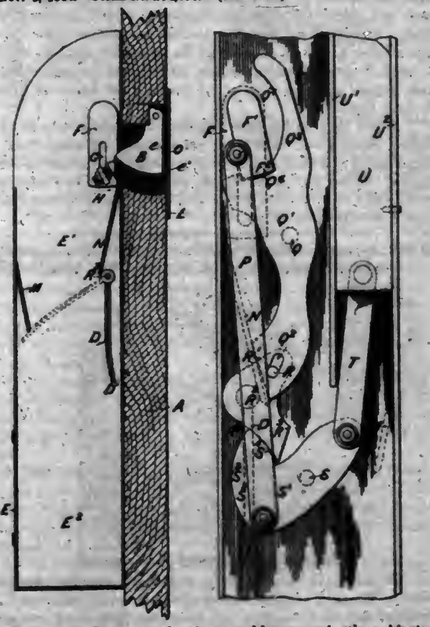
31. The field-magnets A A, made horseshoe shape and formed of sections A A^3, having air-spaces C c between them and having their polar ends brought together, as set out, end standards, D, of non-magnetic material, having bearings, bolts B, extending through the sections A' A^3, and standards to unite them all into a rigid structure, an armature, and its shaft journaled in the standard-bearings.

32. The combination of an armature and an internal field-magnet with a wrapping of magnetic metal between the armature and field windings.



397,551. HAY OR GRAIN UNLOADER. WILLIAM G. HUNTER, Traver, Cal. Filed June 29, 1888. Serial No. 278,586. (No model.)

Claim.—1. In a grain or hay unloader, and in combination with the wagon-bed and the net therein, the poles or bars connected with the top of one side of the wagon-bed and adapted to rest against the stack, and the ropes connected with the top of the poles or bars and with one edge of the net, substantially as herein described.



2. In a grain or hay unloader, and in combination with the wagon-bed and the net therein, the poles or bars hinged to or flexibly connected with the top of one side of the wagon-bed and adapted to rest at any angle against the stack, and the ropes connected with the tops of the poles or bars and with the edge of the net, substantially as herein described.

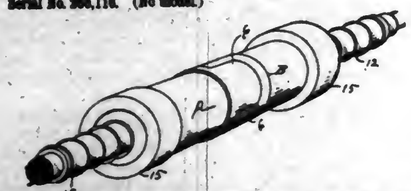
3. In a grain or hay unloader, and in combination with the wagon-bed having straps, and the net in said bed having snaps along its edge, the separate poles or bars connected with the straps and adapted to rest against the stack, and the ropes connected with the tops of the poles or bars, and having rings on the lower ends engaging the snaps on the edge of the net, substantially as herein described.

397,551.

397,552. LETTER-BOX. JEAN A. JACOB, London, England. Filed Nov. 5, 1887. Serial No. 254,656. (No model.)

Claim.—1. In receptacles for postal-letters and other objects, the combination of an upper chamber, E', a lower chamber, E^2, a flap, D, between said chambers, an orifice, O, opening into the upper chamber, a wing, b, substantially as set forth, beneath said orifice, a pivoted flap, B, adapted to close said orifice, and mechanism connecting said flaps B and D, whereby the initial stage of the opening of the

flap B causes the complete closing and locking of the flap D before the flap B has passed the edge of the wing *b*.

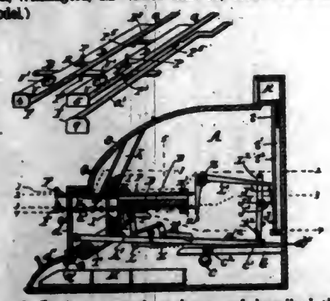


2. In a receptacle consisting of two superposed parts, E E', the combination of a flap, D, adapted to separate said parts, an orifice, O, in the upper part, E, plates *b c d* about said orifice, as set forth, flap B, adapted to close said orifice, said flap having plates *f g h*, adapted to engage with plates *b c d*, as set forth, and mechanism adapted to be operated by the lifting of said flap B to raise the flap D into its closed position and there lock the same before the plates *f g h* are disengaged from plates *b c d*, for the purpose set forth.

3. The combination, with an orifice closed by a hinged flap, of a flange, O', above said hinge, substantially as and for the purpose set forth.

4. The combination, with the flaps B and D, of mechanism comprising the lever F', adapted to be raised by the opening of the flap B, lever Q', having recess Q^4, with noses Q^7 Q^8 and horn Q^5, slot Q^6 in said lever Q', rod R^3, carrying flap D, lever R', fixed on said rod and having pin R, engaging in slot Q^6, substantially as set forth.

5. The combination, with the flaps B and D, of lever F', adapted to be raised by the opening of flap B, lever Q', having recess Q^4, with noses Q^7 Q^8 and horn Q^5, the edge Q^4 being shaped as described, slot Q^6 in said lever Q', rod R^3, carrying flap D, lever R', having pin R, engaging in slot Q^6 and nose R^2, the edge R^4 being shaped as described, lever S', having nose S^2 with edges S^3 S^4, shaped as described, rods P and T, and counter-weight U, substantially as and for the purpose set forth.



397,553. ELECTRIC COUPLING FOR RAILWAY-TRAIN SIGNALING. WILLIAM C. JOHNSTON, Jr., Lynn, Mass. Filed Mar. 5, 1888. Serial No. 266,116. (No model.)

Claim.—1. The combination of the two-part separable conductor A B, having the conducting-rings 7 7, the pivoted levers *a b* 4 4, pivotally supported in the parts of the coupling, an electric conductor attached to each pivoted lever, the levers *a b* being adapted to engage with levers 4 4 when the coupling is closed, thus establishing electric connection between the conductors attached to one part of the coupling and those attached to the other part, and means for automatically establishing connection between the conductors and metallic rings 7 when the parts of the coupling are separated, substantially as described.

2. In a coupling for uniting the detached sections of a direct and return conductor constituting a railway-train signaling-circuit, the combination of a shell or case, as A, and with the conducting-wires, a flanged tubular section of flexible material, as 12, for inclosing the wires, and a screw-cap, as 15, for securing said tubular section to the casing, substantially as described.

397,554. CASH INDICATOR AND REGISTER. CLARENCE H KAHLER, Wilmington, Ill. Filed Mar. 10, 1888. Serial No. 266,876. (No model.)

Claim.—1. In the cash-register shown and described, the combination of the key-slides *a a'*, register-slides D, having apertures V', the means shown for connecting said slides, the tally-check receptacles *h h'*, adapted to register with said apertures, and the means for returning said slides after being pushed in, substantially as and for the purpose set forth.

2. In the cash-register shown and described, the combination of the key-slides *a a'*, having laterally-extending arms and numbered keys, the register-slides D, having apertures V' and pins on both upper and lower sides for being engaged by said arms, the tally-check receptacles *h h'*, arranged to register with the apertures V' of said register-slides, bell-cranks L', tablet-rods t^3, having indicating-tablets *t* on their upper end and having the detent-pins J, swinging detent-bar J^3, and detent-strip J', arm L^2, having the gravity-dogs D^2, arms d^3, bar d^5, cord C', and weight C, door *d*, dogs D', links O, levers L, springs E, and yielding cross-bar B, substantially as and for the purpose set forth.

3. In the cash-register shown and described, the combination of the key-slides *a a'*, register-slides D, having the pins P', yielding bar B, levers L, coil-springs E, links O, detent-dogs D', arms d^3, cross-bar d^4, arms L^2, detent-bar J^3, detent-strip J', weight C, and cord C', substantially as and for the purpose set forth.

4. In the cash-register shown and described, in combination with the key-slides *a a'*, register-slides D, having the pins P', bell-cranks L', cords or chains J^5, and tablet-rods t^3, having the indicating-tablets *t*, and the means shown and described for holding supported said tablet-rods and tablets, substantially as and for the purpose set forth.

5. In the cash-register shown and described, having its key and register slides arranged in separate numerical sections, as specified, the combination, in any one of said sections, of a key-slide having its key provided with denominational characters or numbers, and having laterally-extending arm or arms, and two or more register-slides of said section having combination pin or pins for engaging said arms in such manner that the register-slides operated by said key-slide will register tally-checks having numbers or characters the aggregate of which correspond with that of the key by which they are operated, substantially as and for the purpose set forth.

397,555. CAN-FASTENER. CALVIN KEELER and HARVEY LEWIS, Hobart, N. Y. Filed May 31, 1888. Renewed Jan. 18, 1889. Serial No. 296,793. (No model.)

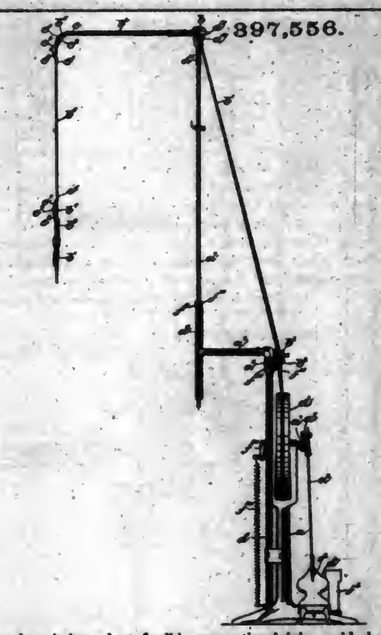
Claim.—1. The combination, with a slotted casting, A, provided with grooves *b*, of the hook B, having flanges *c*, fitted to the grooves *b*, and the cam-lever E, adapted to operate the hook, substantially as described.

2. The combination of the casting A, having the slot *a* and grooves *b*, the hook B, provided with flanges *c*, fitted to the grooves *b*, and furnished with a stud, F, having a head, *f*, and the cam-lever E, pivoted in the casting A and provided with a slot, *d*, and grooves *e*, substantially as described.

397,556. DENTAL ENGINE. JAMES H. KIDDER, Lawrence, Mass. Filed July 30, 1888. Serial No. 281,992. (No model.)

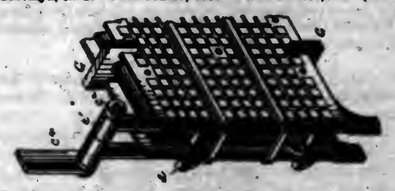
Claim.—1. In a dental engine, the combination, with a stationary upright or standard and a driving-pulley supported thereby, of the swinging arm a^x, pivotally secured to the said standard near the said pulley, to move in a horizontal path with the standard as a center, a tool-shaft, a tool connected thereto, a rod to support said tool-shaft, a pulley on the tool-shaft connected to the driving-pulley and secured to the swinging arm, to move with the said arm to permit the said tool-shaft and tool to be brought into different operative positions while the standard or upright remains unchanged, whereby the tool-shaft and tool may be brought nearer the patient without moving the standard or upright, substantially as described.

2. In a dental engine, the combination, with an upright and a driving shaft a^x, of a foot-treadle connected to said shaft, a rod, f', connected to the foot-treadle and hinged or pivoted to the said upright, and a post, f^3, connected to the rod f', whereby the foot-treadle may be moved into elevated position out of the way by pressure upon the post f^3, substantially as described.



3. In a dental engine, the combination, with a driving-shaft, a^x, having a crank, of a foot-treadle provided with a rod, *f*, a rod, a^9, secured to said crank, and through an opening in which the rod *f* is extended, and a rod, f'', secured to the under side of the treadle, as and for the purpose specified.

4. In a dental engine, the combination, with the shaft a^{12} and rod b^4, of a spring, b^5, and a guard for said spring, consisting of sleeves *c c'*, a shield, c^3, and a hinged connection, substantially as described, hinged to said sleeves and connected to said shield, substantially as described.



5. In a dental engine, the combination, with a tool-shaft and a rod joined to said shaft by a flexible connection, of a tool-holder and a spring, b^5, between said rod and tool-holder, a sleeve, c^3, loose on said rod, and an independent flexible connection joining said sleeve and tool-holder, and consisting of rods c^2 c^3 and spring c^5, whereby buckling of the said spring is prevented, substantially as described.

6. In a dental engine, the combination, with a tool-shaft, a^{12}, a sleeve, b^4, to support said shaft, a lug, *c'*, on said sleeve, a rod, b^5, a spring, b^5, and a guard for said spring, consisting of sleeves *c c'*, a shield, c^3, and links connected to said shield and jointed to said sleeves, and a lug, *c*, on the sleeve *c*, to co-operate with the lug *c'*, substantially as and for the purpose specified.

7. In a dental engine, the combination, with a driving-shaft, a^x, having a crank, of a foot-treadle provided with a rod, *f*, a rod, a^9, secured to said crank, and through an opening in which the rod *f* is extended, and a rod, f'', secured to the under side of the treadle, and a foot-post, f^3, as and for the purpose set forth.

397,557. SECONDARY-BATTERY PLATE. EDWARD B. KNOWLES, Brooklyn, N. Y. Filed Oct. 20, 1883. Serial No. 289,613. (No model.)

Claim.—1. A plate for secondary batteries, consisting of two halves, one half provided with pins or lugs and the other half with holes to receive the same for securing the parts together.

2. A plate for secondary batteries, formed in two parts, one part having feet formed thereon and the other part having the connecting-leg formed upon it.

3. A plate for secondary batteries, having feet enveloped in insulating material.

4. The combination, with a series of secondary-battery plates, of a series of grooved nuts attached to the connecting-lugs of the plates, said nuts having a groove in one face and a projecting ridge on the other.

5. The combination, with a series of secondary-battery plates, of a series of grooved nuts attached to the connecting-lugs of the plates, said nuts having a groove in one face and a projecting ridge on the other, in combination with a bolt and nut for clamping all of said nuts together.

6. A separating-comb for the plates of a secondary battery, composed of a soft flexible non-conducting material.

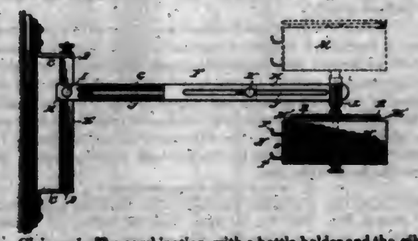
7. In a secondary battery, the combination of a series of positive plates provided with side extensions, a series of negative plates provided with side extensions, and a cross-bar of flexible insulating material interposed between the extensions of each series of plates.

8. In a secondary battery, the cross-bar *d*, for supporting adjacent plates, having a series of flanges thereon.

9. In a secondary battery, the cross-bar *d*, of flexible non-conducting material, for supporting adjacent plates.

10. In a secondary battery, the cross-bar *d*, for supporting adjacent plates, made of flexible non-conducting material having a series of flanges thereon.

11. In a secondary battery, two sets of plates, one having upturned side brackets and the other having reversed brackets, in combination with a detached cross-bar adapted to rest upon the upturned brackets and to support the reversed brackets and their plates.



12. A plate for secondary batteries, provided with feet or legs and a number of projections for connecting up and supporting said plate in the cell, said plate being formed or cast in two parts, one of said parts having formed upon it the said connecting-up and supporting projections and the other part having formed upon it the feet or legs, as set forth.

13. As a connecting device for the plates of a secondary battery, a nut secured to each plate having a slot or groove therein, which is adapted to register with the slots in the nuts upon the plates to which it is to be attached in such a manner as to form one continuous straight slot.

14. A series of secondary-battery plates, each provided with a connecting-leg, each of said legs provided with a notch, groove, or slot adapted to register with all of the slots or grooves in the other plates.

15. A series of secondary-battery plates, each provided with a connecting-leg, each of said legs provided with a notch, groove, or slot adapted to register with all of the slots or grooves in the other plates, in combination with a bolt adapted to pass into said slots when they are in alignment, and a nut upon said bolt for binding the lugs together.

397,558. ADJUSTABLE BRACKET FOR INK-BOTTLES. WILLIAM LUBLEY, Chicago, Ill. Filed Aug. 9, 1888. Serial No. 282,318. (No model.)

Claim.—1. The combination, with a bottle-holder and the gibbet-arm supporting the same, of a vertical spindle or gibbet-post and a sliding friction-connection between said post and arm, whereby the latter may be adjusted vertically upon the former and locked by friction only at any point of its adjustment, substantially as described.

2. The combination, with a bottle-holder, a gibbet-arm, and a pivot-connection between said arm and holder, of a vertical spindle or gibbet-post, and a sliding connection between said arm and post of such a character that said arm will bite or lock by friction at any point upon said post, substantially as described.

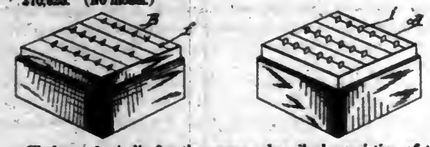
3. The combination, with a bottle-holder, an extensible gibbet-arm, and a pivot-connection between said arm and holder, of a gibbet-post and a sliding friction-lock between said arm and post, substantially as described.

4. The combination, with a bottle-holder and a gibbet-arm supporting the same, of a vertical gibbet-post, a sliding friction-lock between said arm and post, and pivot-bearings for said post, whereby the latter may revolve upon a longitudinal axis, substantially as described.

5. The combination, with a bottle-holder, an extensible gibbet-arm, and a pivot-connection between said arm and holder, of a gibbet-post, a sliding friction-lock between said arm and post, and pivot-bearings for said post, whereby it may revolve upon a vertical axis, substantially as described.

6. The combination, with the gibbet-arm composed of sections having a sliding connection with each other, a vertical spindle attached to one end of said arm, and a bottle-holder loosely journaled on said spindle, of a vertical gibbet-post and a sliding friction-lock between the opposite ends of said arm and the post, substantially as described.

7. The combination, with the gibbet-arm, composed of sections having a pin-and-slot connection therebetween, a vertical spindle attached to one end of said arm, and a bottle-holder loosely journaled on said spindle, of a vertical gibbet-post, pivot-bearings therefor, and an eye on the opposite end of said arm fitting and sliding upon said post, substantially as described.



8. The combination, with a rotatable bottle-holder, a vertical pivot therefor, and a support for said pivot, said holder having two or more bottles arranged circumferentially about its pivot, of a cover for said bottle pivoted upon the pivot of the bottle-holder and free to revolve independently of the bottle-holder, substantially as set forth.

9. The combination, with a rotatable bottle-holder, a pivot therefor, and a support for said pivot, said holder having four bottles arranged circumferentially about its pivot, of a cover for said bottles, consisting of a plate having three radial arms constituting covers for three of said bottles, journaled on the pivot of the bottle-holder, and free to revolve independently of said holder, substantially as described.

10. The combination, with a rotatable bottle-holder, of a pen-rack secured thereto and composed of a single sheet of metal, formed by striking out therefrom lips P, bent outwardly at the detached edge, substantially as set forth.

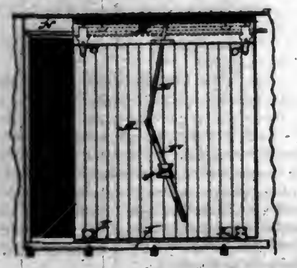
397,559. DIE FOR FORMING TEETH IN VEGETABLE-GRATERS.

WILLIAM MARX, Beaver Falls, Pa. Filed Apr. 14, 1888. Serial No. 270,623. (No model.)

Claim.—1. A die for the purpose described, consisting of two parts, one of which is formed of a number of grooved and ribbed sections, the ribs projecting from the face thereof and presenting points *f*, the other or female part also formed of a number of removable grooved and ribbed sections, but having the ends of the ribs removed to form cavities into which the points *f* are adapted to fit.

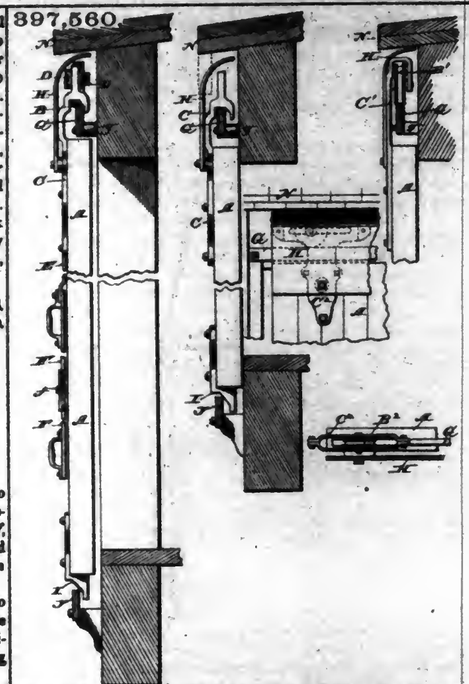
2. A sectional die for the purpose described, composed of two parts, having grooved and ribbed faces of corresponding contour, the ribs of the sections of the male die projecting so as to form sharp vertical faces and sloping diamond or oval backs and means for holding the sections together.

3. A die for the purpose described, consisting of two parts, one of which is formed of a number of removable oval or angularly-grooved and ribbed sections, the ribs projecting from the face thereof and presenting points or teeth *f*, the other or female part also formed of a number of removable grooved and ribbed sections of contours similar to the male die, but having the ends of the ribs removed to form cavities into which the points *f* are adapted to fit, and the points *f* or teeth and the corresponding cavities arranged to lie in diagonal lines across the faces of the dies.



397,560. SHIELDED SLIDING DOOR. EDWARD Y. MOORE, Milwaukee, Wis. Filed Oct. 16, 1888. Serial No. 288,294. (No model.)

Claim.—1. The combination, with a sliding door provided with hangers and a track on which said hangers run, of a shield attached to said door and turned inwardly at its upper edge over the top of said door and over said track and hangers, substantially as and for the purposes set forth.



2. The combination, with a sliding car-door provided with hanger-sheaves and a track on which said sheaves run, attached to the side of the car and held away from the same at intervals by blocks or washers, of a shield attached to and overhanging at its upper edge the top of said door and its hangers, substantially as and for the purposes set forth.

3. The combination, with the sliding door, the track on which it is suspended, and hangers arranged to raise and lower said door, of a shield attached to and extending across said door and bent inwardly at its upper edge, so as to overhang the top of the door, its hangers, and the track-rail adjacent thereto, substantially as and for the purposes set forth.

4. The combination, with a sliding car-door, a track attached to the side of the car, hangers provided with sheaves which run on said track, means for raising and lowering said door slightly, and inclines

397,560.

for carrying said door when lowered snugly against the side of the car, of a shield attached to and partaking of the various movements of said door and bent at its upper edges over the top of the door and its hangers, substantially as and for the purposes set forth.

5. The combination, with a sliding door suspended by sheaves running on a fixed track by the door-opening, of a shield attached to and extending the width of the door, and bent along its upper edge over the top of said door and its hangers, substantially as and for the purposes set forth.

6. The combination, with a sliding door capable of a slight vertical movement and provided with hangers by which it is suspended from a fixed track adjacent to the door-opening, and by means of which it is raised and lowered slightly, of a shield attached thereto, so as to partake of its several movements, and bent along its upper edge inwardly over the top of said door and its hangers, substantially as and for the purposes set forth.

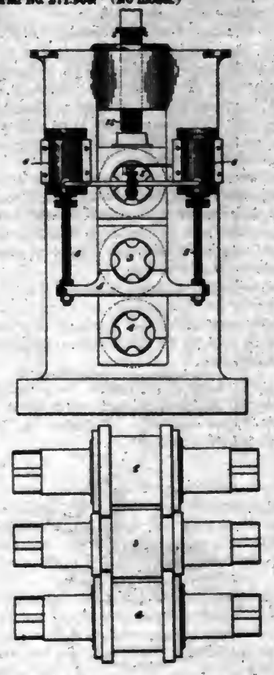
397,561. CLEANING-DOOR FOR BOILERS. DOCTOR F. MORGAN, Akron, Ohio. Filed Aug. 20, 1888. Serial No. 283,177. (No model.)

Claim.—1. In a boiler of the class specified, the combination, with water-sections provided with depressions in contiguous faces, of a door-casing arranged to fit said sections and surround said depressions, having horizontal partitions which register with the sections, and a door to close said casing, all constructed substantially as shown, and for the purpose specified.

2. The combination, with the sections C and casing F, having partitions *f*, of the adjustable plates *f'* F', for fitting the casing and partitions to the sections, substantially as shown and described.

397,562. BUCKLE. JOHN HAIR, Syracuse, N. Y. Filed Oct. 6, 1888. Serial No. 287,447. (No model.)

Claim.—1. A buckle consisting of the plate A, provided with slotway in its front end, a plate, B, provided with a flange, S, on its front end, and a finger-lever provided with a cross-bar, 11, fitting between the plates and behind the flange S, substantially as described.

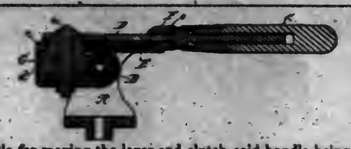


397,562.

2. A buckle consisting of the plate A, constructed with a plane inner face, a plate, B, secured beneath the plate A and provided with a transverse recess in its outer end, and a finger-lever provided with a cross-bar, 11, fitting within the recess, substantially as described.

3. In a buckle, a lower plate bent at its outer end to form a transverse rectangular recess, a plate, A, secured upon the plate B, and having a plane inner face and closing the recess, and a lever slotted across its inner end to form a cross-bar, and the cross-bar mounted in said recess, in combination, substantially as described.

397,563. ROLL. DAVID R. OLIVER, Allegheny, Pa. Filed Apr. 26, 1888. Serial No. 271,969. (No model.)



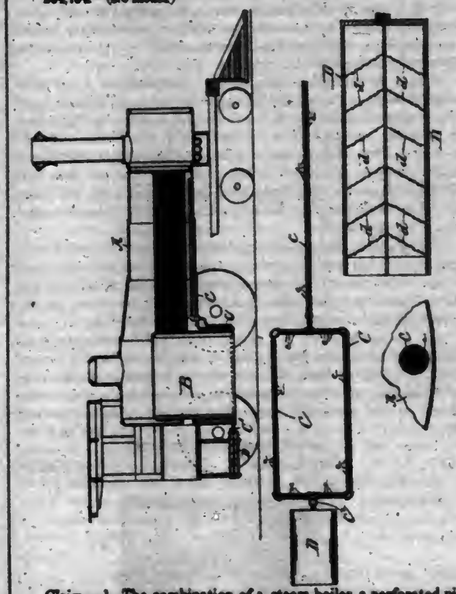
Claim.—1. In a three-high mill, the combination of the housings, a roll set in stationary bearings in the housings, two rolls set in vertically-movable bearings therein, a lifter acting on one of the vertically-movable rolls to raise the same in the housings, and adjusting-screws connected with the bearings of the other of said movable rolls, said rolls being tongued and grooved to form working and reducing passes, having the tongues oppositely placed in the reverse passes, whereby the plate or slab to be rolled is continuously reduced, and the flash or fin formed at one pass is effaced at the reverse pass without reversing such plate or slab, substantially as and for the purposes described.

2. In a three-high mill, the combination of the housings, a roll set in stationary bearings in the housings, two rolls set in vertically-movable bearings therein, hydraulic cylinders, the piston-rods of which act on the bearings of one of the vertically-movable rolls to raise the same in the housings, and adjusting-screws connected with the bearings of the other of said movable rolls, said rolls being tongued and grooved to form working and reducing passes, having the tongues oppositely placed in the reverse passes, whereby the plate or slab to be rolled is continuously reduced, and the flash or fin formed at one pass is effaced at the reverse pass without reversing such plate or slab, substantially as and for the purposes described.

397,564. TAIL-STOCK FOR LATHES. REUBEN R. CORNER, Columbus, Ohio. Filed May 31, 1888. Serial No. 275,636. (No model.)

Claim.—1. In a tail-block for lathes, a lever, a segment of the block having a circular face, a clutch-piece bearing on said face, and

397,564.



a handle for moving the lever and clutch, said handle being mounted upon the lever, combined substantially as shown and described.

2. In combination with the spindle, a pinion having an attached lever, a collar and a clutch-piece bearing on a segment of the lathe-block, and the operating-lever, substantially as shown, and for the purposes set forth.

3. In an attachment for lathes, a spindle, a pinion, a lever connected with the pinion, the threaded handle mounted on the lever, and the collar and clutch-piece for clamping the segment, combined and arranged substantially as shown, and for the purposes set forth.

4. In combination with the tail-block carrying the pinion and spindle, the collar, and its apron, substantially as shown, and for the purposes set forth.

397,565. BLOW-OFF APPARATUS FOR STEAM-BOILERS. ANDREW W. QUACKENBUSH, Moberly, Mo. Filed Sept. 6, 1888. Serial No. 284,734. (No model.)

Claim.—1. The combination of a steam-boiler, a perforated pipe extending inside said boiler, a blow-off cock, and a retarding drum or trap secured at the discharging end of said pipe.

2. The combination, with a blow-off pipe extending inside of a boiler, of a retarding drum or trap consisting of a shell and a number of perforated partitions inside said shell, substantially as set forth.

3. The combination, with a blow-off pipe, of a retarding drum or trap secured to its discharging end and provided with inclined or cone-shaped partitions for breaking the force of the discharge, substantially as shown and described.

4. The combination of a steam-boiler, a blow-off pipe extending along the bottom and inside of said boiler, provided with perforations which enter it at an angle with a vertical line, a blow-off cock inserted in the discharging end of said pipe outside of said boiler, and a drum or trap secured to said discharging end, and containing angular or cone-shaped partitions, all substantially as set forth.

397,566. TEMPORARY CASE FOR MAINSPRINGS. JACOB W. REMLINGER, New York, N. Y. Filed Aug. 20, 1888. Serial No. 284,156. (No model.)

Claim.—1. The combination, in a receptacle for springs, of a case having oppositely-arranged slots in its wall and means arranged to slide in said slots for ejecting the spring, substantially as described.

2. The combination, in a receptacle for springs, of a case having slots in its wall, and a spring-ejector projecting beyond the exterior of the wall of the case and arranged to slide in said slots to eject the spring, substantially as described.

397,566.

3. The combination, in a receptacle for springs, of a case having slots formed in its wall and a depression in its bottom, and means for ejecting the spring, substantially as described.

4. The combination, in a receptacle for springs, of a case having slots formed in its wall and a depression in its bottom, and a spring-ejector constructed and arranged to enter said slots and depression and project beyond the exterior of the wall of the case, substantially as described.

5. The combination, in a receptacle for springs, of a case having oppositely-arranged slots formed in its wall, a spring-ejector adapted to enter said slots, and ears or clips formed on the case for securing the same to a card, substantially as described.

6. The combination, in a receptacle for springs, of a case having oppositely-arranged slots formed in its wall and a depression in its bottom, a spring-ejector, and ears or clips formed on the case for securing the same to a card, substantially as described.

7. As a new article of manufacture, a receptacle for watch-mainsprings, consisting of a case having oppositely-arranged slots in its wall, a spring-ejector, and identifying symbols or letters upon its bottom, substantially as described.

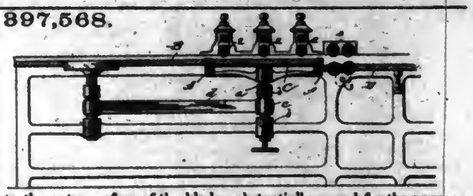
8. As a new article of manufacture, a receptacle for watch-mainsprings, consisting of a case having oppositely-arranged slots in its wall and a depression in its bottom, a spring-ejector, and identifying symbols or letters upon its bottom, substantially as described.

9. As a new article of manufacture, a receptacle for watch-mainsprings, consisting of a case having oppositely-arranged slots in its wall, a spring-ejector, identifying symbols or letters upon its bottom, and ears or clips formed on the case for securing the same to a card, substantially as described.

10. As a new article of manufacture, a receptacle for watch-mainsprings, consisting of a case having oppositely-arranged slots in its wall and a depression in its bottom, a spring-ejector, identifying symbols or letters upon its bottom, and ears or clips formed on the case for securing the same to a card, substantially as described.

11. The combination, in a receptacle for watch-mainsprings, of a case adapted to contain a spring and an ejecting-bar located beneath the spring within the case, the ends whereof project beyond the sides of the said case, whereby the spring may be forced from the case by pressure on the projecting ends of the said bar, substantially as set forth.

397,567. TILTING DRAWER. EDWARD C. ROBERTS, Broadford, Va. Filed Apr. 21, 1886. Renewed May 4, 1888. Serial No. 272,868. (No model.)



Claim.—The combination, with the casing A, provided with the side recesses and the vertical front having openings therein, the ledges *b b'*, and the pivot-bolts, of the tilting drawers B C D, having end boards bounded by circular edges and secured to the pivoted arms, substantially as specified.

397,568. REVOLVING SURFACE-PLANER. JUSTUS H. RUDOLPH, Elmira, N. Y., assignor to the Sterling Slate Company, Walnutport, Pa. Filed Mar. 23, 1888. Serial No. 268,122. (No model.)

Claim.—1. A planer consisting of a circular band having a toothed edge, each of said teeth being provided with two cutting-edges, said edges being formed in different planes, substantially as described.

2. A planer for leveling or making smooth rough and uneven surfaces, consisting of a circular band having a serrated edge forming teeth, said teeth having a cutting-edge in one plane, as horizontal, and an angular cutting-edge extending from the horizontal edge outwardly

397,568.

to the outer surface of the blade, substantially as and for the purpose set forth.

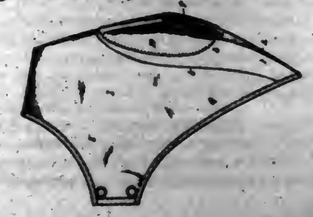
3. The described planer, consisting of a curved band having teeth on its edge, said teeth being provided with cutting-edges formed in different planes, in combination with a suitable table to support the work, substantially as described.

4. In combination, a planer having teeth on its edge provided with cutting-edges formed in different planes, a shaft for supporting the planer, means for rotating it, and a table having one part thereof adjustable, substantially as described.

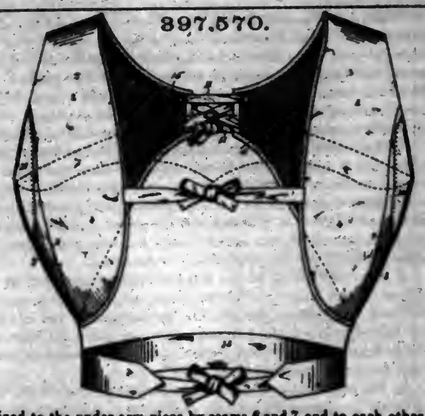
5. In combination, a planer consisting of a circular band having teeth on its edge provided with cutting-edges formed in different planes, a shaft for supporting the planer in horizontal position, a table arranged above the saw having a depression or groove within the diameter of the planer and raised ledges on either side thereof, curved slots for the teeth of the blade to work in, an adjustable table to direct the work to the angular cutting-teeth, and suitable pressure and power rollers, substantially as described.

6. In combination, a planer having teeth on its edge provided with cutting-edges formed in different planes, a shaft for supporting the same, a table for the work, suitable power and pressure rollers, and a disk covered with sand-paper or the like, arranged in line with the same and adapted to finish the work as it passes from the said planer, substantially as described.

7. In combination, a planer consisting of a blade having teeth, said teeth having one cutting-edge extending from one side of the blade partially across the edge of the same, and a second cutting-edge extending at an angle to the first and the other side of the blade, substantially as described.



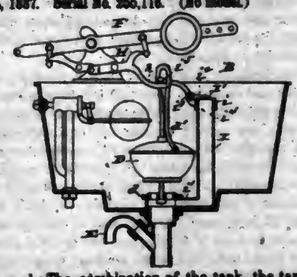
397,569. LAMP ATTACHMENT. JOHN H. SCHENKEL and RICHARD B. MAGRUDER, Baltimore, Md., assignors, by direct and mesne assignments, to Francis Cope Adler, Philadelphia, Pa. Filed Nov. 25, 1887. Serial No. 256,100. (No model.)



Claim.—The combination, in a lamp, of a collar, D, having the depending inner and outer short tubes, *d* and *D'*, with a collar, C, having its aperture substantially in line with the inner wall of the tube *d*, and a vertical tube engaging with and hinged to the tube *D'*, whereby an annular space is formed around the inner junction of the collars C and D, substantially as described.

397,570. UNDER-ARM PAD. CLARA M. SOUTHWORTH, Bridgeport, Conn. Filed Nov. 10, 1883. Serial No. 290,440. (No model.)

Claim.—An under-arm pad formed of two plies, each consisting of front and back pieces, 4 and 5, concave on their inner side edges, a central or under-arm piece, 3, convex on its outer side edges, and suitable filling between the said plies, said front and back pieces being



397,570.

joined to the under-arm piece by seams 6 and 7 and to each other by a seam, 8, and the said back piece having a rear or inward extension, 15, for a connection with a similar extension of a companion pad, whereby is secured a pad which is adapted to give the desired fullness at the edge of the shoulder-blade and between the bust and shoulder, and to be connected with a companion pad, substantially as set forth.

397,571. WATER-CLOSET. PETER WHITE, St. Louis, Mo. Filed Nov. 14, 1887. Serial No. 255,116. (No model.)

Claim.—1. The combination of the tank, the tank discharge pipe, the tank-valve and lever operating the same, the pipe I, cap and cap-arm, and the connection uniting said cap-arm and tank-valve to move said cap and open said pipe I to the outer air as said tank-valve is seated, the air-pipe E, the closet-bowl, and the trap, substantially as described.

2. A water closet bowl having in its bowl-chamber *a* a partition, a^4, combined with the air-pipe E, connecting with said chamber *a* by means of the chamber *c'* at the lower end of said pipe and its outlet a^3 below the level a^2 of said partition a^4, substantially as and for the purposes set forth.

397,572. GATE. WILLIAM R. WHITE, Hooge, Ill. Filed Feb. 2, 1888. Serial No. 262,764. (No model.)

Claim.—The combination of a gate with a supporting-arm and a guide-arm pivoted to the gate at points unequally distant from its ends, and extending from the gate substantially parallel to each other and swinging on parallel vertical axes, substantially as described.

397,573. VOLUMETRIC GAS-REGULATOR. MORRIS G. WILDER, Philadelphia, Pa. Filed Mar. 22, 1888. Serial No. 268,112. (Model.)

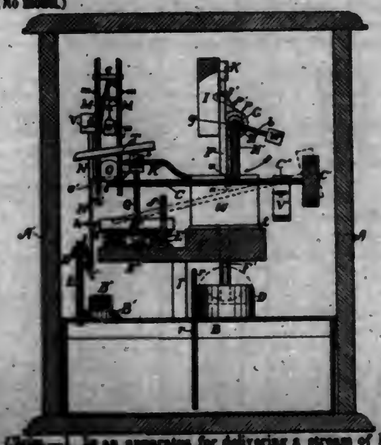
Claim.—1. The combination, with the outer and inner shell of a gas-regulator, of a bridge spanning the gas inlet or outlet hole and furnished with a boss adapted to be riveted to and to secure the inner shell, substantially as described.

2. The combination, with the lower part of the outer case or shell of a gas-regulator, of the post R and inner shell, B', said post being furnished with a shoulder adapted to be riveted over and to hold said shell in place.

3. In a gas or fluid regulator, and in combination, the screw H, made as described, the fibrous or yielding packing wound upon it, and the threaded thimble or drilled seat, when formed, fitted, and operating to securely pack the said screw against leakage and to permit adjustment as required, substantially as set forth.

4. In a gas or fluid regulator, the herein-described regulating-screw, the upper part of which is turned off and which is furnished with a slot in which the ends of the packing-thread may be placed in order to secure them, substantially as set forth.

5. A float, substantially as described, consisting of a punched disk, the center of which is perforated and raised to support and strengthen the joint, combined with a tubular valve passed up through said disk and secured thereto by soldering or swaging the metal of the disk about it.



6. The upper or lower shell of a volumetric regulator, combined with and centrally supported on a bridge attached to the shell or body and extending over the inlet or outlet, so as to allow the gas-passages to be formed by turning or drilling through the central hole in said shell, substantially as described.

7. In a volumetric gas or fluid regulator, the base, working-cylinder and float, and an annular gas-passage extending under the working-cylinder toward the center thereof, when so combined as to permit the gas to act upon the float through said annular gas-passage and suitable perforations in the bottom of the working-cylinder, substantially as described.

8. In a volumetric gas or fluid regulator, the base, working-cylinder, central post and float, gas-passage, and adjusting-screw, when so combined with perforations in the working-cylinder as to permit the gas to enter the cylinder to act upon the lower part of the float through said perforations and afterward to pass the adjusting-screw, and said passage to act upon the upper part of the float, substantially as described.

9. The upper and lower shells of a volumetric regulator, combined with a cup of sheet metal attached to the upper shell and the working-cylinder upon the lower shell, arranged and operating substantially as described, so that the cup forms a cover for the working-cylinder.

397,574. COIN-OPERATED PERFUMING APPARATUS. HERMAN M. WILSON, Cambridge, Mass. Filed Sept. 24, 1888. Serial No. 286,173. (No model.)

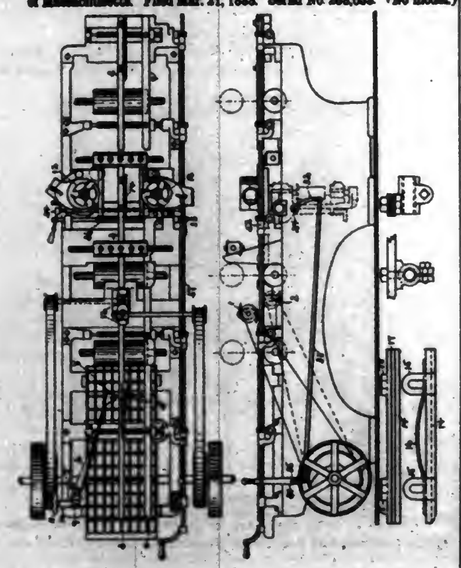
Claim.—1. In an apparatus for delivering a stream of liquid, a spindle provided with a mutilated pinion fixed thereon, in combination

with a rack gearing with said pinion, a weight secured to said rack, a vessel provided with a discharging-tube, and a flexible bulb connected with said vessel and with said weight, all arranged and operated substantially as and for the purposes described.

2. In an apparatus for delivering a stream of liquid, a spindle provided with a crank-handle and having a mutilated pinion secured to said spindle, in combination with a rack gearing with said pinion, a bulb-operating weight connected with said rack, and a locking device whereby the said crank-handle is prevented from turning, all constructed and arranged substantially as and for the purposes described.

3. In a coin-operated apparatus for delivering a stream of liquid, a spindle provided with a crank-handle and having an arm secured thereto, in combination with a mutilated pinion fixed on said spindle, a rack gearing with said pinion, a weight connected with said rack, and a pivoted coin-actuated lever provided with a counter-weight, and having a stop whereby the spindle is prevented from turning, all constructed, arranged, and operated substantially as described.

4. In a coin-operated apparatus, a spindle provided with a crank-handle, an arm, and a counter-weight, all rigidly secured to said spindle, in combination with a counterbalanced coin-operated pivoted lever provided with a stop, whereby, when the lever is depressed, the said handle may be turned through one revolution, substantially as and for the purposes described.



5. In an apparatus for delivering a stream of liquid, a spindle, H, having a ratchet-wheel, P, and a mutilated pinion, G, in combination with the rack F, engaging with said pinion, the weight W, secured to said rack, and the spring-actuated pawl P', engaging with said ratchet-wheel, all arranged and operated substantially as and for the purposes described.

6. In an apparatus for delivering a stream of liquid, a vessel provided with a weight-operated flexible bulb and having a liquid-discharge tube passing nearly to the bottom of the said vessel in combination with an air-admitting tube provided with a valve and a suitable regulating device operating said valve, whereby the amount of discharged liquid is determined, substantially as described.

7. In an apparatus for delivering a stream of liquid, a closed vessel provided with a flexible bulb and a liquid-discharge tube, in combination with a weight operating said bulb, a weighted bellows provided with an air-discharge passage, and an air-admitting tube communicating with said vessel and provided with a valve operated by said bellows, in the manner and for the purpose substantially as described.

8. In an apparatus for delivering a stream of liquid, in combination with the weight W, provided with the rod R, the bellows E, provided with the rod Q, bent at right angles at its upper end and having an air-discharging tube, *f*, the weight W', having the pin A, and the vertically-reciprocating valve-operating rod N', having stops *K' K'*, engaging with said pin, all constructed, arranged, and operated substantially as and for the purposes described.

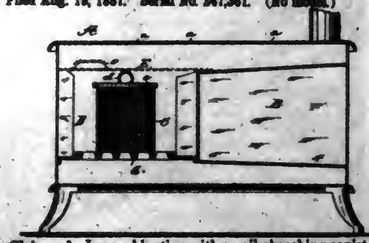
397,575. PLANING-MACHINE. SOLOMON A. WOODS and JOHN R. THOMAS, Boston, Mass., assignors to The S. A. Woods Machine Company, of Massachusetts. Filed Mar. 21, 1888. Serial No. 268,038. (No model.)

Claim.—1. The combination, in a wood-planing machine, of the matcher-heads 1 and 2, mounted upon horizontal shafts above and below the path of the lumber, the matcher-head 13, mounted upon a vertical shaft outside the path of the lumber, the side guide, 4, and the central longitudinal guide-strip, 3, having attached upon the side thereof, toward said side guide and opposite matcher-head 13, an adjustable supplemental guiding-strip, 14, substantially as described.

2. The combination, in a wood-planing machine, of the matcher-heads 1 and 2, mounted upon horizontal shafts above and below the path of the lumber, the matcher-head 13, mounted upon a vertical shaft outside the path of the lumber, the side guide, 4, and the longitudinal central guide, 3, provided with the elastic spring 5, attached to the side thereof opposite said side guide and arranged to press the lumber against the latter, substantially as described.

3. The combination of the polygonal-shaped cross-girt 18, secured at its ends to the frame of the planing-machine, with one corner uppermost, the yoke 21, carrying the matcher-spindle and mounted upon said girt by a saddle embracing its upper angle and faces, and a clamp attached to said yoke and arranged to bind said girt between it and the saddle, substantially as described.

4. The combination of the polygonal-shaped cross-girt 18, with one corner uppermost, the yoke 21, carrying the matcher-spindle and mounted upon said girt by a saddle embracing its upper angle and faces, the clamp-piece 25, embracing the girt on its sides opposite to the saddle, and a cam, 29, arranged to bind against said clamping-piece, substantially as described.



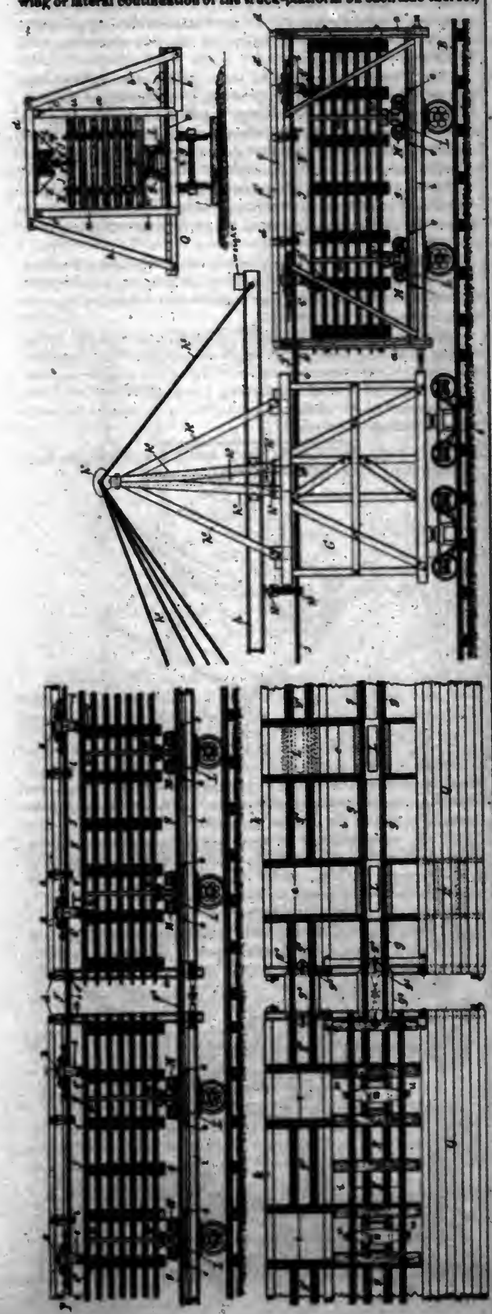
5. The combination of the polygonal-shaped girt 18, secured with one corner uppermost, the yoke 21, carrying the matcher-spindle and mounted upon said girt by a saddle embracing its upper angle and sides, the clamping-piece 25, embracing the girt on its sides opposite to the saddle, the cam 29, and an elastic or yielding medium intervening between said cam and the embracing part of clamping-piece 25 and arranged to transmit the pressure of the cam to the clamping-piece, substantially as described.

6. The combination of the girt 18, the yoke 21, carrying the matcher-spindle and mounted upon said girt by a saddle embracing the same on one side, the clamping-piece 25, embracing the same on the opposite side, the cam 29, arranged to compress the clamping-piece against the girt, the splined rod 24, passing through said cam and arranged to revolve the latter and allow it to be slid over it, the screw 52, journaled in the frame and arranged to move yoke 21 along the girt by means of its sleeve-nut attached to the yoke, and the crank 32, rod 33, and lever 34, connected to the splined shaft 24, leading to the feed-in end of the machine, and the gear 38 and shaft 37 with its crank at the same end of the machine, whereby the operator is enabled, without leaving that end of the machine, to release the yoke 21 and adjust and secure the same to the girt 18 to suit different breadths of lumber, substantially as described.

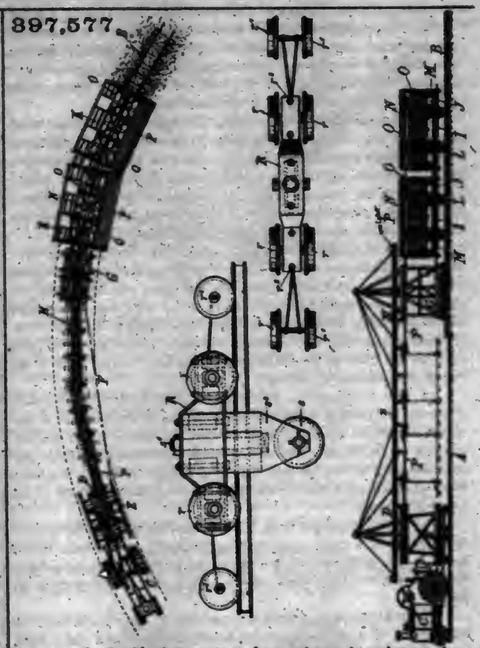
7. The combination of the matcher-spindle 20 and its head, and the chip-breaker 40, surrounding the same and made in the shape of an inclosing-funnel around said head terminating in the exit-spout 42, the said inclosing-funnel having its upper portion in the form of a detachable cover secured to the lower portion by lugs or fastenings, substantially as described, whereby said cover portion may be removed and the head exposed, substantially as described.

8. The combination of the chip-breaker 40, pivoted to the table of the vertical matcher-head by pivot 41, swinging in a curved path around said head and provided with spout 42, and the cover part of the same, 44, extending over said head and secured to the lower portion by lugs 45 and turn-button 46, substantially as described.

397,576. FIRE-KINDLER. JOHN ABTERDAM, New York, N. Y. Filed Aug. 19, 1887. Serial No. 247,361. (No model.)



Claim.—1. In combination with an oil-absorbing canister, a reticulated metal screen surrounding said canister and separated therefrom, whereby a free air-space will be left between said canister and screen, substantially as described.



2. A fire-kindler consisting of an oil-absorbing canister having draft-passages through it, and a reticulated metal screen surrounding said canister and separated therefrom, whereby a free air-space will be left between said canister and screen, substantially as described.

397,577. PLANT FOR LAYING TRACKS. GEORGE ANDERSON, Madras, India. Filed Oct. 18, 1887. Serial No. 252,712. (No model.) Patented in England Aug. 31, 1887, No. 11,630.

Claim.—1. In a track-laying plant, the combination of a construction-train adapted for the transit therealong of loads of track-sections, an overhead carrier, a siding and traverser for the return of the empty track-section bogies, engines adapted to move the construction-train forward and to operate the overhead carrier on their respective tracks, and suitable winding or other gear for operating the various members of the construction-train and overhead carrier.

2. The combination, with the truck of a construction-train, of a wing or lateral continuation of the truck-platform on each side thereof,

one or both of said wings or lateral extensions adapted to receive a siding with traversers operating between the main track and siding, substantially as and for the purpose set forth.

3. The combination, with the truck of a construction-train, of a wing or lateral continuation of the truck-platform on each side thereof, one of said wings or lateral extensions adapted to receive a siding and the other to be fitted as a workshop, store, or cabin, substantially as described.

4. The combination, with the truck of a construction-train, of traversers adapted to run upon rails laid transversely upon the platform of said truck and upon a wing or lateral extension of said platform, upon which traversers are laid sections of the main track of the construction-train, and which sections are adapted to make continuations with either a siding of the same gage as the main track laid upon the wing or lateral extension or with the main track upon the platform, according to the position of the traversers.

5. The combination, with the trucks of a construction-train having a track secured to the platform thereof, of track-sections forming continuations of the main lines, pivotally connected to the said trucks in manner to permit the traverse thereon of the wheels treading the main line, substantially as and for the purpose set forth.

6. The combination, with the trucks of a construction-train having a siding laid upon wings or lateral extensions of the platform of said trucks, of bridge-pieces uniting the tracks forming the sidings of two or more connecting-trucks, and traversers operating between the main track and sidings, substantially as and for the purpose set forth.

7. The combination, with the trucks of a construction-train having a siding laid upon wings or lateral extensions of the platforms of said trucks, of bridge-pieces pivotally connected to the trucks and sidings, respectively, adapted to make continuous the main line from one truck of the construction-train to the adjoining one, and the siding from one wing to the adjoining one, with traversers for connecting, substantially as and for the purpose set forth.

8. The combination, with the platform or floor of a truck forming a member of a construction-train provided with tracks thereon, of two bogies having suitable uprights forming side supports for sections of completed track carried thereby, substantially as set forth.

9. The combination, with the platform of the truck of a construction-train, of vertical posts at the corners of said platform, longitudinal and transverse beams connecting the tops of said vertical posts, and braces connected to said longitudinal or transverse beams and to a wing or lateral extension of said platform.

10. The combination, in a construction-train of one or more trucks, of a superstructure supported over the platform of the said truck or trucks, and an overhead carrier suspended from said superstructure and adapted to transport a load from one part of said construction-train over the track below to the front thereof, substantially as and for the purpose described.

11. The combination, with a construction-train, of a superstructure supported over the platform of all the trucks of said construction-train, and an overhead carrier suspended from said superstructure extending the whole length of the train and adapted to transport the load of said construction-train to the front thereof.

12. The combination of a construction-train having a main track on the platform thereof, wings or lateral extensions of said platforms on one or both sides thereof, a siding upon said wings, and traversers adapted to move between the main line and siding and make connection between the two, said combination adapted for the transport of loaded trucks along the main track to the front of the construction-train and for the return of the empty trucks along the siding.

13. The combination of a construction-train having a main track laid on the platforms thereof, wings or lateral extensions of said platforms on one or both sides thereof, sidings upon said wings, and duplex traversers adapted to move between the main line and the said sidings and make connection between them, respectively, said combination adapted for the transport of loaded trucks along the main track to the front of the construction-train and for the return of the empty trucks along the siding.

14. The combination, with longitudinal and transverse beams supported by vertical posts over the platforms of the trucks of a construction-train, of an overhead carrier connected thereto and adapted to allow loaded bogies to be moved under said carrier along the construction-train and to be used for the purposes of raising the loads from off said bogies and to transport them toward the front of the construction-train.

15. In a construction-train, the combination, with a suitable overhead frame, of a track supported longitudinally over a main line secured to the platform below and one or more carriers adapted to traverse said overhead track, substantially as and for the purpose set forth.

16. In a construction-train, the combination, with a suitable overhead frame, of a track supported longitudinally over a main track upon the platform of the car below, uniting with a like track, a connecting-truck, and a carrier adapted to traverse said track from one truck to another, substantially as described.

17. In an overhead carrier supported over the truck or trucks of a construction-train, holes formed in the foot and web of the rails, adapted to receive one end of the bolt by which the rail is connected to its support and to allow the rail to slide upon the said support as the construction-train is moving on a curve.

18. In a construction-train, the combination, with a bogie adapted to travel upon an overhead track supported longitudinally over the main track secured to the trucks thereof, of a pair of wheels pivotally connected to each end of the frame of said bogie, constructed, arranged, and operating substantially as and for the purpose described.

19. The combination, with a bogie adapted to travel upon the rails of an overhead track supported longitudinally over the main track laid along the truck of a construction-train, of a pair of wheels pivotally connected to the frame of said bogie at each end of it and adapted to lead the wheels of said bogie over the joints and round the bends in the rails of said overhead track.

20. The combination, with the trucks of a construction train, of an overhead carrier supported longitudinally over the main track laid along said trucks, and bridge-pieces pivotally connected to the opposite ends of the rails of the overhead carrier and adapted to make the several sections of the overhead carrier over the several trucks of the construction-train continuous for the length of the construction-train.

21. In a construction-train, the combination, with a bogie adapted to traverse an overhead track supported longitudinally over the main line of said construction-train, of a loop pendent therefrom, a grooved pulley pivoted in said loop, and a suitable connection guided by the latter terminating in a gripper operated by a winding-drum, substantially as and for the purpose set forth.

22. The combination, with a bogie adapted to travel upon an overhead carrier supported longitudinally over the main line of a construction-train, of a loop pendent therefrom, a chain-pulley pivoted in said loop, and a chain terminating in a gripper and led away over said pulley to a winding-drum.

23. The combination, with a construction-train of a track-laying plant, of a cantalever supported upon a truck and pivoted thereon and an overhead track extending along the arm thereof, substantially as set forth.

24. The combination, with the construction-train of a track-laying plant, of a cantalever adapted to turn upon a pivot, and an overhead track fixed to the projecting or front part of said cantalever, substantially as above described.

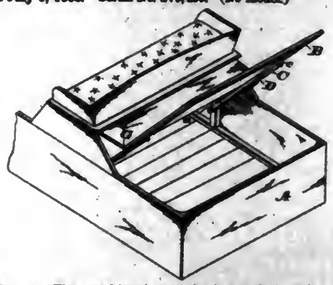
25. The combination, with the construction-train of a track-laying plant, of two cantalevers adapted to turn upon their respective trucks, and overhead tracks fixed to the projecting parts of said cantalevers, substantially as above described.

26. The combination, with the construction-train of a track-laying plant, of a traction-engine adapted to travel on the road-bed, and a cantalever having fixed upon it an overhead arm provided with a track adapted to operate between the engine and the connecting-train, substantially as and for the purpose described.

27. The combination, with a construction-train of a track-laying plant, of a traction-engine provided with and carrying thereon a cantalever, said engine being adapted to operate the train and the track-laying apparatus, substantially as and for the purpose described.

28. In a track-laying plant, the combination, with one or more trucks provided with means for lifting, carrying, and laying sections of track, of an engine or motor adapted to advance the train as required, said engine or motor being provided with a track thereupon, by means of which sections of track may be advanced along and above the said engine or motor from a supply to the construction-train, substantially as set forth.

29. A locomotive adapted for the propulsion of the construction-train of a track-laying plant, and having a continuation of the main track of said train of the same gage as said main track laid upon it at the same level, whereby it is adapted to admit of the bogies being moved from the transport-train along it on the main track of the construction-train, substantially as described.

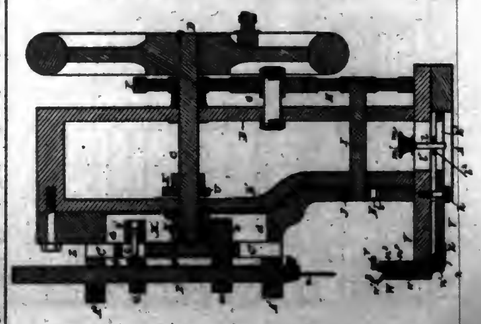


30. The combination, in a construction-train consisting of one or more trucks provided with tracks upon their platforms and traversers above, of an engine-power adapted to operate them, substantially as set forth.

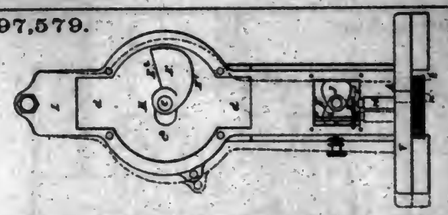
31. The combination of an overhead carrier extending the whole length of the construction and transport train, having a main track thereupon, traversers, sidings, and engine-power adapted to operate them, substantially as described.

32. The apparatus, substantially as herein described, for laying railway-track by a plant, consisting of one or more trucks provided with railway-tracks thereon, cantalever, and engines, whereby sections of track are lifted and advanced along a suspended track from the carrying-truck to the cantalever and lowered to position on the road-bed, substantially as set forth.

397,578. BUGGY-BOOT. PHILIP BOSCHE, New Philadelphia, Ohio.



Filed July 9, 1888. Serial No. 278,429. (No model.)

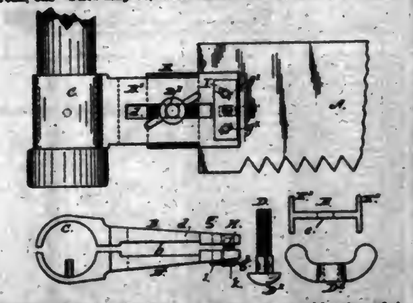


Claim.—1. The combination of the buggy-box A, having hinged thereto the frame B, the bars C, pivotally attached to the frame B, the recesses *b*, adapted to engage the staples *a*, and the springs D, substantially as and for the purpose specified.

2. The combination of the buggy-box A, having hinged thereto the frame B, mitered ends of the frame B, provided with the grooves *d*, and the metal plates E, adapted to be folded over the ends of said frame B, substantially as and for the purpose specified.

397,579. SEWING-MACHINE. JONATHAN BARTLETT, Epping, and GEORGE B. WIGGIN, South New Market, N. H., assignors of one-half to John W. Heard, Providence, R. I. Filed July 23, 1887. Serial No. 245,561. (No model.)

397,579.

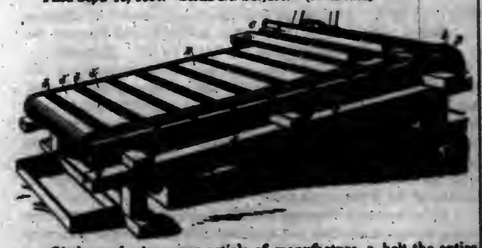


Claim.—1. The vibratory frame L, pivoted at its upper end, and the projecting base V, which supports the thread-looping mechanism carried by and vibrating with said frame, combined with the needle-bar arranged to move in right lines vertically lengthwise of such frame and also to vibrate with it and said base, substantially as shown and described.

2. In combination, the vibratory frame L, pivoted at its top and having a projecting base, V, as described, the looping mechanism supported on such vibrating bed or base, cover O, brackets A' A^3 on said cover, needle-bar P, needle, and a cam for vibrating the frame L, substantially as shown and described.

3. In combination, the vibratory frame L, having a casing, M, and opening N, shafts C and I and their respective cams or eccentrics, removable cover O, needle-bar P, supported on frame L, brackets A' A^3, and blocks *b b'*, substantially as shown and described.

4. In combination, the vibratory frame L, having a casing, M, and opening N, and cam E, the cam or eccentric J, adjustable three-sided piece *i*, and its adjusting-screw *I'*, substantially as shown and described.



397,580. HANDLE FOR CROSSCUT-SAWS. MARTIN BENNETT, Eureka, Cal. Filed May 11, 1888. Serial No. 273,587. (No model.)

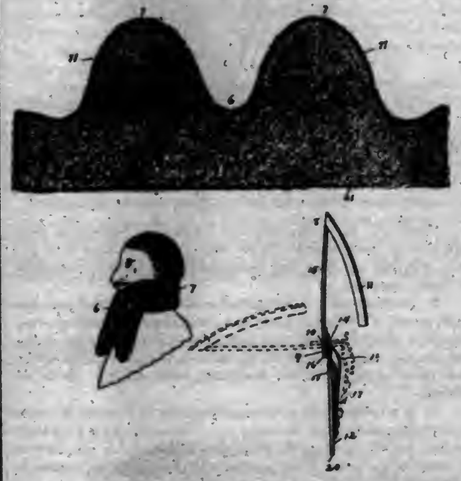
Claim.—1. In a handle for crosscut-saws, the combination of the slotted clamp-plates having sockets at one end, jaws to take the saw-blade at the other end, provided with a stud or studs to take through the saw-blade, and the sliding bearing-block and clamp-screw, arranged, substantially as described, for operation as set forth.

2. In a handle for crosscut-saws, the combination, with the clamp-jaws having the inclined slots or grooves, of the studs or pins movable therein, the bearing-block, and the clamp-screw, all arranged to operate substantially as described.

397,581. ORE-WASHER. HENRY G. BLAISDELL, San Francisco, Cal. Filed Sept. 10, 1887. Serial No. 249,400. (No model.)

Claim.—1. As a new article of manufacture, a belt the entire surface of which is divided into zones or strips of alternate corrugated or rifled portions and plane or smooth portions, substantially as herein described.

2. In an ore-concentrator, and in combination with the belt-supporting frame and its drums over which the belt passes, and the water and pulp distributing apparatus, an endless traveling belt having its entire working-surface divided into zones of alternate corrugated or rifled portions and plane or smooth portions, substantially as herein described.



397,582. WALKING-PLOW. DAVID W. GEBERT, Sparta, Wis., assignor of one-half to Timothy O. Thorbus, same place. Filed Nov. 14, 1888. Serial No. 290,812. (No model.)

Claim.—1. The combination, with the brackets F and F', having the vertical extensions I and I', which are roughened on their opposing faces, and which are vertically slotted, of the blocks C and C', roughened on their outer ends, and the bolt G, substantially as and for the purpose described.

2. The combination, with the landside and mold-board of a plow, of the brackets F and F', having vertical extensions which are roughened on their opposing faces, and which are vertically slotted, the block C and C', having their inner ends rounded and having heads H and H' at their ends, which heads are roughened on their outer ends, the bolt G, and the roller D, mounted on the rounded portions of the blocks and held between the heads H and H', substantially as described.

397,583. EAR-PROTECTOR. REUBEN COHN, New York, N. Y. Filed May 2, 1888. Serial No. 272,611. (No model.)

Claim.—1. As an improvement in folding ear-protectors, a spring device consisting of a hinged vertical member having an elastic appliance secured thereto, against the tension of which said hinged vertical member is adapted to fold, and provided at one of its ends with a rigidly-fixed curved member which projects outward and downward at both sides of said vertical member, and which when covered provides a concave surface adapted to snugly fit over the ear, substantially as set forth.

2. As an improvement in folding ear-protectors, a spring device embodying a vertical member consisting of two parts, 12 and 15, one of which, 12, is broadened, as at 13, and has its center cut away, the ends of the two arms thus produced forming journal-bearings, as shown, and the other part, 15, provided with journals 14 and lug 16, and an elastic device, 17, secured to part 12 and co-operating with lug 16, substantially as set forth.

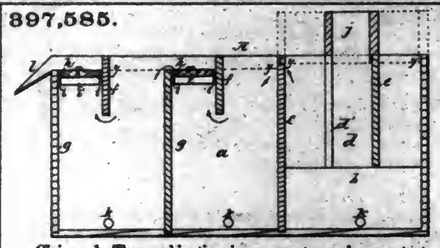
3. A garment for ladies' or gentlemen's wear provided with an ear-protecting attachment consisting of a pair of spring devices, each comprising a single vertical member having an elastic appliance secured thereto and hinged near its center, so as to fold backward or downward against the tension of said elastic appliance and provided at one end with a rigidly-fixed curved member which projects outward and downward at both sides of said vertical member and provides a concave surface adapted to snugly fit over the ear, substantially as set forth.

4. A garment for ladies' or gentlemen's wear provided with an ear-protecting attachment consisting of the metallic piece 21, which gives shape to the garment, in combination with a pair of spring devices appropriately secured to said garment-shaping piece and each consisting of a hinged vertical member provided at one of its ends with a curved member which projects outward and downward at both sides of said vertical member, substantially as set forth.

397,584. TRACK-CLEARER. GEORGE W. COOK, Mountain View, Cal. Filed Mar. 22, 1888. Serial No. 268,137. (No model.)

Claim.—1. The frame-strip C of the swather, having the prow-like front, in combination with the sliding extension-plate c^4 on said front, whereby said front may be extended as to height, substantially as herein described.

2. The frame-strip C of the swather, having an inclined prow-like front provided with a face-plate, in combination with a sliding extension-plate fitted by a side guide to said prow-like front of the frame, and adapted, also, when not in use to be turned over and serve as a face-plate for the top of the frame-strip, substantially as herein described.

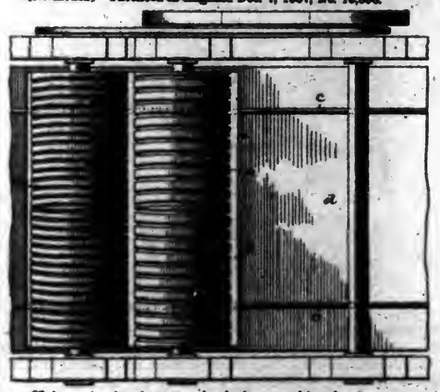


3. In a swather and in combination with its frame-strip having perforations, an inclined directing arm or arms having a head-piece, and the bolts for securing the head-piece of said arm or arms forward or back on the frame of the swather and changing their vertical inclination, substantially as herein described.

4. In a swather and in combination with the swather-frame strip having a series of adjusting-holes, a directing-arm, a head hinged thereto, and bolts passing through said head and into the adjusting-holes, whereby the arm is secured to the frame-strip and its inclination to the frame-strip varied, and means to secure said arm in its inclination, substantially as herein described.

5. In a swather and in combination with the frame having perforations, the inclined directing-arm F, having a head, bolts to enter said perforations, by which said head is secured in different positions on the frame, and the head hinged to said arm, whereby said arm may be moved forward or back, according to the position of the head, and means to secure said arm in its adjustment, substantially as herein described.

6. In a swather and in combination with the frame-strip having perforations, the upper arm, E, having a fixed head, and bolts passing into said perforations and adjustably securing the head, a lower directing-arm having a head hinged thereto, bolts adapted to adjustably secure the head, and means for securing said lower arm after the adjustment of its head, substantially as herein described.



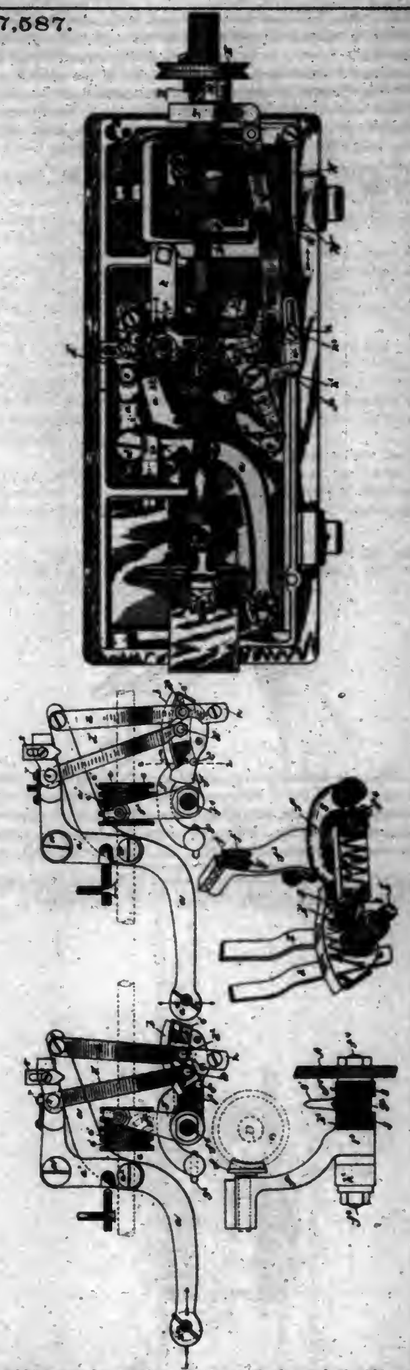
397,585. COMBINED SEPARATOR AND CONCENTRATOR. JOHN D. COPLIN, Denver, Colo. Filed Apr. 15, 1887. Serial No. 234,872. (No model.)

Claim.—1. The combination, in a separator and concentrator, of a receiving-chamber having grooved semi-partitions, a movable hopper located therein, one or more float-saving chambers, each having an upwardly-extending semi-partition and downwardly-extending semi-partitions, and screens located between such semi-partitions, consisting of upper and lower gauzes with an interposed packing of filtering material, whereby the water is caused to pass upward through the screens, leaving its suspended material below the screens, substantially as set forth.

2. A combined concentrator and separator, consisting of compartment *b*, provided with grooved semi-partitions *d d*, a movable hopper, *j*, sustained thereby, compartment *a*, having one or more upwardly-extending semi-partitions, *g*, one or more depending semi-partitions, *f*, and screens *h*, located between partitions *f* and *g*, and formed each of an upper and a lower wire-gauze with an interposed filtering material, substantially as set forth.

397,586. IRONING OR CALENDERING MACHINE. ROBERT CRAWFORD, Belfast, Ireland. Filed July 11, 1888. Serial No. 279,686. (No model.) Patented in England Dec. 7, 1887, No. 16,536.

Claim.—An ironing or calendering machine having a pressing roller or cylinder with its surface grooved, substantially as described, whereby there are formed continuous pressing-surfaces arranged spirally around the cylinder and divergent from the center thereof, whereby the article being operated upon is both stretched and pressed, substantially as set forth.



397,587. BUTTON-SEWING MACHINE. HENRY H. CUMMINGS, Malden, assignor to the Union Button Sewing Machine Company, Boston, Mass. Filed May 12, 1887. Serial No. 237,207. (No model.)

Claim.—1. In a button-sewing machine, the combination, with the machine-bed, a sewing mechanism, and a button-holder, of a button-holder-operating lever, *a*, and an angular arm or branch lever, *a'*, said arm or branch being pivoted to the bed and at one end pivotally connected with said lever, whereby either the pivotal connection of the lever with the arm or branch or the pivotal connection of the branch with the bed may be employed as the fulcrum of the lever in the operation of the latter, as set forth.

2. In a button-sewing machine, the combination, with the machine-bed, a sewing mechanism, and a button-holder, of a button-holder-operating lever, *a*, an angular arm or branch lever, *a'*, said arm or branch being pivoted to the bed and at one end pivotally connected with said lever, rods or bars pivotally connected with the free ends of said lever and arm or branch, an oscillating quadrant, and a block movable or adjustable on said oscillating quadrant to which the other ends of the rods or bars are pivoted, as set forth.

3. In a button-sewing machine, the combination, with the machine-bed, a sewing mechanism, and a button-holder, of a button-holder-operating lever, *a*, an arm or branch lever, *a'*, said arm or branch being pivoted to the bed and at one end pivotally connected

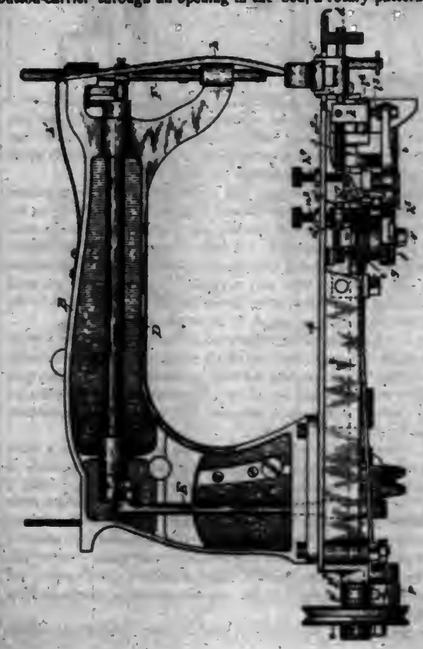
397,587.

with said lever, and a cam for operating on the free end of said branch lever, as set forth.

4. In a button-sewing machine, the combination, with the machine-bed, a sewing mechanism, and a button-holder, of a button-holder-operating lever, *a*, an angular arm or branch lever, *a'*, said arm or branch being pivoted to the bed and at one end pivotally connected with said lever, rods or bars *d d'*, the former pivotally connected with the free end of lever *a* and the latter detachably pivoted to the free end of branch *a'*, an oscillating quadrant, and a block movable or adjustable on said quadrant to which the other ends of rods or bars *d d'* are pivoted, as set forth.

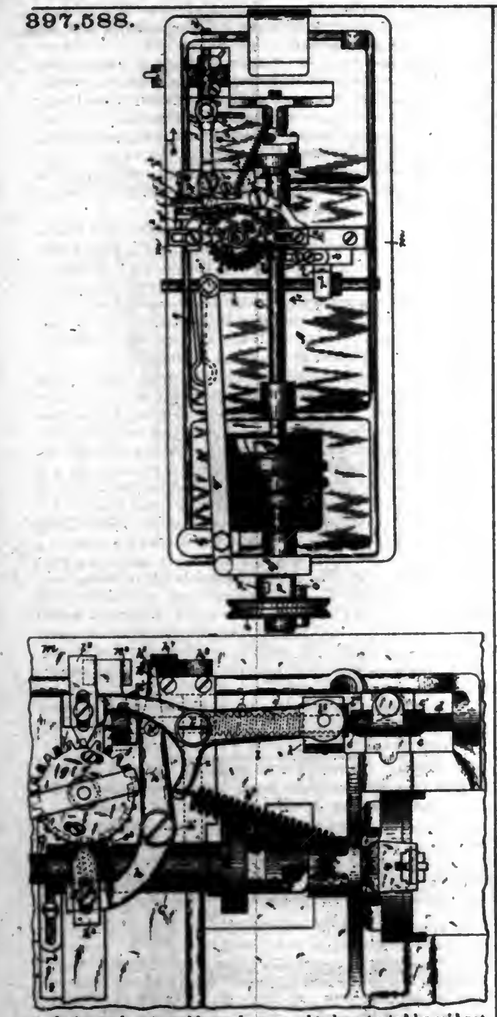
5. In a button-sewing machine, the combination, with the bed of the machine, a sewing mechanism, and a button-holder, of a button-holder-operating lever, *a*, branch *a'*, rods or bars *d d'*, the former pivoted to one end of said lever and the latter pivoted to one end of said branch, an oscillating quadrant, a block movable or adjustable on said quadrant, mechanism, substantially as described, for locking said block in one position on said quadrant, and devices, substantially as described, for unlocking or releasing said block to permit it to be moved to another position on said quadrant, as set forth.

6. In a button-sewing machine, the combination, with the machine-bed, a sewing mechanism, a button-holder, and a button-holder-operating lever, of a quadrant pivoted on the bed, a rod or link connecting the quadrant with the button-holder-operating lever, and means for oscillating said quadrant, each means consisting of a rotary cam, a pivoted switch-lever adapted to engage said cam and be oscillated thereby, and an arm, f^2, rigidly connected with said switch-lever and loosely connected with said quadrant, as set forth.



7. In a button-sewing machine, the combination, with a sewing mechanism, a button-holder, and button-holder-operating lever, of an oscillating grooved quadrant, a rod or link connecting the quadrant with the button-holder-operating lever, an oscillating switch-lever provided with a grooved arm, f^3, the bed of the machine provided with a slot, g^3, arm g', adjustably pivoted in said slot g^3, and blocks *g g*, adapted to slide in the groove of the said quadrant and arm f^3, to which blocks the other end of arm g' is pivoted, as set forth.

8. In a button-sewing machine, the combination, with the sewing mechanism, a button-holder, and button-holder-operating lever, of a quadrant, *b*, provided with a groove, b^3, a slide, *c*, in said groove, a rod or link connecting said slide with said button-holder-operating lever, and means for locking said slide in said groove and releasing the same, consisting of pin *o* and spring *o'*, a stud or bolt, *b'*, connected with said quadrant, in a hole or bore of which stud or bolt said pin and spring are arranged, pin *p*, a lever at one of its ends in contact with said pin, and a cam or wiper to act upon the other end of said lever, adapted to operate in slide *c*, as set forth.



9. In a button-sewing machine, the combination, with a button-holder-operating lever, of plate *v*, button-holder lever w_2, duplex button-holder *z*, thumb-pin *z'*, and spring w^3, as set forth.

397,588. BUTTON-SEWING MACHINE. HENRY H. CUMMINGS, Malden, assignor to the Union Button Sewing Machine Company, Boston, Mass. Filed May 16, 1887. Serial No. 238,263. (No model.)

Claim.—1. A sewing-machine bed and a sewing mechanism, combined with a button-carrier constructed and arranged to reciprocate on the bed, a shaft, *d*, and its bearings beneath the bed, said shaft being longitudinally movable in its bearings and connected with the button-carrier through an opening in the bed, a rotary pattern disk

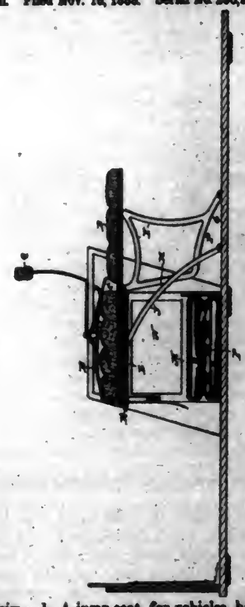
397,588.

or device, and a pivoted lever, *A*, arranged to be actuated by said pattern device and connected with said shaft, whereby the latter may be operated and the button-carrier moved in line with the axis of the shaft, substantially as hereinbefore set forth.

2. A sewing-machine bed and a sewing mechanism, combined with a button-carrier constructed and arranged to reciprocate on the bed, a rock-shaft, *d*, beneath the bed and connected with the button-carrier through an opening in the bed, a rotary pattern disk or device, and a pivoted lever, *l*, arranged to be actuated by said pattern device and connected with said rock-shaft, whereby the rock-shaft may be operated and the button-carrier moved at right angles to the axis of the rock-shaft, substantially as hereinbefore set forth.

3. A sewing mechanism, combined with a button-carrier, a rock-shaft and its bearings, said rock-shaft being longitudinally movable in its bearings and connected with the button-carrier, two rotary pattern disks or devices, and two pivoted levers arranged to be actuated by said pattern device and connected with said rock-shaft, substantially as hereinbefore set forth.

4. A sewing mechanism, combined with a button-carrier, a rock-shaft and its bearings, said rock-shaft being longitudinally movable in its bearings and connected with the button-carrier, a rotary shaft, a worm thereon, a worm-gear actuated by said worm, interchangeable pattern-disks connected with said worm-gear, levers intermediate of said pattern-disks and longitudinally-movable rock-shaft and actuated by said disks, said levers being connected with said shaft, whereby said shaft may be rocked and moved longitudinally in one direction, and springs to move said shaft in the opposite direction, substantially as hereinbefore set forth.



5. The bed of a button-sewing machine and a sewing mechanism, combined with a button-carrier located upon or above the bed, a rock-shaft and its bearings located below the bed, said rock-shaft being longitudinally movable in its bearings, and connections between the rock-shaft and button-carrier, whereby the bed of the machine may be left free of means for operating the button-carrier, and by rocking said shaft and moving it longitudinally in its bearings the button-carrier may be moved to properly present the button to the needle of the sewing mechanism, substantially as hereinbefore set forth.

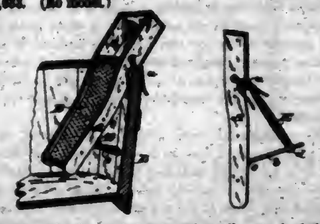
397,589. SAIL. WILLIAM P. CUTLER, Baltimore, Md. Filed Sept. 6, 1888. Serial No. 284,702. (No model.)

Claim.—A reversible diagonal-cut two-part sail formed of widths or strips of cloth, C and D, the seams of which run in reverse or diverging directions from the middle line of the bolt-rope H or completed sail to the leech-rope E and foot-rope F of the sail, the diverging seams in the respective portions of the sail being parallel, as set forth.

397,590. VEHICLE-SEAT. JOSEPH F. GOODRICH, New Haven, Conn. Filed Nov. 16, 1888. Serial No. 290,985. (No model.)

Claim.—1. A jump-seat for vehicles, having an independently-movable back and means for supporting such back in a horizontal position independent of the adjustments of other parts of the vehicle, substantially as set forth.

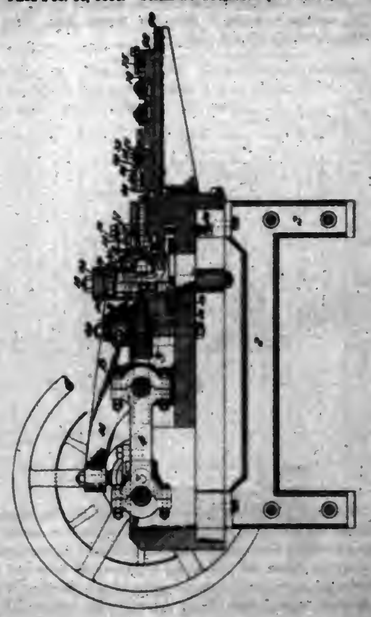
2. A jump-seat for vehicles, having an independently-movable back and means for supporting such back in a horizontal position and disconnected from it to permit it to be used as a seat or as a back independent of the adjustments of the other parts of the vehicle, substantially as set forth.



3. The combination, in a vehicle, with a seat, of a jump-seat adapted to be used by itself and to be jumped over and upon the other seat and having a movable or hinged back, and means for supporting such back in a horizontal position to form a seat, substantially as set forth.

4. A jump-seat for vehicles, having a hinged back and a frame pivoted to the seat and to the vehicle-body and supporting the seat in its ordinary position and the seat-back when the seat is jumped forward and the back turned down to form a seat, substantially as set forth.

5. A jump-seat for vehicles, having a hinged back and pivotal frames pivoted to the seat and to the vehicle-body, and having seat-bearings upon which the seat rests when in its normal position, and arms which support the seat in such position and the seat-back when the seat is jumped forward and the back turned down to form a seat, substantially as set forth.



6. A jump-seat for vehicles, having a hinged back and two light skeleton metal frames pivoted to such seat and to the vehicle-body and adapted to support the seat when in its ordinary position and its back when the same is turned down to form a seat, substantially as set forth.

397,591. WASH-BOARD. HENRY C. HALL, Canton, Ohio, assignor of one-half to E. L. Vickers, same place. Filed Mar. 8, 1888. Serial No. 266,653. (No model.)

Claim.—The side pieces, A, having pivotally attached thereto the embracing-hoops *a*, the pivoted brace *b*, and the link E, substantially as and for the purpose specified.

397,592. WIRE-NAIL MACHINE. HENRY B. HAPPS, Pittsburg, Pa. Filed Feb. 16, 1888. Serial No. 264,302. (No model.)

Claim.—1. In a wire-nail machine, the combination, with the driving-shaft, of a pillow-block, boxes in the pillow-block, and a key, substantially as and for the purposes described.

2. In a wire-nail machine, the combination, with cutters, of a housing whereon they are mounted, said housing being adjustably movable, and a sliding key bearing on the housing for moving the same, substantially as and for the purposes described.

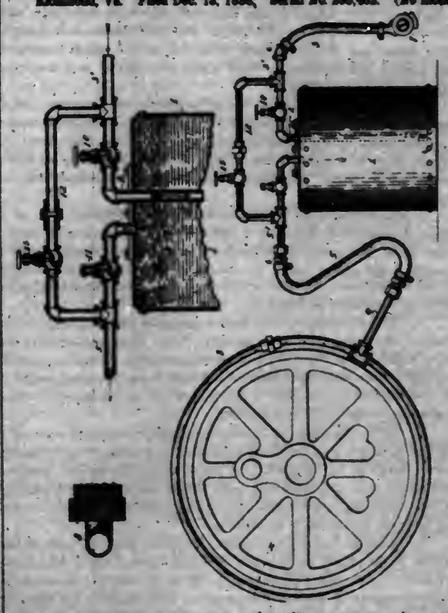
3. In a wire-nail-cutting machine, the combination, with a longitudinally-adjustable housing for the cutter-heads, of cutter-heads mounted thereon, one of said cutter-heads being longitudinally adjustable thereon, substantially as and for the purposes specified.

4. In a wire-nail-cutting machine, the combination, with a longitudinally-adjustable housing for the cutter-heads, of cutter-heads mounted thereon, one of said cutter-heads being longitudinally adjustable on the housing, and laterally and vertically adjustable cutters mounted on the cutter-heads, substantially as and for the purposes specified.

5. In a wire-nail machine, the combination, with a lever, a cam having an incline and a groove, said lever being secured to one end of a rock-shaft, of two arms secured to the other end of said rock-shaft and provided with anti-friction rollers which bear upon said cam, whereby a positive motion is imparted to the rock-shaft, substantially as and for the purposes specified.

6. In a wire-nail machine, the combination, with a feed-carriage, of a movable feed-dog mounted thereon in an inclined slideway, substantially as and for the purposes described.

7. In a wire-nail machine, the combination, with a moving feed-carriage, of a feed-dog mounted thereon in a way inclined to the course of the wire, substantially as and for the purposes described.



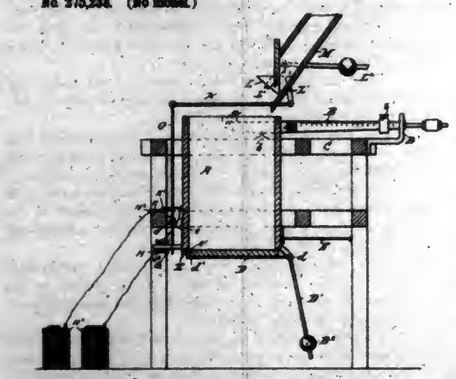
8. In a wire-nail machine, the combination, with a movable feed-carriage, of a feed-dog mounted thereon in a way inclined to the course of the wire, and a spring which bears on the dog, substantially as and for the purposes described.

9. In a wire-nail machine, the combination, with a moving feed-carriage, of a feed-dog mounted thereon in a way inclined to the course of the wire, and a rod, 75, whereby the dog is moved, substantially as and for the purposes described.

10. In a wire-nail machine, the combination, with the two jaws of the feed-dog, of set-screws bearing on the jaws, whereby the opposite jaws are adjustable to and from a common center, substantially as and for the purposes specified.

11. In a wire-nail machine, the combination, with a moving feed-carriage, of a feed-dog mounted thereon in a way inclined to the course of the wire, a rod, 75, whereby the dog is moved, and an eccentric acting on the rod, substantially as and for the purposes described.

397,593. TIRE-HEATING APPARATUS. WILLIAM HANSHAW, Richmond, Va. Filed Dec. 13, 1888. Serial No. 293,402. (No model.)



Claim.—1. In a tire heating and cooling apparatus, the combination of a reservoir or tank, a valved air-supply pipe communicating therewith and adapted to be connected with an air-pump, an annular

distributing-pipe, a valved outlet-pipe intermediate of the tank and distributing-pipe, and a valved branch pipe connected to said air supply and outlet pipes at points on opposite sides of the valves thereof, as and for the purpose described.

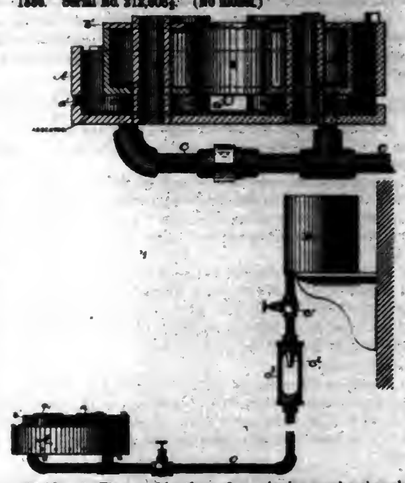
2. In a tire heating and cooling apparatus, the combination of a tank or reservoir having an absorbent porous filling adapted to contain a liquid hydrocarbon, an air-supply pipe passing through said filling within a short distance from the base of the tank, and having a cock or valve, 10, an air-pump connected to said pipe, an annular distributing-pipe, an outlet-pipe connected to said distributing-pipe and the tank, and having a check-valve, 11, and a branch pipe, 12, connected to the air supply and outlet pipes on opposite sides of the valves 11 12 thereof, and having a cock, 13, substantially as and for the purpose described.

397,594. ELECTRO-MAGNETIC GRAIN-SCALE. WILLIAM A. HOLLEY and ULRIK MALIE, Holland, Mich. Filed May 26, 1888. Serial No. 275,233. (No model.)

Claim.—1. The combination, in an electro-magnetic weighing-scale, of a frame, a scale-beam, a hopper supported thereby, a counterbalanced discharge-valve, a detent upon the hopper, electro-magnets, an armature secured to said detent, an electric circuit, and contact-points located, respectively, upon said hopper and frame, substantially as described.

2. The combination, in an electro-magnetic weighing-scale, of a frame, a scale-beam, a vertically-movable hopper supported thereon, a discharge-valve hinged to said hopper, a stay-hook connecting one side of said vertically-movable hopper with said frame, a discharge-valve detent and electro-magnets located upon the opposite side of said hopper, and an armature held within the field of said magnets, substantially as described.

3. The combination, in an electro-magnetic weighing-scale, of a frame, C, a scale-beam, B, a hopper, A, supported upon said scale-beam, a supply-spout, M, a counterbalanced supply-valve, L, crank-arms L', upright lever O, link N, electro-magnets H, and contact-plates K K', located, respectively, upon said frame and hopper, substantially as described.



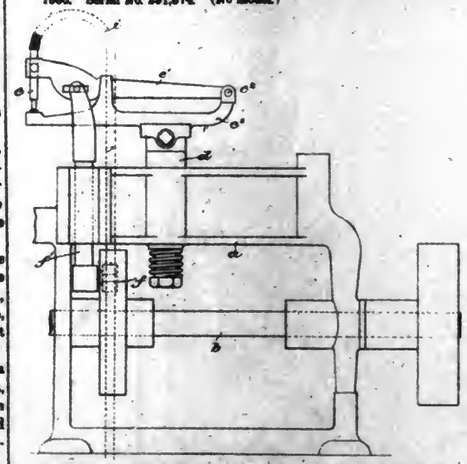
4. The combination, in an electro-magnetic weighing-scale, of a frame, a scale-beam, a hopper, a supply spout and valve, a discharge-valve upon the hopper, a discharge-valve detent, electro-magnets for operating said detent, and a lever-connection between the armature of said electro-magnets and supply-valve for electrically actuating the same, substantially as described.

5. The combination, in an electro-magnetic weighing-scale, of the frame C, the hopper A, the scale-beam B, the discharge-valve D, the valve-detent E, the armature I, secured thereto, the electro-magnets H, arranged in a circuit controlled by said scale-beam, the supply-valve L, the crank-arms L', the link N, and the rod O, all arranged for joint operation substantially as described.

6. The combination, in an electro-magnetic weighing-scale, of a hopper, a supply-valve, a discharge-valve, a discharge-valve detent, electro-magnets for operating the same, a lever-connection between said supply-valve and discharge-valve detent, and a lock-lever adapted to lock said supply-valve until the discharge-valve detent is in working position, substantially as described.

7. The combination, in an electro-magnetic weighing-scale, of the hopper A, the supply-valve L, the discharge-valve D, the detent E, the armature I and stud e', arranged to form the angular recess i, the electro-magnets H, the lever-connections O, N, and L', the plate Q', having arms Q and inclined recesses g the rod P', and the lock-lever P, consisting of the front transverse portion, p, and the rearwardly-extending arms p', substantially as described.

397,595. BURNER FOR LIQUID HYDROCARBONS AND VAPORS THEREOF. WARREN T. KELLOGG, Lansingburg, N. Y. Filed Sept. 3, 1886. Serial No. 212,603. (No model.)

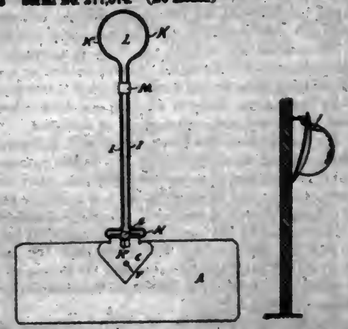


Claim.—1. The combination of a primary combustion-chamber provided with a series of vertical air-tubes which have a free opening through them from top to bottom, a vaporizing-chamber fixed within said combustion-chamber so as to leave a clear space between the sides and bottoms of the two chambers, the air-tubes of said combustion-chamber passing loosely through the top and bottom plates of said vaporizing-chamber, and an oil-pipe arranged to deliver its supply of oil primarily into the vaporizing-chamber, as and for the purpose herein specified.

2. The combination, with a casing, A, provided with standing air-tubes a, and having a bottom layer of asbestus or other absorbent material, of a vaporizing-chamber, B, contained in said casing, and having the air-tubes a passing therethrough, so as to leave leaky joints around said tubes at the top and bottom of said chamber, and an oil-supply pipe, C, adapted to primarily feed the supply of oil into the vaporizing-chamber B, all being arranged to operate as herein specified.

397,596. WITHDRAWN.

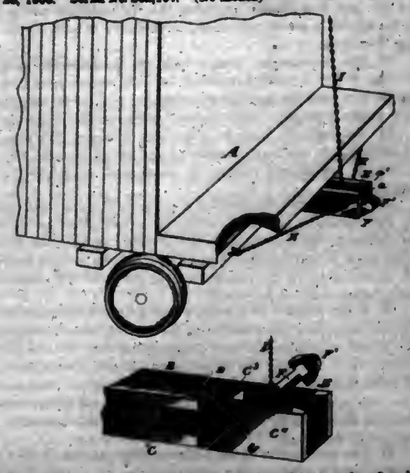
397,597. EYELETING-MACHINE. HARRY S. LYLE, North Brookfield, assignor to Alfred H. Batcheller, Boston, Mass. Filed Nov. 20, 1888. Serial No. 291,374. (No model.)



Claim.—In an eyeleting-machine, the tubular eyelet-punch and mechanism for moving it, combined with a delivery or conveying tube of spirally-wound wire attached to and forming a continuation of the tubular eyelet-punch, for delivering or conveying from the machine the eyelet-pieces punched from the material, the vibration of the tube moving said eyelet-pieces freely therethrough, substantially as described.

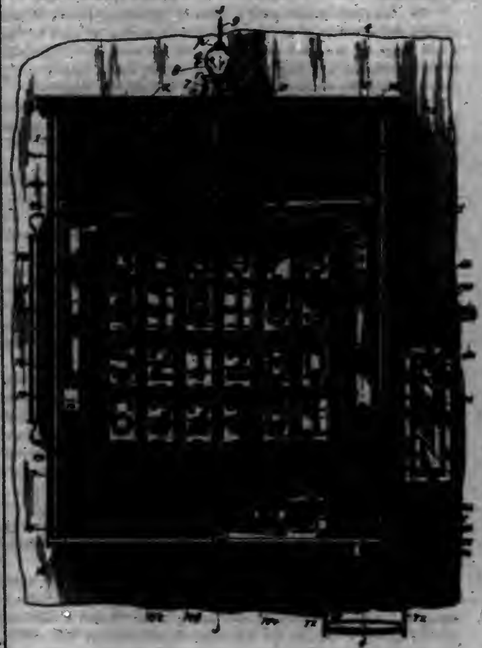
397,598. CARPET-FASTENER. CARSON L. MCCLEARY, Jerusalem, Ohio. Filed Oct. 3, 1888. Serial No. 287,101. (No model.)

Claim.—The herein-described binder and fastener for carpets, composed of a strip having a groove or channel in its under side and having bearing-faces on each side of the said groove or channel to rest upon and clamp the carpet between them and the floor, and a binding-strip adapted to be inserted in the said groove or channel and come flush with the said bearing-faces and clamp the carpet between it and the walls of the said groove or channel, substantially as described.



397,599. HAT-HANGER. THEODORE R. MCDONALD, Northville, Mich., assignor to George W. Huntley, same place. Filed June 14, 1888. Serial No. 277,074. (No model.)

Claim.—1. In a hanger for hats, a plate for attachment to the hat, a clip embracing the edge of said plate, provided with hinge-bearings and a spring, and a hanger pivoted in said bearings, provided with a projection on its heel for engagement with the spring, and at its opposite end with a clasping device for suspending the hat, as and for the purpose set forth.



2. In a hanger for hats, a plate, a clip embracing the edge of said plate, provided with hinge-bearings and a spring, and perforations in the plate, in combination with a pin adapted to be inserted in the perforations and through the hat, with a hanger pivoted in the hinge-bearings, provided with a projection upon its heel for engagement with the spring on the clip, as and for the purpose set forth.

397,600. CAR-COUPLING. ARTHUR MCLEAN, Bettington, assignor of one-half to Jefferson Valentine Knight, Orpha, W. Va. Filed Nov. 28, 1888. Serial No. 292,107. (No model.)

Claim.—The combination, with a car and its truck, of a draw-head secured to the truck and having its free end rounded and provided with a horizontal recess, a bumper cast in a single piece and provided with a horizontal tenon adapted to fit within the horizontal recess in the draw-head, a chamber open at its top and end formed within the bumper, a latch pivoted at one of its ends within said chamber and provided at its free end with an arrow-shaped head, chains H, connecting the bumper with the truck, and chain I, connecting the latch with a point upon the roof of the car, substantially as described.

397,601. FARE-REGISTER. JOHN W. MEAKER, Chicago, Ill., assignor to the Railway Register Company, same place. Filed Jan. 19, 1888. Serial No. 261,220. (No model.)

Claim.—1. The combination, with the chains of a fare-register, of a pull-bar, 10, having side arms, sliding blocks connected with said arms, a bar carried by the sliding blocks, and pawls on the bar for advancing the chains, substantially as described.

2. The combination of a pull-bar, 10, having side arms, connecting-pins 17, tapered both ways, sliding blocks 18, connected with the side arms by the pins, a supporting-bar carried by the blocks, and actuating-pawls on the bar, substantially as described.

3. The combination of a pull-bar, 10, having side arms, sliding blocks connected with the arms and tubes 20 and 21, and posts 23, affording supports and guides for the blocks, substantially as described.

4. The combination of the pull-bar 10, side arms, 11 and 12, pins 17, tapered both ways from the center, and sliding blocks 18, with the tubes 20 and 21 and posts 23, substantially as and for the purpose specified.

5. The combination, with the fare-register chains and their pivot-pins, of the plates 24, connected by transverse tubes 26, and having flanges 25 and 26, forming a trackway for the chain-pivots, substantially as described.

6. The combination, with the chains of a fare-register, of the actuating-pawls, each formed with side flanges and a perforated head, the pivot-wire 45, passing through the heads, and the reciprocating bar carrying the pivot-wire, substantially as described.

7. The combination, with the chains of a fare-register, of reciprocating bar 47, having recesses 49, provided with inclined faces, the pivot-wire 45, carried by the bar, and chain-actuating pawls carried by the pivot-wire, substantially as described.

8. The combination, with the chains of a fare-register, of the reciprocating bar 47, having recesses 49, provided with inclined faces, the pivot-wire 45, carried by the bar, a series of actuating-pawls having side flanges and mounted on the pivot-wire, and a spring, 46, for each pawl, arranged on the pivot-wire and bearing on the bar, substantially as described.

9. The combination, with the chain-links and the pivot-pin 35, therefor, of a catch, 50, having a flange, 51, with a recess, 52, having

a straight wall, 53, and a curved wall, 54, for engaging the end of the pin 35 and locking the chain against back rotation, substantially as specified.

10. The combination, with the chain-links and the pivot-pin 35 therefor, of a catch, 50, having on each side a flange, 51, with recesses 52, for engaging the end of the chain-pivot and holding the chain against back rotation, substantially as specified.

11. The combination, with the chain-links, the pivot-pin 35 therefor, the catch 50, having a flange, 52, and pivot-rod 55, of a spring, 56, and a stop-rod, 57, for holding the catch 50 engaged, substantially as described.

12. The combination, with a series of registering-chains formed of links connected by pivots 35, of a series of catches, 50, each having a side flange, 51, provided with a notch, 52, a pivot-wire, 55, common to all the catches, a spring, 56, for each catch, and a stop-wire, 57, for the springs 56, substantially as and for the purpose specified.

13. The combination, with the chain-links, the pivot-pin 35 therefor, and the main pull, of a stop-finger, 58, rock-shaft 59, and means for rocking the shaft from the main pull to release the finger, substantially as specified.

14. The combination, with the chain-links, the pivot-pin 35 therefor, and the main pull, of a stop-finger, 58, a rock-shaft, 59, an arm, 60, carrying a pin, 61, and a cam, 62, on the arm of the pull-bar for operating the stop-finger, substantially as and for the purposes specified.

15. The combination, with a series of registering-chain links, pivots 35 therefor, and the pull-bar 10, having arms, of a series of stop-fingers, 58, a rock-shaft common to all the fingers, an arm, 60, carrying a pin, 61, and a cam, 62, on an arm of the pull-bar for releasing and engaging the stop-fingers and pivots 35, substantially as and for the purpose specified.

16. The combination of the chain-links having the pivot-pins 35, the rock-shaft 59, having stop-fingers 58, and provided at one end with an arm, 60, having a cam, 63, and lateral pin 61, the pull-bars 10 and 65, a set of pawls connected with each pull-bar, and means, substantially as described, for acting on the cam and pin of the arm by the movements of the pull-bars to turn the rock-shaft and swing the fingers, substantially as described.

17. The combination, with the chain-links and the pivot-pin 35 therefor, of a pull-bar, a stop-finger, 58, rock-shaft 59, arm 60, having a cam, 63, and a cam, 64, on the pull-bar for resetting a trip-register, substantially as and for the purposes specified.

18. A rod, 59, carrying a series of stop-fingers, 58, and an arm, 60, carrying a pin, 61, and having a cam, 63, in combination with a main pull-bar provided with an arm having a cam, 62, and a resetting pull-bar having a cam, 64, for operating the stop-fingers from either pull, substantially as described.

19. The combination, with the chains, the supporting-frames 24, and the projecting pivot-pins 35, of pivoted stop-catches 50, composed of plates having notched side flanges to engage the projecting ends of the pivots, substantially as described.

20. The combination, with the chains, the supporting-frames 24, and pivot-pins 35, of the pivoted catches 50, each having notches provided with the straight face 53 and curved face 54, substantially as described.

21. The combination, with the frames 24, the chains, and the projecting pivot-pins 35, of the catches pivoted above the chains and having side flanges, 51, provided with notches having straight faces 53 and curved faces 54, substantially as described.

22. The combination, with the casing, the chains, the resetting pull-bar 65, and its pawls for resetting the trip-chains, of a slotted tube located in the casing and inclosing and forming a bearing for the said pull-bar, substantially as described.

23. The combination, with the chains of the trip-register, of the pull-bar 65, the pawl-supporting bar 77, projecting at right angles therefrom and provided with recesses 78, and the resetting-pawls 80 and 81, pivoted in said recesses of the supporting-bar, substantially as described.

24. In combination with the pull-bar 65, bearing tube 66, bar 77, provided with recesses 78, having inclined faces, and pawls 80 and 81, with the pivot-wire 82, springs 83, and the chains of a trip-register for resetting the chains, substantially as specified.

25. The combination, with the trip-chains and the canceler therefor, of the tube 66, having the slot 84, the pull-bar inclosed and guided by the tube, the plate 87, having the stop 88 and the lateral arm 86, projecting through the slot in the tube, the shaft 97, having the arm 96 and connected with the canceler, the spring 97, and the resetting-pawls connected with said pull-bar, substantially as described.

26. The combination, with the trip-chains having pins 102 and 103, the pull-bar 65, and the resetting-pawls, of the cancelers 100 and 105, the shafts 97 and 106, having arms 96 and 108, the plate 93, having the stop 94, the plate 87, having the stop 88 and arm 86, and springs 95, substantially as described.

27. The combination, with the trip-chains having pins 102 103, the tube 66, having the slot 84, the pull-bar 65, inclosed by the tube, and the resetting-pawls connected with the pull-bar, of the plate 92, carrying the pivot 90, the cancelers 100 and 105, the shafts 97 and 106, having arms 96 and 108, the pivoted plate 93, the pivoted plate 87, having the ear 110, and the arm 86, extending through the slot in the tube, and the springs 95, substantially as described.

28. The plate 87, having the ear 110, and plate 93, having the stop 94, in combination with the trip-chains, a stop-arm, 108, shaft 106, and canceler 105, for operating the canceler, substantially as specified.

29. The arm 86, plate 87, having a stop, 88, and ear 110, in combination with the cancelers, the trip-chains, and the plate 93, having the stop 94, for operating the cancelers for a trip-register chain by the movement of the arm 86, substantially as described.

30. The plates 87 and 93, each having a stop, a spring, a pivot for the plates, and a connection between the two plates, in combination with the cancelers 100 and 105, and a connection between each canceler and the stop of the plate for operating the cancelers, substantially as specified.

31. The pull-bar 65, having the incline 85, tube 66, having the slot 84, arm 86, plate 87, having the stop 88, ear 110, plate 93, having the stop 94, pivot 90, and spring 95, in combination with the stop-arms 96 and 108, shafts 97 and 106, springs 98 and 107, and cancelers 100 and 105, substantially as and for the purpose specified.

32. The combination, with the trip-chain, of a canceler movable across the chain, a shaft carrying the canceler and having a stop-arm, a pivoted swinging plate having a stop to engage the stop-arm, and a stop-pin for limiting the throw of the stop-arm when released from the stop of the pivoted plate, substantially as described.

33. The combination, with the cancelers, the trip-register chains, the resetting pull-bar for a trip-register, and an arm operated by the movement of the pull-bar, of pivoted swinging stop-plates, one engaging the other by a lip, and actuated by the arm to release the cancelers for the chains of the trip-register, substantially as specified.

34. The pull-bar 65 and bar 114, having pin or pivot 115, in combination with the cancelers, the chains, the plate 116, having the groove 117, and the guide 118, for preventing the turning of the plate without operating the canceling devices for the chains of a trip-register, substantially as specified.

35. The combination, with the chains, the actuating-pawls, and the pull-bar for moving the pawls, of the stop-pins 123 and 124, and the vibrating arm 119, pivoted on the pull-bar, and having recesses 122 at one end and hooks 121 at the other end, substantially as described.

36. The combination, with a pull-bar, 10, and a vibrating arm, 119, having hooks 121 and recesses 122, of a series of pins 123 and a series of pins 124, for locking the pull-bar against return until the full travel has been made, substantially as specified.

37. The combination, with a pull-bar, 10, and vibrating arm 119, having hooks 121 and recesses 122, of a series of pins 123 and a series of pins 124, and stops for engaging the end of the vibrating arm at the limit of the pull for turning the arm, substantially as and for the purposes specified.

38. The combination, with the pull-bar 10, of a vibrating arm, 119, having a frictional contact for holding the arm against movement by a jar, and stop-pins for engaging the vibrating arm and locking the bar against a return movement, substantially as and for the purposes specified.

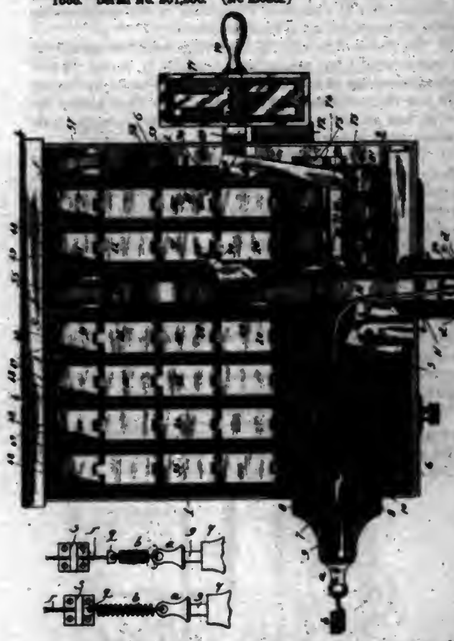
39. The combination, with a bell, 130, hammer 131, cam 135, and stem 136, of a pull-bar, a sliding bar, 141, carrying the stem, and a connection between the sliding bar and the pull-bar for sounding an alarm at the completion of the registry, substantially as specified.

40. The bell 130, hammer 132, roller 134, cam 135, stem 136, and shaft 137, in combination with the spring 138, bracket 140, sliding bar 141, pin 143, and pull-bar 10, substantially as and for the purposes specified.

41. A fare-register comprising a casing having the edge opening 155, and containing numeral-bearing devices and means for operating said devices to register the fares, and provided with the seal 153, the sliding cover 3, carrying spring-pawls 147, and the pivoted lever-arm 149, extending across the seal and having the plate 148 to move the pawls, substantially as described.

42. A fare-register comprising a casing having the edge opening 155, and containing numeral-bearing devices and means for operating said devices to register the fares, and provided with the seal 153, the sliding cover 3, carrying the spring-pawls 147, the pivoted lever-arm 149, extending across the seal, the bar 152 behind the seal, and the screw 151, passing through the bar, to hold the seal and prevent the unlocking movement of the lever-arm until the seal is broken, substantially as described.

43. The combination, with a fare-register having its face-plate provided with a sight-opening and key-holes, of a vertically-sliding plate having a notched locking-bar, 163, the recessed spring-fingers 165, and the recessed bar 168, substantially as described.



44. The combination, with the casing of a fare-register having an edge opening and a frangible seal, of a sliding face-plate or cover provided with locking devices located on its inner side to engage behind the edge of the said opening, and an adjustable plate mounted on the casing and concealed behind the seal to move the locking devices into line with said edge opening, substantially as described.

45. A face-plate having a sight-opening and carrying a covering-plate for the sight-opening having a locking-bar, in combination with spring-fingers coacting with the locking-bar to lock the covering-plate in a closed or open position, substantially as specified.

46. A face-plate provided with a sight-opening and with key-slots having a larger diameter at one end than at the other, and a covering-plate carried by the face-plate and having a locking-bar, in combination with spring-fingers having notches and coacting with the locking-bars and keys having unlocking-pins of different diameters, substantially as and for the purpose specified.

47. A face-plate having an opening, in combination with a covering-plate for the opening, a locking-bar, 163, having slots 164, spring-fingers 165, having recesses 166, and support 168, having recesses 167, for locking the covering-plate either open or closed, substantially as and for the purposes specified.

397,602. FARE-REGISTER. John W. Meaker, Chicago, Ill., assignor to the Railway Register Company, same place. Filed Jan. 19, 1888. Serial No. 261,230. (No model.)

Claim.—1. The combination of a casing, the traveling chains therein, a pull-bar, 15, having a direct reciprocating movement, and actuating-pawls carried by said pull-bar to advance the chains, and a side pull-bar, 9, sliding lengthwise in the casing and connected with the pull-bar carrying the pawls, substantially as described.

2. The combination, with a casing, traveling register-chains therein, a pull-bar, 15, having a direct reciprocating movement, and pawls carried by said pull-bar to advance the chains, of a wheel, 12, mounted in bearings located inside the casing, a side pull-bar, 9, sliding lengthwise through the casing, and a strap, 11, passing over the wheel and connecting the two pull-bars, substantially as described.

3. The combination, with registering devices and a casing inclosing the same, of a lengthwise-reciprocating rigid pull-bar arranged and guided in the casing and carrying actuating-pawls, and a rigid side pull-bar sliding lengthwise through the side of the casing, a flexible connection, 11, between the pull-bars, and a support for the flexible connection inside the casing, substantially as described.

4. The combination, with the casing and the traveling chains of a register, of a reciprocating pull-bar, 15, having longitudinal slots, grooved wheels having the hubs between the flanges arranged, respectively, in the slots of the pull-bar for carrying and guiding the latter, pawls for advancing the chains, a side pull-bar, and a connection between the pull-bars, substantially as described.

5. The combination, with registering devices of a register, of a lengthwise-reciprocating pull-bar having slotted ends, and grooved carrying-wheels having the hubs between their flanges extending through the slots in the bar, substantially as described.

6. The combination, with the register-chains, of a lengthwise-reciprocating pull-bar having a slot at each end, grooved wheels having hubs respectively extending through the slots of the bar, and pawls for advancing the chains, substantially as described.

7. The combination, with the registering-chains, of a reciprocating pull-bar having a solid portion, 18, and a slot in each end, grooved wheels having the hubs between their flanges respectively extending through the slots, bearings for the wheels, a pawl-carrying bar secured to the solid part of the pull-bar, and the pawls on the said carrying-bar, substantially as described.

8. The combination, with the registering devices of a register, of a longitudinally-slotted pull-bar, carrying and guide wheels, each comprising two flanges embracing the bar and connected by a hub extending through the slot, bearings passing through the hubs, and pawls operated by the pull-bar, substantially as described.

9. The pull-bar 15, having a slot at each end, and grooved wheels 20 and 22, in combination with the tubes 23, 24, and 25, for supporting the grooved wheels, substantially as set forth.

10. The tubes 23, 24, and 25, in combination with the frame-plates 26, grooved wheels 20 and 22, and pull-bar 15, substantially as and for the purposes specified.

11. The combination, with the chains of a register, of the rock-shaft 51, having stop-fingers 50 and arms 55 and 57, the pull-bar 15, having a cam, 56, and the pull-bar 60, having a cam, 58, for releasing the stop-fingers by the movement of either bar, substantially as described.

12. The combination, with the trip-chains of a register, of the resetting-bar 60, having the lateral bar 69, provided with a handle, 70, the guide-plate 72, and the plate 71, journaled on the lateral bar, substantially as described.

13. The bar 60, having a slot at each end, and a groove, 63, in its side face, in combination with the grooved wheels having one flange of a diameter to fit within the groove 63, for guiding and supporting the pull-bar 60, substantially as and for the purpose specified.

14. The combination of the register-chains, the pawls, the pull-bar 60, having a slot at each end, the grooved wheels carrying and guiding the bar, the tubes 68, and the tubes 25, substantially as described.

15. The tubes 23, 24, 25, and 68, in combination with the frame-pieces 26, pull-bars 15 and 60, and grooved guiding and carrying wheels for the pull-bars for securing the several parts together, substantially as described.

16. The combination, with the pull-bar and bell of a register, of a bell-hammer having an engaging projection and a cam having steps coacting with the projection to prevent the return of the pull-bar until the limit of the pull is reached, substantially as described.

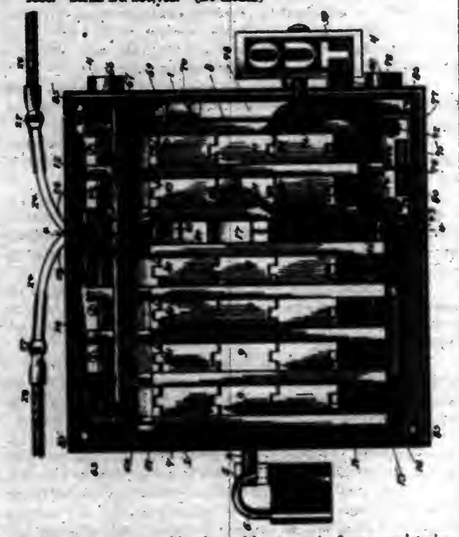
17. The bell-hammer 101, having a cam, 102, and stepped cam 103, in combination with a bell, a pull-bar, 15, the stem 104, and spring 106, substantially as and for the purposes specified.

18. The combination, with the pull-bar of a register and a bell, of a bell-hammer having an engaging projection, and a fixed stepped cam, 103, having engaging-notches *m*, coacting with the projection to prevent the return of the pull-bar in either direction until the limit of the pull is reached, substantially as described.

19. The pull-bar 15, bushing 106, ring 107, spring 108, and pin 109, in combination with the stem 104, stepped cam 103, cam 102, bell-hammer 101, and bell 99, substantially as and for the purposes specified.

20. The combination, with the bell and pull-bar of a register, of a swinging stem connected with the pull and having a hammer provided with a projection, a stepped cam coacting with the projection, and a coiled spring connected at one end with the pull-bar and at the other end with the swinging stem to throw the hammer and sound the alarm and to restore the hammer to its normal position after the alarm has been sounded, substantially as described.

21. A fare-register consisting of a casing having edge notches, *o*, and containing numeral-bearing devices and means for operating the same to register the fares, and provided with a frangible seal, 120, a sliding face-plate, 110, having spring-catches 112, a slotted slide-plate behind the seal for releasing the catches, and a set-screw, 116, to secure the sliding plate in a fixed position behind the seal and hold the latter in place, substantially as described.



22. The combination, with the pull-bar 15 and a bell of a register, of a stem, 104, having a bell-hammer, 101, provided with a projection, 102, a stepped cam having notches *m*, a lengthwise-sliding side pull-bar, 9, a connection, 11, between the two pull-bars, the pull-cord *r*, and the spring *b*, connecting the cord and side pull-bar to relieve strain when the bell-hammer engages the notches of the stepped cam, substantially as described.

23. A fare-register comprising a casing having a notched edge *o*, and a frangible seal, 120, and provided with numeral-bearing de

vices, means for operating the same to register the fare, the sliding face-plate having spring-catches 112, the support 116 behind the seal, the slotted sliding plate 114, and the set-screw 113 in said support passing through the sliding plate and bearing upon the seal, substantially as described.

24. The combination, with the casing and the registering-chains of a register, of an air-cushion cylinder secured on and carried by the casing, and a pull-bar carrying chain-actuating pawls and having a disk entering the cylinder to prevent a quick return of the pull-bar after its advance to move the chains, substantially as described.

397,608. FARE-REGISTER. JOHN W. MEAKER, Chicago, Ill., assignor to the Railway Register Company, same place. Filed July 23, 1888. Serial No. 280,782. (No model.)

Claim.—1. The combination, with the main frame, registering chains, and chain-actuating mechanism of a fare-register, of a supporting-piece, 16, having a chamfer, 15, the chain-frames having flanges 14, seated on the chamfer, and the clamping-plates 12, secured to the chamfered piece and bearing against the flanges of the chain-frames, substantially as described.

2. The combination, with the frame and the numeral-bearing devices of a fare register, of a main pull-slide, 17, located in the frame, and a pull-strap, 24, divided longitudinally into parts of equal length, each extending into the frame through an opening and connected to said slide, substantially as described.

3. The combination, in a fare-register, of a main frame having an opening, 25, numeral-bearing chains, and chain-frames, of a guided main pull-slide, 17, for actuating the chains, and a pull-strap, 24, divided longitudinally into two parts of equal length, each extending into the frame through said opening and secured to the said slide, substantially as described.

4. The combination, in a fare-register, of the bell and the main pull-slide 17, having a pull-strap connected with one side thereof, a bell-hammer secured to the slide in a direct line with the pull-strap, and a stepped cam, 33, located in a direct line with the bell-hammer and pull-strap, and with which cam the bell-hammer engages in said direct line, substantially as described.

5. The combination, with the bell, the main pull-slide, and the pull-strap of a fare-register, of a stepped cam and a bell-hammer connected with the slide in a direct line with the pull-strap and stepped cam, said strap acting in direct line with said bell-hammer and cam, substantially as described.

6. The combination, in a fare-register having a bell, of a main pull-slide, 17, provided with a bell-hammer, 29, having a friction-roller, 32, and a beveled pin, 37, and the stepped cam 33, having a notch, 36, to receive the roller and permit the pin to engage the cam, substantially as described.

7. The combination, in a fare-register having a bell, of a fixed stop-pin, 39, located near the bell, a main pull-slide, and a bell-hammer, 29, carrying an attached cushion, 38, which strikes the stop-pin on the return movement of the slide and prevents the hammer rebounding and double ringing the bell on a single registration, substantially as described.

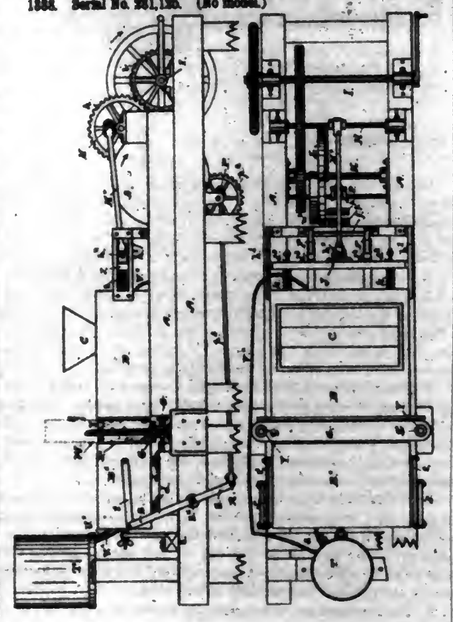
8. The combination, in a fare-register, of a main pull-slide, 17, a bell-hammer having a pin, 37, roller 32, and cushion 38, a stepped cam, 33, having a notch, 36, a bell, 31, and a stop-pin, 39, near the bell, substantially as described.

9. The combination, with the frame of a fare-register having a guide-slot, 23, and the registering-chains, of a slide for actuating the chains, having a lateral guiding projection, 22, extending into the slot and provided at each end with a buffer to strike the ends of the slot and limit the motion of the slide, substantially as described.

10. The combination, in a fare-register, of the total-registering chains, the main pull-bar having a cam, a rock-shaft having stop-fingers for the total-chains and an arm to engage with the cam, the trip-register chains, the resetting-slide having a cam, and a second rock-shaft having stop-fingers for the trip-register chains, an arm to engage the cam on the main pull-slide, and an arm to engage the cam on the resetting-slide, whereby the chains for both registers may be simultaneously operated for counting and the trip-register separately released for resetting, substantially as described.

11. The combination, with the registering-chains, of the chain-frame, the tubes secured in the chain-frame, the rollers mounted on the tubes, the locking-pins passing through the tubes, and the slide moving on the rollers and having overhanging edges which prevent the withdrawal of the pins, substantially as described.

12. The combination, with the registering-chains and chain-actuating mechanism of a fare-register, of the canceler 71, having the projections 74, the spring for throwing the cancelers across the chains, the resetting-slide, and a stop-arm, 76, actuated by the resetting-slide to release the cancelers, substantially as described.



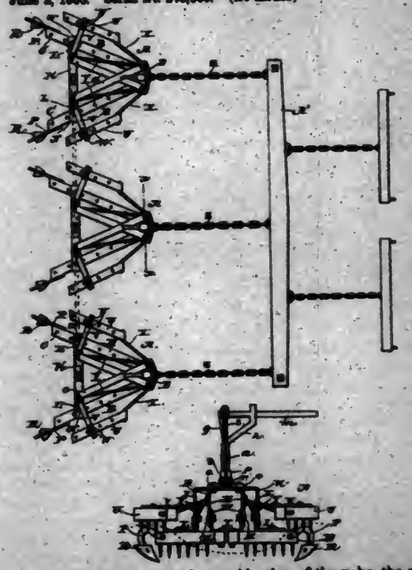
13. The combination, with the registering-chains and chain-actuating mechanism of a fare-register, of the canceler 71, having the projections 74, the spring 73, the stop-arm 76, the cross-bar 77, having the arm 78, and the resetting-slide 48, having a notch, 79, to receive the end of the arm on said cross-bar when the parts are in normal position, substantially as described.

14. The combination, with the registering-chains and chain-frame of a fare-register, of a main pull-slide, 17, having a cross-bar, 44, provided with a pin, 45, and a plate, 47, secured in the chain-frame and having a slot, 46, receiving the end of said pin to secure a correct movement of the outer end of the cross-bar, substantially as described.

15. A fare-register composed of a main frame containing the registering mechanism and provided with a front case, 83, having a sight-opening, 87, containing a glass, 88, the surrounding frame 89, holding the glass, and the spring-plate 90, having the lip 91, closing one end of the said surrounding frame, substantially as described.

16. A fare-register comprising a main frame provided with the registering-chains and their actuating mechanism, and having the projecting bar 3 at one side and two holes at the opposite side, and the base-plate 4, having a staple, 5, receiving said pin, and two pins, 2, entering said holes, substantially as described.

397,604. BRICK-MACHINE. JOSEPH MORHARD, San Francisco, Cal., assignor of one-half to Adolph Both, same place. Filed July 26, 1888. Serial No. 281,125. (No model.)



Claim.—A machine for molding bricks, building-blocks, and like articles, having a two-part separable mold, of which one part is fixed and has a moving head or presser and the other part is movable and has a fixed head, as described, a cutting device adapted to work between the said two parts when separated to cut off that portion of material lying between the line of separation and the said fixed head, a movable table or elevating device adapted to receive and raise the cut-off portion clear of the mold, and mechanism, substantially as described, in combination therewith, to operate the movable part of the mold, the cutter, and the table with respect to one another, as set forth.

2. In a brick-molding machine, the combination of the two-part mold having one part fixed with a movable head or plunger in it and an opening for the introduction of the material, and the other part movable and separable from the said fixed part with a fixed head set therein, a cutting device placed for operation at the line of separation of the said parts and adapted to work between them when separated, an elevating-table also placed for operation at the same point to pass between the said parts when separated, and mechanism whereby the said plunger, movable part of the mold, cutter, and elevating-table are operated with respect to one another and in time, as set forth.

3. In combination with the plunger or movable head, the stop device consisting, essentially, of the cross-head having connection with the crank-shaft, the rods, springs, notched bars, pawls, and connecting-rod, applied for operation substantially as described.

4. In combination with the fixed part B and the movable head D working therein, the movable part B^x, and the fixed head D^x, which is adjustable therein, substantially as and for the purpose described.

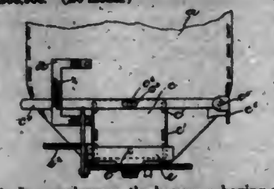
397,605. HARROW. HUGH A. MURPHY, Elk City, Kans. Filed June 2, 1888. Serial No. 275,908. (No model.)

Claim.—1. In a harrow, the combination of the yoke, the right-angled coupling-irons bolted to the vertical arms of the yoke and having the adjusting-openings in the horizontal arms, and the beams bolted to and laterally adjustable on horizontal arms of the coupling-irons, substantially as described.

2. The combination of the harrow, and the side beams or wings arranged above the beams of the harrow and adapted to play vertically, substantially as set forth.

3. The combination of the yokes, the harrow-beams secured thereto, the arms and link-rods flexibly secured to the yokes and projecting laterally therefrom, and the side beams or wings secured to the outer ends of said arms and link-rods and supported thereby above the harrow-beams, as set forth.

4. The combination of the harrow-sections having the U-shaped connecting-yokes, the side wings or beams, the arms hinged to the rear yoke and projecting outwardly therefrom, the link-rods loosely connected to the front yoke, the side beams or wings being secured to the said link-rods, and secured to and laterally adjustable on the arms, substantially as described.



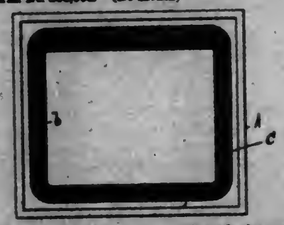
5. The combination of the harrow-section, the evener-bar attached thereto, the standards *c*, having their lower ends pivotally secured to the harrow-sections, and the jointed rods *m*, connecting the upper ends of the said standard, substantially as described.

6. The combination, with the harrow-sections, of the standards *c*, pivotally connected thereto and adapted to vibrate laterally, and the rods *m*, having their inner ends connected to the central standard, *a*, by the ball-and-socket joint, and their outer ends pivotally attached to the outer standards, *c*, substantially as described.

7. The combination, with the harrow-sections, of the standards *c*, having their lower ends pivotally attached thereto, the vertically-adjustable boxes or straps *o*, arranged on the standards and having the arms *r* adapted to engage the upper sides of the harrow-sections, for the purpose set forth, and means, substantially as specified, connecting the upper ends of the standards, substantially as described.

8. The combination, with the harrow-sections, of the standards *c*, having their lower ends pivotally connected thereto, the brackets *g* at the upper end of the outer standards, having the inwardly-extending arms *h*, provided with the vertical guides *i*, the stirrup *k*, pivoted to the upper ends *c* of the said outer standard, and the rods *m*, having their inner ends secured to the upper ends of the central standard by ball-and-socket joints and their outer ends passed through the guide-ways *i* and secured to the stirrups *k*, substantially as described.

397,606. SEED-SOWER. WILLIAM A. C. OAKE, Antrim, N. H., assignor to the Goodell Company, same place. Filed Oct. 20, 1888. Serial No. 288,908. (No model.)

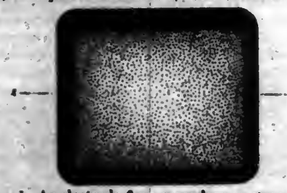


Claim.—1. In a seed-sower, the hopper *a*, having an exit-orifice, and the rotatable distributer for scattering the seed delivered from the said orifice, combined with a valve-plate movable to vary the width of the said orifice from end to end, substantially as described.

2. In a seed-sower, the hopper *a*, having an exit-orifice, and the rotatable seed-distributer, combined with a movable valve-plate for the said orifice, and the pivoted valve-plate *e* thereon, for varying the width of the orifice from end to end unequally, substantially as described.

3. In a seed-sower having an exit-orifice, the rotatable seed-distributer, combined with the sliding valve-plate *e* and hand-lever for moving it, and the movable plate *e* and hand-lever for moving it at an angle with relation to the lower edge of the said valve-plate, substantially as and for the purposes set forth.

397,607. PROCESS OF PREPARING ELECTRODES FOR SECONDARY BATTERIES. LEONARD PAGE, New York, N. Y., assignor to the Maxtaem Storage Battery Company, same place. Filed Oct. 23, 1888. Serial No. 288,503. (No model.)



Claim.—1. The described process of producing an electrode for use in a secondary or storage battery, consisting in fusing a metallic substance which possesses electrical storage properties, and then subjecting this fused substance to the action of a properly-disposed reducing agent, which causes the metallic base to assume the position of a grid, frame, or support carrying the residual substance in the nature of active material, or material adapted to become active, substantially as described.

2. The described process of producing an electrode for a secondary or storage battery, consisting in fusing a metallic substance which possesses electrical storage properties, as lead oxide, and then subjecting this fused substance to the action of a reducing agent, as carbon mixed with niter, said reducing agent being placed in a mold in such position that as the fused substance is poured into the mold metallic lead is produced by the reducing agent and the residual substance assumes the position of active material, or material adapted to become active, and held in place by its union with the metallic base, substantially as described.

3. The described process of producing an electrode for use in a secondary or storage battery, which consists in forming the grid, frame, or support and the active material, or material adapted to become active, at one and the same operation, substantially as described.

4. The described process of producing an electrode for use in a secondary or storage battery, consisting in fusing active material, or material adapted to become active, and then subjecting this molten material to the action of a reducing agent, whereby an electrode is formed consisting of a support and active material, or material adapted to become active, so intimately united that there is no line of demarkation between the two, substantially as described.

397,608. ELECTRODE FOR SECONDARY BATTERIES. LEONARD PAGET, New York, N. Y., assignor to the Macrucon Storage Battery Company, same place. Filed Nov. 3, 1888. Serial No. 289,893. (No model.)

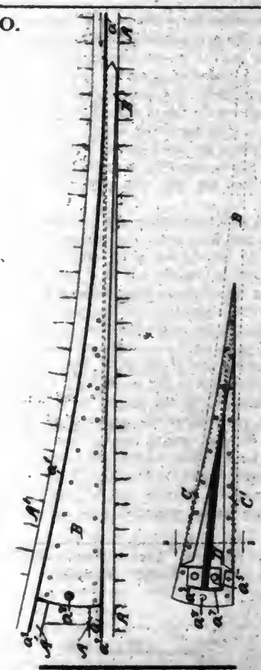
Claim.—1. An electrode for a secondary or storage battery, in which the active material, or material adapted to become active, and the grid, frame, or support merge into each other, substantially as described.

2. An electrode for a secondary or storage battery, in which the active material, or material adapted to become active, and the grid, frame, or support are merged into each other, the active material being held in place by the surrounding frame, substantially as described.

3. An electrode for a secondary or storage battery, in which the grid, frame, or support is of lead and the active material of a salt of lead, the two being merged into each other, so that it is not possible to distinguish any definite line of demarkation between them, substantially as described.

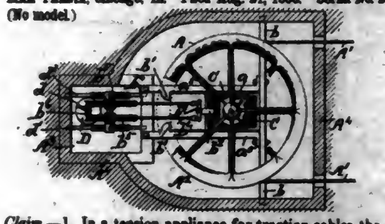
397,609. VEHICLE-AXLE STOCK. ANDREW PATERSON, McKeesport, Pa., assignor to the National Tube Works Company, Boston, Mass. Filed Aug. 1, 1888. Serial No. 281,613. (No model.)

Claim.—A hollow metallic axle-stock comprising the body A, having side walls, and the longitudinally-grooved lower surface or bottom, D, integrally united to the side walls of the body and forming the edges H, substantially as and for the purpose set forth.



397,610. AUTOMATIC SWITCH FOR CABLE RAILWAYS. WILLIAM PERRIX, Chicago, Ill. Filed Aug. 21, 1888. Serial No. 283,306. (No model.)

Claim.—1. In an automatic switch for cable roads, the combination, with a supporting-standard, of the base-plate a^4, the fixed spring-head a^5, the cap a^6, cut out as described, the angle-plates C C', the composed spring D, the switch-plate secured to said angle-plates, and the pivot-bolt a^7, whereby the loose end of said switch-plate is adapted to have a lateral movement in a horizontal plane, substantially as and for the purpose set forth.



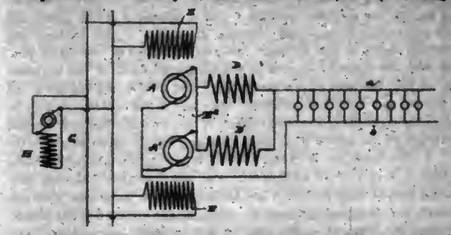
2. The combination, with a conduit-yoke having the bifurcated standard formed integral therewith, of the base-plate a^4, the fixed spring-head a^5, the cap a^6, provided with the recess a^7, the angle-plates C C', secured at their back ends to said cap, the spring D, having one end inserted in said head a^5 and the opposite end bearing alternately against the inner sides of said angle-plates, and the switch-plate loose at one end and pivoted at the other, the loose end being adapted to normally cover the grip-slot of the main line, whereby a train coming in one direction is thrown onto the turn-out and the main line automatically opened by a train passing in the opposite direction, substantially as set forth.

397,610. (Image)

397,611. TENSION APPLIANCE FOR TRACTION-CABLES. WILLIAM PERRIX, Chicago, Ill. Filed Aug. 21, 1888. Serial No. 283,304. (No model.)

Claim.—1. In a tension appliance for traction-cables, the combination, with the slide C, the hub whereof is rigidly mounted on the shaft B and provided on the upper end with the vertical annular rim a^3, of the tension-wheel A, loosely mounted on the upper end of the shaft B, the hub whereof is provided with an annular recess, with which the rim a^3 loosely engages, substantially as set forth.

2. In a tension appliance, the combination, with the traction-cable, of a tension sheave-wheel arranged in an inclined horizontal position, the shaft B, upon the upper end of which said wheel is loosely mounted, the slide C, arranged underneath said tension-wheel and rigidly mounted on the lower end of said shaft, means for supporting said slide, the draw-bar b^2, the evener-bar b^3, the weight-cables b^4 b^4, connected by their upper ends to the respective ends of the evener-bar b^3, the vertical companion sheaves b^5 b^5, the evener-bar b^6, to the respective ends of which are connected the lower ends of the weight-cables b^4 b^4, and the weight D, suspended from the longitudinal center of said evener-bar, substantially as and for the purpose set forth.



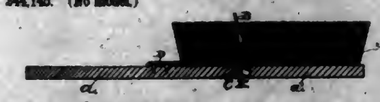
3. In a tension appliance for traction-cables, the combination, with the slide C, of the guides a^9 a^9, provided near one end with the stop-lugs, and the angle-bar b, supporting the opposite ends of said guides, substantially as and for the purpose set forth.

397,612. COMPOSITION FOR MAKING ARTICLES OF COMMERCE AND ART. FRANKLIN S. RANDALL, Philadelphia, Pa., assignor, by direct and mesne assignments, of two-thirds to Franklin S. Gibson and Theodore C. Avis, both of same place. Filed Aug. 9, 1888. Serial No. 282,345. (No specimens.)

Claim.—1. A composition formed of the intermixture of two parts of sawdust, four parts asbestus, one part alum, two parts dextrine, and six parts of glue mixed with one part of acetic acid.

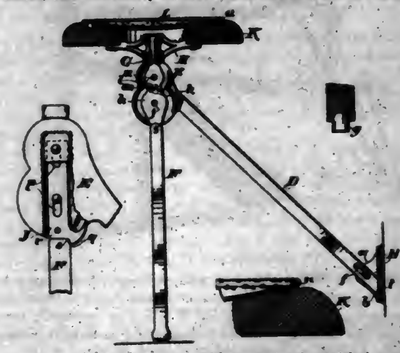
2. A composition formed of the intermixture of sawdust, asbestus, alum, dextrine, and glue and acetic acid, substantially as and for the purposes described.

397,613. REGULATION OF DYNAMOS. EDWIN W. RICE, Jr., Lynn, Mass. Filed July 26, 1888. Serial No. 281,057. (No model.)



Claim.—1. The improved bank or battery of dynamos herein described, comprising two or more dynamos having their armatures connected in multiple arc to the mains through field exciting-coils, an equalizing connection or connections, E^2, between the armature-circuits, and separate field exciting-coils E of constant effect supplied from a common separate source, as described.

2. The improved bank or battery of dynamos herein described, comprising two or more dynamos having their armatures connected in multiple to the main through exciting-coils, equalizing-connections between the armature-circuits, and separate field exciting-coils of constant effect supplied in multiple from wires fed by the separate generator.



3. The improved bank or battery of dynamos herein described, comprising dynamo-machines having their armatures connected in multiple to the mains through field exciting-coils D D', &c., an equalizing-connection, E^2, between the armature-circuits, field exciting-coils E of constant effect for each dynamo, and a common supply-generator for the latter having a shunt-field, H, as described.

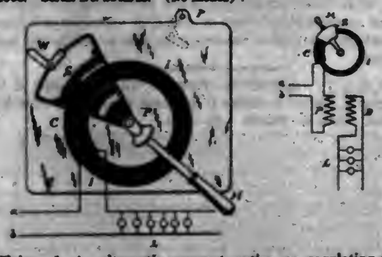
397,614. COMBINED HAIR-BRUSH AND COMB. WILLIAM J. SCOTT, Albany, N. Y., assignor to Jacob C. R. Scott, Helen M. Scott, and Martha J. Scott, all of same place. Filed July 13, 1887. Serial No. 244,145. (No model.)

Claim.—A comb combined with a hair-brush in the manner herein described, said comb being fixed amid the bristles of the brush and attached to springs, whereby the points of the comb-teeth will be normally held to project beyond the outer ends of the tufts of bristles and in such manner that the operations of combing and brushing can only be effected conjunctively, as and for the purpose herein specified.

397,615. COUNTER-STOOL FOR STORES. ALBERTUS O. SLEETH, Canton, Ohio. Filed May 22, 1888. Serial No. 274,716. (No model.)

Claim.—1. In a counter-stool, the combination, with the seat, of the reach adapted to be pivotally connected to the counter with one end and provided with a chambered head at its opposite end, the seat-supporting stem, the standard, and the latch, the said seat-supporting stem and the standard being geared together and having their gear portions inclosed within said chambered head, substantially as set forth.

2. The combination, in a counter-stool, of a reach pivoted at one end and provided at its opposite end with a chamber or inclosure, a seat-supporting stem pivoted in said inclosure, a seat journaled upon said stem, and a standard pivoted in said inclosure and having a geared engagement with said seat-supporting stem, substantially as set forth.



3. The combination, in a counter-stool, of a reach having one of its ends pivoted to the counter and provided at its opposite end with a chamber or inclosure, said chamber or inclosure constructed with a recess or depression in its side, a seat-stem pivoted in said inclosure and provided with a cogged head, a standard provided with a cogged head and a projection, a, said standard pivoted in said inclosure and having its cogged head meshing with the cogged head of the seat-supporting frame, and a latch sliding and concealed within the depression of the chamber, substantially as set forth.

4. The combination of the plate B, having lugs a, rib b, reach D, having a beveled end, t, elongated perforation f, and chambered head E, seat-supporting stem G, standard F, seat-support H and seat, and the latch J, substantially as described, and for the purpose set forth.

5. The combination, with a seat for a counter-stool adapted to be pivoted to and folded against the counter, of an elastic bead located upon the face of said seat, substantially as set forth.

6. The combination, in a counter-stool, of a reach pivoted at one end to the counter and provided with a chamber or inclosure at its opposite end, a seat-support pivoted within said inclosure, a standard pivoted within said inclosure and provided with a shoulder, s, and having a geared engagement with the supporting-stem, and a sliding latch concealed and sliding within said inclosure and adapted to engage the shoulder s and lock the stool in its normal position, substantially as set forth.

397,616. REGULATING AND MOTIVE DEVICE FOR ALTERNATING CURRENTS. ELIHU THOMSON, Lynn, Mass. Filed July 26, 1888. Serial No. 281,242. (No model.)

Claim.—1. An alternating-current motive or regulating device consisting of an iron core of endless form or inclosed magnetic circuit and two electric conductors encircling the same, the parts being properly mounted, as described, to permit change in the inductive relation of the two circuits or conductors, as and for the purpose set forth.

2. The herein-described device for use on alternating-current circuits, consisting of two or more circuits placed on a core whose magnetic circuit is closed and movable to a greater or less extent from the position where one is superposed upon another.

3. As a means of varying the self-inductive resistance in an alternating-current circuit, a closed coil or band adjustable over or under another coil or band placed on a core of iron of endless form included in the circuit whose self-induction resistance is to be varied.

4. The herein-described alternating-current motive or regulating device, consisting of a core on closed magnetic circuit, a coil or conductor on said core placed in an alternating-current circuit, and a second coil, conductor, or band movable over the same core or closed magnetic circuit and having its electric circuit closed on itself, as and for the purpose described.

5. The alternating or varying current motive or regulating device herein described, consisting of two or more conductors encircling a closed-circuit core and movable with relation to one another, as described, so that they may either produce a neutralization of one another's magnetic effects, or when removed from proximity may have each a self-induction due to their magnetizing action on the core.

6. The combination, with an alternating-current circuit containing translating devices—such, for instance, as incandescent lamps—of an adjustable reactive device consisting of a coil on a closed-circuit magnetic core, and a closed-circuit conductor applied to the same core and adjustable with relation to the coil.

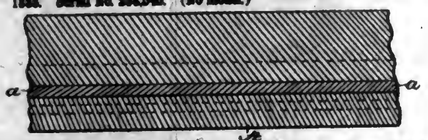
7. The combination, with translating devices in an alternating-current circuit, of a regulator of the current flowing to the translating devices, consisting of a reactive coil connected to the circuit of said translating devices and placed on an iron core, and a coil or band on closed circuit and inductively related to the first-named coil, one or the other of said coils being partially counterbalanced and movable with relation to the other under the repulsive action to positions where a balance of repulsive and counterbalancing action may be established.

8. The combination, with the coil placed in an alternating-current circuit and surrounding an iron core, of a second closed band or coil whose inductive relation to the first is variable or adjustable, and

an electric switch connected to the circuit of the closed band or coil, as and for the purpose described.

9. The combination, with a reactive coil in an alternating-current circuit, of a second adjustable closed-circuit conductor in inductive relation to the core for the first coil, and an electric switch for interrupting the circuit of the adjustable conductor on a movement thereof to a predetermined extent.

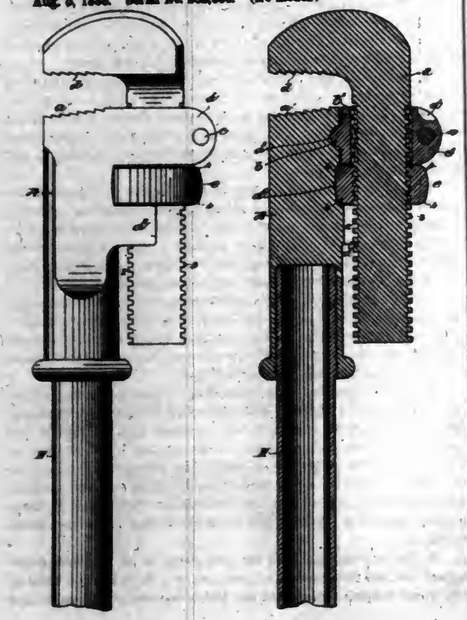
10. The combination, with the core and coil in an alternating-current circuit, of a second conductor or band through and beyond which the said core or the magnetic extension thereof passes and adjustable in its inductive relation to the alternating-current coil, and a mass of iron external to both coils or conductors and parallel to or in close proximity to the portion of core beyond the second coil.



11. The combination, with the two coils or conductors movable with relation to one another on the same core, of an armature for one coil connected or movable with the other coil, as and for the purpose described.

12. The combination, with two or more circuits in parallel and each containing one or more translating devices, of a self-adjustable reactive coil in each branch and in the circuit with the translating device or devices of said branch, for the purpose described.

13. The combination, with a core and coil, I C, of a closed-circuit band or conductor let into a notch or depression in the iron mass parallel to said core, so as to bring the core and the part of the iron mass to either side of the closed-circuit band or conductor into close proximity.



14. The combination, with the coil in one alternating-current circuit, of an iron core having a recess or depression to receive the coil, and a second circuit band or conductor encircling said core and adjustable in its inductive relation to the first, as and for the purpose described.

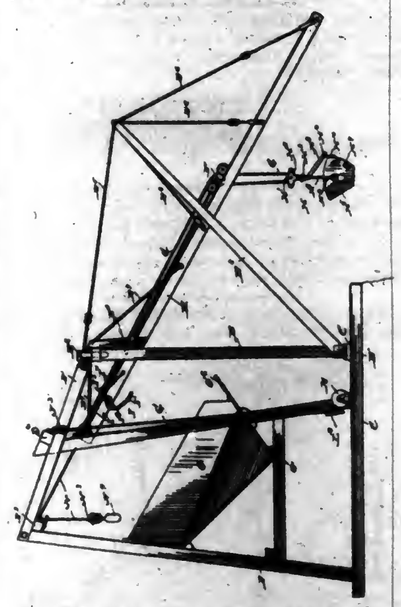
397,617. SLED-SHOE. FRANK W. TILDEN, Hinsdale, N. H., assignor of one-half to Charles D. Mortiman, same place. Filed Oct. 19, 1888. Serial No. 288,545. (No model.)

Claim.—As a new article of manufacture, the herein-described sled-shoe, consisting of cast-iron or other metal having bars cast within it during the operation of casting, one of which is provided with a dovetail groove for receiving a dovetail formed upon the runner, substantially as herein shown and described.

397,618. PIPE-WRENCH. JOHN H. VIETOR, Boston, Mass., assignor to the Trimont Manufacturing Company, Portland, Me. Filed Aug. 5, 1888. Serial No. 282,066. (No model.)

Claim.—1. The fixed jaw A of the wrench, it having a serrated portion, *a*, ears *a' a'* and *a² a²*, and a seat, *a³*, and the movable ⅂-shaped jaw having the serrated portion *d* and a threaded shank, combined with the rocker *b'*, mounted between the ears *a' a'* and between the threaded shank of the movable jaw and one edge of the fixed jaw, and with the ring-nut applied to the threaded shank of the movable jaw outside the said ears *a'* and at one end of the said rocker *b'*, all as shown and described, whereby one end of the said nut is free to take bearing entirely about the shank of the movable jaw and against the edges of the ears *a' a'*, as described, and for the purposes set forth.

2. The fixed jaw A of the wrench, it having the serrated portion *a*, ears *a' a'* and *a² a²*, and seat *a³*, and the movable ⅂-shaped jaw having the serrated portion *d* and threaded shank, combined with the rockers *b' b'*, mounted between the ears *a' a'*, the rocker *b'* being placed between the inner threaded edge of the movable jaw and the fixed jaw, and with the ring-nut applied to the threaded shank of the movable jaw outside the said ears *a'* and at the ends of the said rockers, the combination being in operation as shown and described.

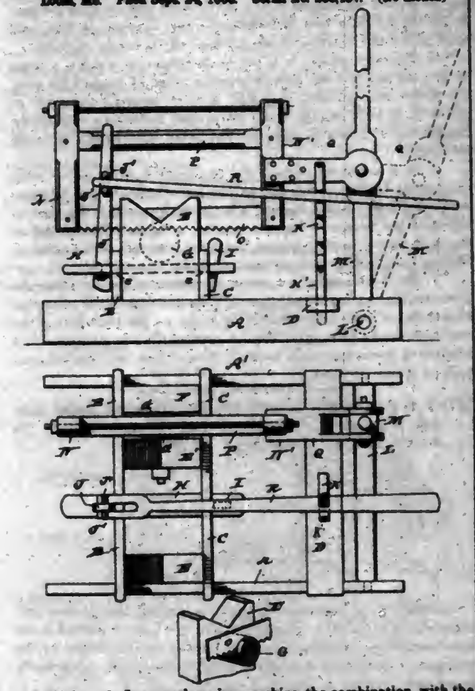


397,619. NEEDLE FOR SEWING-MACHINES. LEGRAN C. WING, Boston, Mass., assignor to the Union Button Sewing Machine Company, same place. Filed Dec. 19, 1887. Serial No. 258,333. (Model.)

Claim.—A sewing-machine needle having an abruptly-tapered conical point, *c d*, and a less abruptly-tapered portion above said point and below the eye, as set forth.

397,620. WITHDRAWN.

397,621. HOISTING-MACHINE. GEORGE J. ANDERSON, West Superior, Wis. Filed May 8, 1888. Serial No. 273,180. (No model.)



Claim.—1. The combination, with the frame D, having a hopper, O, of the vertical mast journaled in said frame in front of the hopper, and having an inclined boom, E, extending rearwardly beyond the mast into the frame over the hopper, and a carriage traveling on the boom past the mast, substantially as set forth.

2. The combination, with the supporting-frame, the vertical mast adapted to rotate and having an inclined truck-boom extending in rear of the mast at its upper end, and provided with a trip at said rear end, of a carriage traveling on the boom and carrying a dumping-bucket provided with a latch into the path of which said trip projects, substantially as set forth.

3. The combination, with the frame having forwardly-projecting top beams, D', and a forwardly-projecting base, C, of the vertical mast journaled in the said projecting parts of the beams and base, and having an inclined boom projecting at its rear or upper end beyond the mast, the carriage traveling on the boom, the rope N, passing over pulleys on the frame secured at its ends to the frame and having a weighted pulley, N³, suspended from it, the hoisting-rope G, secured to the carriage and having a traveling pulley, H', under the carriage, passing thence over a pulley on the carriage to a pulley on the frame, and the rope L, for turning the boom, substantially as set forth.

4. The combination, with the inclined boom and the carriage traveling thereon, of the tripping-lever I, pivoted at the upper end of the boom projecting forwardly thereunder, provided at its ends with upwardly-extending projections I², springs I³, connected to the boom and said projections, links I⁴, extending rearwardly from said projections, and the blocks I⁵, sliding on the boom in the path of the carriage and connected to said projection, whereby when the carriage forces the blocks rearwardly the lever I' will be operated, substantially as set forth.

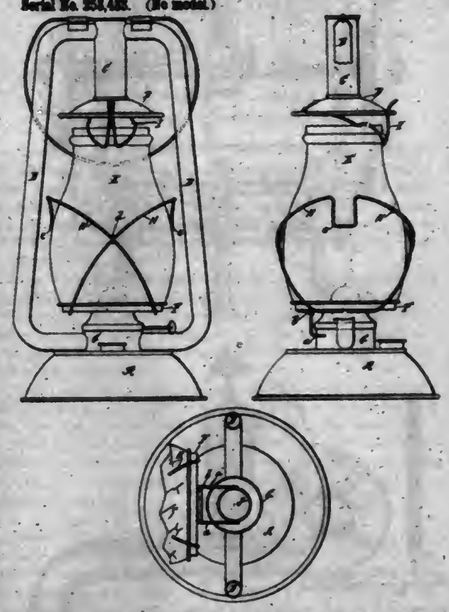
397,622. WOOD-SAWING MACHINE. THOMAS J. BALDWIN, St. Louis, Mo. Filed Sept. 24, 1888. Serial No. 286,157. (No model.)

Claim.—1. In a wood-sawing machine, the combination, with the frame and the reciprocating saw, of a support for the wood to be sawed, and a vertically-rotating roller to one side of the said support below the saw, with its axis at right angles thereto and having a peripheral groove to receive the saw after it passes through the piece of wood, substantially as set forth.

2. In a wood-sawing machine, a base, A A', connecting cross-pieces B C D, each provided with an opening, a bar, H, provided with two openings, said bar being engaged in the openings in the cross-pieces B C aforesaid, a notched standard, J, provided with pins, and a wedge, I, said standard and wedge being engaged in the respective openings in the bar H, a notched bar, K, and wedge K', engaged in the opening in the cross-bar D, in combination with a support for receiving a stick of wood, a saw, and a lever jointed thereto, substantially as shown and described.

397,623. CARRIAGE FOR DIRECT-ACTING ROCK-DRILLS. GUSTAV A. HABTH, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Oct. 13, 1888. Serial No. 288,201. (No model.)

Claim.—1. The combination of a bed-plate having rollers *j* and supported thereby on planking *k*, screw-bolt (or bolts) *m*, having hook *n*, and nut *o*, means for rotating said nut, and a block or cradle, *a*, having bearings *b*, with a direct-acting steam or pneumatic engine provided with pivots or trunnions, substantially as shown, and for the purpose described.



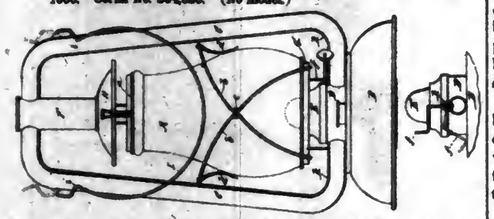
2. The combination of a bed-plate having rollers *j* and supported thereby on planking *k*, screw-bolt (or bolts) *m*, having hook *n*, collar *q*, and nut *o*, means for rotating said nut, and a block or cradle, *a*, having bearings *b*, with a direct-acting steam or pneumatic engine, provided with pivots or trunnions, substantially as shown, and for the purpose described.

397,628.

3. The combination of a bed-plate having rollers *j* and supported thereby on planking *k*, screw-bolt (or bolts) *m*, having hook *n*, collar *q*, nut *o*, and lever *p*, and a block or cradle, *a*, having bearings *b*, with a direct-acting steam or pneumatic engine provided with pivots or trunnions, substantially as shown, and for the purpose described.

397,624. LANTERN. LEWIS F. BEITS, New York, N. Y., assignor of two-thirds to The R. E. Dietz Company, same place, and to the Steam Gauge and Lantern Company, Rochester, N. Y. Filed Dec. 20, 1887. Serial No. 258,482. (No model.)

Claim.—1. In a lamp or lantern, the combination of the air-chamber, burner-collar located therein, the hinged bottom plate, and the support for the hinge, the said support passing through the wall of the air-chamber and being secured upon the burner-collar, substantially as explained.

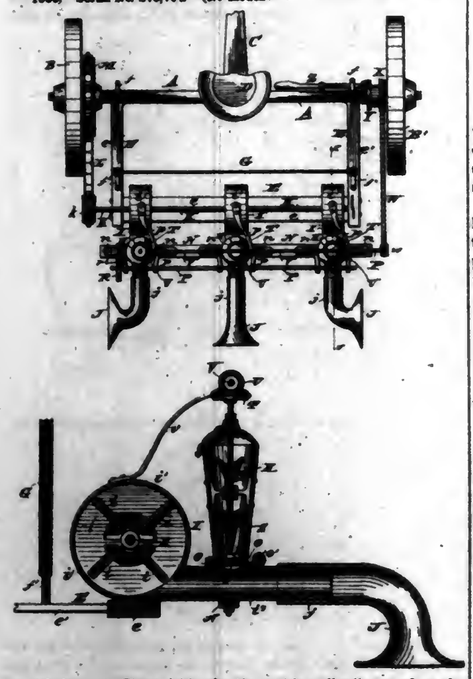


2. In a lamp or lantern, the combination of the oil-pot, burner-

collar, air-chamber, hinged bottom plate, and support for the hinge thereof, said support comprising horizontal and vertical portions of which the horizontal portions extend through the air-chamber and are located above the top of the oil-pot, and the vertical parts supporting the hinge axis, substantially as and for the purposes set forth.

3. In combination with the hinged bottom plate and the globe resting thereon, the crossed guard-wires bearing upon the globe at points above the swell therein, and arranged to hold the globe upon the bottom plate as the latter is moved upon the hinge, substantially as and for the purposes set forth.

4. In combination with the globe, the guard-wires crossing each other and secured together at the crossings, as explained, said wires bearing upon the globe at points above the swell therein, and arranged to yield above their points of union to permit the withdrawal and insertion of the globe, substantially as explained.



397,625. TUBULAR LANTERN. LEWIS F. BURR, New York, N. Y., assignor of two-thirds to The R. E. Dietz Company, same place, and the Steam Gauge and Lantern Company, Rochester, N. Y. Filed Feb. 21, 1888. Serial No. 264,826. (No model.)

Claim.—1. In a lantern, the combination, with the guard-wires, of the metal bearing pieces or projections bent upon and secured to the wires and arranged to bear against the globe, substantially as and for the purposes set forth.

2. In a lantern, the combination, with the globe and removable base-plate connected therewith and bearing the guard-wires, of the bent-wire catch provided with the gage passing through an aperture in the base-plate, substantially as shown, and for the purposes set forth.

397,626. MACHINE FOR DISTRIBUTING POISON ON PLANTS. GEORGE R. BROWN and JOHN W. BROWN, Pledger, Tex. Filed July 2, 1888. Serial No. 278,764. (No model.)

Claim.—1. The combination, in a poison-distributer, of an air-blast apparatus, a hopper for holding the poison and conducting it to the air-blast pipe, and an axially-adjustable bent discharge-nozzle fitted to said pipe, substantially as described, for the purposes set forth.

2. The combination, in a poison-distributer, of an air-blast apparatus, a hopper for holding the poison, and fitted with a valve controlling discharge of the poison into an air-blast pipe, and an agitator operating in the hopper to prevent clogging of the poison therein, substantially as herein set forth.

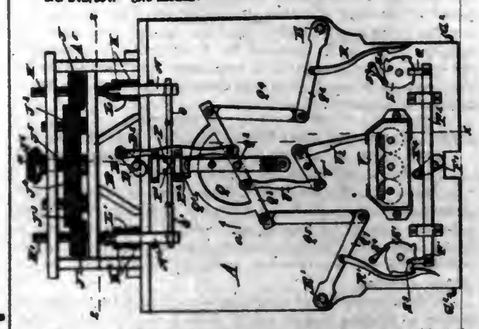
3. The combination, in a poison-distributer, of a sulky air-blast apparatus mounted thereon, a series of hoppers for holding the poison and discharging it into the air-blast pipes, a series of agitators journaled in the hoppers, a shaft to which all the fans are fixed, and belt-and-wheel connections from said shaft to one of the sulky-wheels, a shaft geared with the agitators of all the hoppers, and belt-and-wheel connections from said shaft to one of the sulky-wheels, substantially as described, for the purposes set forth.

4. The combination, in a poison-distributer, of a sulky, a series of air-blast fans thereon, a corresponding series of hoppers for holding poison and discharging it into the air-blast pipes, a shaft common to all the air-blast fans, and belt-and-wheel connections from said shaft to one of the sulky-wheels, substantially as herein set forth.

5. The combination, in a poison-distributer, of a sulky, a series of air-blast fans thereon, a corresponding series of hoppers for holding poison, and provided each with a valve controlling passage of poison to an air-blast pipe, and a worm-shaft connecting with all the hopper-valves to actuate them simultaneously, substantially as herein set forth.

6. In a poison-distributer, the combination, with one or more hoppers for holding poison, and having a discharge-opening, of a pivoted valve fitted to said opening, a worm-shaft to which the valve or valves of the hopper or hoppers connect, a notched hand-wheel on the shaft, and a pawl engaging the notches of said wheel, substantially as described, for the purposes set forth.

7. The combination, in a poison-distributer, of a sulky, three air-blast fans thereon, a poison-hopper communicating with the blast-pipe of each fan, a rearwardly-discharging nozzle on the blast-pipe of the central fan, and a bent nozzle fitted to each of the side blast-pipes and adapted to discharge poison to both sides of the machine, substantially as herein set forth.

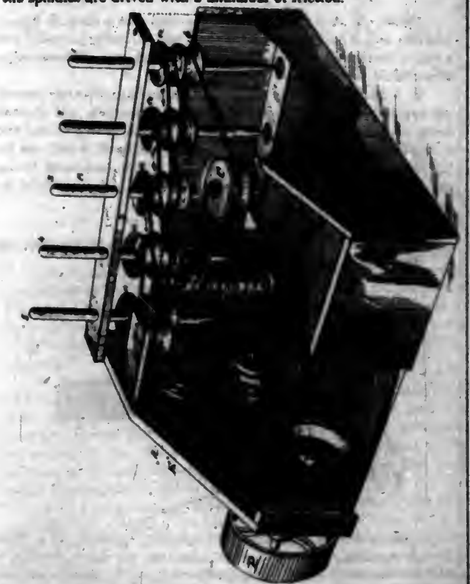


397,627. MUSIC OR BOOK HOLDER. HERBERT O. BROWN, Auckland, New Zealand. Filed Nov. 21, 1887. Serial No. 255,752. (No model.) Patented in Canada May 7, 1888, No. 28,100.

Claim.—1. A leaf-holder consisting of an attaching portion provided with spring-arms to engage the shelf, and a finger pivoted at the outer end of said attaching portion to swing at right angles to the spring-arms, and provided on its lower end with a weight, substantially as set forth.

2. As an improved article of manufacture, a music and book holder consisting of the spring-clip A, formed of a strip of metal bent twice at right angles, forming the outwardly-curved arms *a b* and the plain surface *c*, and the finger D, pivoted to the surface *c*, and provided with the weight A on its short arm, as set forth.

397,628. GRAIN WEIGHING AND REGISTERING MACHINE. WILLIAM H. H. BRUNTON, Elk City, Kans. Filed May 1, 1888. Serial No. 272,407. (No model.)



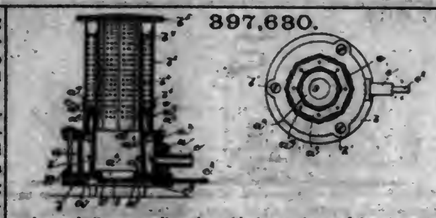
Claim.—1. In a grain measuring and registering-machine, the combination, with a box provided with two compartments and swinging bottoms held in the said compartments, of arms operated by the said swinging bottoms, hooks pivoted on the said arms, ratchet-wheels operated by the said hooks, a longitudinal bar receiving a sliding motion by the said ratchet-wheels, a shaft receiving a turning movement by the said bar, and a gate secured on the said shaft and onto which open the said swinging bottoms, substantially as shown and described.

2. In a grain measuring and registering machine, the combination, with a box provided with two compartments and swinging bottoms held in the said compartments, of arms operated by the said swinging bottoms, hooks pivoted on the said arms, ratchet-wheels operated by the said hooks, a longitudinal bar receiving a sliding motion by the said ratchet-wheels, a shaft receiving a turning movement by the said bar, and a gate secured on the said shaft and onto which open the said swinging bottoms, and hoppers located below the said swinging bottoms and carrying the bags to be filled, the said gate opening alternately in the said hoppers, substantially as shown and described.

3. In a grain measuring and registering device, the combination, with two hoppers and a gate secured to a shaft and opening alternately into the said two hoppers, of a crank-arm secured to the said gate-shaft, a longitudinally-sliding bar pivotally connected with said crank-arm, lugs projecting from the said bar, and ratchet-wheels having a turning movement and each provided with a pin operating on the said lugs so as to impart an alternate forward and backward sliding movement to the said bar to change the position of the said gate, substantially as shown and described.

397,629. DRIVING MECHANISM FOR SPINNING-SPINDLES. THOMAS L. BUTLER, Blackstone, Mass. Filed Oct. 18, 1888. Serial No. 288,509. (No model.)

Brief.—The object of the invention is to provide an improved construction and arrangement of the spindle-driving devices, whereby the spindles are driven with a minimum of friction.

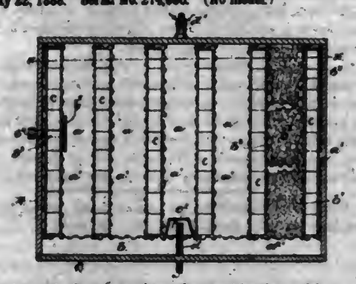


Claim.—1. The combination, with a series of spindles having double whirls, of a single continuous driving-belt wound around the whirls of the spindles in pairs, so as to have a double lap, as described, and a pair of multiple grooved drums arranged at one end of the series and having the belt wound around the same in multiple convolutions to positively actuate the belt, as described.

2. The combination, with a series of spindles having double whirls, of a single continuous driving-belt wound around the whirls of the spindles in pairs, so as to have a double lap, as described, a spring tension-pulley for the belt, a pair of multiple grooved arms having the belt wound around the same in several convolutions, and a pair of lead-pulleys for directing the course of the belt to and from the spindles, as described.

397,630. BURNER. ROBERT R. CARSLEY, New Bedford, Mass., assignor to the Triumph Heat and Light Company, Portland, Me. Filed May 22, 1888. Serial No. 274,668. (No model.)

Claim.—1. In a burner, the combination, with an inner and outer foraminous tube, of a base to support said tubes and composed of an outer shell provided with openings for the admission of gas and air, an inner shell surrounding the said air-opening and forming with the outer shell a gas-chamber, and a cap for said gas-chamber having gas-outlets to admit gas between the said tubes, substantially as described.



397,680.

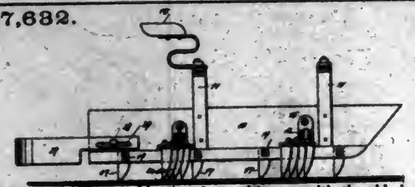
2. In a burner, the combination, with an inner and outer foraminous tube, of a muffle covering said tubes, and a base provided with a gas-outlet to admit gas between the said tubes, and an air-passage to admit air to the inner tube, the products of combustion being caused by the said muffle to pass through the sides of the outer tube, substantially as and for the purpose set forth.

3. In a burner, the combination, with an inner and outer foraminous tube, of a muffle covering said tubes, and a base composed of an outer shell provided with openings for the admission of gas and air, an inner shell surrounding the said air-opening and forming with the outer shell a gas-chamber, and a cap for said gas-chamber having gas-outlets to admit gas between the said tubes, substantially as described.

4. In a burner, the combination, with an inner and outer foraminous tube, of a muffle covering said tubes, and a base composed of an outer shell provided with openings for the admission of gas and air, an inner shell surrounding the said air-opening and forming with the outer shell a gas-chamber, and a cap for said gas-chamber having gas-outlets to admit gas between the said tubes, and with a damper to regulate the supply of air to the burner, substantially as described.

397,631. VAPORIZER. ROBERT R. CARSLEY, New Bedford, Mass., assignor to the Triumph Heat and Light Company, Portland, Me. Filed May 22, 1888. Serial No. 274,669. (No model.)

Claim.—1. In a vaporizer, the combination, with a vessel provided with a liquid-inlet and a vapor-outlet, of a series of substantially-vertical double partitions forming vapor-ways and arranged within said vessel to form chambers, absorbent material in said chambers, and a plate or wall to support said double partitions, the said plate or wall forming, with the bottom of the vessel, a vapor-receiving chamber, substantially as described.



2. In a vaporizer, the combination, with a vessel provided with a liquid-inlet and a vapor-outlet, of a series of double partitions forming vapor-ways, and arranged within said vessel to form chambers, absorbent material in said chambers, a plate or wall to support said double partitions, and shelves b^2 to support the absorbent material, substantially as described.

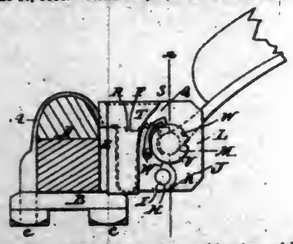
3. In a vaporizer, the combination, with a vessel provided with a liquid-inlet and a vapor-outlet, of a series of double partitions forming vapor-ways, and arranged within said vessel to form chambers, absorbent material in said chambers, a plate or wall to support said double partitions, and shelves to support the absorbent material, and an inverted trough or cap located above the outlet-pipe of the vessel, substantially as described.

4. In a vaporizer, the combination, with a vessel provided with a liquid-inlet and a vapor-outlet, of a series of double partitions forming vapor-ways, and arranged within said vessel to form chambers, absorbent material in said chambers, a plate or wall to support said double partitions, and shelves to support the absorbent material, and an inverted trough or cap located above the outlet-pipe of the vessel, and a check-valve secured to the top of the vessel and adapted to open to admit air to the vessel when the vapor is being withdrawn from the said vessel, substantially as described.

397,632. CULTIVATOR AND HARROW. THOMAS R. CARTER, Augusta, Kans. Filed Oct. 31, 1888. Serial No. 289,695. (No model.)

397,632.

Claim.—1. The combination, in a cultivator, with the side bars having vertically-slotted toothed plates, of transverse eyebolts projecting therethrough, and vertically-swinging teeth carrying arms having their inner ends provided with hooks or bends entering the eye of said bolts, the hooks or bends having teeth or projections interlocking with said toothed plates, substantially as set forth.



2. The combination, with the side bars of the cultivator, of the plates 18, extending longitudinally along the lower outer edges of said side bars, the teeth projecting up between plates and bars, and the bolts passing through the teeth and bars and securing both in place, substantially as set forth.

3. In a combined cultivator and harrow, the combination, with the side pieces, adjustable and sectional yokes or arches connecting the same, cultivator-teeth attached to the under face of the side pieces, and adjustable scrapers attached to the rear end of the said side pieces curving inward, of adjustable arms attached to the outer face of the said side pieces extending rearward at an inclination therefrom, and adjustable harrow-teeth attached to the said arms, substantially as and for the purpose specified.

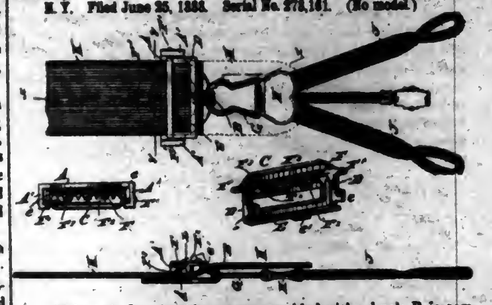
4. In a combined cultivator and harrow, the combination, with side pieces provided with a series of vertical spaced slots, laterally adjustable and sectional yokes or arches connecting the same, teeth attached to the under face of the side pieces, scrapers adjustably secured to the rear ends of the said side pieces curving inward, and a toothed or notched plate surrounding the outer edge of the slots in the side pieces, of a bolt projected through the said slot provided with an eye at the outer end, arms supported by the said bolt, having an inclination to the rear and provided with a hooked extremity having a roughened surface, and harrow-teeth adjustably attached to the said arms, substantially as shown and described.

5. In a combined cultivator and harrow, the combination, with the side pieces of a cultivator provided with a series of vertical spaced slots and toothed plates surrounding the outer edges of the said slots, of a bolt projected through the slots beyond the plate, arms supported by the said bolt and held at their inner ends against the toothed plates, and teeth adjustably secured to the under side of the said arms, all combined to operate substantially as shown and described.

397,633. THILL-COUPLING. ISAAC CLARK, Morris Plains, N. J. Filed June 19, 1888. Serial No. 277,502. (No model.)

Claim.—1. In a thill-coupling, the combination, with an axle-clip, A, having forward-projecting parallel lugs E, formed with front half-bearings, G, and pivot-holes H, of a block, J, pivoted to the holes H and formed with rigid upward-projecting jaws L, having inner half-bearings, M, and with rigid rearward-projecting bearing-arms Q, a T thill-iron, O, pivoted and embraced between the jaws L, and a locking-connection for the arms Q and lugs E, substantially as shown and described.

2. In a thill-coupling, the combination, with an axle-clip formed with coupling-lugs E, of a pivoted block, J, having beveled stop-shoulders K, and jaws L and arms Q, forming thill-iron hooks, substantially as shown and described.

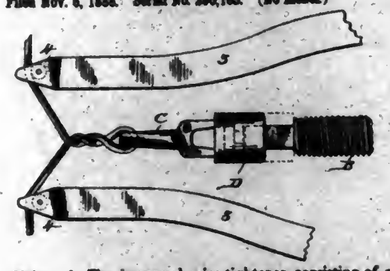


3. In a thill coupling, the combination, with an axle-clip formed with coupling-lugs E, having top mortises, F, and front half-bearings G, of pivotal jaws L, having half-bearings M, and formed with rearward-projecting arms Q, having bottom tenons, R, a locking-connection for the arms Q and lugs E, and a thill-iron, O, substantially as described.

4. In a thill-coupling, the combination, with clip-lugs E and movable jaws L, having corresponding sectional bearings, G M, of a T thill-iron, N, having a cross-head, P, adapted to the bearings G M, and formed on its opposite ends with lateral bracing-disks V, substantially as described.

5. In a thill-coupling, the combination, with parallel clip-lugs E, having corresponding bearings, of a T thill-iron pivoted to and between said bearings, and having a notched disk, V, on an end outside the bearing, and a dog, W, pivoted to the outside of the corresponding lug, E, substantially as described.

6. In a thill-coupling, the combination, with an axle-clip, A, having forward-projecting parallel lugs E, formed with front half-bearings, G, and pivoted holes H, of a block, J, pivoted to the holes H, and formed with rigid upward-projecting jaws L, having inner half-bearings, M, and with rigid rearward-projecting bearing-arms Q, and a locking-connection for the arms Q and lugs E, substantially as shown and described.



397,634. SUSPENDER-BUCKLE. JAMES ROSLAND, New York, N. Y. Filed June 25, 1888. Serial No. 278,161. (No model.)

Claim.—1. In a buckle, a plate provided with a hook, B, in combination with a bar pivoted to said plate, said bar being provided with a lug, *c*, and also provided with teeth inclined at a different angle, substantially as shown and described.

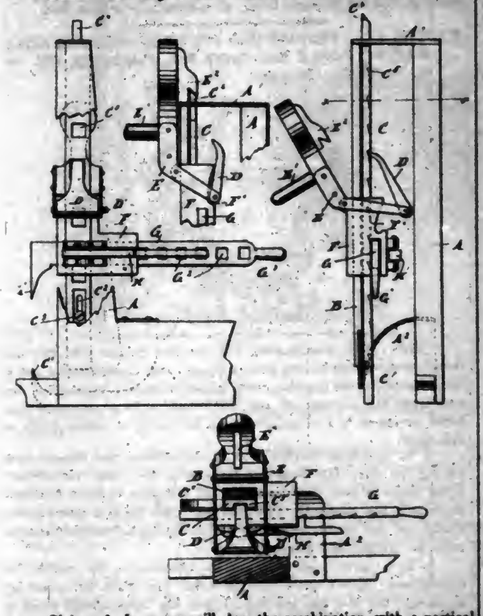
2. A buckle consisting of a base-plate having outwardly-extending apertured ears, a bar provided with side journals, said journals being mounted in the ears aforesaid, said bar being also provided with a longitudinal row of teeth, one or more of the teeth in said row being inclined at a different angle from the others, each tooth having the same axis and each movable in the same arc, substantially as described.

397,635. WIRE-TIGHTENER. LOUIS S. PLATAU, Pittsburg, Tex. Filed Nov. 6, 1888. Serial No. 290,165. (No model.)

Claim.—1. The improved wire-tightener consisting of a frame having opposite guides and a central bearing, the screw threaded in said bearing, the hook swiveled on said screw, and the shackle whereby to key the hook to the screw, substantially as set forth.

2. In a wire-tightener, the combination of guides for the wire and a looper movable longitudinally and rotatably, whereby to draw the wire into a loop between said guides and twist it, substantially as set forth.

3. A wire-tightener comprising a frame having two guides fixed with relation to each other and adapted to guide the wire, and a rotatable looper movable longitudinally between the said fixed guides, whereby it may draw the wire between the same and twist it to secure the portion so drawn, substantially as set forth.



4. In a wire-tightener, substantially as described, the combination of a frame having a threaded bearing, a screw turning in said bearing, a hook swiveled on said screw, and a shackle by which to key said hook on the screw, substantially as set forth.

5. In a wire-tightener, the combination of a frame having a threaded bearing, a screw turning in said bearing, a hook swiveled on said screw, such hook and screw having adjacent non-circular portions, and a sleeve having non-circular bores or openings fitted to said portions and constituting a shackle whereby to key the hook on the screw, substantially as set forth.

6. An improved wire-tightener comprising an approximately U-shaped frame having at the ends of its arms guides for the wire and provided centrally with a threaded bearing, and the screw turning in said bearing and provided with a hook, substantially as set forth.

7. The improved wire-tightener herein described, consisting of the U-shaped frame having guides for the wire and provided centrally with a threaded bearing, the screw-turning in said bearing, the hook swiveled on said screw, and the sleeve forming a shackle by which to key the hook to the screw, all substantially as and for the purposes specified.

397,636. SAW-MILL DOG. JOHN FLEMING, Eagington, Ontario, Canada. Filed Aug. 4, 1888. Serial No. 281,962. (No model.)

Claim.—1. In a saw-mill dog, the combination, with a vertical guide-post, of a bar held to slide vertically on the said guide-post and carrying a hook on its lower end, a sleeve held to slide vertically on both the post and the said bar, and a second bar having a hook and held to slide transversely in the said sleeve, substantially as shown and described.

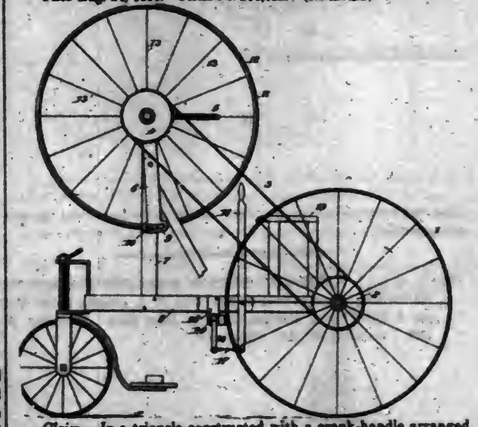
2. In a saw-mill dog, the combination, with a vertical guide-post, of a bar held to slide vertically on the said guide-post and carrying a hook on its lower end, a sleeve held to slide vertically on both the post and the said bar, a second bar having a hook and held to slide transversely in the said sleeve, and a spring-pawl fulcrumed on the said sleeve and adapted to engage the said second bar to lock it in place, substantially as shown and described.

3. In a saw-mill dog, the combination, with a vertical guide-post, of a toothed or notched bar held to slide on the said post, and provided with a hook at one end, a sleeve fitted to slide on the said bar and guide-post, a lever pivoted to the sleeve, a spring-pawl carried by the lever and engaging the teeth or notches of the bar, a toothed or notched bar sliding transversely in the sleeve, and provided with a hook at one end, and a spring-pawl pivoted to the sleeve and engaging the teeth or notches of the transversely-sliding bar, substantially as herein shown and described.

4. In a saw-mill dog, the combination, with a vertical guide-post, of a bar held to slide thereon and carrying a hook at its lower end, being also provided with a pointed top end, a sleeve held to slide on both the said bar and the said post, a second bar having a hook held to slide transversely on the said sleeve, a lever fulcrumed on the said sleeve, and a spring-pawl adapted to engage notches in the first-named bar, and a catch formed on the said lever and adapted to engage the upper pointed end of the said first-named bar, substantially as shown and described.

397,637. CAR-AXLE BOX. JOHN C. FRENCH, Concord, N. H. Filed May 31, 1888. Serial No. 275,500. (No model.)

Claim.—1. The combination, with a car-axle box having a dust-guard chamber, of hollow side flanges forming extensions for said chamber, covered openings formed partly in said extensions or flanges at each side of the journal-bearing, and a dust-guard formed in two

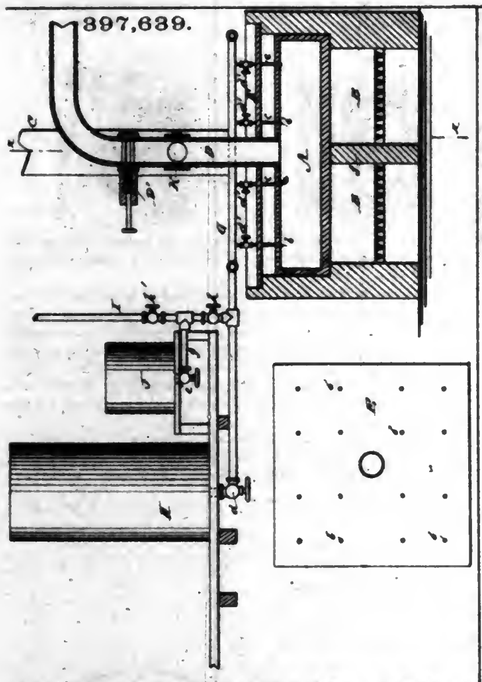


397,637.

segments, each adapted to enter either of said covered openings, having slots to facilitate their removal and springs for maintaining continuous contact with the journal.

2. The combination of a dust-guard formed in two segments, and a chamber in the car-axle box exceeding beyond the side walls of said box into flanges formed for this purpose on its sides, having openings in its top for admitting either segment of said dust-guard on opposite sides of the journal, and one or more threaded openings at its bottom closed by screw-plugs, and covers for said top openings provided with suitable fastenings and springs for maintaining continuous contact of the dust-guard segments with the journal.

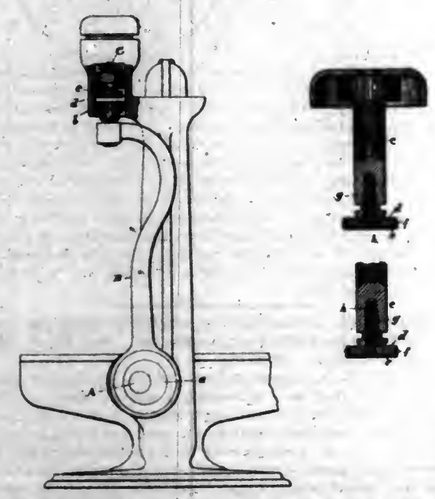
397,638. TRICYCLE. PATRICK GALLAGHER, New York, N. Y. Filed Aug. 24, 1888. Serial No. 283,622. (No model.)



Claim.—In a tricycle constructed with a crank-handle arranged in front of and above the level of the seat of the vehicle, and having its bearings in adjustable arms pivoted to uprights on the frame of the machine, and an endless chain connecting a chain-wheel on the crank-handle shaft with a similar wheel on the driving-wheel shaft, the combination, with the pivoted adjustable arm 6 and the crank-handle 5, having its bearing therein, of a fly-wheel, 11, on the shaft of said adjustable crank-handle, the vehicle-seat 19, the driving-wheels 1, a brake adapted to bear on said driving-wheels, and a hand-lever, 18, operating said brake and arranged for manipulation from one side of the seat and in front of the latter and out of line with the operating crank-handle, substantially as shown and described, and for the purposes herein set forth.

397,639. APPARATUS FOR THE MANUFACTURE OF GAS. JOHN C. GARVIN and HENRY MOODY, Leadville, Colo. Filed Mar. 31, 1888. Serial No. 269,124. (No model.)

Claim.—1. In an apparatus for the manufacture of gas, the combination, with the furnace, of the retort A, arranged above said furnace, provided with a series of perforations, *b*, in its top, and an exhaust-pipe, D, connected therewith, the perforated slab E, arranged over the retort and forming a cover for the furnace, the oil-tank H, the oil-supply pipe G, connected to said tank H, provided with a valve and the series of feed-pipes *c*, said pipes connected with the supply-pipe G at one end and passed through the perforated slab E and entered through the perforations *b* into the retort, substantially as and for the purpose described.



2. In an apparatus for the manufacture of gas, the combination, with the furnace, the retort A, mounted in the top of said furnace, the oil-tank H, a supply-pipe, G, connected therewith, provided with a valve, *d*, the series of oil-feed pipes *c*, having valves *d'*, connecting the supply-pipe with the retort, the gas-exhaust pipe D, provided with a valve, D', and the furnace-flue K, provided with a valve, *k*, of the liquid-detergent-holding receptacle J, and the steam-pipe I, connected with said receptacle, and oil-supply pipe and valves controlling said steam-

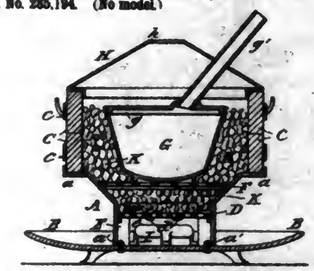
397,639.

pipe and receptacle J, all arranged substantially as and for the purpose specified.

397,640. AUTOMATIC TENSION APPARATUS FOR SEWING-MACHINES. JAMES S. GORTON, New York, N. Y., assignor to the Wilcox & Gibbs Sewing Machine Company, same place. Filed Nov. 20 1888. Serial No. 291,326. (No model.)

Claim.—1. In a tension apparatus, the combination, with the tension-stud and tension-rod for actuating the same, of the thrust-washer interposed between the two and suspended from the tension-stud by a frictional spring-connection, substantially as described.

2. The combination, with the tension-stud and tension-rod for actuating the same, of the thrust-washer suspended from the tension-stud by a spring friction-pin, substantially as described.



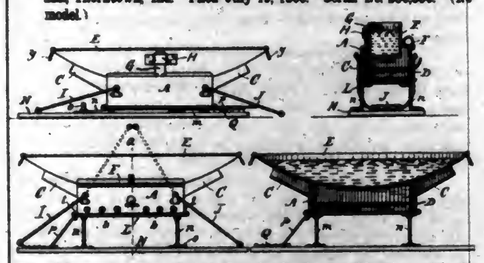
3. The combination, with the tension-stud and actuating tension-rod, of the thrust-washer suspended from the former by a ball-ended split friction-pin, having its split ball end expanded in a hole in said washer, substantially as described.

397,641. METHOD OF MAKING METAL ARTICLES WITH A GLASS LINING. THOMAS R. HALFORD and ROBERT MORANT, London, County of Middlesex, assignors to Dan Rylands, Stairbot, England. Filed Oct. 4, 1887. Serial No. 251,477. (No model.) Patented in England Mar. 15, 1887, No. 3,907.

Claim.—1. The process of making metal articles with a glass or other lining, which consists in coating the said lining with a suitable non-conducting substance and casting the metal around the prepared lining, all substantially as described.

2. The process of making metal articles with a glass or other lining, which consists in coating the said lining with a suitable non-conducting substance, thoroughly drying the same, and casting the metal around the prepared lining, all substantially as described.

397,642. PORTABLE KILN FOR FIRING DECORATED CHINA, GLASS, &c. FANNY R. HALL, Catskill, N. Y. Filed Sept. 12, 1888. Serial No. 285,194. (No model.)



Claim.—1. In combination, in a portable ceramic kiln, the sectional furnace-grate having grate-supports, with draft-chamber below the lower grate, the hearth underlying and extending beyond the furnace-walls, the pot-support, and the furnace-walls of refractory material arranged in a series of sections vertically, all substantially as described.

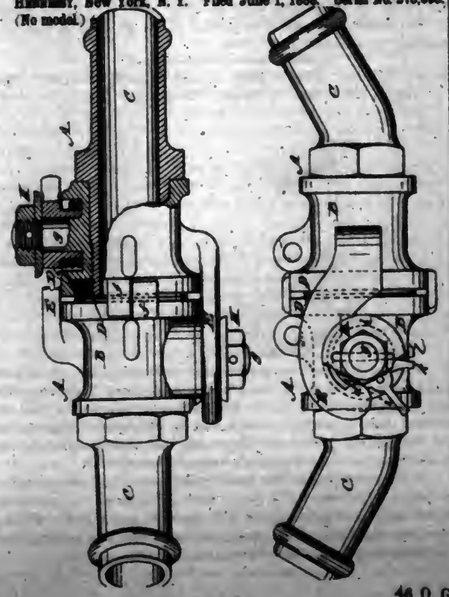
2. In a portable ceramic kiln, in combination, the furnace-base having the removable sectional grate, with the center section narrower than the door of the furnace, the firing-pot support, the shelf supporting the refractory walls, the said walls made in sections vertically, and the hearth underlying and extending beyond the furnace-walls, all substantially as described.

3. In a portable ceramic kiln, in combination, the hearth, the furnace-base, with a draft-chamber below the grate, the grate for supporting the fuel, the pot-support, and the furnace-walls made in sections vertically, all substantially as described.

397,643. PORTABLE OIL-BATH FOR WHEELS. HENRY C. HANDLER, Thorntown, Ind. Filed July 19, 1888. Serial No. 280,356. (No model.)

Claim.—1. In an oil-bath for wheels, the combination, with the oil-trough and the furnace supporting said trough and having extensions *l l*, of the table having grooves *s s*, the bed-plate, and two pairs of legs connecting said table and bed-plate, said legs being hinged at one end to the table and at the other end to the bed-plate, whereby the oil-trough may be placed beneath a wheel and then raised into engagement therewith, substantially as and for the purpose specified.

2. In an oil-bath for wheels, the bed-plate, the table having folded legs hinged to the bed-plate and provided with an arm which engages the bed-plate when the legs are perpendicular thereto, the pawl hinged to the table and arranged to engage the bed-plate, the furnace mounted on said table and having the flues C C, and the segmental trough adapted to receive oil and the rim of a wheel and mounted on the furnace, all arranged to co-operate substantially as specified.



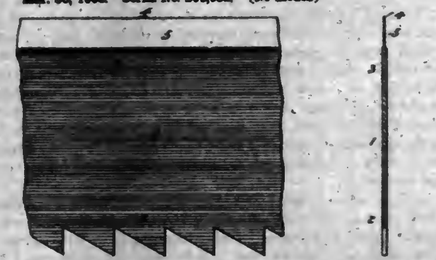
397,644. FISH-WEIR. SILAS H. HARDING, Chatham, Mass. Filed Dec. 17, 1888. Serial No. 293,232. (No model.)

Claim.—1. In a fish-weir, a bowl comprising a side net secured to the weir-stakes and a bottom net secured to said side net, said bottom net being in two sections, adjacent edges of which are detachably secured to a centrally-arranged latchet-rope, substantially as described.

2. In a fish-weir, the bowl A, comprising the side net, H, secured by its upper edge to weir-stakes *b*, its lower edge being detachably secured to said stakes by lines *d*, passing through openings in the lower ends thereof, and a bottom net, K, secured to said side net and formed in two sections, adjacent edges of said sections being detachably secured to a rope, P, by latchets *p*, substantially as set forth.

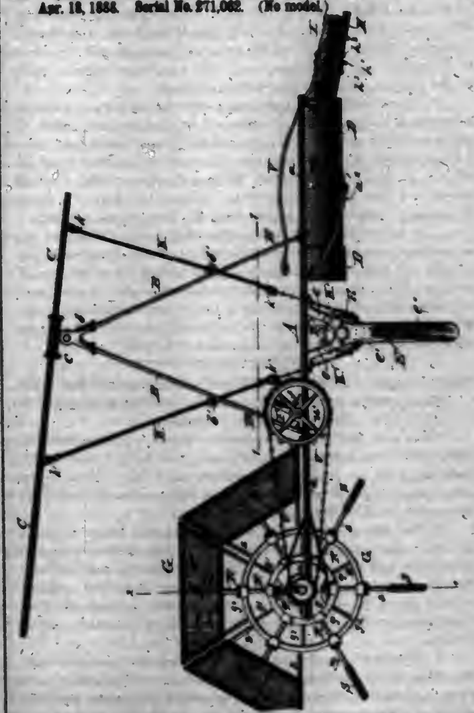
3. In a fish-weir, the combination of the side net, H, secured to stakes *b*, and provided with lines *d*, running in eyes in the lower ends of said stakes, the bottom net, K, constructed in sections *l m*, and secured to the lower edge of said side net, the centrally-arranged latchet-rope P, provided with latchets *p*, and the thimbles *t*, disposed in adjacent edges of said net-sections, all being arranged to operate substantially as described.

397,645. HOSE-PIPE COUPLING FOR RAILWAY-CARS. DAVID HERSHEY, New York, N. Y. Filed June 1, 1888. Serial No. 275,695. (No model.)



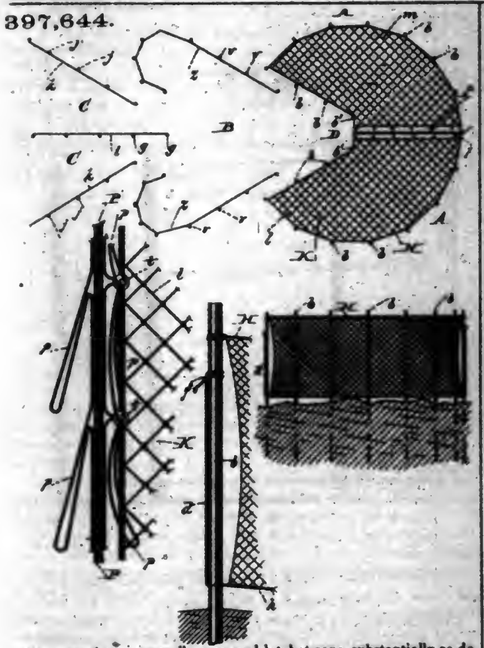
Claim.—1. In a hose-pipe coupling for railroad-cars and other purposes, the two half-couplings provided each with a locking side arm on opposite sides, respectively, of said half-couplings, and with a rotating notched locking device on reverse sides of the half-couplings to those occupied by the side arms and adapted to engage with the side arms, substantially as specified.

2. The combination, with the head or body portions B B of the two half-couplings and the facially-projecting elastic packings or rings D D, of the forwardly-projecting side arms, E E, arranged on opposite sides of the two half-couplings, respectively, and constructed with engaging nose ends *d*, and the rotatable notched locking devices G G on reverse sides of the half-couplings to those occupied by the side arms, essentially as shown and described.



3. The combination, with the head or body portion B of either half-coupling and the facially-projecting elastic packing or rings D D and locking side arms, E, of the rotatable notched locking device G on either half-coupling, and the spring *h*, controlling said rotatable locking device, substantially as specified.

397,646. SAW. GEORGE H. HOLMES, Ogdensburg, N. Y. Filed Mar. 30, 1888. Serial No. 268,952. (No model.)



Claim.—A band-saw for cutting wood, having an annealed back, and the rest of the blade and cutting-edge tempered with the ordinary temper of wood-saws, the back of the blade being thin and the rest of the blade of even thickness, substantially as shown and described.

397,647. AIR-SHIP. JOHN P. HOLMES, Oak Valley, Kans. Filed Apr. 18, 1888. Serial No. 271,062. (No model.)

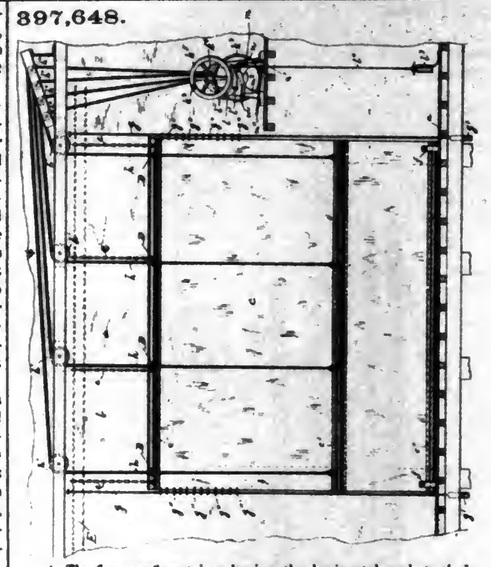
Claim.—1. An air-ship consisting of the horizontal frame having upwardly-extending supports between its ends, the vertically-rocking aero-plane mounted on the upper ends of said supports, the vertical propeller at the front end of the frame, the aeronaut's support be-

397,644.

tween the rear ends of the frame, and the propeller and aero-plane-operating mechanisms within reach of the front end of said support, and the rudder-sail extending from the rear end of the aeronaut's support for operation by the legs of the operator, substantially as set forth.

2. An air-ship consisting of the horizontal frame having upwardly-extending supports or suspension-rods between its ends, the aero-plane pivoted to rock vertically on the said supports, the propeller mounted at the front end of the frame, the support at the rear end of the frame, upon which the aeronaut may lie, the horizontal crank-shaft journaled between the propeller and front end of the aeronaut's support within reach of the operator, gearing connecting said shaft and propeller, a second horizontal crank-shaft journaled on the frame adjacent to the said aeronaut's support, and having connections with the aero-plane fore and aft of the fulcrum, locking-bolts at opposite ends of the said second shaft engaging parts of the frame to lock the plane in position, and operating-levers at the cranked or hand-hold part of the shaft connected with said bolts, whereby the aeronaut may rotate the first-named shaft with one hand and release and operate the second shaft with the other, substantially as set forth.

3. In an air-ship, the combination, with an aero-plane and a frame suspended therefrom and carrying an aeronaut's support, and to which frame the plane is fulcrumed to rock fore and aft, of a transverse tubular cranked shaft, E, journaled on the frame or in brackets held thereto, latch-bolts L, fitted to and within the ends of the shaft and adapted to engage any one of a series of notches, *m*, formed in casings M on the frame, levers and links N O P, fitted in the shaft, and the two levers P, extended at *p p* through the center of the crank-wrist in reach of the aeronaut, substantially as described, for the purposes set forth.



4. In an air-ship, the combination, with a frame suspended from an aero-plane and carrying an aeronaut's support, of a propeller consisting of a shaft, J', journaled on the frame, and blades or wings pivoted by their radial shafts to the propeller hub or body, sleeves J J, held to the shaft one above and the other below it and one at each side of the propeller, and said sleeves having cam-faces *f f* and trip-levers T on the propeller-blade shafts and operating on the cam-faces to turn and hold the blades into and out of the wind as the propeller rotates, substantially as herein set forth.

5. In an air-ship, the combination, with a frame suspended from an aero-plane and supporting a propeller and its operating mechanism, of a support for the aeronaut at the stern of the frame, a rudder-sail connected thereat and behind the aeronaut's support, and sacks held to the rudder and adapted to receive the legs of the aeronaut lying on the support, substantially as herein set forth.

6. In an air-ship, the combination, with the main frame carrying an aeronaut's support and a propeller and its operating mechanism, all suspended from an aero-plane, of a rudder, H, consisting of side bars, *h h*, a cross-bar, *h'*, having end eyes, h^3, receiving the bars *h* loosely, a fabric, h^4, held to and between the bars *h h h'*, and sacks I I, held one to each side bar of the rudder and adapted to receive the legs of the aeronaut, substantially as described, for the purposes set forth.

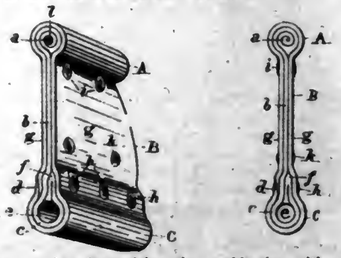
7. In an air-ship, the combination, with the main frame carrying an aeronaut's support and a propeller and its operating mechanism, of a rudder, H, held to the aeronaut's support, sacks I I, held one to each side bar of the rudder and adapted to receive the legs of the aeronaut, and straps or cords V, connected to the sacks and adapted for attachment at their forward ends to the aeronaut's support or the frame, substantially as described, for the purposes set forth.

397,648. FIRE-PROOF CURTAIN. LUKE E. JENKINS, East Boston, Mass., assignor, by mesne assignments, to Louisa Maria Jenkins. Filed Jan. 9, 1888. Serial No. 260,126. (No model.)

Claim.—1. The fire-proof asbestus curtain *c*, having horizontal upper and lower pockets, c' c'', and metal pipes *d d'*, inserted therein, combined with one or more intermediate horizontal pockets, c^3, and metal pipe or pipes *d''*, and hoisting-ropes connected to the latter, substantially as and for the purpose set forth.

2. The fire-proof asbestus curtain *c*, having lower horizontal pocket, c'', and metal pipe *d''*, one or more intermediate horizontal pockets, c^3, and pipe or pipes *d''*, hoisting-ropes *h h h h*, secured at their lower ends to the said pipe *d''*, and upper horizontal pocket, c' with its pipe *d*, provided with eyes or guides D D, through which the hoisting-ropes are passed loosely, substantially as set forth and described.

3. The fire-proof asbestus curtain *c*, having the upper intermediate and lower horizontal pockets, c', c^3, and c'', and corresponding metal pipes *d*, *d''*, and *d'*, arranged in said respective pockets, as described, combined with the hoisting-ropes *h h h h*, guides D D on the pipe *d*, and chains *e e*, attached to the upper pipe, *d*, and to the metal beam E or other portion of the proscenium-wall, substantially as and for the purpose set forth.



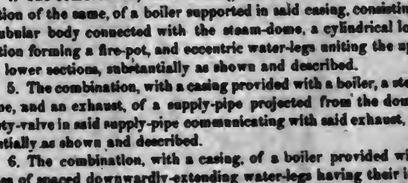
4. The fire-proof curtain *c*, having the horizontal pockets c', c^3, and c'', and the metal pipes *d*, *d''*, and *d'*, placed therein, and having the hoisting-ropes *h h*, arranged and connected for operation as described, in combination with the guide-wires *g g* and rings or ferrules g'' g', secured to the vertical edges of the curtain, substantially as and for the purpose set forth.

5. The fire-proof asbestus curtain *c*, having the horizontal pockets c', c^3, and c'', and corresponding metal pipes *d d''* *d'*, supporting-chains *e e*, and hoisting-ropes *h h*, arranged as described, in combination with the hoisting device having the wheel k^5, friction-lever and shoe *l l''*, adjustable spring *n*, releasing-lever *m*, adapted to be actuated by the lever *m''* and the weight *P* and rope P^1, substantially as and for the purpose set forth.

6. The fire-proof curtain *c*, having the horizontal pockets and metal pipes arranged therein, as described, and having the supporting-chains and hoisting-ropes connected to it, as described, combined with a hoisting apparatus having a brake lever and shoe *l l''*, the adjustable spring *n*, and rope P^1, attached to said brake-lever and provided with a weight, *P*, substantially as and for the purpose set forth.

7. The fire-proof curtain *c*, having the horizontal pockets and metal pipes arranged therein, as described, and having the supporting-chains and hoisting-ropes connected to it, as described, combined with the guides *f f*, for guiding and holding the lower edge of the curtain in close proximity to the rear portion of the proscenium-wall, substantially in a manner as set forth.

397,649. LOOM-PICKER. HAROLD KELLY, Biddeford, Me. Filed July 20, 1888. Serial No. 280,505. (No model.)



Claim.—1. In a loom-picker, the combination, with an outside jacket, of an inside filling made from a siegle piece of material, one end being rolled into a coil for the head, a straight middle part extending down through the shank and the other end folded around the rod-hole, said jacket and filling being held together by rivets, substantially as and for the purposes hereinbefore set forth.

2. In a loom-picker, the combination, with an outside jacket, of an inside filling made of a siegle piece of material, one end being rolled into a coil for the head and the other or free end extending down into the shank within the jacket, and rivets holding the jacket and filling together, substantially as set forth.

3. In a loom-picker, the combination, with an outside jacket, of an inner filling made of a siegle piece of material, one end being rolled into a coil for the head, the middle part extending down through the shank and the other end folded around the rod-hole, extending back a short distance, and then turned back upon itself in front of the rod-hole, said jacket and filling being held together by rivets, substantially as and for the purposes set forth.

397,650. SECONDARY BATTERY. WILLIAM KINGLAND, Gunnersbury, County of Middlesex, England. Filed June 4, 1888. Serial No. 275,944. (No model.) Patented in England Apr. 22, 1887, No. 5,967.

Claim.—1. In secondary batteries, the anodes B and platinum-foil contact-pieces A, in combination with the clamping washers or strips D, of similar material to the anode, and bolts and nuts C, as set forth.

2. The combination, with two or more anodes, B, and platinum-foil contact-pieces A, of the distancing washers or strips D, of similar material to the said anodes, and bolts and nuts C, as set forth.

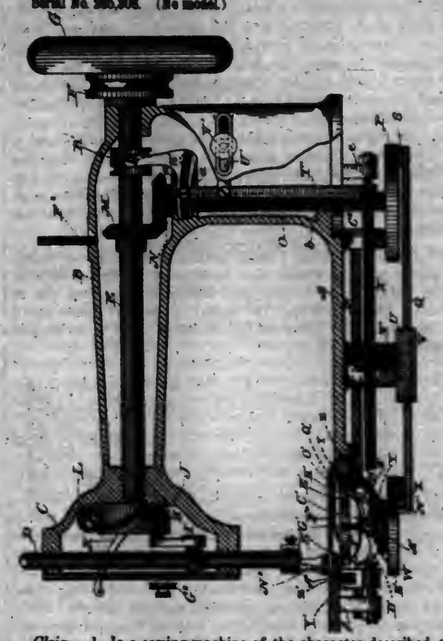
3. The combination, with two or more anodes, B, cathode or cathodes B', and platinum-foil contact-pieces A, of the distancing strips or pieces D, of the same material as the anodes B, insulating-washers D', and nuts and bolts C, as set forth.

397,651. STEAM-HEATER. DANIEL D. G. LANGLANDS and OTIS E. MOULTON, Dover, N. H. Filed May 18, 1888. Serial No. 274,248. (No model.)

Claim.—1. A steam-heater comprising a casing, its grate, ash-pit, and smoke-outlet, a boiler within the casing and forming the fire-pot, flues through the upper part of the boiler, vertical spaced water-legs in the upper end of the fire-pot, and a steam-dome above the flues and communicating with the boiler, all constructed and combined substantially as set forth.

2. The combination, with a casing, of a boiler provided with a series of spaced downwardly-extending water-legs and connected with a circular eccentric fire-pot and flues projected through the upper or body portion of the boiler, and a steam-dome connected with and supported above the boiler within the casing, substantially as shown and described.

3. The herein-described boiler, comprising the fire-pot 11, having vertically-projecting spaced water-legs 12, vertical flues through its top, and a steam-dome over said flues and communicating with the boiler, substantially as set forth.



4. The combination, with a casing and a steam-dome forming a portion of the same, of a boiler supported in said casing, consisting of a tubular body connected with the steam-dome, a cylindrical lower portion forming a fire-pot, and eccentric water-legs uniting the upper and lower sections, substantially as shown and described.

5. The combination, with a casing provided with a boiler, a steam-dome, and an exhaust, of a supply-pipe projected from the dome, a safety-valve in said supply-pipe communicating with said exhaust, substantially as shown and described.

6. The combination, with a casing, of a boiler provided with a series of spaced downwardly-extending water-legs having their inner and outer walls eccentric, and flues projected through the upper or body portion of the boiler, and a steam-dome connected with and supported above the boiler within the casing, substantially as shown and described.

7. The combination, with a casing, of a boiler provided with a series of spaced downwardly-extending water-legs having eccentric inner and outer walls and flues projected through the upper or body portion of the boiler, a steam-dome connected with and supported above the boiler, a steam-gage connected with the dome, a water-gage connected with the boiler, and a safety-valve and outlet-pipe connected with the said steam-dome, substantially as shown and described.

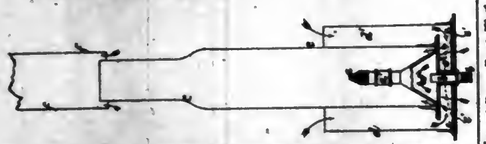
397,652. ROTARY-SHUTTLE SEWING-MACHINE. FRANCIS T. LESLIE, Bridgeport, Conn. Filed Oct. 8, 1885. Renewed Feb. 25, 1888. Serial No. 265,308. (No model.)

Claim.—1. In a sewing-machine of the character described, the combination, with the needle, the needle-bar, and the main shaft and crank-connection for producing a vertical reciprocation therein, of the horizontal rotary shuttle provided with driver-recesses, as described, the pivoted shuttle-driver, the cam-surface formed within the race-casting, the driver-shaft and vertical connecting-shaft, the disks secured upon said driver-shaft and vertical shaft, and the transversely-oscillating lever-pitman connecting said disks and adapted to effect in the driver-shaft a variably-speeded rotary motion, substantially as set forth.

2. In a sewing-machine, the combination of the main shaft, the needle-bar, and the needle carried thereby, the vertical shaft geared to the main shaft, the transversely-oscillating lever-pitman and the disks at either end thereof, the horizontal rotary shuttle, the cam-surface formed within the race, the vertical driver-shaft, and the two-armed shuttle-driver pivoted upon its upper extremity, the latter adapted to drive the shuttle and to receive a variably-speeded rotary motion from the driver-shaft and a vertical oscillation from the contour of the cam-surface, substantially as shown and described.

3. In a sewing-machine of the character described, the combination of the horizontal rotary shuttle, the circular shuttle-race, the cam-surface within the latter, the variably-speeded vertical driver-shaft, and the two-armed shuttle-driver pivotally mounted thereon, the vertically-reciprocating needle-bar and needle, the main shaft journaled in the arm and its link-connection with the needle-bar, the cam-actuated take-up lever operated from the shaft, and the mechanism, as shown, for imparting the variable rotation to the driver-shaft, whereby each loop is thrown, opened, cast off, and drawn tight in the fabric before the commencement of another stitch, substantially as specified.

4. The combination of the main shaft, the grooved cam mounted thereon, the bell-crank lever pivoted within the arm and actuated by the cam, the vertical connecting-rod adjustably secured to the bell-crank, the thumb-nut binding on the arm and securing the connecting-rod in its adjustment, the rock-shaft pivoted beneath and extending longitudinally of the bed-plate, and the arms mounted thereon, the carved and pivoted lever, the connecting-rod, the inclined and adjustable bracket, and the feed-bar pivoted to the vertical rock-arm and with its free end resting upon the bar D^9, all arranged as described and for the purpose specified.



5. The combination, with the main shaft and the needle-bar carried thereby, of the peripherical cam fixed thereon, the pivoted bell-crank lever, the vertically-reciprocated connecting-rod, the rock-shaft

operated thereby, the transverse feed-bar actuated by said rock-shaft, the cam-actuated pivoted lever, and the longitudinally-reciprocating bar inclined at its free end, and the inclined adjustable bracket engaging with the incline on the bar upon which the free end of the feed-bar rests, all arranged as described and adapted to give to the feed-dog both a to-and-fro movement and a vertical throw, substantially as set forth.

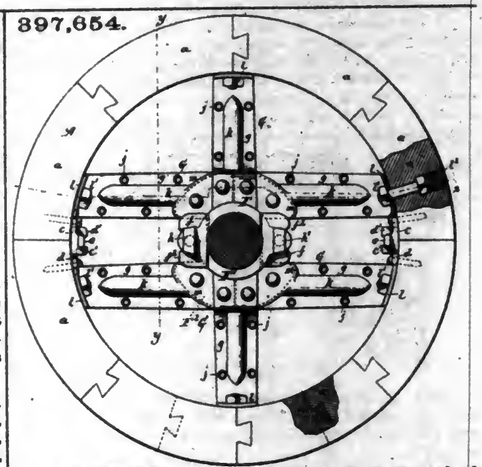
6. The combination, in a rotary-shuttle sewing-machine, with the main shaft, of the bell-crank lever and the cam on said main shaft, whereby it is actuated, the vertical connecting-rod, the rock-shaft and the arms upon the latter, the curved and pivoted lever, the bar at right angles thereto, said bar having an inclined surface thereon, and the feed-bar pivotally attached to the rock-shaft arm and resting upon the bar D^3, all arranged as and for the purpose specified.

7. In combination with the race, the rawhide pencils P', set in the metal, their peripheries cutting the periphery of the race, said pencils being inserted at an angle and so spaced each from the next that the vertical plane of the bottom of each shall be a little in advance of the plane of the next succeeding pencil, substantially as specified.

397,653. BURNER. JAMES LEWIS, Brockley, County of Surrey, assignor to George Matthey, John Scudamore Sclfon, Edward Matthey, and Richard Davies Matthey, all of London, England. Filed Sept. 10, 1884. Serial No. 142,588. (No model.) Patented in France Apr. 7, 1883, No. 154,737; in England Feb. 26, 1884, No. 3,964, and in Germany May 15, 1884, No. 31,188.

Claim.—1. In an incandescent burner, the combination, with a gas-supply pipe, of an air and gas chamber having an imperforate wall of conical form, into which air and gas chamber said gas-supply pipe extends, passages for air beneath said air and gas chamber and communicating therewith, an imperforate portion constituting a passage for the mixed air and gas, connected with and extending above said air and gas chamber, incandescing material arranged upon said imperforate portion, near the upper end thereof, a chimney inclosing said air and gas chamber, and a support for said chimney provided with perforations inward of the chimney, substantially as specified.

2. In an incandescent gas-burner, the combination, with a gas-supply pipe, of an air and gas chamber having an imperforate wall of conical form, into which air and gas chamber said gas-supply pipe extends, passages for air beneath said air and gas chamber communicating therewith, an imperforate portion constituting a passage for the mixed air and gas, connected with and extending above said air and gas chamber, incandescing material arranged upon said portion, near the upper end thereof, a chimney inclosing the said air and gas chamber, and a second chimney of cylindrical form having an open upper end and inclosing the chimney first named, said second-named chimney being supported below the chimney first named in such manner as to form an air-passage downwardly through said second-named chimney and beneath the air and gas chamber, substantially as specified.



397,654. SPLIT PULLEY. JOHN A. MACKINNON, Brooklyn, N. Y. Filed Mar. 30, 1888. Serial No. 267,820. (No model.)

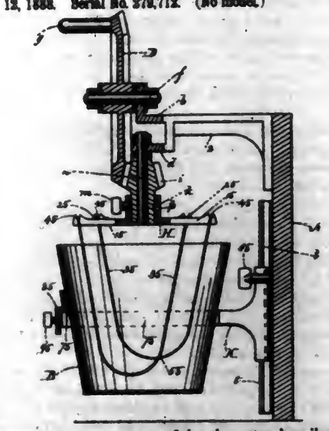
Claim.—1. In a pulley, the combination, with the rim composed of rings provided in their contiguous sides with oblique dovetail grooves, of dovetail keys or locking-bars arranged in said grooves, the planes of the keys connecting one pair of rings intersecting the plane of the keys connecting the adjacent pair of rings, substantially as set forth.

2. In a split pulley, the combination, with two pulley-sections, of a plate secured to one of said sections and provided with two hooks or lugs separated by an open space, a plate secured to the opposing section and provided with a hook or lug projecting into the space between the hooks or lugs of the first-mentioned plate, and a key or wedge engaging between the inner faces of said interlocking hooks or lugs, substantially as set forth.

3. In a split pulley, the combination, with two pulley-sections, of a plate secured to one of said sections and provided with two hooks or lugs having beveled inner faces and separated by an open space, a plate secured to the opposing section and provided with a hook or lug projecting into the space between the hooks or lugs of the first-mentioned plate and having a beveled inner face, and a key or wedge having beveled sides engaging between the inner beveled faces of said interlocking hooks or lugs, substantially as set forth.

397,654.

4. In a split pulley, the combination, with the meeting ends of the rim, of a plate, *e*, secured to one of said meeting ends and provided with two hooks or lugs, e' e^2, a plate, *d*, secured to the opposing end of the rim and provided with a hook or lug, d', and a key or wedge, *e*, engaging between the hooks e' e^2 d' and provided with a screw-shank, e^3, and clamping-nut e', substantially as set forth.



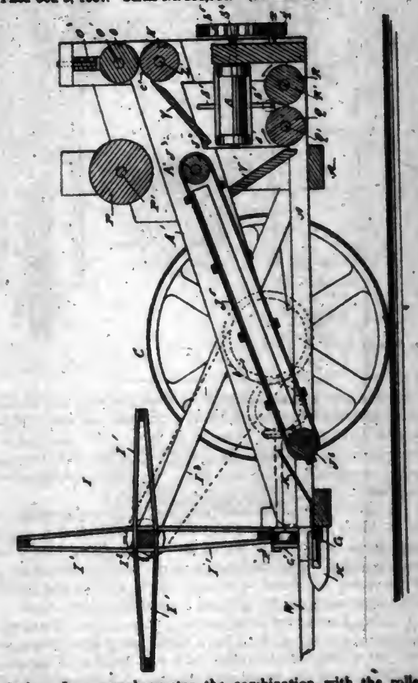
5. In a split pulley, a divided hub composed of two semicircular sections or halves, F F', each provided on one side with two lugs or hooks, f' f^3, and on the opposite side with a single hook, *f*, the hook *f* of one section engaging in the space between the hooks f' f^3 of the other section, and keys or wedges *h h'*, engaging between the hooks f f' f^3, substantially as set forth.

6. In a pulley, the arms G, each composed of two plates, *g g'*, one plate being provided with eyelets *j*, formed integral therewith and passing through openings in the other plate, against which the eyelets are headed, substantially as set forth.

7. The combination, with the rim and the divided hub composed of two parts, each provided with an external flange, F^3, of the arms G, each composed of two bent plates, *g g'*, secured with their outer ends to the rim and with their inner ends to the flanges F^3 of the hub-sections, substantially as set forth.

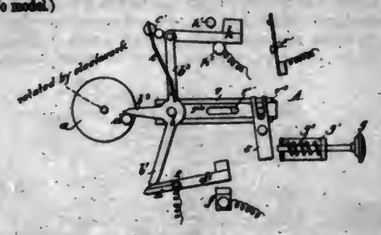
8. The combination, with the rim and the divided hub composed of two parts, each provided with an external flange, F^3, of the arms G, each composed of two bent plates, *g g'*, provided at their outer ends with lips or flanges *l*, whereby they are secured to the rim, and having their inner ends provided with shoulders *m* and resting against the flanges F^3, substantially as set forth.

397,655. EGG-BEATER. JOHN J. MCDOWELL, Boston, Mass. Filed July 12, 1888. Serial No. 279,712. (No model.)



Claim.—1. In an apparatus of the character described, the combination of the standard A, provided with the track *l*, the bracket K, fitted to slide on said track and provided with the holder or loop 75, the bracket *z*, secured to said standard and provided with the arms *b d*, the gear D, journaled in the arm *b*, and the pinion *i*, journaled in the arm *d* and provided with the hub *k*, adapted to receive and revolve a beating or mixing disk when said gear D is rotated, substantially as set forth.

2. In an apparatus of the character described, the combination of the standard A, provided with the vertical track *l*, the bracket K, fitted to slide on said track and having the holder or loop 75, the pan B, provided with the lugs 85 and thumb-screws 95, the bracket *z*, secured to said body and provided with the arms *b d*, the gear D, journaled in the arm *b*, the pinion *i*, journaled in the arm *d* and having the hub *k*, and the disk H provided with the fingers 15 and 25 and looped wires 35, said disk being adapted to be detachably secured to said hub and revolved as the gear D is rotated, substantially as specified.

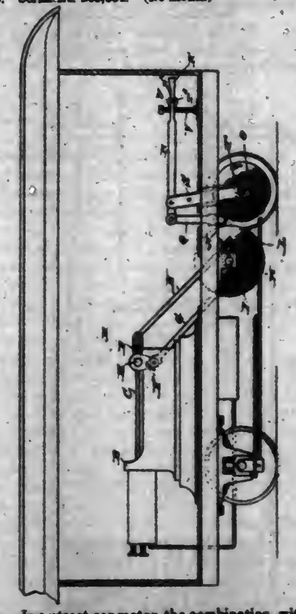


3. The disk H, provided with the long arms 15 and short arms 25, said arms being provided with slots or recesses 45, to receive the wires 35, and said wires respectively looped from the short arms to the opposite long arms, substantially as described.

397,656. CORN-HARVESTER. JAMES MCKIVETT, Garrison, Iowa. Filed Oct. 5, 1887. Serial No. 251,516. (No model.)

Claim.—In a corn-harvester, the combination, with the rollers N O, the operating-faces of which rotate toward each other, and the endless carrier J^3, said rollers N O arranged at the upper discharging end of said carrier, of the lower rollers, Q R, the operating-faces of which rotate toward each other, the endless belt S, traveling above the rollers Q R in the direction of their lengths and provided with pins to enter the space between said rollers, the inclined board V above said belt receiving the corn from rollers N O, and the lower inclined board, V', receiving from the inclined board V and delivering upon the upper surface of the rollers Q R, substantially as set forth.

397,657. AUTOMATIC ALARM APPARATUS. EMIL MEYER, Ottleben, Prussia, Germany. Filed Nov. 3, 1888. Serial No. 290,094. (No model.)

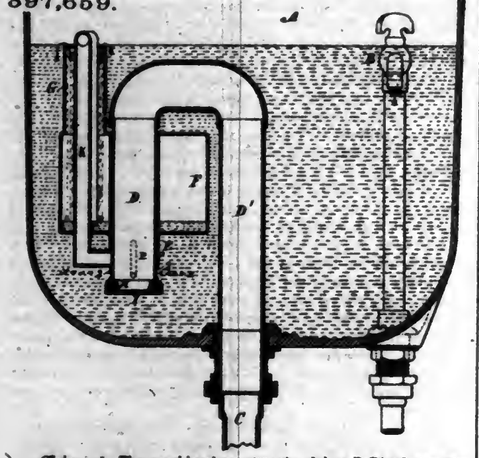


Claim.—1. An automatic alarm apparatus comprising a three-armed lever fulcrumed on a plate horizontally movable in a fixed support, a rotary stud-carrying disk intermittently engaging said lever, contact-levers above and below said plate and actuated by said lever, two electric circuits, each containing a battery and alarm-bell and closed and opened by said levers, and means for automatically restoring the levers to normal position, substantially as shown and described.

2. In an automatic alarm apparatus, the combination, with a three-armed lever fulcrumed on a plate horizontally movable in a fixed support, of a rotary stud-carrying disk intermittently engaging the horizontal arm of said lever, a contact-lever fulcrumed below said support and actuated by a vertical arm of said lever, an electric circuit containing a battery and alarm-bell, said circuit being closed and opened by said levers, and means for automatically restoring said levers to normal position, substantially as shown and described.

3. In an automatic alarm apparatus, the combination, with a three-armed lever fulcrumed on a plate horizontally movable in a fixed support, a rotary stud-carrying disk intermittently engaging the horizontal arm of said lever, and a contact-lever fulcrumed below said support and actuated by a vertical arm of said lever, of a horizontal contact-lever connected to and actuated by the other vertical arm of said lever, two electric circuits each containing a battery and alarm-bell and closed and opened by said levers, and means for automatically restoring said levers to normal position, substantially as shown and described.

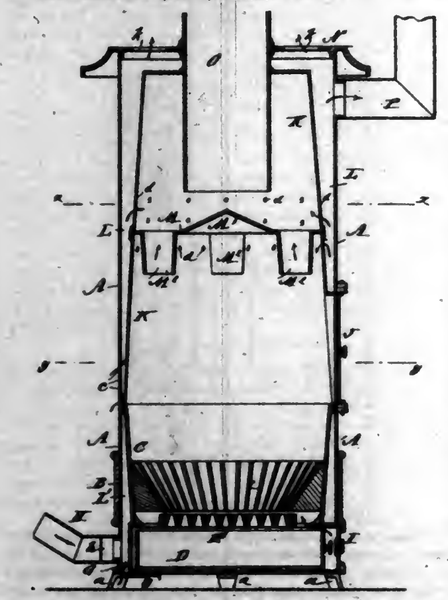
4. In an automatic alarm apparatus, the combination, with a plate horizontally movable in a fixed support and having a pin fixed in its face at one extremity; a three-armed lever fulcrumed on the other extremity of said plate, a rotary stud-carrying disk intermittently actuating said lever, contact-levers above and below said support and actuated by said three-armed lever, and two electric circuits opened and closed by said levers, each circuit containing a battery and alarm-bell, of a vertical lever fulcrumed below said support and engaging the pin in said plate, a horizontally-movable pin adapted to engage said vertical lever, and means for automatically restoring said sliding pin and levers to normal position, substantially as shown and described.



397,658. STREET-CAR MOTOR. BURDETT B. MOORE and CHARLES D. MONTANYE, Kansas City, Kans. Filed Apr. 6, 1888. Renewed Jan. 9, 1889. Serial No. 295,881. (No model.)

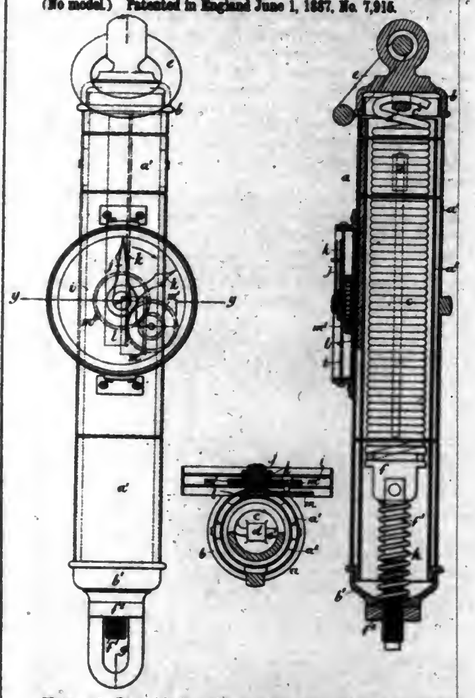
Claim.—In a street-car motor, the combination, with the friction-wheel L, the means for rotating it, and the friction-wheel O on the car-axle, of the pivoted lever R, having a downwardly-extending arm or link, Q, the friction-wheel N on the lower end of said arm or link between the wheels L O, the vertical worm V near the outer end of the lever R, the sliding worm U on said lever and meshing with the vertical worm, the hand-lever T, pivoted on lever R and having a pin, T^3, at its forward end, carrying the said worm U and extending through a slot in the lever R, substantially as set forth.

397,659. CISTERN FOR WATER-CLOSETS. JORDAN L. MOTT, Jr., New York, N. Y., assignor to The J. L. Mott Iron Works, same place. Filed Aug. 16, 1882. Serial No. 282,852. (No model.)



397,659.

Claim.—1. The combination, with the siphon D D', of the tube E, sliding freely upon the same and having openings 2 near the lower end thereof, the valve H, connected with the said tube and acting to close the lower end of the siphon, the float F, around and connected to the tube E and having an overflow-dam, G, and the secondary siphon K within the float and passing through the bottom thereof and opening through the tube E, substantially as set forth.



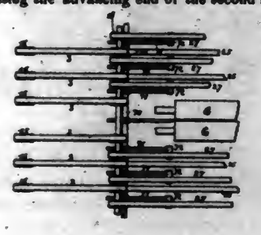
2. The combination, with the cistern for a water-closet and the flushing-pipe thereof, of a siphon-pipe within the cistern, a valve for closing the end of the siphon-pipe, and a float for moving the said valve, and a secondary siphon connected with the float and opening at its lower end into the main siphon for discharging water out of the float, substantially as set forth.

397,660. HOT-AIR FURNACE. BENJAMIN F. PRICE, Bloomington, assignor of one-half to Joseph Ewing Porter, Ottawa, Ill. Filed May 7, 1888. Serial No. 273,134. (No model.)

Claim.—The conical inner casing, K, the bottom casing, C, and outer casing, L, surrounding the inner casing and made upright to form an air-space between the outer casing and the casing K, there being openings e formed in the outer casing and openings d in the inner conical casing, K, in combination with the pipe O, entering the tops of the two casings K L, and the horizontal plate M, held in casing K below the pipe O, the cone M' in said plate, and the short tubes M², fitted in the plate M, near its outer edge, substantially as described.

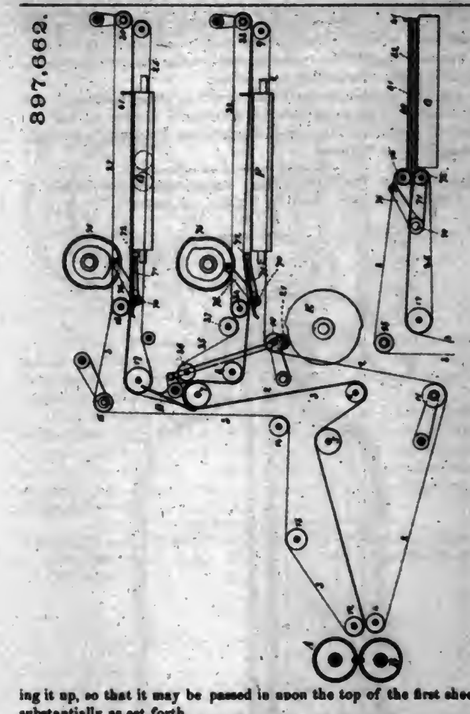
397,661. REGISTER FOR SHIPS' LOGS. RICHARD ROOD, Portswood, Southampton, England. Filed Apr. 12, 1888. Serial No. 270,409. (No model.) Patented in England June 1, 1887, No. 7,916.

Claim.—1. In a ship-log, the combination, with two telescoping tubes, one of which is provided with a dial and indicator, of a spring secured to the closed end of one of the tubes, a rod attached to said spring and passing through the closed end of the other tube, and a spring-connection between said closed end and rod, substantially as described.



2. In a ship-log, the combination, with two telescoping tubes, one of which is provided with a dial and indicator, of a spring secured to the closed end of one of the tubes, a plate provided with a screw-threaded rod which passes through the closed end of the other tube, a spring interposed between the plate and the said closed end of the tube, and a nut for said rod, substantially as described.

3. In a ship-log, the combination, with two telescoping tubes, of a dial attached to one of the tubes, a shaft passing through said dial in gear with a rack upon the other tube, and two hands mounted on said shaft, one of said hands being capable of movement in one direction only, substantially as described and shown.



397,662. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. WALTER SCOTT, Plainfield, N. J. Filed Mar. 2, 1888. Serial No. 265,922. (No model.)

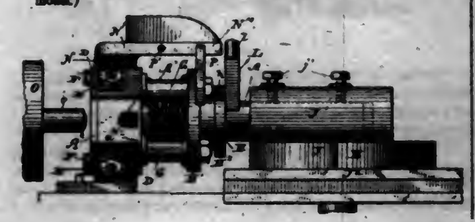
Claim.—1. The combination, with the folding-rolls and the ranges of tapes or belts for conveying the sheets to and over the folding-rolls, of the rolls or bars 72, a rock-shaft for moving the same periodically and lifting the advancing end of the second sheet, and also raising the upper tapes at such rolls or bars to give the proper space for passing the second sheet freely in above the first sheet by the movement of the tapes, substantially as specified.

2. The combination, with the folding-rolls and a stationary fence for stopping the sheet above the rolls, and tapes or rods for supporting the sheets as they pass over the folding-rolls, of lifting rolls or bars 72, for raising the advancing end of the second sheet and holding it up, so that it may be passed in upon the top of the first sheet, substantially as set forth.

397,662.

397,663. COMBINED MATCH-BOX AND CANE. SIMON B. SIMON, New York, N. Y. Filed Feb. 24, 1888. Serial No. 265,099. (No model.)

Claim.—1. A cane-head formed of a tube having a diametrical track across its upper or outer end and a lid sliding upon said track substantially as set forth.



2. A cane-head formed of a tube having a recessed central diametrical track across its upper or outer end and a lid having a central diametrical rib on its under or inner face entering said recess substantially as set forth.

3. A cane-head formed of the inner tube, a, to enter a socket in the upper end of a cane, having opposite notches in its upper end, the outer concentric tube, B, having a recessed track across its upper end resting in said notches, and the lid having a rib on its under side sliding in track-recesses, substantially as set forth.

4. The combination, with a cane or similar stick, of a match-box consisting of a body provided with a diametrical track and a lid sliding upon said track, substantially as shown and described.

5. The combination, with a cane or similar stick, of a match-box consisting of a body provided with a diametrical track, a lid sliding on said track, and a stop limiting the movement of the lid, substantially as and for the purpose specified.

397,664. DIE-CARRYING HEAD FOR BOLT-THREADING MACHINES. JOHAN M. SIMPSON, Chicago, Ill., assignor to William Deering & Company, same place. Filed Sept. 20, 1883. Serial No. 286,731. (No model.)

397,664.

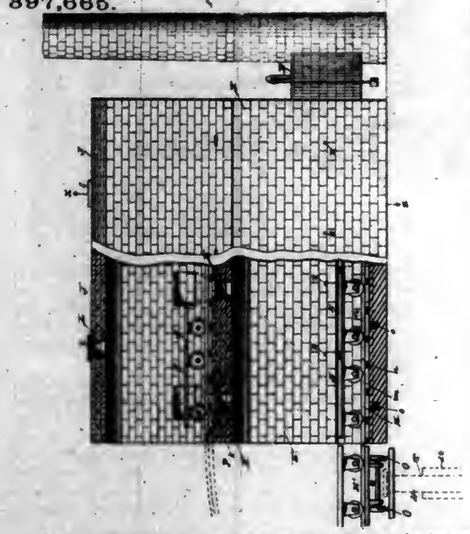
Claim.—1. In combination with the head having the chamber a', the cams reciprocating longitudinally therein, the cutter-holding blocks engaged by said cams, the cams and blocks having the one a tongue and the other a groove oblique to the reciprocation of the cams, and the collar H, sliding on the stem of the head and connected to all the cams, whereby they may all be reciprocated longitudinally simultaneously and equally, substantially as set forth.

2. In combination with the head having the chamber a', the cams reciprocating longitudinally therein, and the cutter-holding blocks engaged by said cams, the cams and blocks having the one a tongue and the other a groove oblique to the reciprocation of the cams, the collar H, connected to the rear protruding end of the cams, and the spring I, interposed between the head and said collar and tending to force the collar away from the head, whereby the cutters are held normally removed from the center of the cutter-head, substantially as set forth.

3. In combination with the cutter-head, cams G, and cutter-holding blocks D, constructed substantially as described, the collar H, secured to the rear end of the cams, and the spring I, reacting between the collar and the head to force them apart, and the latch L, pivoted to the stem of the head and adapted to be moved into position behind the collar H when it is forced forward to compress the spring, substantially as and for the purpose set forth.

4. In combination with the cutter-head, the cutter-holding blocks D, and their actuating-cams G, the collar H, secured to the rear end of the cams, and the spring I, interposed between the collar and the head, and the latch L, pivoted to the stem of the head, the collar H, having the notch h in its rear edge adapted to receive the latch, and the spring L', actuating the latch to hold it normally aside from the notch h, whereby when the collar is forced forward to actuate the cams and the cutter-blocks the latch L is caused to engage behind the collar and detain it forward, substantially as set forth.

5. In combination with the cutter-head and cutter-holding blocks therein, and the cams G, by which they are actuated, the collar H, which actuates said cams longitudinally with respect to the shaft and having the notch h in its rear edge, the turret to which the cutter-head is secured, the fixed cam K, eccentric to the axis of said turret and in position to engage the collar H at the rear as the turret is revolved, the latch L, pivoted to the stem A, and the spring L', tending to actuate the latch aside from the notch h, whereby the revolution of the turret forces forward the collar H and the cams G and the latch L locks them forward, substantially as set forth.



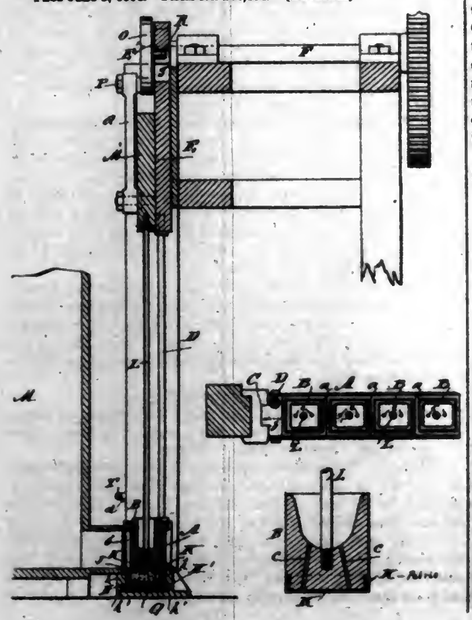
6. In combination with the cutter-head having the devices which force the cutters toward the center, and the collar H, which actuates them, provided with a notch, h, the latch L, which locks said collar in the position in which it holds the cutters toward the center and adapted to enter said notch, the bracket N, fixed with respect to the bolt-holding chuck, and having the cam-faces n', located in the path of the latch L as the cutter-head advances toward the chuck, whereby the latch is tipped into position to enter the notch h, substantially as and for the purpose set forth.

7. In combination with the cutters having the aperture e, the bolt E, having the head adapted to enter said aperture, and its stem adapted to extend out through the same, the block D, having the rectangular aperture to receive the cutter, and the hole d' to admit the bolt, and the nut F, screwed onto the end of the bolt, substantially as and for the purpose set forth.

397,665. BRICK-KILN. BENJAMIN F. SHAKESPEARE and SAMUEL J. ROSE, Chester, Pa.; said Rose assignor to said Shakespeare. Filed Apr. 19, 1887. Serial No. 235,205. (No model.)

Claim.—1. The herein-described kiln, consisting of a single structure providing an upper horizontal chamber and two lower horizontal chambers, having flues connecting the lower chambers with the upper chamber, flues connecting each of said lower chambers with a stack or chimney, and a valve for alternating the connection with said chimney, heating means for heating the lower chambers alternately, and means for removing the brick from the upper chamber to either of the lower chambers, substantially as described.

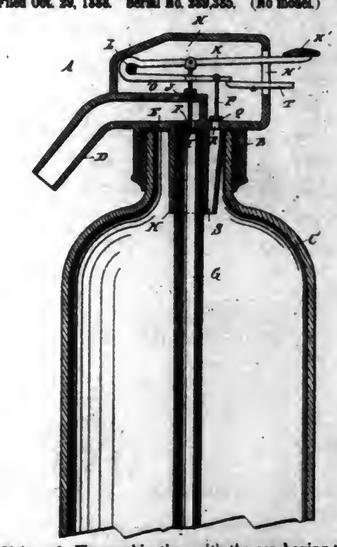
397,665.



2. The combination, with a horizontally-extending kiln having an open bottom and an end opening, tracks below the bottom extending the length of the kiln, trucks with platforms for supporting the brick to be burned, adapted to be moved into and out of the kiln with the brick through the end opening and to be lifted to close the bottom of the kiln, and a lever for lifting said platforms against the bottom, substantially as described.

3. The herein-described kiln, consisting of a drying-chamber and two burning-chambers, each having flues communicating with the drying-chamber and provided with open bottoms, platform-cars for closing the bottoms of said chambers, rail-sections supporting said cars, and means for raising the sections and cars, substantially as described.

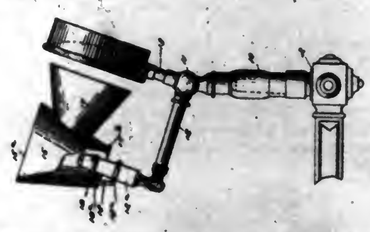
4. The combination, with a chamber of a kiln having side ledges, 22, of platform-cars supporting the bricks, adapted to be raised against said ledges to close the bottom of the chambers, track-sections supporting said cars, and levers for raising the cars and track-sections, substantially as described



397,666. BRICK-PRESS. JAMES H. STEELE, Butte City, Mont. Filed June 5, 1888. Serial No. 276,131. (No model.)

Claim.—1. The vertically-reciprocating molds A, head in the main frame in ways C C and formed with the openings *b* at one side, in combination with the vertically-reciprocating followers B, fitted in the said molds, substantially as described.

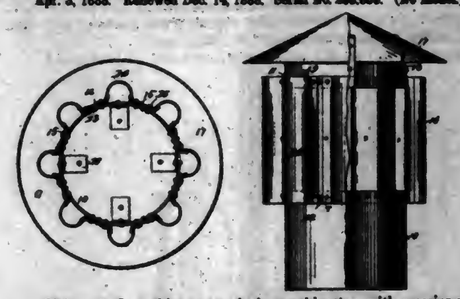
2. The vertically-reciprocating molds A, having openings *b*, and the flange J, made wider than the thickness of a brick, in combination with the vertically-reciprocating followers B, fitted in said molds, substantially as described.



397,667. BOTTLE-FAUCET. FELIX STEFANY, New York, N. Y. Filed Oct. 29, 1888. Serial No. 289,585. (No model.)

Claim.—1. The combination, with the cap having two openings, F R, in its top E, and the pipe D, leading from the opening F, of the upwardly-closing valve I, having a stem extending up through opening F and pipe D, the downwardly-closing valve over opening R, the stem P, parallel with stem J, and the two horizontal spring-arms, one connected to stem J and pressing it up, and the other connected to stem P and pressing it down, substantially as set forth.

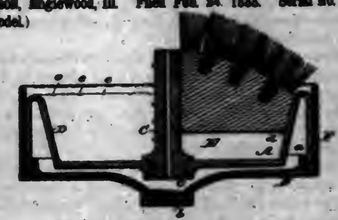
2. The combination, with the cap B, having a top, E, provided with two openings, F R, a casing, N, upon the top, having a vertical slot, N', in its side, and a pipe, D, leading from the opening F out through the casing N, of the parallel valve-stems J P, provided with valves I Q, closing said openings F R upwardly and downwardly, respectively, the horizontal two-armed spring K, rigidly secured at L within the casing, with its long arm projecting through the slot therein and connected with stem J to press it upward, the shorter arm, O, being connected to stem P and pressing it down, and the lever T, pivoted in the casing, extending at its inner end under the short arm O, and projecting at its opposite end through slot N', substantially as set forth.



397,668. SHADE FOR BURNERS. JAMES STRATTON and WILLIAM J. STRATTON, Brooklyn, N. Y. Filed June 21, 1888. Serial No. 277,764. (No model.)

Claim.—1. The combination, with a shade formed with an elliptical top and provided at one side with a funnel-shaped ray-conductor, of a wire coil or ring carried by the shade and adapted to receive a burner-tip, substantially as described.

2. The combination, with a shade formed with an elliptical top and provided at one side with a funnel-shaped ray-conductor, of the holder consisting of a ring and an aligning-coil, both being supported from and carried by the shade, substantially as described.

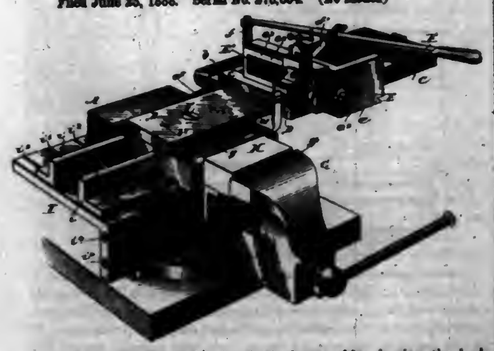


397,669. CHIMNEY-COWL. DAVID TERRY, New York, N. Y. Filed Apr. 3, 1888. Renewed Dec. 14, 1888. Serial No. 293,668. (No model.)

Claim.—1. In a chimney-cowl, the combination, with a series of vertical equidistant stripe seperated by slots, of a series of semi-cylindrical plates arranged vertically, covering said slots, and serving as smoke-conductors, as shown and described.

2. In a chimney-cowl, the combination, with the lower cylinder, 12, the upper ring, 11, and the equidistant essentially U-shaped plates 15, which connect them, of a series of semi-cylindrical conductors attached to the connecting-plates and spanning the space intervening said plates, and a cap attached to but separated from the upper ring, substantially as and for the purpose specified.

397,670. FOUNTAIN BRUSH AND SPONGE HOLDER. SAMUEL THORNTON, Englewood, Ill. Filed Feb. 24, 1888. Serial No. 265,135. (No model.)



Claim.—1. A head for fountain-brushes provided with the inner and outer walls, A B, the central cavity, D, the nozzle C within the cavity, and the handle-receiving neck *b*, substantially as described.

2. A head for fountain-brushes provided with the inner and outer walls, A B, the apertures *c*, the central cavity, D, the nozzle C, projecting from the bottom of the cavity, and the threaded handle-receiving neck *b*, substantially as herein shown and described.

3. In a fountain-brush, the combination, with the hollow head provided with the inner and outer walls, A B, the threaded neck *b*, the threaded aperture *c*, and the apertures *c*, of the externally-threaded nozzle C, and the brush E, received on the nozzle C, substantially as described.

397,671. PLANING-MACHINE. THOR A. THORSEN, Chicago, Ill. Filed June 23, 1888. Serial No. 278,064. (No model.)

Claim.—1. A portable hand planing-machine having the body portion constructed hollow, with the recess *d'* at the top, whereby it is adapted to receive and fit upon one of the jaws of a vise, and provided with a reciprocating tool-holder arranged to permit the tool to set upon work held by the vise when said body portion is fitted upon one of the vise-jaws, substantially as described.

2. A portable hand planing-machine comprising the hollow body A, constructed to fit upon one of the jaws of a vise and provided with screws to screw it thereto, the reciprocating carriage guided upon the hollow body, and an adjustable tool-holder supported upon the carriage, said members being combined substantially as described.

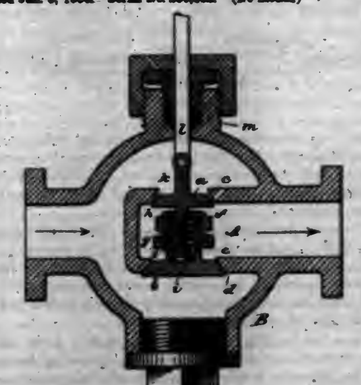
3. In a hand planing-machine, the guide-plate B, arranged upon a portable body, the reciprocatory carriage arranged to work upon said guide-plate, the slide E, arranged upon and adjustable transversely to the line of movement of the carriage, a suitable tool-holder applied to said slide, and means, substantially as set forth, for securing the portable body to one of the jaws of a vise, all combined substantially as and for the purpose described.

4. In a hand planing-machine, the reciprocatory carriage arranged to work upon a guide, the hand-lever applied for operating the reciprocatory carriage, the slide adjustably held upon the said carriage and provided with a tool-holder, and a feed device for automatically adjusting the slide, substantially as described.

5. In a hand planing-machine, the combination, with a reciprocating carriage and adjustable tool-holder supported thereon, of the guide B, supporting the reciprocatory carriage and adjustably held upon the stationary body of the machine, substantially as set forth, whereby the work may be planed from different directions or at different points, substantially as described.

6. In a hand planing-machine, the combination, with the stationary body and a reciprocating carriage arranged thereon and provided with a tool-holder, of a work-holding bracket, such as set forth, attached to said body, for the purpose described.

7. In a hand planing-machine, the combination of the hollow body portion A, provided at one side with a jaw and constructed to fit upon one of the jaws of a vise, a reciprocatory tool-holder supported upon said body, and a screw arranged for holding the said body portion of the machine to the stationary jaw or body of the vise, substantially as and for the purpose described.



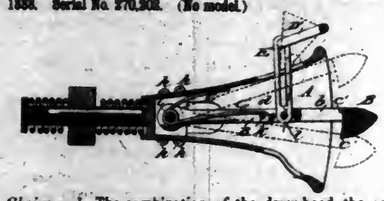
8. In a hand planing-machine, the combination, with the stationary body portion, substantially as set forth, of one or more screws, a^4, arranged at one side of the said stationary body portion as a means for adjusting the same.

9. In a hand planing-machine, the combination, with the guide-plate B, of the carriage C, provided along its under side with a groove adapted to receive the guide-plate and across its upper provided with a groove, *c'*, wherein a portion of the slide for a tool-holder is received, substantially as described.

10. In a hand planing-machine, the combination, with the reciprocating carriage, of the slide E, provided with a tool-holder, the feed-screw supported by the carriage and engaging the slide, and the pawl-and-ratchet device for actuating the feed-screw, and the cam or incline c^3, for effecting the operation of the pawl, substantially as described.

11. In a hand planing-machine, the combination, with the guide-plate B and the reciprocating carriage C, of the bracket *b*, attached to the guide-plate, and the hand-lever fulcrumed upon said bracket and connected with the carriage, substantially as described.

397,672. THROTTLE-VALVE. JOHN TOWER, Minneapolis, Minn. Filed Jan. 5, 1888. Serial No. 259,883. (No model.)

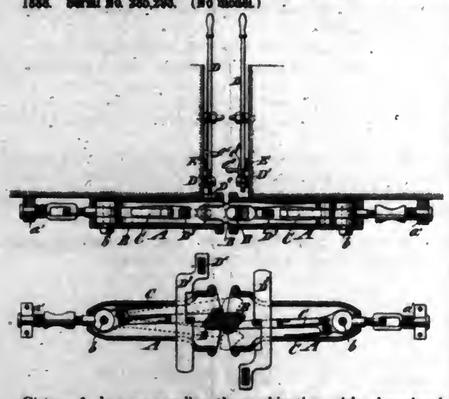


Claim.—1. The combination, with the valve *b*, provided with the tubular stem *c*, of the screw-cap *f*, the valve *a*, provided with the stem *h*, and the spiral spring *j*, surrounding the tubular stem and compressed between the cap *f* and the flange *i* of the valve-stem, substantially as described.

2. As an improved article of manufacture, a valve formed of the valve-casing B, provided with the valve-seats *c d*, the valve *b*, having the perforated tubular stem *c*, the screw-cap *f*, fitted to the valve-stem *c*, the jam-nut *g*, the valve *a*, provided with the stem *h*, having

the flange *i*, the spring *j*, interposed between the flange *i* and the screw-cap *f*, and the rod *l*, jointed to the valve-stem *k*, substantially as described.

397,673. CAR-COUPLING. WILLIAM C. WATSON, Paterson, N. J., assignor of one-half to Theodore Y. Kinne, same place. Filed Apr. 10, 1888. Serial No. 270,202. (No model.)

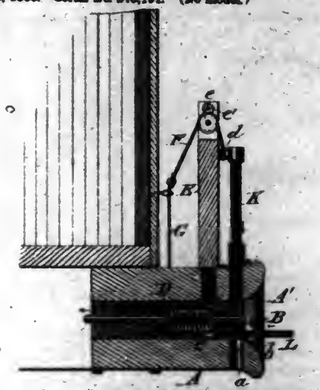


Claim.—1. The combination of the draw-head, the coupling-hook provided thereon and the spring provided between them, substantially as herein described, a slotted link connected with the coupling-hook, an operating-shaft provided with a crank engaging the slotted link, and means, substantially as described, for locking the shaft in different positions, as and for the purpose set forth.

2. The combination of the draw-head, the coupling-hook provided thereon and the spring provided between them, substantially as herein described, whereby when the coupling-hook is unlocked and left free it is thrown over by the spring with its back beyond the central position, substantially as and for the purpose herein set forth.

3. The combination of a coupling-hook provided with upper and lower integral pivots, a draw-head having formed in it a bearing for the upper pivot, a removable plate fitted to and secured in the opening in the lower part of the draw-head and containing a bearing for the other pivot, a spring applied within the draw-head between it and the coupling-hook, and the removable pin for holding said spring inserted in the coupling-hook and secured therein by said removable plate, all substantially as herein set forth.

397,674. CAR-COUPLING. WILLIAM C. WATSON, Paterson, N. J., assignor of one-half to Theodore Y. Kinne, same place. Filed Sept. 13, 1888. Serial No. 285,283. (No model.)



Claim.—1. In a car-coupling, the combination, with a draw-head, of a coupling-hook within the draw-head, a spring for moving the coupling-hook in one direction, a slider-bar, a pull-rod, a connection between the slider-bar and the pull-rod, and a lever for moving the slider-bar, substantially as specified.

2. In a car-coupling, the combination, with a draw-head, of a coupling-hook within the draw-head, a spring for moving the coupling-hook in one direction, a slider-bar, a pull-rod, a connection between the slider-bar and the pull-rod, a lever for operating the slider-bar, and a stop for maintaining the slider-bar in a position into which it may be adjusted, substantially as specified.

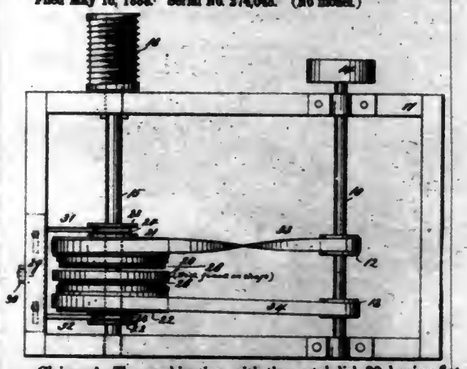
3. In a car-coupling, the combination, with a draw-head, of a coupling-hook within the draw-head, a spring for moving the coupling-hook in one direction, a slider-bar, a pull-rod, a connection between the slider-bar and the pull-rod, a lever for operating the slider-bar, and a stop having portions extending to opposite sides of the car and adapted to engage either of the end portions of the slider-bar to maintain the latter in position into which it may be adjusted, substantially as specified.

4. In a car-coupling, the combination, with a draw-head, of a coupling-hook within the draw-head, a spring for moving the coupling-hook in one direction, a slider-bar, a pull-rod, a connection between the pull-rod and the slider-bar, and a lever for operating the slider-bar, said lever having projections extending to opposite sides of the car and a projection extending above the car, substantially as specified.

397,675. CAR-COUPLING. CHESES WELLS, Newberry, S. C. Filed May 5, 1888. Serial No. 273,191. (No model.)

Claim.—1. In a car-coupling, the combination, with the slotted draw-head, of a pin-supporting device contained therein and consisting of a skeleton frame having solid ends, a central longitudinal rod located in said frame, a coiled spring around the rod within the frame, and a stationary transverse rod fixed in the draw-head and through the skeleton frame, and against which the spring bears, all substantially as described.

2. In a car-coupling, the combination, with the slotted draw-head, of a pin-supporting device consisting of a rod adapted to slide in said head and carrying a block attached to its forward end, so as to lie across the pin-hole, a spring coiled about said rod, and a stationary transverse bar located in the head and against which the spring bears, substantially as described.



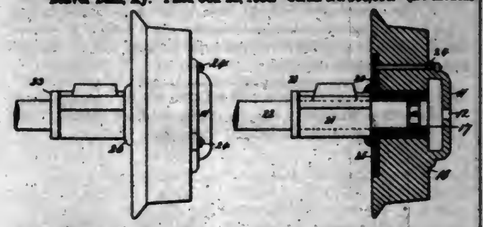
3. The herein-described coupling-link inclined or beveled at one end and square at the other end, substantially as described.

4. The herein-described coupling-link L', beveled at one end, as at *l*, substantially as and for the purpose described.

5. The combination, with the coupling-pin K, of the rectangular frame *n*, surrounding the draw-head, and having a spring, *o*, tensioned between its lower cross-piece and the under surface of the draw-head, and the cords *m m*, whereby the pin K is lifted, substantially as described.

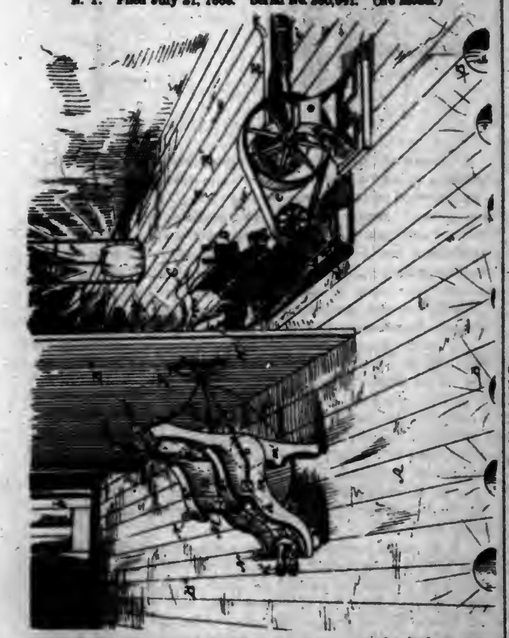
6. The herein-described coupling-link beveled at one end, substantially as described.

397,676. REVERSING-GEAR. SAMUEL J. WHITE, Bearden, Ark. Filed May 16, 1888. Serial No. 274,048. (No model.)



Claim.—1. The combination, with the metal disk 20, having flat sides, of a shifting pulley arranged parallel thereto and provided with a laterally-projecting annular flange, 25, and the friction-ring 26, made of soft material and secured to and projecting laterally beyond the said flange, whereby it is adapted to bear against the side of the disk when the pulley is shifted toward the latter, as shown and described.

2. The combination of the frame 11, main shaft 10, the counter-shaft 15, the metal disk 20, rigidly secured upon the latter, friction-drums mounted loosely on the counter-shaft and having peripherally-grooved hubs 23, the parallel arms 31 32, shifting-bar 29, and lever 30, the open belt 34, crossed belt 33, and a spirally-grooved

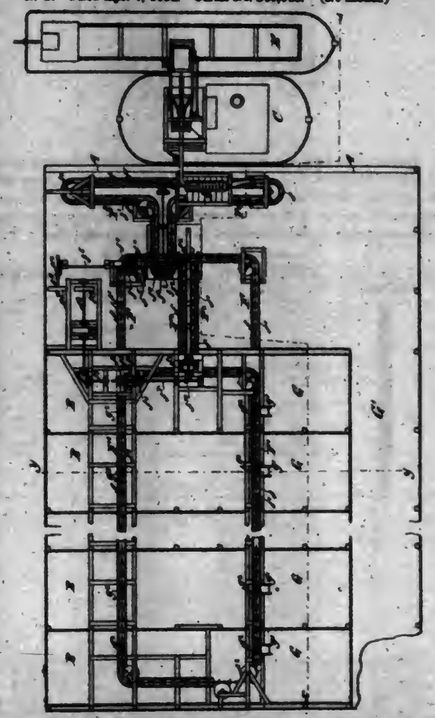


spool, 16, on one end of the counter-shaft, the pulleys 18, and a rope, 17, wound on said spool, and the shifting carriage 19, with which the rope is connected, all as shown and described.

397,677. CAR-WHEEL AND BEARING. JESSE S. WILLIAMS, Beaver Dam, Ky. Filed Oct. 22, 1888. Serial No. 288,810. (No model.)

Claim.—The hereinbefore-described improvement in car-wheels and bearings, consisting of an axle formed with a fixed collar and a circumferential groove, a wheel provided with an outer apertured cap formed integral therewith, recesses formed in the hub, brakes arranged within said wheel-hub having projections fitting the recesses in the hub and flanges adapted to enter the groove of the axle, an inner cap, and bolts by which the cap is secured to the wheel, all arranged substantially as shown and described.

397,678. THEATRICAL APPLIANCE. FRED WILSON, New York, N. Y. Filed July 21, 1888. Serial No. 280,641. (No model.)



Claim.—1. The combination of a stage, a mechanical structure representing the interior of adjoining compartments, a chair in one compartment having electric lamps mounted thereon, a push-button adjacent to said chair, a battery in the adjoining compartment, wires connected with said battery and push-button, and wires connected with said lamps engaging said button, all arranged to operate substantially in the manner and for the purpose specified.

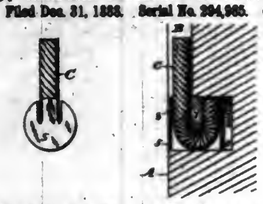
2. The combination of a stage, a mechanical structure representing the interior of adjoining compartments, a chair having a balanced pivoted body; electric lights mounted upon the chair-body, a push-button adjacent to said chair, a battery, wires connected with said battery and push-button, and wires connected with the lamps engaging the button, all arranged to operate substantially as shown and described.

3. In a theatrical appliance, a chair provided with a head-support, electric lamp attached to said chair, a generator of electricity, wires establishing a circuit between the generator, the chair, and the lamps, and a switch or button controlling said circuit, all arranged substantially as shown and described.

4. In a theatrical appliance, a chair having a pivoted and balanced body, electric lamps attached to said chair, a generator of electricity, wires establishing a circuit between the generator and lamps, and a device, substantially as shown and described, to open or close the circuit, as and for the purpose specified.

397,679. APPARATUS FOR HANDLING AND DISTRIBUTING GRANULAR OR LUMPY SUBSTANCES. EDGAR J. WOOD, Brooklyn, N. Y. Filed Apr. 7, 1888. Serial No. 269,913. (No model.)

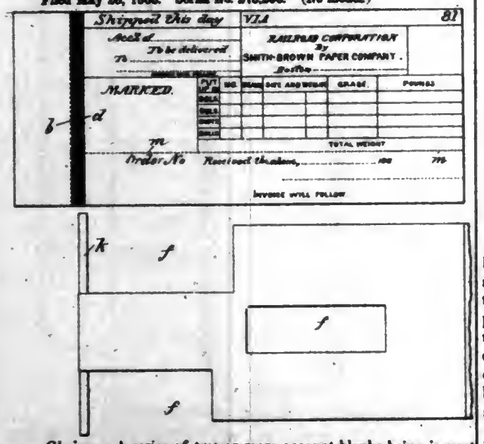
Claim.—1. The combination, with the frame-work, as D', having slideways, as d^{10}, of an endless chain of buckets, wheels journaled in boxes fitting said slideways and arranged to rotate in the same plane, whereby the chain of buckets is caused to travel in a straight line in passing between the said wheels, and a pair of toggle-levers having their end joints connected with the wheel-journals, and an adjusting-screw connected with the middle joint of the toggle-levers for adjusting them to vary the distance of the wheels apart, substantially as herein described.



2. An apparatus for handling and distributing granular or lumpy substances, comprising a series of bins and a series of pockets each having a delivery-outlet, and a substantially-horizontal endless chain conveyer having two parallel intercommunicating runs extending one over the series of bins and the other over the series of pockets, the said conveyer being reversible and its runs having delivery-outlets, those of one run being over the several bins and those of the other run being over the several pockets, substantially as herein described.

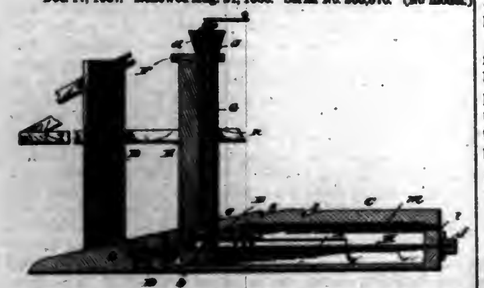
3. An apparatus for handling and distributing granular or lumpy substances, comprising a series of bins and a series of pockets, each having a delivery-outlet, and a substantially-horizontal endless chain conveyer having two intercommunicating runs extending one over the series of bins and the other over the series of pockets, the said conveyer being reversible and its runs having delivery-outlets, those of one run being over the several bins and those of the other run being over the several pockets, and an inclined conveyer for receiving the material and delivering it to the said horizontal conveyer, to be thereby delivered to any one of the bins or to any one of the pockets, substantially as herein described.

4. An apparatus comprising a series of bins arranged side by side and a series of elevated pockets similarly arranged, and each having a delivery-outlet, a lower substantially-horizontal conveyer having two runs for taking material from any bin and reversible in its direction of movement, an upper substantially-horizontal conveyer having two runs or arms, respectively, over the bins and pockets, also reversible in its direction of movement, and having outlet-openings, those of one run being into the bins and those of the other run into the pockets,



and an inclined conveyer into which material is delivered by the lower conveyer, and by the inclined conveyer delivered to the upper conveyer, substantially as herein described.

397,680. **SASH-CORD FASTENER.** EDWIN W. ABBE, New Britain, Conn. Filed Dec. 31, 1888. Serial No. 294,985. (No model.)



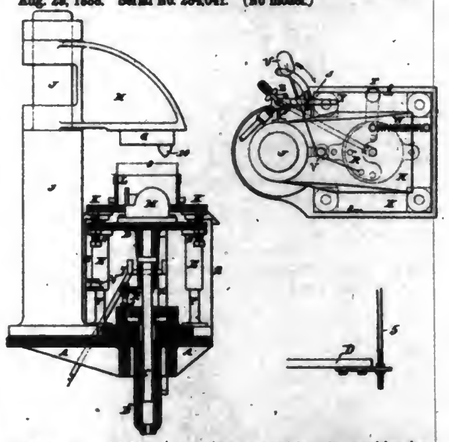
Claim.—The herein-described sash-cord fastener, consisting of the end plates connected by a shell or frame, the cross-bar between said end plates for doubling the cord over, and a fastening tongue formed integral with one or both of said end plates for impinging upon the cord, substantially as described, and for the purpose specified.

397,681. **ACCOUNT-BOOK.** EDWARD G. ALBREE, Boston, Mass. Filed May 28, 1888. Serial No. 275,290. (No model.)

Claim.—A series of two or more account-blanks being in part duplicates, the duplicate portions being in the same relative positions on each blank, combined with one or more sheets of carbon-paper, which are cut away or have their surfaces covered throughout those parts which correspond with the portions of the account-blanks which are not duplicates, substantially as shown and described.

397,682. **MOLE-PLOW.** JOHN C. ALLEN, Brookston, Ind. Filed Dec. 17, 1887. Renewed Aug. 21, 1888. Serial No. 283,870. (No model.)

Claim.—1. The combination, with the front and rear moles connected as described, of the front and rear vertical cutters, the plat form mounted thereon, the feed-tube communicating to the rear mole with the hopper thereon, and the auger therein, and the crank-shaft and agitator, all adapted to operate substantially as specified.



2. A mole formed in two longitudinal sections, the upper one of which has its forward end tapered and its outer side grooved transversely, and also recessed to form outlet-apertures, and a plate interposed between the two sections and extended laterally, substantially as specified.

3. The combination, with a mole, of a feed-tube, a rotative shaft therein, and an agitator in the mole and connected with the rotative rod, whereby a reciprocation may be imparted thereto, substantially as specified.

4. The combination, with the mole having a vent-aperture in its rear end, of the agitator, and a clearing-rod secured to the agitator and passing through the vent-aperture, substantially as described.

5. The combination, with the mole, of the vertical feed-tube having a hopper, the rotative rod therein, the auger secured to the rod, and the agitator connected with the lower cranked end of the said rod, substantially as specified.

397,683. **APPARATUS FOR MAKING MOLDS.** STEPHEN ALLEY and JOHN A. MACLELLAN, Glasgow, County of Lanark, Scotland. Filed Aug. 29, 1888. Serial No. 284,041. (No model.)

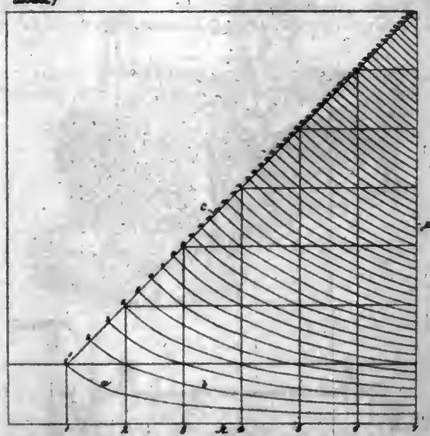
Claim.—1. Molding apparatus comprising, in combination, a hydraulic cylinder with its ram extending upward and having a platen, a pattern fixed on the platen, a parting-plate with a contour opening through which the pattern can project, adjusting-pins screwed in the platen to determine the position of the parting-plate when lifted by the platen, a mold-box, a resisting-block above the platen, a movable chock-plate for temporarily supporting the platen at a point in its descent, and a valve for controlling the action of the water in the hydraulic cylinder, the several parts being arranged and operating substantially as herein set forth.

2. Molding apparatus comprising, in combination, a hydraulic cylinder with its ram extending upward and having a platen, a pattern fixed on the platen, a parting-plate with a contour opening through which the pattern can project, adjusting-pins screwed in the platen to determine the position of the parting-plate when lifted by the platen, a mold-box, a resisting-block above the platen and fixed upon a bracket upon a pillar at the back of the machine, a movable chock-plate for temporarily supporting the platen at a point in its descent, and a valve for controlling the action of the water in the hydraulic cylinder, the several parts being arranged and operating substantially as herein set forth.

3. In molding apparatus having a rising platen with a pattern fixed on it, a parting-plate adjustable in relation to the platen, combined with a device for guiding the platen and stopping the parting-plate when the platen has partly descended, such device consisting of rods fixed to the bed-plate and extending up through guide-tubes fixed to the platen, with their upper ends acting as stops for the parting-plate, substantially as herein set forth.

397,684. **TURN-TABLE FOR MOLDERS.** STEPHEN ALLEY and JOHN A. MACLELLAN, Glasgow, County of Lanark, Scotland. Filed Oct. 5, 1888. Serial No. 287,346. (No model.)

Claim.—1. A turn-table constructed to turn on a central fixed pillar and comprising, in combination, a frame-work, a platform, a raised annular ledge or table, a central small table adapted to carry cores, &c., and gearing connecting the said central table with the turn-table, whereby a person standing on the turn-table may revolve the latter by turning the central table, substantially as herein set forth.

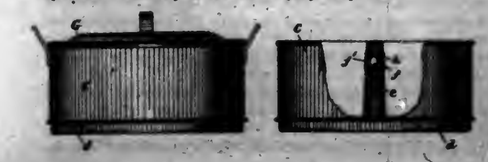


2. A turn-table with the gearing for turning it, consisting of a central rimmed table or disk, a pinion fixed to the center bon of the table or disk, a vertical shaft carried by the turn-table and having on it a spur-wheel gearing with the said pinion, and a pinion on the vertical shaft gearing with a fixed spur-wheel, substantially as herein described.

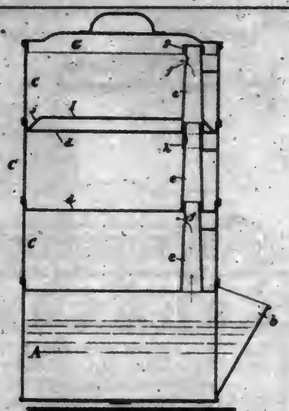
397,685. **MOWING-MACHINE CUTTER-BAR.** ISAAC F. RAMSDEN, Springfield, Ohio, assignor of one-half to Daniel Young, same place. Filed July 16, 1888. Serial No. 280,110. (No model.)

Claim.—The combination of a cutter-bar having a vertical flange on its rear portion and a dovetailed channel extending its entire length, a dovetailed bar fitting in the said channel and carrying the cutter-blades, the rear ends of which rest against the said flange, and screws d' engaging threaded openings a^2 in the cutter-bar for holding the bars together, substantially as described.

397,686. **SCALE FOR SURFACE MEASUREMENTS.** GEORGE H. BENEDICT, Chicago, Ill. Filed May 19, 1888. Serial No. 274,358. (No model.)

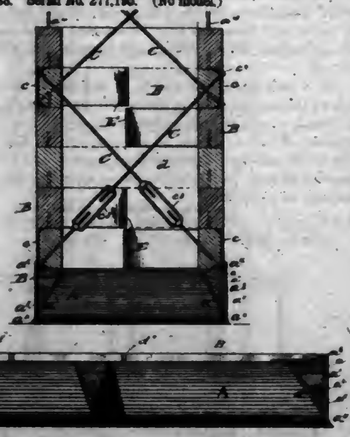


Claim.—1. A scale for ascertaining the number of units of square measure in a square or rectangular surface containing a multiplicity of such units, the same consisting of a series of curved or angular lines projected in successive order upon a diagram divided by vertical and horizontal lines into a number of the square units to be ascertained, the vertical lines bounding one side of each square being subdivided between each pair of horizontal lines into as many parts as the numbered position of the line from the measuring-corner of the scale indicates, and each curved or angular line intersecting all the vertical lines at the same point of subdivision in said lines, substantially as described.



2. A scale for ascertaining the number of units of measure in a square or rectangular surface containing a multiplicity of such units, the same consisting of a diagram squared by one of such units, one side of each of which squares is divided into a successive series of parts, beginning with unity and progressing in consecutive order, and having curved lines projected across said diagram, intersecting each series of divisions in successive or progressive order, substantially as described.

397,687. **STEAM-COOKER.** WINFIELD S. BEVERIDGE, Baltimore, Md. Filed May 26, 1888. Serial No. 275,151. (No model.)



Claim.—The steam-cooker herein described, consisting of a base-boiler having arranged above the same a series of receptacles provided with perforated pipes having perforated collars mounted thereon, a removable cap on the upper end of the upper tube, and a removable flanged bottom having a notch which surrounds the pipe of the receptacle, substantially as and for the purpose specified.

397,687.

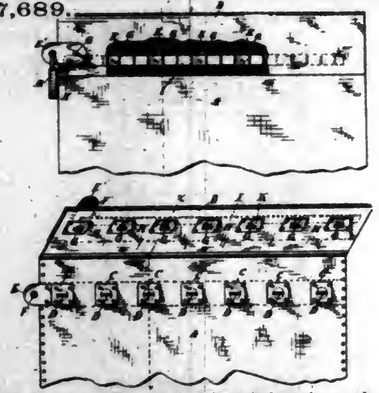
397,688. **MINING-CAISSON.** SILAS A. BOWE, Huron, Dak. Filed June 15, 1888. Serial No. 277,196. (No model.)

Claim.—1. A base for a mining-caisson, consisting of a series of metallic and wooden frames incased in a metallic jacket having a flange extending around and projecting beyond its lower end to prevent the earth coming in contact with the side of the base, and a flange extending beyond its upper end in which the lower frame of the caisson rests, substantially as described.

2. A base for a mining-caisson, consisting of a series of metallic and wooden frames having their outer sides vertical and their inner sides slanting, in combination with the jacket having its lower end bent out to form a flange and its upper end extended to form a flange in which the lower frame of the caisson rests, substantially as described.

3. The combination, with the base, of metal sheets secured to the inner and outer surfaces of the frames, the inner sheet being bent out to form a flange to prevent the earth coming in contact with the sides of the caisson, and the outer sheet extended up to form a flange in which the lower frame of the caisson rests, substantially as described.

4. The combination of the base, the frames seated thereon and held in position against lateral displacement by means of projections on the frame engaging corresponding openings on the base, and the truss-rods secured to the frames by means of plates and nuts, substantially as described.

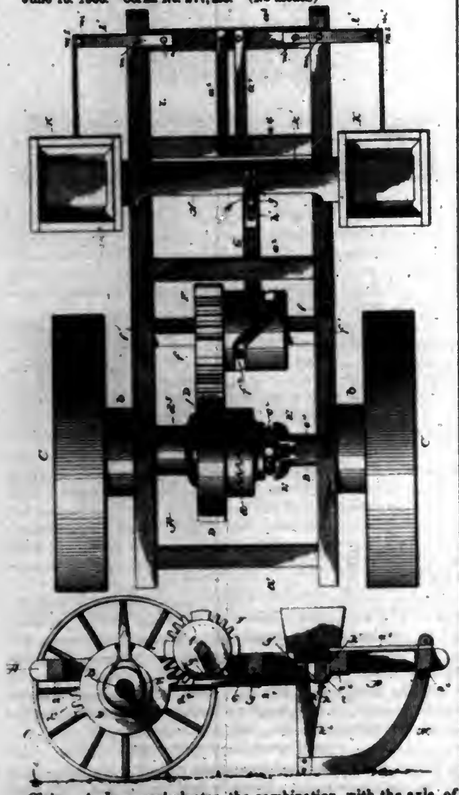


5. The combination of the base, the frame secured thereto, the truss-rods for connecting a number of the frames securely together, and the turn-buckles on the truss-rods for drawing the frames in line and also for clamping the frames to prevent the entrance of water to the shaft, substantially as described.

6. The combination, with the frames, of the grooves formed therein, designed for the reception of partitions for dividing the caisson into compartments, substantially as described.

397,689. **MAIL-BAG FASTENING.** HOMER L. BOYLE, Grand Rapids, assignor of one-half to Horace B. Peck, Allegan, Mich. Filed Aug. 1, 1888. Serial No. 281,688. (No model.)

Claim.—1. In combination with the body of a mail-bag and the plates C, attached thereto and slotted at D, the flap B, provided with

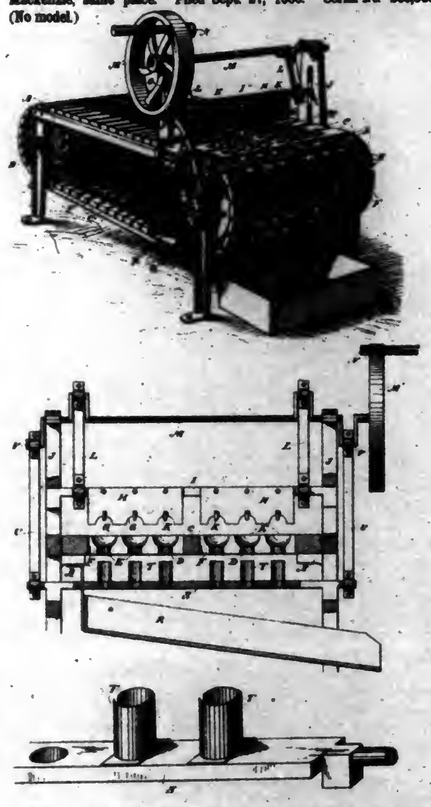


397,689.

plates H, the T-bolts G G, extending through these plates and adapted to enter said slots, the arms K, attached to said bolts, the bar I, attached to said arms, the plate E, pivoted on said flap and attached to the end of said strap, the plate E, attached to the body of the bag, and the padlock M, for locking said plates together, substantially as set forth.

2. A mail-bag having a body, A, and flap B, the latter provided with an interior chamber or space, of a bar moving longitudinally in said space, a series of arms attached to said bar, a series of inwardly-extending T-bolts attached to and operated by said arms, and the body of the mail-bag adapted to be engaged by said T-bolts, the above fastening devices being wholly covered when the bag is closed, substantially as set forth.

397,690. CORN-PLANTER. JAMES BRADY, Neuvoo, Ill. Filed June 18, 1888. Serial No. 277,423. (No model.)



Claim.—1. In a seed-planter, the combination, with the axle, of the mutilated gear-wheel mounted loosely on the axle, the clutch adapted to connect the axle and mutilated gear, the second gear-wheel mounted contiguous to the first and rigidly connected to the wheel having the cam-groove, and the valve-rod connected to and receiving motion from the second gear-wheel, substantially as described.

2. In a seed-planter, the combination, with the axle, of the mutilated gear mounted loosely on the axle, the supporting-wheels, the pawls and ratchets connecting the wheels and the axle, the clutch connecting the axle and the gear, the second gear arranged contiguous to the first, the wheel having the cam-groove rigidly connected to the second gear-wheel, the sliding valve-rod, and the lever connected at one end to the valve-rod and having its other end projecting into the cam-groove, substantially as described.

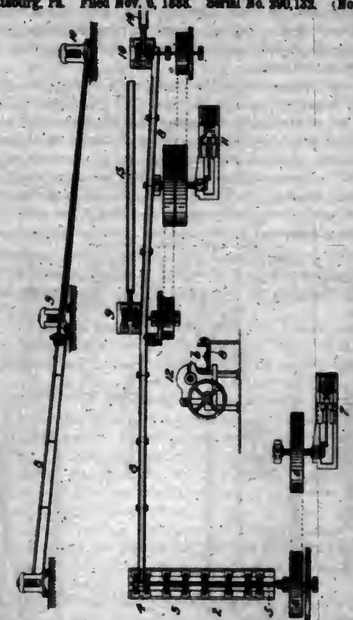
3. In a seed-planter, the combination of a frame constructed in two parts, one supported by the axle having the mutilated gear-wheel and carrying the second gear having the cam-grooved wheel connected thereto, and the lever communicating motion from the cam-grooved wheel to the valve-rod, and another part carrying the hoppers and valve-rods, the two portions being connected by the angular joining-pieces, and the runners connected, substantially as described.

397,691. FRUIT-PITTER. JOHN G. BRIGGS and FRANK CAVALLARO, San José, Cal.; said Cavallaro assignor of one-half his right to A. S. Mackenzie, same place. Filed Sept. 27, 1888. Serial No. 286,669. (No model.)

Claim.—1. A fruit-stoning machine consisting of the endless belt formed of transverse bars linked together and drums around which they pass and by which they are driven, said bars having the concave depressions or chambers upon their surfaces, holes through the bottom of the chambers, and slots extending through their sides, in combination with the vertically-reciprocating cutters or knives and the pins or spurs by which the pits are forced out, substantially as herein described.

2. The endless traveling belt formed of transverse bars having concave depressions to hold the fruit, holes through the bottom of each depression for the escape of the stone, and slots extending out at each side, in combination with the vertically-reciprocating concave knives or blades having projecting points or spurs in the center of the arch, substantially as herein described.

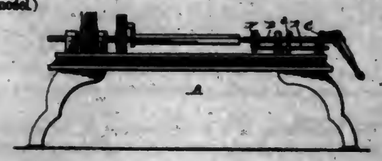
3. In a fruit-pitting machine, the endless intermittingly-traveling belt with perforations and concave depressions in the surface, the vertical reciprocating concave knives with central projecting spurs or points, the crank-shaft, and connecting-rods, in combination with the ratchet-wheel, pawl, and actuating mechanism, whereby the belt is moved forward simultaneously with each reciprocation of the knives, substantially as herein described.



4. In a fruit-pitting machine, the endless traveling fruit-carrying belt, the pawl-and-ratchet mechanism by which it is advanced, and the vertically-reciprocating concave knives or cutters with the central projecting points or spurs, in combination with a second bar beneath the belt, mechanism whereby it is caused to reciprocate in the opposite direction from the cutters, and the elastic upwardly-projecting curved knives or cutters fixed to its upper surface, substantially as herein described.

397,692. KNIFE-BLADE. ABBIE I. CLARK, Easton, Pa. Filed Oct. 26, 1887. Serial No. 253,640. (No model.)

Claim.—The herein-described knife having a fixed handle and a blade provided with a series of transverse corrugations extended from top to bottom throughout, causing the edge to have a larger and smaller series of curves on each side, respectively, the members of one of which series alternate with those of the other, substantially as specified.



397,693. ART OF ROLLING METAL STRIPS. EDWARD I. CLARK, Pittsburg, Pa. Filed Nov. 6, 1883. Serial No. 290,132. (No model.)

Claim.—1. The method of rolling metal strips, which consists in forming a strip by rolling and elongation of a billet, stopping the progress of the strip, dividing the strip, scaling it, and passing the separated sections through finishing-rolls at about the same time, substantially as and for the purposes described.

2. The method of rolling metal strips, which consists in forming a strip by rolling and elongation of a billet, stopping the progress of the strip, dividing the strip, scaling it, and passing the separated sections forward, ends first, at about the same time through separate sets of finishing-rolls, substantially as and for the purposes described.

397,694. LATHE ATTACHMENT. FRED CLARKE and HERBERT H. RASSETT, Piqua, Ohio. Filed July 26, 1888. Serial No. 281,068. (No model.)

397,694.

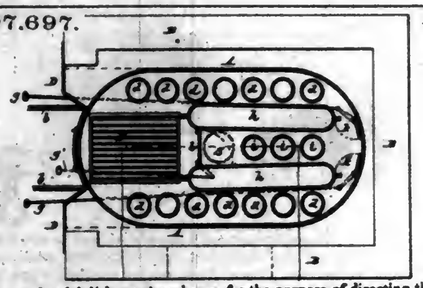
Claim.—1. The combination of the tail-block and dead-spindle of a lathe with a movable cutter-block supported on said spindle and adapted to be moved in contact with the end of the blank supported by said spindle, substantially in the manner and for the purpose described.

2. The combination of the tail-block and dead-center spindle of a lathe with a sliding cutter-block mounted on said spindle, the rod mounted on said tail-block and connected to said cutter-block, and its operating-handle, all substantially as described.

397,695. LEVELING-INSTRUMENT. EDWIN R. GLOOSE and EDWARD M. EARLEY, Lebanon, Mo. Filed May 16, 1888. Serial No. 274,050. (No model.)

Claim.—In a leveling-instrument, the combination, with metal base and the flexible connecting-tube, of the glass tubes having the longitudinal openings *a*, and having the graduated scale on the outer surface, the metal caps B, having the internally-threaded flange and the small opening *c*, the hinged cover C, the spring-latch, and the metal band, substantially as specified.

397,696. FIRE-KINDLER. EDWIN R. GLOOSE and FRANKLIN JOURN, Lebanon, Mo. Filed May 26, 1888. Serial No. 275,191. (No model.)

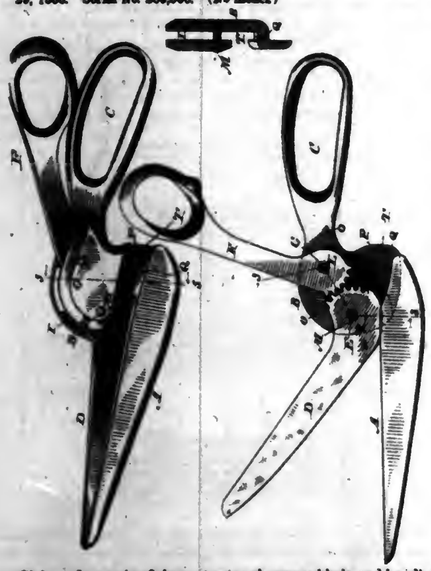


Claim.—A fire-kindler composed of the oil-chamber, located centrally and having the openings *f*, the absorbent packing completely surrounding said chamber, the outer casing, and the handle, substantially as specified.

397,697. FURNACE. REUBEN C. CORDT, Kansas City, Mo. Filed May 22, 1888. Serial No. 274,672. (No model.)

Claim.—1. A furnace consisting of the body A, having the two oblong air-pipes *h h* arranged therein in rear of the fire-box, and the

397,697.



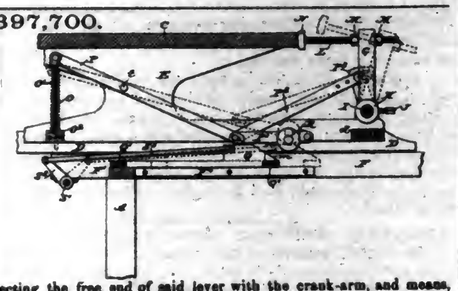
dampers *l* and *k' K'*, located as shown, for the purpose of directing the products of combustion and thereby heating more or less of the furnace, as herein set forth.

2. The combination, in a heating-furnace, of the body A, the oblong air-pipes *h h*, with the two exterior rows of air-tubes, *d*, and the valves *k*, *K'*, and *l*, all arranged substantially as shown and described.

3. The combination, in a furnace, of the body A, having the oblong air-pipes *h h*, the two rows of air-tubes *d*, and the central air-tubes, *i*, located therein as shown, with the valves *k*, *K'*, and *l*, all arranged to operate as set forth.

397,698. SHEARS. FRANK J. COOPER, Emporia, Kans. Filed Oct. 29, 1888. Serial No. 289,360. (No model.)

Claim.—In a pair of shears having the upper blade and handle in two parts, the horizontal shank of the lower blade at P projecting from the upper heel part of the blade and leaving a plain surface, Q, upon the heel part of the blade offering no obstruction to the cut edge of material on that side, in combination with the block H, forming, with the shank P, the recess at T, so as to leave no obstruction to the passage of the cut edge of material on the other side, whereby all lateral strain upon the cut edges of material is prevented, substantially as set forth

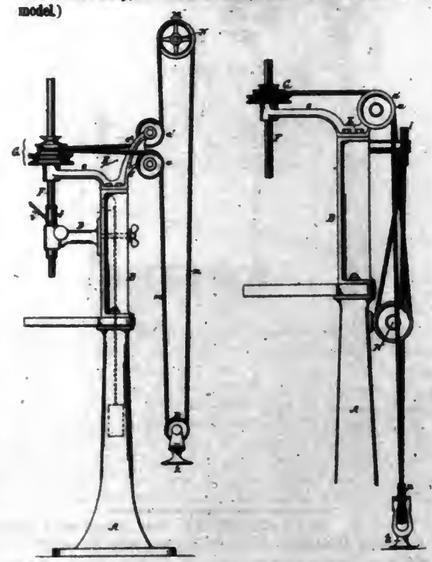


397,699. ALLOY. EUGENE H. COWLES and ALFRED H. COWLES, Cleveland, Ohio. Filed July 5, 1886. Serial No. 171,011. (No specimens.)

Claim.—A metallic alloy consisting of a proportion of copper, nickel in about half the proportion of the copper, and a percentage of aluminium, substantially as set forth.

397,700. IRONING-MACHINE. WILLIAM F. CREVERT and JOHN CLAUS, New York, N. Y. Filed Apr. 23, 1888. Serial No. 271,542. (No model.)

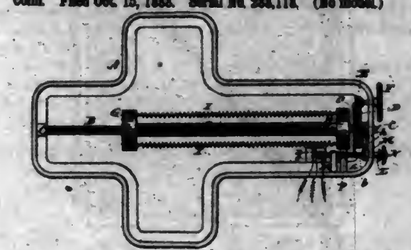
Claim.—1. The combination, in an ironing-machine, with its ironing-table, of the movable carriage supporting the same, the clamping-plates engaging the edge of the table, the transverse rock-shaft mounted upon the carriage and upon which said plates oscillate, a crank-arm projecting upward from the rock-shaft, a horizontal lever pivoted at one end to the carriage below the rock-shaft, a link connecting the free end of said lever with the crank-arm, and means, substantially as described, for producing an upward movement of the horizontal lever by the movement of the carriage, substantially in the manner and for the purpose herein set forth.



397,700.

2. The combination, in an ironing-machine, with the ironing-table and the carriage upon which the table is mounted, of a pair of movable clamping-plates engaging the edge of the table, a transverse rock-shaft upon the carriage, arms projecting radially from said shaft, transverse rods at the ends of said arms to which the clamping-plates are secured, a crank-arm projecting upward from the rock-shaft, a lever pivoted at one end to the carriage below the rock-shaft to rest normally in a horizontal position, a link connecting the end of said lever with the crank-arm, and a horizontal slide provided with an incline formed and located substantially as described with relation to the free end of the lever, whereby, when said incline strikes the lever, the lever shall be swung upward and thereby throw back the clamps from the ironing-table, substantially in the manner and for the purpose herein set forth.

3. In an ironing-machine, the combination, with the ironing-table, the clamps engaging its edge, the rock-shaft supporting and actuating the same, its crank-arm, the clamp-supporting arms and rods, and the horizontal lever pivoted at one end and coupled at the other to said crank-arm, of an inclined lever pivoted at its inner end to the free end of the horizontal lever, and a spring actuating the outer end of said lever, whereby the power of the spring is made to close and hold the clamps automatically against the edge of the table, substantially in the manner and for the purpose herein set forth.



397,701. DRILLING-MACHINE. WILLIAM P. DALLETT, Philadelphia, assignor to himself, and Thomas H. Dallett and George A. Dallett, both of Thornbury, Pa. Filed Nov. 12, 1888. Serial No. 290,606. (No model.)

Claim.—1. The combination, in a drilling-machine, of the drill-spindle, a rack thereon, and two independent pinions, both engaging with said rack, one pinion adapted to be moved by hand to force the drill to its work and the other pinion acted on by a spring or weight to counterbalance said spindle, substantially as and for the purpose specified.

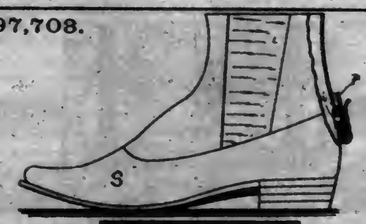
2. The combination, in a drilling-machine, of the cone-pulley splined directly to the spindle with a belt adapted to pass around guiding-pulleys and around a pulley on a suspended friction-weight and over a stationary driving-pulley, substantially as described.

397,702. ELECTRIC MOTOR. JULIAN P. DEMING, New Haven, Conn. Filed Oct. 15, 1888. Serial No. 288,118. (No model.)

Claim.—1. The combination of the rotating resistance for electric motors with a disk arranged upon its axis and so as to revolve therewith, a key arranged to slide parallel with the axis of the resistance and by which the circuit may be opened or closed, the said key standing within the line of the periphery of the said disk, the said disk constructed with a notch in its periphery corresponding to the surface of said key, and the key also constructed with a notch corresponding to the thickness of the disk, and which notch is brought into line with the disk when the circuit is closed, substantially as described, and so that the rotation of the said disk causes it to interlock with the said key, substantially as and for the purpose described.

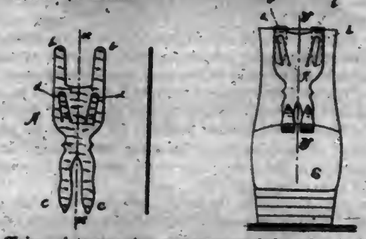
2. In an electric motor, the combination therewith of a resistance consisting of several coils arranged upon an axis within the base of the machine and so as to rotate thereon, an independent contact for each coil of the resistance, the said contacts being of segment shape and arranged in line with each other, and so as to form a broken cylindrical surface concentric with the axis of rotation of the resistance, a contact stationary in the frame, against which the said contacts of the resistance will work, a key arranged to slide in the base parallel with the axis of rotation of the resistance, the said key being adapted under its sliding movement to close or open the circuit through the resistance, a disk on the axis of said resistance and so as to revolve therewith, the said key standing within the line of the periphery of the said disk, the said disk constructed with a notch corresponding to the said key when the resistance is fully applied, and the key constructed with a notch with which the said disk may interlock under the rotation of the resistance when the circuit is closed, substantially as and for the purpose described.

3. In a electric motor, the combination of a shaft supported in bearings in the base, a resistance consisting of several coils arranged upon said shaft and so as to revolve therewith, an independent contact for each coil, the said contacts of segment shape and together forming an interrupted cylindrical surface concentric with said shaft, a stationary contact arranged to bear upon the contacts of the resistance, a key supported in bearings in the base and adapted to slide longitudinally to close and open the circuit, a disk on said shaft and so as to revolve therewith, the said disk and key constructed to be interlocked only upon the closing of the circuit or disengaged only upon the opening of the circuit, a gear upon said shaft and so as to revolve therewith, with a pinion supported in said base arranged to work into said gear, the said pinion provided with a hand-wheel outside the base, whereby rotation may be imparted to said pinion, substantially as and for the purpose described.



4. A resistance for electric motors, composed of several coils, each coil having a contact independent of the contacts of the other coils, the several contacts adapted to move in the same path and so as to present a broken or interrupted surface, a stationary contact against which the several resistance-coil contacts will successively bear as the said contacts move, a key arranged to slide at right angles to the path of movement of said resistance-coil contacts, and mechanism, substantially such as described, between said resistance-contacts and said key to interlock said contacts with said key, substantially as specified, and whereby the key can only be moved to open or close the circuit when the resistance is fully applied.

397,708. PANTALOONS-PROTECTOR. ABRAHAM DIAMOND and OTTO KOMMERS, New York, N. Y. Filed Feb. 20, 1888. Serial No. 264,656. (No model.)

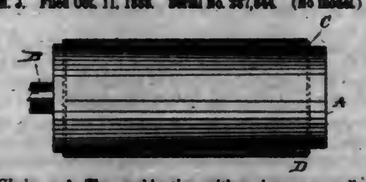


Claim.—In combination, with a boot or shoe, the pantaloons-supporter consisting of the hook A and eyelet B, the latter having its tube slotted to receive the back seam, substantially as shown and described.

397,708.

397,704. PANTALOONS-PROTECTOR. ABRAHAM DIAMOND and OTTO KOMMERS, New York, N. Y. Filed Feb. 20, 1888. Serial No. 264,657. (No model.)

Claim.—A trousers-leg supporter consisting of a single piece of metal having two bent prongs, *b b*, at one end, and two bent prongs, *c c*, at the other end, and two tongues, *d d*, which project toward the prongs *b b*, substantially as shown and described.



397,705. METHOD OF WINDING FIELD-MAGNETS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Sept. 15, 1888. Serial No. 285,235. (No model.)

Claim.—1. The method of winding a magnet, which consists in placing a cylinder on the magnet-core and turning said cylinder to wind the wire thereon, substantially as set forth.

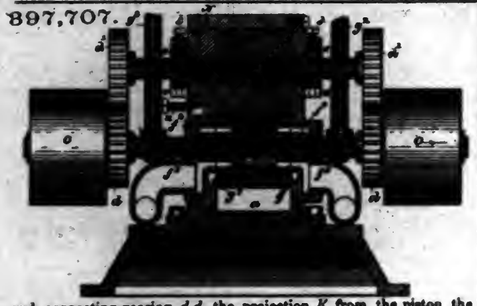
2. The method of winding a magnet-core, which consists in placing on the core a cylinder made in two halves and turning said cylinder so as to wind the wire thereon, substantially as set forth.

397,706. PHONOGRAPH. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Oct. 11, 1888. Serial No. 287,644. (No model.)

Claim.—1. The combination, with a phonogram-cylinder, of a false shell for receiving the phonogram-blank, substantially as set forth.

2. The combination, with a tapering phonogram-cylinder, of a false shell having a tapering bore for receiving a phonogram-blank, substantially as set forth.

3. The combination, with a phonogram-cylinder, of a false shell having a tapering bore, and a less tapering outer surface for receiving the phonogram-blank, substantially as set forth.



4. The combination, with a tapering phonogram-cylinder, of a false shell having a tapering bore and a less tapering outer surface, and a phonogram-blank having a slightly-tapering bore, substantially as set forth.

397,707. ROTARY STEAM-ENGINE. SILAS B. FARRINGTON, Portland, Me. Filed Aug. 13, 1888. Serial No. 282,603. (No model.)

Claim.—1. In a rotary steam-engine, the combination of the recessed abutment C, the piston B, having the projection *b'*, exhaust-passage F, steam-inlet g^3, and the opening and exhaust-passages $f f$, extending through the piston, and having also the steam-supply passages g^4, with the casing A, having the ports f^2 f^2 and the curved supply-passages g^2, substantially as described.

2. In a rotary engine, the combination of the casing having the chambers *a a'*, the piston B in the chamber *a*, the abutment C in the chamber *a'*, having the recess *c'*, the piston-shaft *b*, abutment-shaft *c*,

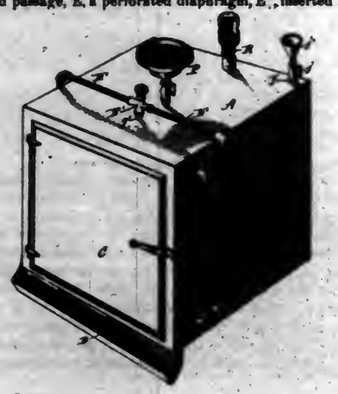
897,707.

and connecting-gearing *d d*, the projection *b'* from the piston, the steam-exhaust passage upon one side of said projection extending through the cylinder to its ends, the steam-supply passage upon the other side of said projection extending through the piston to its ends, and the uncontrolled exhaust-outlets through the ends of the casing arranged in line with the exhaust-outlets in the ends of the piston, and the curved supply-passages in the casing ends arranged in line with the openings in the piston ends in the steam-supply passages, substantially as described.

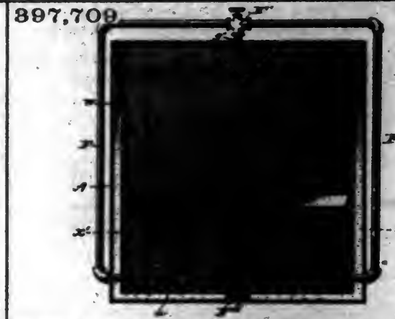
3. The combination, with the rotary piston having a supply-port, g^4, and radial guides for the segment-shaped valve H, of said valve H and springs A, fitted in recesses in the piston and bearing on said valve, substantially as described.

4. The combination, in a rotary engine, of the casing A, piston-chamber *a*, piston B, having a projection, *b'*, and the steam-supply passages g^3, extending from the ends of the piston and opening back of the projection *b'*, with the segment-shaped spring-balanced valves H, fitted to radial guides in said piston, substantially as described.

897,708. BEDSTEAD-TIE. MAGNUS FENNAU, Fintonia, Tex. Filed Aug. 31, 1888. Serial No. 284,258. (No model.)



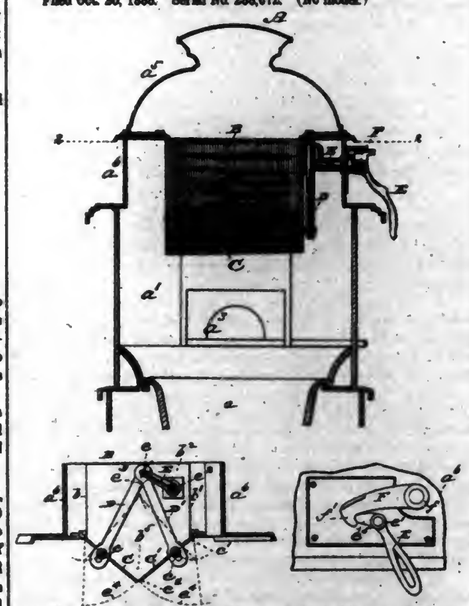
Claim.—1. The bedstead-tie keeper consisting of the bent strap D, slotted near its inner end and bent downward and outward from the slotted portion, the upturned hook at its outer end, and the upturned tooth at its inner end, in combination with a bolt adapted to pass through an opening in the slat, and a thumb-nut, substantially as specified.



2. The combination, with a bedstead and the perforated slats thereof, of the bent metal keeper D, having a slot, E, a downward and outward bend from said slot, the upturned hook at its outer end, and the bolt and thumb-nut fastening, substantially as specified.

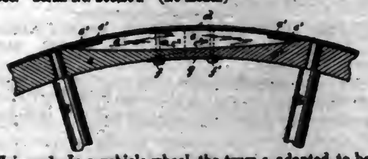
897,709. STEAM COOKING APPARATUS. WILLIAM H. FILER, Grove City, Pa. Filed June 2, 1888. Serial No. 275,339. (No model.)

Claim.—1. The combination of the casing A of the cooker, the oven B, somewhat smaller than the casing and inserted in one side of the said cooker, whereby a water and steam space is formed around the oven, the said casing and oven having formed through their bottoms a flanged passage, E, a perforated diaphragm, E", inserted in the said



897,709

passage, a flanged removable cover, E", placed over the said passage, and valved steam-conducting pipes connecting the steam-space of the cooker with the oven, substantially as described.

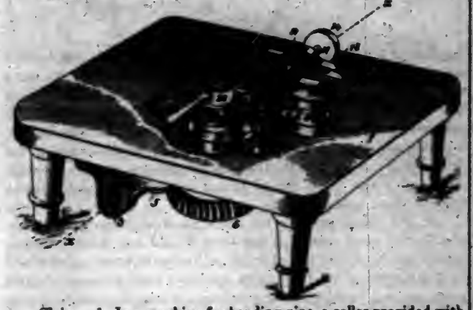


2. The combination of the casing, the oven B, smaller than the casing and inserted in one side of the cooker, whereby a water and steam space is formed around the oven, the said casing and oven having formed through their bottoms a flanged passage, a removable cover placed over the said passage, and valved steam-conducting pipes connecting the steam-space of the cooker with the oven, substantially as described.

897,710. HEATING-STOVE. GILES F. FILLEY, St. Louis, Mo. Filed Oct. 20, 1888. Serial No. 288,672. (No model.)

Claim.—The combination of the stove, the fuel-hopper, the bottom parts, C C, the links, and the crank-lever, said links at the lower end thereof being jointed to said parts C C, respectively, and at the upper end thereof being both jointed to said crank-lever, and said crank-lever being journaled as described, as and for the purpose set forth.

897,711. VEHICLE-WHEEL. JOHN R. FISHER, Boston, Mass., assignor of one-third to Whitfield W. Baxter, same place. Filed Nov. 5, 1888. Serial No. 290,264. (No model.)



Claim.—1. In a vehicle-wheel, the truss *e*, adapted to be placed within a recess in the felly of the wheel, and having the bearing-plates *d' d'* made at or near the extreme end of said truss, for the purpose set forth and described.

2. In a vehicle-wheel, the combination of the truss *e*, bearing-plates *d' d'*, made at or near the extreme ends of said truss, and one or more rivets or bolts, c^5 c^5, as and for the purpose set forth.

3. In a vehicle-wheel, the truss *e*, having bearing-plates *d' d'* made at or near the extreme ends of said truss, as described, placed within a recess in the felly of the wheel, in combination with the clasp *g* and bolts *f f'*, as and for the purpose set forth.

4. In a vehicle-wheel, the hub *a*, spokes *b b*, felly *c c'*, tire *d*, truss *e*, having bearing-plates *d' d'* made at or near the extreme ends of said truss, rivets c^5 c^5, clasp *g*, and bolts *f f'*, all combined and arranged in a manner and for the purpose set forth.

897,712. MACHINE FOR BENDING PIPE. HERBERT H. FOWLER, New Haven, Conn. Filed May 12, 1888. Serial No. 273,723. (No model.)

Claim.—1. In a machine for bending pipe, a roller provided with a gripping clamp or eye projecting radially from its periphery, in combination with an opposite roller having a groove or recess to receive the said gripping clamp or eye, substantially as specified.

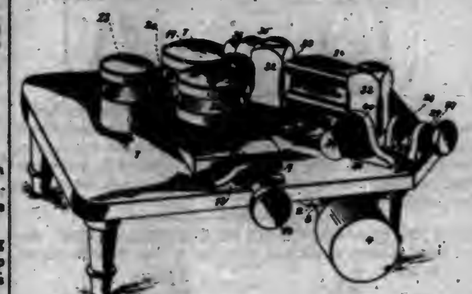
2. In a machine for bending pipe, a bending-roller comprising two separable sections, each carrying a part to form a gripping clamp or eye, in combination with a bending-roller having a groove or recess adapted to receive the said clamp or eye, substantially as specified.

3. In a machine for bending pipe, a bending-roll formed in two separable sections, and each having a circumferential curvilinear groove at their adjacent sides, and also having respectively a part which forms a gripping clamp or eye, in combination with a bending-roll having a groove or recess to receive the said clamp or eye, and also a circumferential curvilinear groove to match the corresponding groove in the opposite roll, substantially as specified.

4. In a machine for bending pipe, the combination of a shaft formed with a shoulder and with a reduced and screw-threaded upper end, a roller which consists of two halves, formed with grooved or recessed edges, which form a nearly semi-cylindrical groove in the periphery of said roller, provided with two registering hook-shaped clamping-jaws in their peripheries, which form a projecting eye, and with a registering pin and hole in their facing sides, a washer upon said shaft and supported upon the top of said roller, and a nut upon the screw-threaded end of said shaft and clamping said washer and roller-halves against the shoulder upon said shaft, substantially as described.

5. In a machine for bending pipe, the combination, with a bending-roller provided with a projecting eye at its periphery, of an opposite bending-roller formed in its periphery with a notch or recess which registers with and receives said eye, substantially as described.

6. In a machine for bending pipe, the combination, with a bending-roller provided with a projecting and adjustable clamp or grip at its periphery, of an opposite bending-roller formed in its periphery with a notch or recess which registers with and receives said eye, substantially as described.



7. In a machine for bending pipe, the combination, with a bending-roller formed with a slightly less than semi-cylindrical and circumferential groove and provided with projecting and adjustable clamping-jaws at its periphery, of an opposite bending-roller formed with a similar circumferential groove and in its periphery with a notch or recess which registers with and receives said eye, substantially as described.

8. In a machine for bending pipe, the combination of a frame or table formed with a transverse slot and with a bearing at the inner end of said slot, a spindle or shaft journaled in said bearing, a block which slides in said slot, and is formed with a lip at its outer end and a bearing at its inner end, a screw which fits through a screw-threaded perforation in a lip upon said table at the outer end of said slot and bears against the lip upon said sliding block, a shaft or spindle journaled in the bearing in said sliding block, two meshing cog-wheels which are of the same diameter, provided with long cogs and secured upon said spindles or shafts, means for revolving one of said spindles or shafts, and interchangeable bending-rollers upon said spindles or shafts, substantially as described.

9. In a machine for bending pipe, the combination of a circumferentially-grooved bending-roller provided with a projecting clamping or gripping eye, a circumferentially-grooved bending-roller formed with a notch or recess in its periphery which registers with said eye, and a circumferentially-grooved guide-roller arranged in a line with the space between the bending-rollers and at right angles to a line drawn through the centers of said rollers, substantially as described.

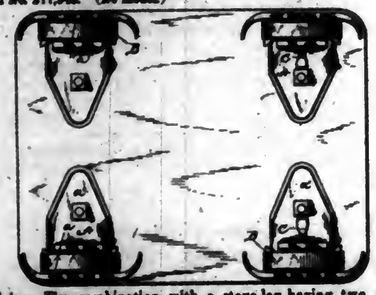
10. In a machine for bending pipe, the combination of the machine frame or table formed with the slot 9, the drive-shaft 3, formed with the worm 4, the shaft or spindle 7, formed with the threaded end 23 and with the worm-wheel 6 and cog-wheel 18, and journaled in said frame or table, the divided and grooved roller 20 21, formed with the jaws 27 and 28, the washer 25 and handled nuts 23 24, the sliding block 8, having the adjusting-screw 11, the shaft or spindle 15, journaled in said sliding block and provided with cog-wheel 17, the roller 31 upon said shaft and formed with the groove 32 and notch or recess 33, and the guide-roller 34, substantially as described.

897,713. MACHINE FOR BENDING PIPE. HERBERT H. FOWLER, New Haven, Conn. Filed May 12, 1888. Serial No. 273,724. (No model.)

Claim.—1. In a machine for bending and coiling pipe, the combination, with a pair of feed-rollers, of a pair of bending-rollers formed with molded ends journaled one above the other and arranged to project into the space between said feed-rollers, and, together with one of said rollers, to force the pipe to follow the contour of the opposite feed-roller for a portion of its periphery, and to form a continuation of the periphery of said first-named roller, substantially as described.

2. In a machine for bending and coiling pipe, the combination, with a pair of feed-rollers, of a pair of bending-rollers formed with molded ends journaled one above the other and arranged to project into the space between said feed-rollers, and, together with one of said rollers, to force the pipe to follow the contour of the opposite feed-roller for a portion of its periphery, and to form a continuation of the periphery of said first-named roller, and means for adjusting said rollers toward and from said feed-rollers, substantially as described.

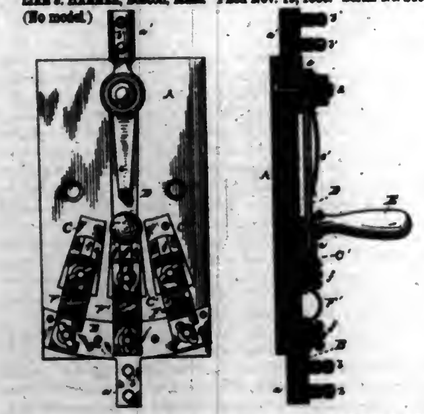
3. In a machine for bending and coiling pipe, the combination, with a pair of feed-rollers, of a pair of bending-rollers formed with molded ends journaled one above the other and arranged to project into the space between said feed-rollers, and, together with one of said rollers, to force the pipe to follow the contour of the opposite feed-roller for a portion of its periphery, and to form a continuation of the periphery of said first-named roller, said a slide which forms bearings for said bending-rollers, and is provided with a feed-screw for adjusting it toward or from said feed-rollers, substantially as described.



4. In a machine for bending and coiling pipe, the combination, with a pair of feed-rollers, of a slide provided with a screw for adjusting it toward and from the space between said feed-rollers, a plate or frame pivoted upon said slide, a screw for tilting or laterally adjusting said plate or frame, and a pair of bending-rollers which are journaled one above the other at the inner end of said plate or frame and formed with molded ends, and, together with one of said feed-rollers, force the pipe to follow the contour of the opposite feed-roller for a portion of its periphery, substantially as described.

5. In a machine for bending and coiling pipe, the combination of a pair of grooved feed-rollers, a slide provided with a screw for adjusting it toward and from the space between said feed-rollers, a plate or frame pivoted upon said slide, a screw for laterally adjusting said plate or frame, and a pair of bending-rollers which are journaled upon said plate or frame and formed with molded ends which correspond to the grooves in the feed-rollers, and, together with one of said feed-rollers, force the pipe to follow the contour of the opposite feed-roller for a portion of its periphery, substantially as described.

6. In a machine for bending and coiling pipe, the combination of the machine frame or table formed with the diagonal slot 24, the



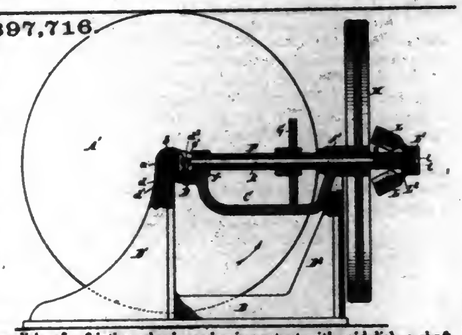
feeding-rollers 19 and 21, formed with the registering circumferential grooves 20 and 22, the guide-rollers 23, the guide 41, the slide 25 in said slot 24, the screw 27, for adjusting said slide, the plate or frame 31, pivoted upon said slide and formed with the uprights 32, which are provided with the horizontal bearings 33, the screw 38, which bears against the outer upright, 32, the shafts 34 in said bearings 33, and the bending-rollers 35, upon the inner ends of said shafts and formed with the molds, grooves, or rabbets 36, which correspond in shape to the grooves in said feed-rollers, substantially as described.

397,714. STOVE-FOOT. JOSEVILLE F. FOWLER, Alliance, assignor of one-half to Homer M. Silver, Salem, Ohio. Filed June 23, 1888. Serial No. 277,942. (No model.)

Claim.—The combination, with a stove-leg having two downwardly-extending arms, of a roller mounted therein provided with a number of inwardly-extending teeth, and a thumb-screw working in a threaded opening in one of the arms, the inner end of the said screw being designed to engage the teeth on the roller to lock the same in place, substantially as described.

397,715. SAFETY DEVICE FOR ELECTRICAL CIRCUITS. WILLIAM J. HANNER, Boston, Mass. Filed Nov. 19, 1886. Serial No. 219,268. (No model.)

Claim.—1. The combination, with a broken conductor of an electrical circuit, of two or more fusible safety-catches, all connected in parallel circuit with one terminal of said conductor, and a switching device for connecting the other end of any one of said safety-catches with the other terminal of said conductor, substantially as set forth.



2. The combination, with a broken conductor of an electrical circuit, of two or more fusible safety-catches, all connected in parallel circuit with one terminal of said conductor, and a pivoted switch-arm connected with the other terminal and adapted to be brought into connection with any one of said safety-catches, substantially as set forth.

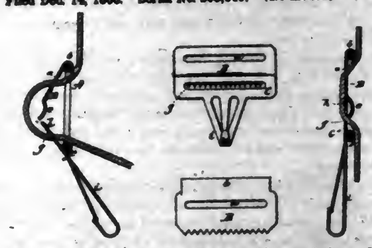
3. The combination of the insulating-base, a circuit-terminal at one end thereof, two or more separate contact-plates on the base, fusible safety-catches joining said contact-plates with said terminal, another terminal at the other end of the base, and a switching device for connecting said last-named terminal, substantially as set forth.

4. The combination, with the conductor of an electrical circuit, of two or more fusible safety-catches of different conducting capacities, and a switching device for interpolating any one of them in the circuit of said conductor, substantially as set forth.

397,716. SPEED-REGULATOR. FREDERICK HART, Poughkeepsie, N. Y. Filed Apr. 12, 1888. Serial No. 270,442. (No model.)

Claim.—1. In a speed-regulator, the combination, with the driving-disk, of a friction-wheel running in contact with said disk, a shaft which is rotated by said wheel and on which the wheel can move toward and from the center of the driving-disk, and a frame in which said shaft is mounted and which is movable in a plane parallel with the working-face of the driving-disk on one side of the center thereof, whereby said shaft can be placed at an angle to the radius of the driving-disk and the friction-wheel can be placed at an angle to the direction of motion of the driving-disk at its point of contact with the friction-wheel, substantially as set forth.

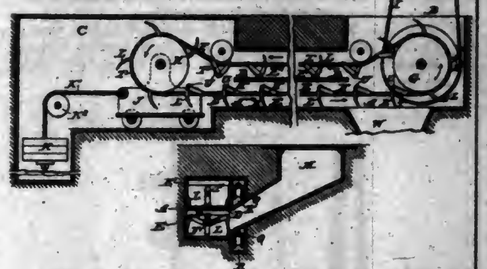
2. In a speed-regulator, the combination, with the driving-disk, of a friction-wheel running in contact with said disk, a shaft which is rotated by said wheel, and on which said wheel can move toward and from the center of the driving-disk, a pivoted bearing supporting said shaft near the periphery of the driving-disk, and a movable bearing supporting the shaft near the center of the driving-disk and capable of movement toward and from the radial line of the driving-disk, substantially as set forth.



3. In a speed-regulator, the combination, with the driving-disk, of a friction-wheel running in contact with said disk, a shaft which is rotated by said wheel and on which the wheel can move toward and from the center of the driving-disk, a movable frame in which said shaft is mounted, and whereby said shaft can be placed at varying angles, and a governor whereby the position of the frame is automatically adjusted, substantially as set forth.

4. The combination, with the driving-disk A', of a stationary frame, B, an elbow-lever, D, supported in said frame, a movable frame, C, pivoted at one end in said frame and attached at its opposite end to said elbow-lever, a hollow shaft, F, journaled in said frame, a shifting-rod, *k*, arranged in said shaft and connected at one end with said elbow-lever, a governor connected with the opposite end of the shifting-rod, and a friction-wheel, G, mounted on the shaft F, substantially as set forth.

5. The combination, with the driving-disk A', of the movable frame C, a hollow shaft, F, journaled in the same and provided with a feather, *h*, and a friction-wheel, G, mounted on the shaft F and provided in its hub with an anti-friction roller, *i*, bearing against said feather, substantially as set forth.



6. The combination, with the driving-disk A', of the stationary frame B, the movable frame C, the elbow-lever D, the hollow shaft F, journaled in the frame C, the shifting-rod *k*, arranged in the shaft F, the governor-weights L, pivoted to the shaft F, the head L', arranged in said shaft and connected with the governor-weights, and the washers *m*, interposed between the shifting-rod *k* and the head L', substantially as set forth.

397,717. BUCKLE. HENRY A. HARTSHORN, West Haven, Conn. Filed Dec. 14, 1888. Serial No. 293,619. (No model.)

Claim.—The herein-described buckle, consisting of the wire frame A, forming an upper and lower bar, the sheet-metal part B, constructed with the lip closed around the upper bar of the frame as a hinge, and the said part B constructed to form a jaw at its lower edge, and with a longitudinal slot, *a*, above the jaw edge combined with the part C hinged to the lower bar of the frame, and constructed with a longitudinal slot, *g*, forming a bar, *h*, upon the upper edge of the said part C, the said part C in its closed position adapted to overlap the jaw edge of the part B and present the jaw edge of the part B to the said slot in the part C, substantially as described.

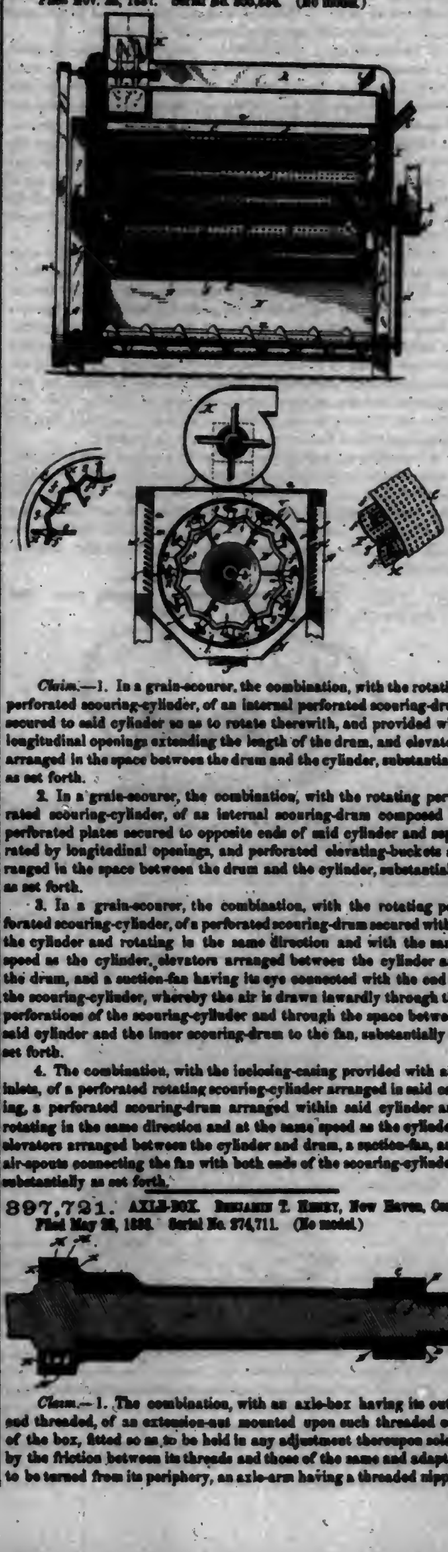
397,718. APPARATUS FOR COLLECTING AND CONVEYING ASHES, &c. FREDERICK H. HAWKINS, New York, N. Y. Filed Aug. 16, 1888. Serial No. 282,983. (No model.)

Claim.—1. The combination, in an apparatus for collecting and conveying street-sweepings, snow, and other refuse material in cities, of an underground main conduit, an endless carrier moving through said conduit, one or more lateral conduits communicating with said main conduit, an endless carrier moving through each lateral conduit, chutes communicating from the street-level with said main and lateral conduits, conveying-blades attached to the carriers, and mechanism, substantially as described, connecting the main and lateral carriers with a common motor to obtain a synchronous movement thereof, all substantially in the manner and for the purpose herein set forth.

2. The combination, in an apparatus for collecting and conveying street-sweepings, snow, and other refuse material in cities, of an underground main conduit longitudinally divided into two compartments, an endless conveying-cable moving forward through the lower compartment and returning through the upper compartment, conveying-blades attached to said cable, means, substantially as described, for operating said cables, and chutes communicating from the street-level with the lower compartment of the conduit, substantially in the manner and for the purpose herein set forth.

3. The combination, in an apparatus for collecting and conveying street-sweepings, snow, and other refuse material in cities, of an underground main conduit, an endless cable moving through said conduit, conveying-blades carried by said cable, lateral conduits communicating with said main conduit, an endless cable moving through each lateral conduit, conveying-blades carried thereby, a motor actuating the main cable, an endless auxiliary driving-cable carried in a conduit parallel with the main conduit and driven by said motor, and gearing, substantially as described, connecting said auxiliary cable with the driving-pulley of each lateral cable, substantially in the manner and for the purpose herein set forth.

4. The combination, substantially as described, with an endless cable, of a conveying-blade having a central slot to embrace the cable, and a connecting-yoke pivoted to the cable.



5. The combination, substantially as described, with an endless cable, of a conveying-blade having a central slot to embrace the cable, a connecting-yoke pivoted to the cable, and a spring attached to the yoke to bear upon the blade, substantially in the manner and for the purpose herein set forth.

397,719. GUN HAND-PROTECTOR. ROLLA O. HERRIN, Dayton, Ohio. Filed Sept. 12, 1888. Serial No. 285,181. (No model.)

Claim.—A double-barreled-gun hand-protector comprising a spring metal handle lined with a non-conductor of heat, the edges of which bear against the upper surfaces of said barrels, thereby admitting of longitudinal adjustment, substantially as shown and described.

397,720. GRAIN-SCOURER. ANDREW HEINS, Silver Creek, N. Y. Filed Nov. 28, 1887. Serial No. 256,234. (No model.)

Claim.—1. In a grain-scourer, the combination, with the rotating perforated scouring-cylinder, of an internal perforated scouring-drum secured to said cylinder so as to rotate therewith, and provided with longitudinal openings extending the length of the drum, and elevators arranged in the space between the drum and the cylinder, substantially as set forth.

2. In a grain-scourer, the combination, with the rotating perforated scouring-cylinder, of an internal scouring-drum composed of perforated plates secured to opposite ends of said cylinder and separated by longitudinal openings, and perforated elevating-buckets arranged in the space between the drum and the cylinder, substantially as set forth.

3. In a grain-scourer, the combination, with the rotating perforated scouring-cylinder, of a perforated scouring-drum secured within the cylinder and rotating in the same direction and with the same speed as the cylinder, elevators arranged between the cylinder and the drum, and a suction-fan having its eye connected with the end of the scouring-cylinder, whereby the air is drawn inwardly through the perforations of the scouring-cylinder and through the space between said cylinder and the inner scouring-drum to the fan, substantially as set forth.

4. The combination, with the inclosing-casing provided with air-inlets, of a perforated rotating scouring-cylinder arranged in said casing, a perforated scouring-drum arranged within said cylinder and rotating in the same direction and at the same speed as the cylinder, elevators arranged between the cylinder and drum, a suction-fan, and air-spouts connecting the fan with both ends of the scouring-cylinder, substantially as set forth.

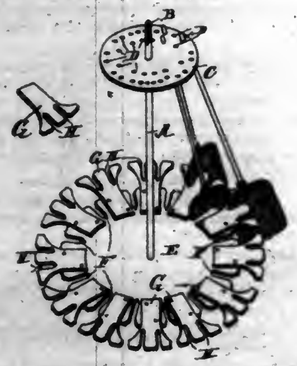
397,721. AXLE-BOX. BENJAMIN T. HENRY, New Haven, Conn. Filed May 28, 1888. Serial No. 274,711. (No model.)

Claim.—1. The combination, with an axle-box having its outer end threaded, of an extension-nut mounted upon such threaded end of the box, fitted so as to be held in any adjustment thereupon solely by the friction between its threads and those of the same and adapted to be turned from its periphery, an axle-arm having a threaded nipple,

and a nipple-nut screwing over such nipple and bearing against the outer end of the extension-nut, whereby the said extension-nut may be adjusted to take up the wear without the removal of either of the nuts or the use of washers, substantially as set forth.

2. The combination, with an axle-box having its outer end threaded, of an extension-nut mounted upon such threaded end of the box, fitted so as to be held in any adjustment thereupon solely by the friction between its threads and those of the box, an axle-arm having its nipple threaded in an opposite direction from the threads on the axle-box, and a nipple-nut screwing over such nipple and bearing against the outer end of the extension-nut, whereby the said extension-nut may be adjusted without the removal of either of the nuts or the use of washers, and whereby and owing to the opposite threading of the box and nipple damage is prevented in case the nuts should get bound together, substantially as set forth.

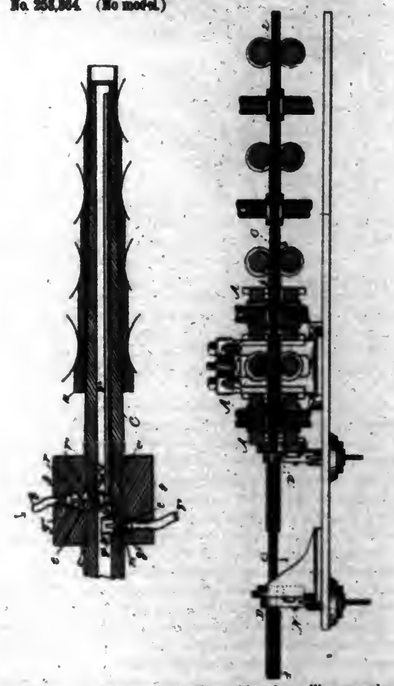
3. The combination, with an axle-box having its outer end threaded, of an extension-nut mounted upon such threaded end of the box, fitted so as to be held in any adjustment thereupon solely by the friction between its threads and those of the same, having a circular recess in its outer end and adapted to be turned from its periphery, an axle-arm having a threaded nipple, and a nipple-nut screwing over such nipple and having at its inner end a flange adapted to enter the circular recess in the extension-nut, whereby the said extension-nut may be adjusted to take up wear without the removal of either of the nuts or the use of washers, and whereby, also, dust is excluded from the wearing-surfaces of the device, substantially as set forth.



4. An axle-box the inner end whereof is provided with an annular retaining-chamber, an annular intercepting-passage leading from the bore of the box into such chamber, and one or more flanges located within the chamber and closing the said passage to the inner portion thereof, whereby foreign matter gaining access to the box is intercepted by the said passage and thence conveyed to the chamber, where it is retained, substantially as set forth.

397,722. HOPPLE. THOMAS HERRIN, Stockville, Nebr. Filed June 26, 1888. Serial No. 278,223. (No model.)

Claim.—The herein-described pig-hopple, composed of the band A and the similar band, C, secured together to form a strap, which is provided at one end with a buckle and at the other end with eyelets therefor, and the points or pricks B, with the hooks *e* at their lower ends, secured between the bands A and C, having their upper ends curved outwardly from the leg when in place thereon and provided just above the strap with the outward-extending loops *b*, substantially as and for the purpose specified.



397,723. BROOM-RACK. WESLEY C. JONES, Waxahachie, Tex. Filed Nov. 27, 1888. Serial No. 292,025. (No model.)

Claim.—1. A broom-rack comprising a central supporting-rod, a pair of circular plates secured to the ends of the said rods, and radial tongues secured to the lower plate, the upper plate being provided with perforations to receive the broom-handles, and the lower plate and the tongues secured thereto being provided with notches to receive the broom-heads, as set forth.

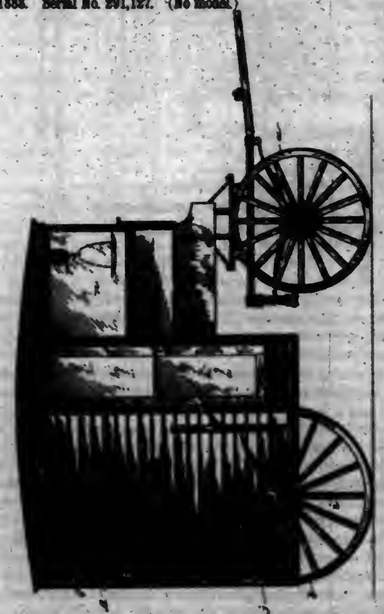
2. A broom-rack comprising a central supporting-rod provided at its upper end with a loop or ring, a circular disk secured to the upper end of said rod and provided with concentric series of perforations, a circular disk secured to the lower end of the supporting-rod and having radial notches in its edge, and a series of radial tongues secured to the upper side of the said plate between the notches in the same and projecting beyond the edge of the said plate, the said tongues being provided with notches in their outer ends, as set forth.

397,724. MACHINE FOR ROLLING SEAMLESS TUBING. CHARLES KELLOGG, Buffalo, N. Y., assignor to the Kellogg Seamless Tube and Manufacturing Company, Boston, Mass. Filed Dec. 24, 1887. Serial No. 258,804. (No model.)

Claim.—1. In an organized machine for rolling seamless tubes and similar articles, the combination, with a series of pairs of rolls arranged for progressively rolling an ingot into a tube or similar article, of the stationary tapering or conical mandrel projected between said rolls, and suitable supports for said mandrel, substantially as specified.

2. In an organized machine for rolling seamless tubes and similar articles, the combination, with the grooved rolls of said machine, of the tapering or conical mandrel projected between said rolls and centered in the grooves thereof, and suitable supports for the said mandrel, substantially as specified.

3. The combination, with a series of pairs of positively-driven rolls provided with suitable grooves and arranged for progressively rolling an ingot into a tube or similar article, of a tapering or conical mandrel projected between and centered in grooves in the said rolls, and suitable grips or holders that grasp the mandrel at several points and are susceptible of being separately released from the mandrel to permit an ingot to be passed onto the mandrel and thence to and through the rolls without removing the mandrel from the machine, substantially as specified.



4. The combination, with a mandrel of a rolling-machine, of grippers for grasping and supporting the same, a cylinder and piston for operating each of said grippers, suitable pipes and valves for conducting the operating agent to and away from said cylinder and controlling its movements, and brackets or standards for operating in connection with said grippers, substantially as described.

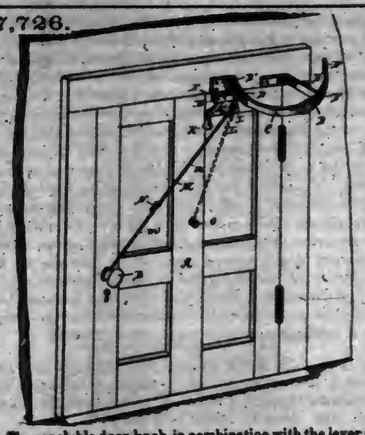
5. A gripper for grasping the end of the mandrel of a rolling-machine, consisting of two levers pivoted together near their middles and provided in their upper ends with recesses of the same shape as the mandrel, combined with a steam-cylinder, a piston fitted to operate therein, suitable pipes and regulating devices for controlling the flow of steam or other actuating agent to and from said cylinder, and connecting devices between the lower ends of the levers composing the gripper and the piston, substantially as described.

6. The combination, with a hollow mandrel and a gripper for grasping the same, of devices carried by said gripper for conducting water to and away from the mandrel when said mandrel is grasped by the gripper, and mechanism for cutting off the supply of water and preventing the escape of the same from said supply or from the interior of the mandrel when the gripper is released from the mandrel, substantially as described.

7. The gripper D, consisting of the two levers *f f*, pivoted together near their centers and provided in their upper ends with recesses *i i* and $f' f'$, combined with their hollow mandrel C, provided with the orifices c^3 c^3, tubes g^1 g^2, pipes g g^4 g^5, the valves r r' r^6, springs *s*, and means for opening and closing the grippers, substantially as described.

397,725. BUTCHER'S WAGON. GEORGE R. KENT, Burlington, Wis., assignor of one-half to A. J. Hannan, same place. Filed Nov. 17, 1888. Serial No. 291,127. (No model.)

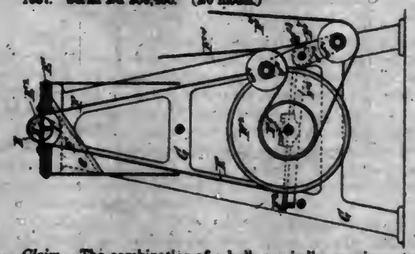
Claim.—1. A butcher's wagon the body of which has central and rear parts, the bottoms of which are depressed below the centers of the rear wheels, and a front part, having side and front windows, and the floor or bottom of which is elevated above the tops of the forward wheels and is of suitable height to sustain a chopping-block, said rear part having a meat-compartment closed at its sides and rear end, but provided with a door in front, and said central part (which is for the driver or attendant) being closed by side doors, substantially as set forth.



2. A butcher's wagon having a bent rear axle, *i*, a wagon-body, A, the central and rear parts of which are depressed below the center of the rear wheels, springs *j* at the sides of the rear part of said body, on which the latter is suspended, a rear meat-compartment, *c*, having a door, *f*, at its front, an ice-chamber, *h*, above said meat-compartment, and a driver's space, *d*, with a depressed floor and with side doors and a closed front, the floor of which is raised above the tops of the forward wheels, and which thus affords a suitable support for the chopping-block *m*, substantially as set forth.

397,726. COMBINATION DOOR-CHECK AND ALARM. CHARLES R. KING, Lampasas, Tex. Filed Mar. 22, 1888. Serial No. 268,179. (No model.)

Claim.—1. The combination, with a curved notched bar, C, secured to the door-frame above the upper edge of the door, of the latch G, pivoted on the door and adapted to engage the notches in the bar C, and having a guide-slot, H, operating on a stationary pin, I, to limit the movement of the catch, the operating-arm L, depending from the shorter arm of the latch, the cord, wire, or chain connecting the lower end of this operating-arm to the door-knob, and the swinging or jingle bell depending from the longer arm of the latch, substantially as specified.



397,726.

2. The revoluble door-knob, in combination with the lever mounted on the door and having a swinging or jingle bell attached to its longer arm, and the cord, wire, or chain affixed at one end to the shorter arm of the lever, and connected at the other end to the said door-knob, whereby when the latter is turned the shorter arm of the lever is depressed and the bell is rung, substantially as specified.

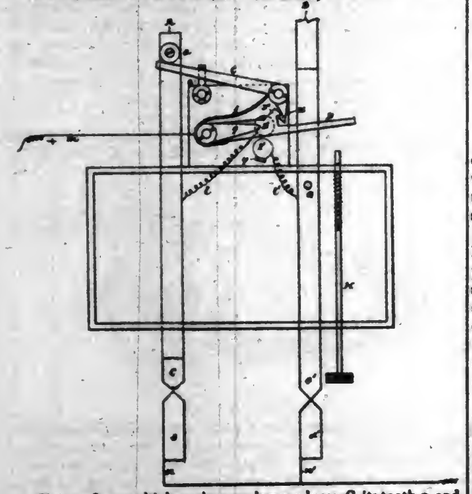
397,727. MACHINE FOR MAKING CYLINDRICAL PINS AND TUBES OF WOOD. ROBERT KIDD, Brooklyn, N. Y. Filed Dec. 31, 1887. Serial No. 259,460. (No model.)

Claim.—The combination of a hollow spindle carrying a tubular cutter, a driving-belt which in passing around the spindle describes an arc less in radius than the radius of said cutter, and a table for the work, having a tongue-like prolongation into or through the hollow spindle, substantially as herein described.

397,728. SLEIGH. FREDERICK C. KLIPSTEIN, Leland, Wis. Filed Nov. 7, 1888. Serial No. 290,301. (No model.)

Claim.—1. In a sleigh-knee, the standard secured at its lower end to the runner and having a concavity in its upper end, combined with the rocking block secured to the beam and having a rounded under side bearing in the concavity of the standard, the convexity of the block being more abrupt than the concavity of the standard, whereby the block is allowed a free rocking motion, substantially as specified.

2. In a sleigh-knee, the standard secured at its lower end to the runner and provided with a concavity in its upper end, in which is arranged a transverse rounded rib, *d'*, combined with the rocking block secured to the beam and provided with a convex under side fitting loosely in the concavity and a rounded transverse recess, *f'*, fitting upon the said rib, substantially as specified.



3. In a sleigh-knee, the combination of the hollow standard C, secured at its lower end to the runner and provided at its upper end with a concavity and a rib, *d'*, the rocking block I, secured to the beam of the sleigh and having a lower convex surface and a recess, *f'*, fitting on the transverse rib, and the bolt H, with its head fitting in the bore of the standard and its shank extending through vertically-aligned perforations in the upper end of the standard, the rocking block, and the beam, and engaged by a suitable bolt, substantially as specified.

4. In a sleigh, the combination, with the beam and runner, of the standard provided at its upper end with a concavity and at its lower end with the arms D, having depending flanges *d* at their sides, which engage the runner, the rocking block secured to the beam and having a convex under surface bearing in the concavity of the standard, and the bolt H, fitting loosely in registering perforations in the standard, the rocking block, and the beam, substantially as specified.

5. In a sleigh, the combination of the runner, the rave secured at its front end to the runner and connected thereto at its rear end by the brace *b*, the hollow standard secured at its lower end to the runner and provided at its upper end with a concavity intersected by a transverse rib, the beam arranged under the rave, the rocking block bolted to the under side of the beam and having a convex under surface intersected by a transverse recess fitting over the rib on the standard, the bolt H, passing through registering perforations in the upper end of the standard, the rocking block, and the beam, and the bolster swiveled on the upper side of the beam above the rave, substantially as specified.

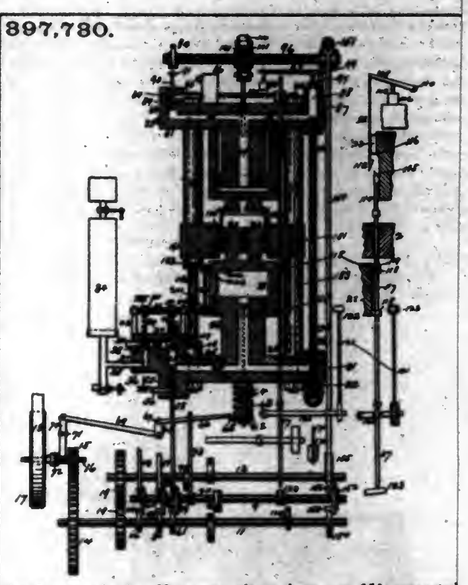
397,729. AUTOMATIC SWITCH FOR ELECTRIC-ARC LAMPS.

EDWARD R. KNOWLES, Brooklyn, N. Y., assignor to the Mutual Electric Manufacturing Company, of New York. Filed Sept. 24, 1885. Renewed Dec. 21, 1888. Serial No. 294,263. (No model.)

Claim.—In a multiple-carbon arc lamp, a lever, C, its tooth *x*, and a stop, *c*, for limiting the upward movement of said lever, the lever D, having a tooth, *x'*, to engage the tooth of the other lever, the connecting and operating spring *f*, common to both levers, the contacts E and F, and the spring *g*, to hold the lever D in electrical contact therewith, combined with the carbon-holder A, provided with means to operate the lever C, all arranged in electric circuit and adapted to operate substantially as shown and described.

397,730. HYDRAULIC BRICK-MACHINE.

JULIUS J. KOCH, St. Louis, Mo. Filed May 22, 1888. Serial No. 274,768. (No model.)



Claim.—1. In a brick-machine, the combination, with the upper plunger having a cylinder and a piston, of two fluid-chambers, 32 33, one of which is in communication with said cylinder and the other with a source of fluid under pressure, a rod, 33, projecting into both of said chambers, a valve, 47, for shutting off said fluid-pressure, and cam 54, adapted to open said valve, substantially as set forth.

2. A brick-machine having an upper and lower plunger, the upper plunger having a piston with ports, in combination with a chamber connected with one of said ports, a valve, 97, closing an opening in said chamber, and the rod 33, adapted to enter said chamber, substantially as and for the purpose set forth.

3. In a brick-machine, the combination, with the upper and lower plungers having cylinders, pistons in said cylinders, and a source of fluid under pressure connected with the lower cylinder, of two chambers, 33 32, connected with said upper and lower cylinders, respectively, a rod, 33, projecting into said chambers, a valve between said source of pressure and the lower cylinder, cams 154 155, for raising and lowering said upper plunger, and mechanism for operating said valve, substantially as set forth.

4. In a brick-machine, the combination, with the upper plunger having a cylinder and a piston therein and a pipe for fluid under pressure, of two chambers, 33 32, communicating with said cylinder and pressure-pipe, respectively, a rod, 33, projecting into both of said

397,730.

chambers, a valve in said pressure-pipe, a lever-arm, 151, connected with said plunger, cams 154 155, acting upon said crank-arm alternately in opposite directions, and a cam, 54, for opening said valve, substantially as set forth.

5. In a brick-machine, the combination, with the upper plunger having a cylinder and a piston therein, and a pipe for fluid under pressure, and a lower plunger having a cylinder and a piston and a source of fluid under pressure, of two chambers communicating with said upper and lower cylinders, respectively, a rod projecting into both of said chambers, a valve, 47, in said pressure-pipe, a lever-arm, 140, connected with said upper plunger, cams acting upon said lever-arm alternately, and a cam, 54, for opening and a spring, 64, for closing said valve, substantially as set forth.

6. In a brick-machine, the combination of the upper plunger provided with a cylinder, a fixed piston fitting in the cylinder of the plunger, provided with ports, and a water-chamber connected with the cylinder, a rod for displacing the water in the chamber and remaining normally withdrawn, and suitable mechanism for reciprocating said rod, substantially as set forth.

7. In a brick-machine, the combination of the upper and lower plungers having cylinders, fixed pistons having ports for the passage of water into the chambers between the respective cylinders and pistons, chambers communicating with the respective ports of the upper and lower pistons, and a rod fitting in said chambers and adapted to be forced into the upper chamber by the water in the lower chamber, substantially as and for the purpose set forth.

8. In a brick-machine, the combination of the upper and lower plungers provided with cylinders, fixed pistons having ports and chambers, a rod extending into the respective chambers at its upper and lower ends, and a weight connected to the rod, substantially as and for the purpose set forth.

9. In a brick-machine, the combination of the lower plunger provided with a cylinder, a fixed piston having ports 23, 24, 28, and 29, valves 37 and 47, and mechanism for operating the valves, consisting of levers 40 and 50 44 and 60, connecting-rods 43 and 51, and cams 46 and 54, mounted on an operating-shaft, substantially as and for the purpose set forth.

10. In a brick-machine, the combination of the lower plunger provided with a cylinder, a fixed piston having ports 23, 24, 28, and 29, valves 37 and 47, and mechanism for operating the valves, consisting of levers 40 and 50, connecting-rods 43 and 51, levers 44 and 60, and cams 46 and 54, connected to an operating-shaft, and additional means for operating the valve 37, consisting of a shaft, 41, and lever 200, connected to the cylinder of the plunger by means of a rod, 201, substantially as and for the purpose set forth.

11. In a brick-machine, the combination of the lower plunger provided with a cylinder, a fixed piston having ports 23, 24, 28, and 29, valves 37 and 47 in port 29, provided with means for operating them, and tank 34, connected with port 29, substantially as and for the purpose set forth.

12. In a brick-machine, the combination of the lower plunger provided with a cylinder, a piston having ports 23, 24, 28, and 29,

valves 37 and 47, provided with means for operating them, and a shaft, 41, to which the valves are connected, the valve 37 being loosely connected to the shaft, substantially as and for the purpose set forth.

13. In a brick-machine, the combination of the lower plunger adapted to be raised hydraulically, and mechanism for lowering the plunger, consisting of rods 63, a cross-head, 62, and springs 64, substantially as and for the purpose set forth.

14. In a brick-machine, the combination of a lower plunger, a shaft provided with a sliding clutch, and a lever for operating said clutch, said lever being oscillated by the movement of the plunger, substantially as set forth.

15. In a brick-machine, the combination of the lower plunger, a shaft provided with a sliding clutch, and mechanism for operating the clutch by the movement of the plunger, consisting of an arm, 70, link 69, a lever, 66, and a cross-head, 62, connected to the plunger by means of rods 63, substantially as and for the purpose set forth.

16. In a brick-machine, the combination of a lower plunger, a counter-shaft provided with a sliding clutch, mechanism for moving the clutch to engage it by the action of the plunger, and mechanism for disengaging the clutch, consisting of an arm, 70, link 69, lever 66, link 73, arm 74, and cam 75, substantially as and for the purpose set forth.

17. In a brick-machine, the combination of an upper plunger provided with a cylinder, a fixed piston fitting in the cylinder, provided with ports 79 and 80, means for forcing water through the ports into the chamber between the piston and cylinder, and means for allowing the escape of water, consisting of a valve, 103, fitting in a port, 101, communicating with the port 80, and passing through a chamber, 106, provided with a pipe, 107, communicating with a tank, 86, substantially as and for the purpose set forth.

18. In a brick-machine, the combination of an upper plunger provided with a cylinder, a piston fitting in the cylinder and having ports 79 and 80, means for forcing the water through the ports into the chamber between the cylinder and piston, and means for allowing the escape of water, consisting of a perforated pipe controlled by suitable mechanism, and a valve, 88, operated by a cam, 94, in one direction and a spring, 97, in the other direction, substantially as and for the purpose set forth.

19. In a brick-machine, the combination of the upper plunger provided with a cylinder, a fixed piston fitting in the cylinder and having ports 79 and 80, mechanism for forcing water through the ports into the chamber between the cylinder and piston, and mechanism for allowing the escape of water, consisting of a valve, 103, a latch for holding said valve closed, and a trip for lifting said latch, the valve 88, and a cam for unseating said valve, substantially as and for the purpose set forth.

20. In a brick-machine, the combination of the upper plunger provided with a cylinder, fixed piston fitting in the cylinder, having ports 79 and 80, and chamber 101, a valve fitting in the chamber, lever 106, connected to the valve, and hook 112, secured to the lever, the lower plunger, means for raising the lower plunger, and rods 114 117, operated by the lower plunger and having an incline, 115, adapted to come against an incline, 116, to disengage the hook 112 from a projection, 113, on the cylinder of the upper plunger, substantially as and for the purpose set forth.

21. In a brick-machine, the combination of the upper and lower plungers, rod-valve 103, lever 106, rods 111 117, hook 112 on the rod 111, incline 115 on the rods 114 117, incline 116, and projection 113 on the upper plunger, and connection between the rod 117 and the lower plunger, substantially as and for the purpose set forth.

22. In a brick-machine having upper and lower plungers operated to do the pressing hydraulically, a valve for releasing the upper plunger, and mechanism for releasing the valve, consisting of a lever, 106, rod 111, having hook 112, rods 114 117, having incline 115, adapted to bear against an incline, 116, on the upper plunger, to disengage the hook 112 from the projection 113 on the upper plunger, and lever 123, operated by the cam 123½, substantially as and for the purpose set forth.

23. In a brick-machine, the combination of the upper and lower plungers operated hydraulically to press the bricks, a valve for releasing the pressure on the upper plunger, and mechanism for relieving the valve, consisting of rods 111 114 117, one having a hook and the other an incline, as specified, and means for moving the rod by hand, consisting of a lever, 120, and rod 121, substantially as and for the purpose set forth.

24. In a brick-machine, the combination of the upper and lower plungers operated hydraulically to press the bricks, a valve for relieving the pressure on the upper plunger, a latch holding said valve closed, and a trip-clutch operated by the lower plunger for disengaging said latch, substantially as set forth.

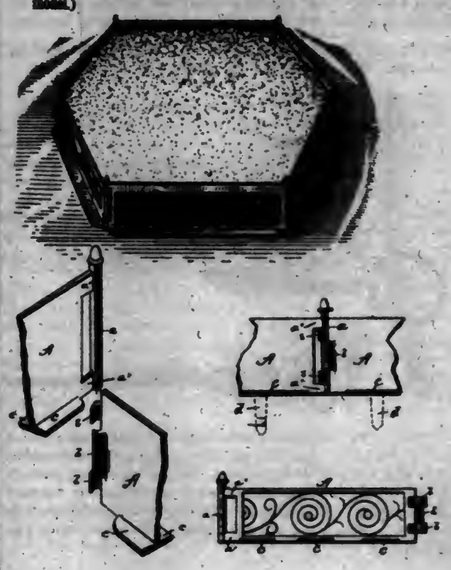
25. In a brick-machine, the combination of an upper plunger adapted to be lowered mechanically the first part of its downward movement and to be raised mechanically by mechanism consisting of a shaft, 96, lever 140, cross-head 142, rod 143, lever 151, rod 150, lever 152, and cams 154 155, mounted on an operating-shaft, substantially as and for the purpose set forth.

26. In a brick-machine, the combination of the mold and frame, the latter having grooves to receive the former, cross-pieces 184, and keys 185 186, substantially as and for the purpose set forth.

27. In a brick-machine, the combination of the mold and frame, the latter having grooves to receive the former, cross-pieces 184, and screws 187, substantially as and for the purpose set forth.

397,731. ROLLER FOR MARKING DESIGNS IN ARTIFICIAL STONE.

JAMES LAIRD and WILLIAM MERCHAN, Philadelphia, Pa. Filed Apr. 19, 1888. Serial No. 271,133. (No model.)



Claim.—1. The combination, with the roller for marking designs upon cement pavements or walls, of the body having longitudinal grooves therein, detachable ribs adapted to said grooves, and detachable screw-rings adapted to be screwed upon each end of said roller and over the ends of the ribs, substantially as described.

2. The combination, with the roller for marking designs upon cement pavements or walls, of the body having longitudinal grooves therein, design-plates having ends adapted to said grooves, retaining-ribs for said plates, and retaining-rings adapted to the body of the roller and to the ribs, substantially as set forth.

3. The combination, with the roller for marking designs upon cement pavements or walls, of the body having longitudinal grooves therein, concave plates the ends of which are adapted to said grooves, retaining-ribs for said plates, and retaining-rings for the ribs, said rings and ribs forming the dividing-lines for the said designs, substantially as set forth.

397,732. BORDER-PLATE FOR FLOWER-BEDS.

ISRAEL I. LANDIS, Lancaster, Pa. Filed Sept. 26, 1888. Serial No. 286,443. (No model.)

Claim.—1. A border for flower-beds, consisting of a series of vertical plates detachably hinged together at their adjacent ends by means of vertical pintles formed integral with or rigidly attached to the ends of the plates, whereby a chain-like arrangement is formed, the said pintles being embraced by curved lugs formed integral with the adjacent plates, substantially as described.

2. The confining-border herein described, consisting of a series of vertical plates detachably hinged together and provided at their lower edges with angular flanges *c* on one or both sides, substantially as described.

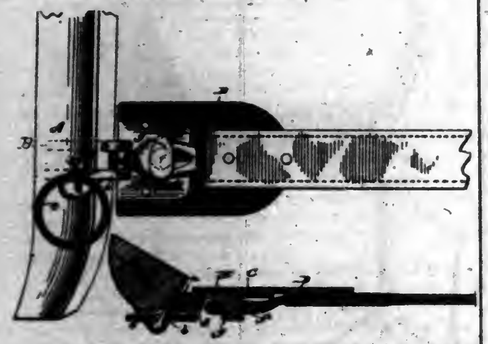
3. As a new article of manufacture, a border-plate, A, having cast integral with it at one end a vertical pintle, and on its other end curved embracing-lugs, substantially as described.

4. As a new article of manufacture, a border-plate provided on its respective ends with a vertical pintle and curved embracing-lugs, and on its lower edge with an angular flange or flanges, substantially as described.

5. The confining-border for flower-beds herein described, consisting of a series of plates adapted to set upright on the surface of the ground, the said plates being detachably hinged together by means of vertical pintles formed integral or rigidly attached to the plates, substantially as described.

6. The combination of two or more border-plates detachably hinged together at their adjacent ends and provided with notched angular flanges *c* on their lower edges, substantially as described.

397,738. HORSE-DETACHER. HEZEKIAH LATHAW, Batavia, N. Y. Filed Oct. 11, 1888. Serial No. 287,797. (No model.)



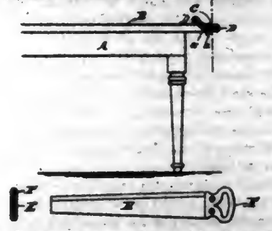
Claim.—1. The combination of a singletree, the trace-hooks pivoted to the ends thereof and provided with the inwardly-extending arms, these arms being provided with curved notches on their inner ends, casings secured to the singletree, the sliding locking-bars, these bars being kept pressed normally against the top of the said casing by means of an inclosed spring, and the operating-straps, substantially as described.

2. The combination of the singletree, trace-hooks C, pivoted in the ends thereof and constructed as described, the slotted casings, the elastic blocks E, the slotted sliding locking-bar, and the spring *j*, substantially as described.

3. A holdback consisting of the following parts: a main plate, a forwardly-extending hook, *d'*, formed integral with the main plate and extending parallel therewith, a slotted cylinder formed integral with the main plate and terminating near the forward end of the hook *d'*, forming a throat, *d'*, and a spring-actuated bolt working in said cylinder and adapted to close the said throat *d'*, substantially as described.

397,784. HAME. HEZEKIAH LATHAW, Batavia, N. Y. Filed Oct. 11, 1888. Serial No. 287,798. (No model.)

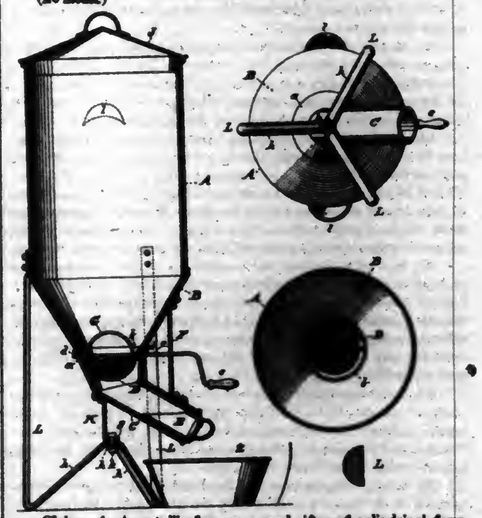
Claim.—The combination, with a hame provided with a pair of eyebolts, of a plate, C, provided on its front edge with an eye and on its face with a flanged or capped post, *f*, the said eye being pivotally secured between the said eyebolts on the hame, a trace-iron provided with an eye, and a trace attached to this iron whereby the trace may move both vertically and laterally, substantially as and for the purpose herein set forth.



397,785. WEEDING-MACHINE. JAMES B. MARSFIELD, Milbridge, Me. Filed Sept. 24, 1888. Serial No. 286,214. (No model.)

Claim.—1. In a weeding machine or implement, the combination of the light metal frame having an operating-handle and formed with the downwardly bent and curved lower ends, the light curved metal plate, the side stops formed at their rear ends, as described, the cutter-blade beveled and sharpened on both its front and rear edges, and the transverse pivot-rod, substantially as set forth.

2. In a weeding implement, the combination of the metal frame having the upper rear socket and the lower bent and curved ends, the light curved metal plate, the side stops, formed at their rear ends as described, the cutter-blade beveled on both its front and rear longitudinal edges, the transverse pivot-rod, and the wooden handle, substantially as and for the purpose set forth.

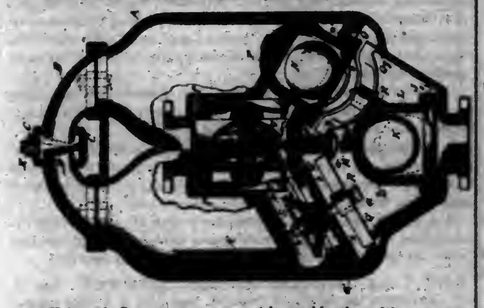


397,786. WALL-PAPER CUTTER. JAMES MARES, Bayonne, N. J. Filed Sept. 24, 1885. Serial No. 177,961. (No model.)

Claim.—1. In a paper-cutter, the combination of a free flexible blade having plane parallel faces and straight knife-edges, each knife-edge being formed by a chamfer on one face of the blade, and the two chamfers being on opposite faces of the same, with a handle at one end of the blade, substantially as described.

2. In a paper-cutter, the combination of a free flexible blade having plane parallel faces and a straight knife-edge, with a handle at the end of the blade, and a board or table provided with a fixed knife-edge, substantially as shown.

397,787. FLOUR HOLDER AND SIFTER. CHARLES H. MARSHALL, Wood River, Nebr. Filed Sept. 20, 1888. Serial No. 286,370. (No model.)



Claim.—1. A metallic flour case and sifter of cylindrical form, having its lower portion a cone frustum let into an angular spout,

front and rear braces to the spout, and angle-legs having short ends, turned inward and upward and secured to each other and to the rear brace of the spout, substantially as specified.

2. In a metallic flour-case, the combination, with the cylinder-case and its angular spout, of the lateral angle-legs bent inward and upward, the receiving-case secured to the lateral legs, the rear angle-leg, and the short brace-iron connecting said angle-legs to the spout, substantially as specified.

397,788. STEAM-PUMP. JOHN MARIN, Jersey City, N. J. Filed Mar. 6, 1888. Serial No. 266,371. (No model.)

Claim.—1. In a steam-pump, and in combination with a removable valve-seat, as O, set on the under side of the inlet-port, a cross-bar resting on a stationary portion of the shell, and a screw passing through said cross-bar and pressing the valve-seat to its place and away from the cross-bar, substantially as described.

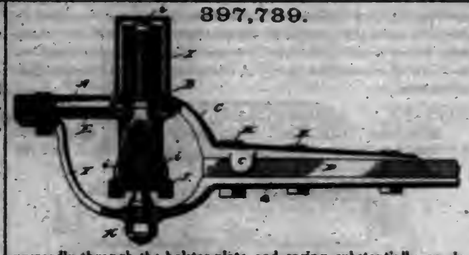
2. In a steam-pump, and in combination with a removable valve-seat set on the under side of the inlet-port, a cage, a cross-bar resting on a stationary part of the shell, and a screw passing through said cross-bar and forcing the valve-seat to its place and away from the cross-bar, substantially as described.

3. In a steam-pump, the shell of which is divided into two parts by a diaphragm, *a'*, and in combination with removable valve-seats, as O O', the cross-bars resting on stationary parts of the shell and bolts for securing them in position on the under side of said diaphragm, substantially as described.

4. The combination, in a pump, of a diaphragm dividing said pump into two chambers and having openings for the inlet-valves, with an inlet into the lower chamber, and three valve-seats, one being on the inlet into said chamber and the others secured to the under side of the diaphragm, substantially as described.

5. The combination, in a pump, of a diaphragm dividing said pump into two chambers and having openings through the same for the inlet-valves, with an inlet into the lower chamber and three valve-seats, one being on the inlet into said chambers and the other secured to the under side of the diaphragm, and a single hand-hole constructed to give access to all of said valves, substantially as described.

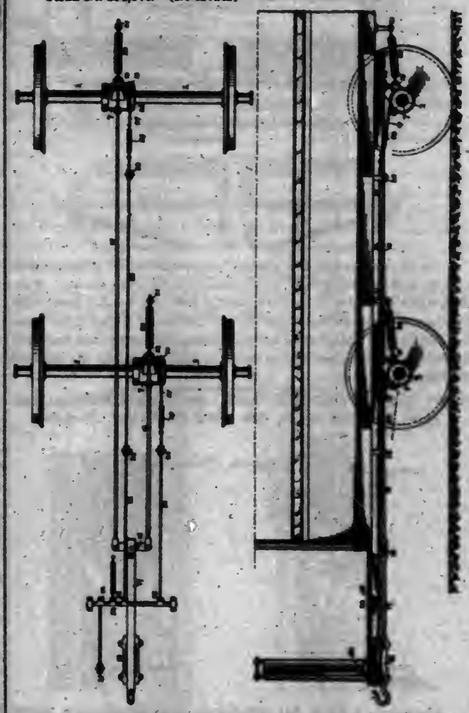
6. The combination, in a pump, of a valve-chamber having opposite inlets with two movable valve-seats facing each other, and a fastening device, as the bolt X and nut or sleeve Y, pressing the said seats in opposite directions, substantially as described.



7. The combination, in a pump, of a valve-chamber having opposite inlets and a ball-valve therein, with two movable valve-seats facing each other, and fastening devices, as the bolts X and sleeves Y Y', arranged above and below said valve, and the lower sleeve provided with a projection, *y'*, substantially as and for the purpose specified.

8. The combination, in a steam-pump, of a neck-casting, as B, having a double-seated valve-chamber provided with openings above and below the same, and a double-acting disk-valve vibrating within said chamber, with two caps closing said openings, and one forming a support for the bottom of the valve and the other having an opening for the connection of a steam-pipe, substantially as described.

9. The combination, in a pump, of a valve-chamber, a valve-seat resting against the walls of an opening therein, a cage, L, resting on the valve-seat, and a bolt, M, pressing against a stationary part of the pump, and the nut *m*, resting in a recess in the cage and constructed to firmly hold the valve-seat in its place, substantially as described.



397,789. FIFTH-WHEEL FOR VEHICLES. JAMES MCCASLEY, Auburn Park, assignor to the Abbott Buggy Company, Chicago, Ill. Filed Oct. 26, 1888. Serial No. 289,177. (No model.)

Claim.—In a running-gear for vehicles, the combination, with a lower fifth-wheel plate clipped to the axle, of an upper fifth-wheel plate having a bolster-plate and curved reach constructed integrally therewith, and a clip king-bolt secured to the axle and extended

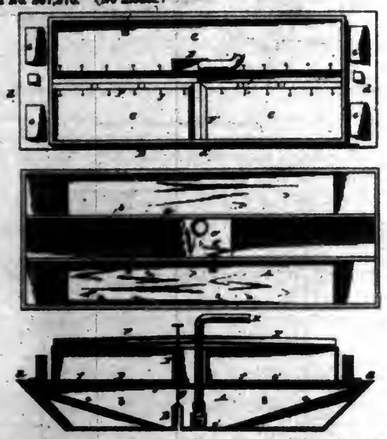
upwardly through the bolster-plate and spring, substantially as described.

397,740. STARTING AND DRAFT MECHANISM FOR STREET-CARS. FRED C. MCDONALD, New York, N. Y. Filed Dec. 22, 1887. Serial No. 258,678. (No model.)

Claim.—1. The combination of the axle, pawl-and-ratchet starting mechanism, a box hung to the axle and carrying one of the elements of said mechanism, a draft-bar connected to said box, and anti-friction-roller bearings interposed between the box and the axle, all substantially as specified.

2. The combination of the two axles of a car, a draft-box with pawl-and-ratchet starting mechanism on each axle, and a draft-bar connected to both of said boxes and having a whiffletree-connection at the front end, all substantially as specified.

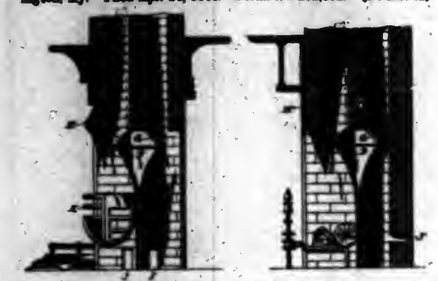
3. The combination of the two axles of the car, each having a draft-box with pawl-and-ratchet mechanism, a draft-rod, an evener carried thereby, and rods extending from said evener to the draft-boxes of the axles, all substantially as specified.



4. The combination of the axle, the ratchet-wheel secured thereto, the draft-box hung to the axle and having a pawl engaging with said ratchet-wheel, and a rock-shaft carried by the box and having a toe for acting upon the pawl to throw it out of gear, all substantially as specified.

5. The combination of the axle, the ratchet-wheel secured thereto, the draft-box having a pawl engaging with said axle, the draft-rod connected to said box, a releasing-shaft carried by the box, an operating-slide on the platform of the car independent of the draft-rod, and means for connecting said slide to the releasing-shaft of the draft-box, all substantially as specified.

6. The combination of the two axles of a car, the draft-boxes,



each having pawl-and-ratchet mechanism, and a releasing-shaft for the pawl, an operating-slide on the platform of the car, and connections between said slide and the releasing-shaft of each draft-box, each of said connections having an interposed spring, all substantially as specified.

397,741. METHOD OF TRANSPORTING SAND, &c. ALEXANDER MCDOUGALL, Duluth, Minn. Original application filed Apr. 26, 1888, Serial No. 272,185. Divided and this application filed Oct. 5, 1888. Serial No. 287,278. (No model.)

Claim.—The method, substantially as described, for raising, transporting, and delivering sand, which consists in pumping the same from the bottom of a river or harbor upon the deck of a scow, transporting the same in such position to the place of discharge, dropping the same into the hold of the scow or barge, diluting with water, and pumping the sand and water out of the hold through a pipe to the place of discharge.

397,742. FIRE-BACK PLATE. MAGDALENE H. MCDOWELL, Lexington, Ky. Filed Apr. 26, 1888. Serial No. 272,162. (No model.)

Claim.—1. A double-flue chimney, in combination with a double fire-back arranged between the flues and flattened at top and adapted to form a support for the bricks between the flues, substantially as described.

2. A double fire-back having its lower part vertical and resting upon the floor, its upper part inclined outward at D and then inclined inward again to form an air-chamber, and having a flat surface above said inwardly-inclined part to form a support for the bricks of the flue, substantially as described.

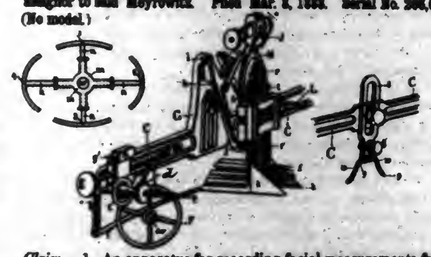
3. The combination, with a chimney arranged between two chambers and having substantially equal openings into the opposite chambers, of a double radiating fire-back and a heating apparatus, as the grate K, arranged in one of said chambers, whereby one chamber is heated by the grate and the other by direct radiation from the opposite side of the fire-back, substantially as described.

4. The combination, with a chimney arranged between two chambers on the same floor, and having two flues and also two substantially equal openings into the opposite chambers, of a double radiating fire-back and a heating apparatus, as the grate K, arranged in one of said chambers, whereby the two chambers on the same floor and one or more chambers above may be heated by a single fire, substantially as described.

5. The combination, with a chimney having side air-flues, of a hollow fire-back open at each end and two plates built into the masonry of the flues and extending into the interior of the fire-back, substantially as and for the purpose specified.

6. The combination, with a chimney and a hollow fire-back, of air-flues leading into and out of said fire-back, and a movable partition arranged between the opposite ends of said fire-back, constructed to vary the size of the air-passage through said fire-back, substantially as and for the purpose specified.

397,743. PROCESS OF MANUFACTURING STEEL. JAMES J. MOTHERS, Pittsburg, Pa. Filed Mar. 5, 1884. Serial No. 122,126. (No specimens.)



Claim.—1. The process of manufacturing steel, consisting in desiliconizing, decarburizing, and oxidizing molten iron by air or oxygen, then deoxidizing, desulphurizing, and dephosphorizing by commercial marsh-gas, commonly known as "natural gas," and finally recarburizing to any degree desired by the dissociating carbon of the same marsh or natural gas.

2. The process of manufacturing steel, consisting in subjecting iron while in a molten state to the action of natural gas or methane, substantially as described.

3. The process of manufacturing steel by first melting cast-iron, then burning out its silicon and carbon with air, and finally, while still molten, recarburizing the iron by subjecting it to the action of natural gas or methane, substantially as described.

4. In the manufacture of steel, the process of recarburizing decarburized iron by forcing natural gas or methane through the iron while the latter is in its molten state, substantially as described.

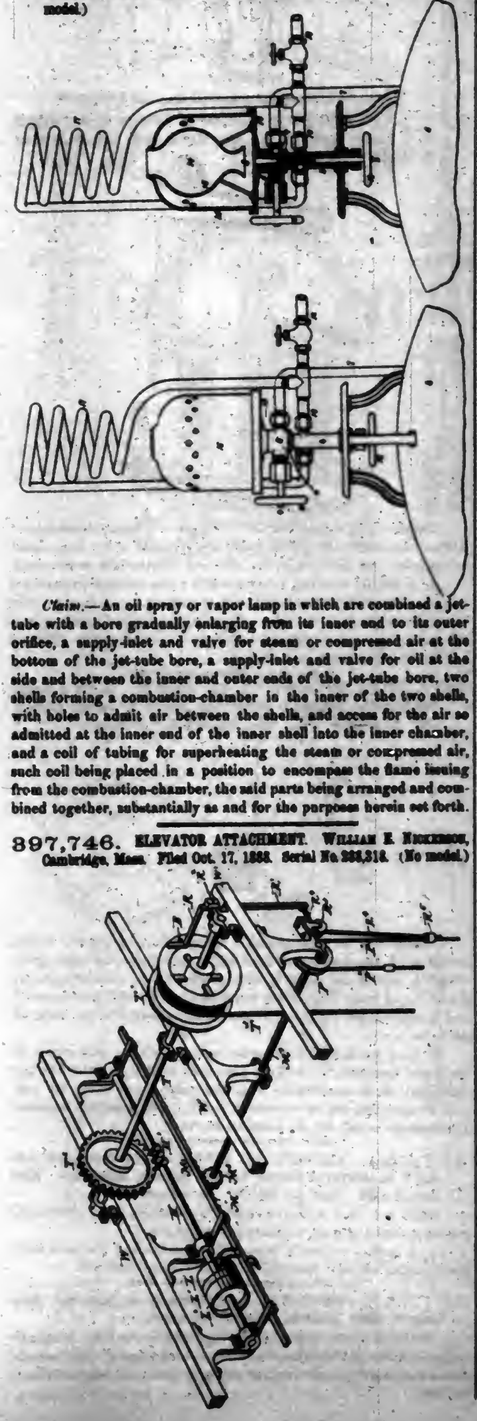
397,744. OPTICIAN'S MEASURING-INSTRUMENT. EMIL R. MEYROWITZ and CHARLES H. DRESSLER, New York, N. Y.; said Dressler assignor to said Meyrowitz. Filed Mar. 8, 1888. Serial No. 266,627. (No model.)

Claim.—1. An apparatus for recording facial measurements from which to make spectacles or eyeglasses, consisting of a box or two-part frame, one part provided with a measuring-instrument having registering points, and the other part provided with a templet counterpart for said registering-points and adapted to receive one or more papers or blanks, whereby the measurements are transferred to such paper or blanks when placed in position by the closing of the box or frame, substantially as and for the purposes set forth.

2. A measuring and registering instrument for opticians' use, consisting of a skeleton frame provided with adjustable temple bars or rods having secured thereto registering pins or points, substantially as and for the purposes set forth.

3. A measuring and registering instrument for opticians' use, consisting of a skeleton frame provided with lens-gages, as F, adjustable to bring central holes therein opposite the pupils of the eyes of the face measured, in combination with adjustable pins, as *y*, whereby said pins are adjusted to register the positions of said holes, substantially as and for the purposes set forth.

4. A measuring-instrument for opticians' use, consisting of a frame provided with an adjustable secondary frame or carriage containing a templet adjustable to the bridge of the nose, from and by means of which the contour of the same may be transferred, substantially as and for the purposes set forth.



5. A measuring-instrument for opticians' use, consisting of a skeleton frame provided with a nose-measuring device consisting of an adjustable carriage containing adjustable measuring-rods for obtaining the bridge-contour of the nose and preserving such contour after the withdrawal of the instrument from the parts measured by it, substantially as and for the purposes set forth.

6. A measuring and registering instrument for opticians' use, consisting of a skeleton frame provided with a nose-measuring device consisting of an adjustable carriage containing adjustable measuring-rods for obtaining the bridge-contour of the nose, provided with registering pins or points which preserve the contour after the withdrawal of the instrument from the parts measured by it, substantially as and for the purposes set forth.

7. A measuring and registering instrument for opticians' use, consisting of a skeleton frame provided with a nose-measuring device consisting of an adjustable carriage, as H, containing registering-knives which preserve the measurements effected by them after the withdrawal of the instrument from the parts measured by it, substantially as and for the purposes set forth.

8. A measuring-instrument for opticians' use, consisting of a skeleton frame carrying lens-gages, as F, provided with perimeters adjustable to varying sizes of eyes, substantially as and for the purposes set forth.

397,745. OIL SPRAY OR VAPOR LAMP. ALEXANDER NEILSON, Inkermann, County of Renfrew, and JAMES TAYLOR, Linlithgow, County of Linlithgow, Scotland. Filed July 24, 1888. Serial No. 280,883. (No model.)

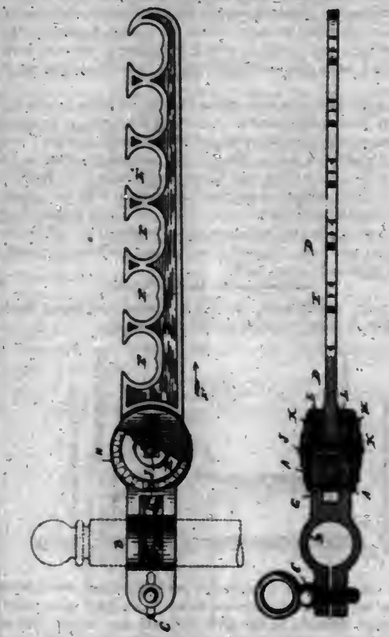
Claim.—An oil spray or vapor lamp in which are combined a jet-tube with a bore gradually enlarging from its inner end to its outer orifice, a supply-inlet and valve for steam or compressed air at the bottom of the jet-tube bore, a supply-inlet and valve for oil at the side and between the inner and outer ends of the jet-tube bore, two shells forming a combustion-chamber in the inner of the two shells, with holes to admit air between the shells, and access for the air so admitted at the inner end of the inner shell into the inner chamber, and a coil of tubing for superheating the steam or compressed air, such coil being placed in a position to encompass the flame issuing from the combustion-chamber, the said parts being arranged and combined together, substantially as and for the purposes herein set forth.

397,746. ELEVATOR ATTACHMENT. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Oct. 17, 1888. Serial No. 288,318. (No model.)

Claim.—1. The combination of the hoisting-drum, provided with the spring-pressed latch and a latch-holding jack adapted to hold the latch inoperative by the pressure of the hoisting-rope, with the lever R R' and the belt-shifting devices, all substantially as described.

2. The combination of the drum T, jack B', and latch B with the lever R R', rope R', roller R', and shifting-rope P', all operating together substantially as described, and for the purpose set forth.

397,747. BOB-SLEIGH. RICHARD H. OLIVE, Wayland, Mich. Filed Sept. 26, 1888. Serial No. 286,440. (No model.)

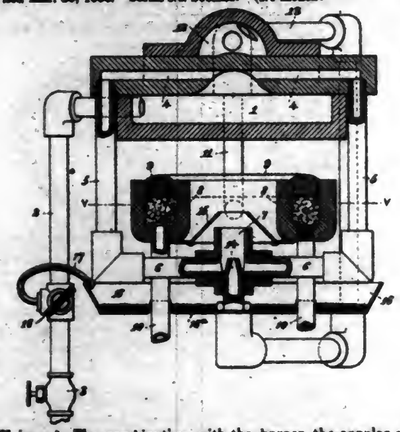


Claim.—1. As an article of manufacture, the combined sleigh beams and knees, consisting of a horizontal piece provided with the end tongues and the downwardly-diverging and curved knee parts, all integral with each other, substantially as set forth.

2. The combination of the combined beams and knees, consisting of the single piece provided with the integral end tongues and downwardly-diverging curved knee parts, and the combined runners, raves, and rear brace end of the raves, all associated together, substantially as set forth.

3. The combination of the combined beams and knees, consisting of the single piece provided at the ends with the integral downwardly-diverging and curved knee parts and the integral end tongues, and the runners and raves of a sleigh, the lower ends of the knee parts being attached to the runners and the raves being attached to said end tongues, substantially as set forth.

397,748. BRACKET. RAYMOND P. PALMENBERG, New York, N. Y. Filed Dec. 8, 1888. Serial No. 293,044. (No model.)

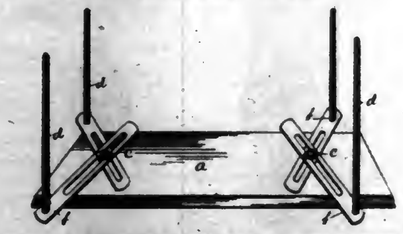


Claim.—1. The combination, with a pair of ears or jaws, of a bracket having one end pivoted between said ears or jaws, which bracket is provided on its pivoted end with a series of teeth, a pin held by said jaws and adapted to engage the teeth on the pivoted end of the bracket, and springs acting on the bracket and keeping the teeth on the pivoted end of the bracket in engagement with the above-mentioned pin held by the jaws, substantially as set forth.

2. The combination, with a pair of jaws having slots extending toward the front ends, of a bracket having one end between said jaws, a pivot passed through the bracket and the slots in the jaws, springs placed in said slots between the front ends of the same and the pivot, teeth formed on the pivoted end of the bracket, and a pin on the

jaws with which the bracket-teeth can engage, said bracket being provided in its top edge with notches, substantially as set forth.

397,749. HYDROCARBON-BURNER. JEFFERSON PATTEN, Green Point, N. Y., assignor of part to Charles Kennedy Hamilton, Jr., Summit, Ivers A. Gard, Bergen Point, and Charles H. Mundy, Metuchen, N. J. Filed Mar. 23, 1883. Serial No. 269,265. (No model.)



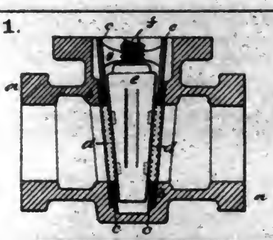
Claim.—1. The combination, with the burner, the annular generator 8, the hydrocarbon-vaporizer 1, and steam-dome 12, of a pipe connecting said dome and generator and pipes connecting said dome and hydrocarbon-vaporizer with the burner, substantially as set forth.

2. In a hydrocarbon-burner, the combination, with the mixing chamber or nozzle 7 and the vaporizing-chamber 1, and the steam-generating chamber 8, arranged above said chamber 7, of the pan 16, for containing oil, arranged below said generating-chamber 8, and a superheating-chamber arranged above the burner, connected with the chamber or nozzle 7 and also with the chamber 8, and said chamber or nozzle 7 being also connected with the vaporizing-chamber, as set forth.

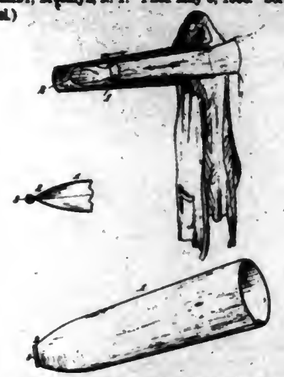
3. In a hydrocarbon-burner, the combination, with the vaporizing-chamber and the mixing-chamber 7, connected therewith, of an annular steam-generating chamber arranged around said chamber 7 and connected therewith, a porous filling in said annular chamber, and a screw-cap, 9, for compressing said filling, substantially as set forth.

4. In a hydrocarbon-burner, the combination, with the steam-generating chamber and the mixing-chamber connected therewith, of the vaporizing-chamber, the radial passages 4, leading from said vaporizing-chamber, and pipes connecting said passages with said mixing-chamber, substantially as set forth.

397,750. GOODS-RACK. NATHAN D. PHINNEY, New Bedford, Mass. Filed Nov. 13, 1888. Serial No. 290,757. (No model.)



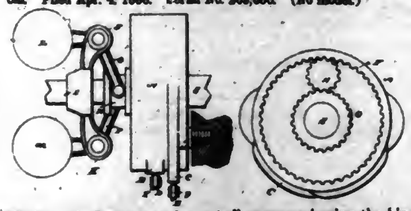
Claim.—A goods-rack consisting of suitable uprights attached to slotted arms, which arms are secured to a suitable base by a screw passing through the slots in the arms and into the base in such a manner that the uprights may be adjusted to or from each other by means of the slots in said arms, as may be desired, in order to support the goods to be displayed, as shown and described.



397,751. VALVE. RUFUS H. PRATT, Hartford, Conn., assignor to the Pratt & Cady Company, same place. Filed July 7, 1888. Serial No. 279,394. (No model.)

Claim.—In combination with the herein-described valve, thin metallic plates, each provided with an opening larger than the port-opening in the body, the walls of said opening being beveled outwardly, and a non-metallic ring thicker than the plate loosely placed in the opening, substantially as described.

397,751.



397,752. DEVICE FOR ASSISTING IN PUTTING ON GARMENTS. IDA V. READY, Brooklyn, N. Y. Filed May 3, 1888. Serial No. 272,602. (No model.)

Claim.—1. A sheath or casing to assist in dressing, consisting of a thin sleeve of the substantial contour and length of the arm, closed at the lower end and open at the other end, substantially as described.

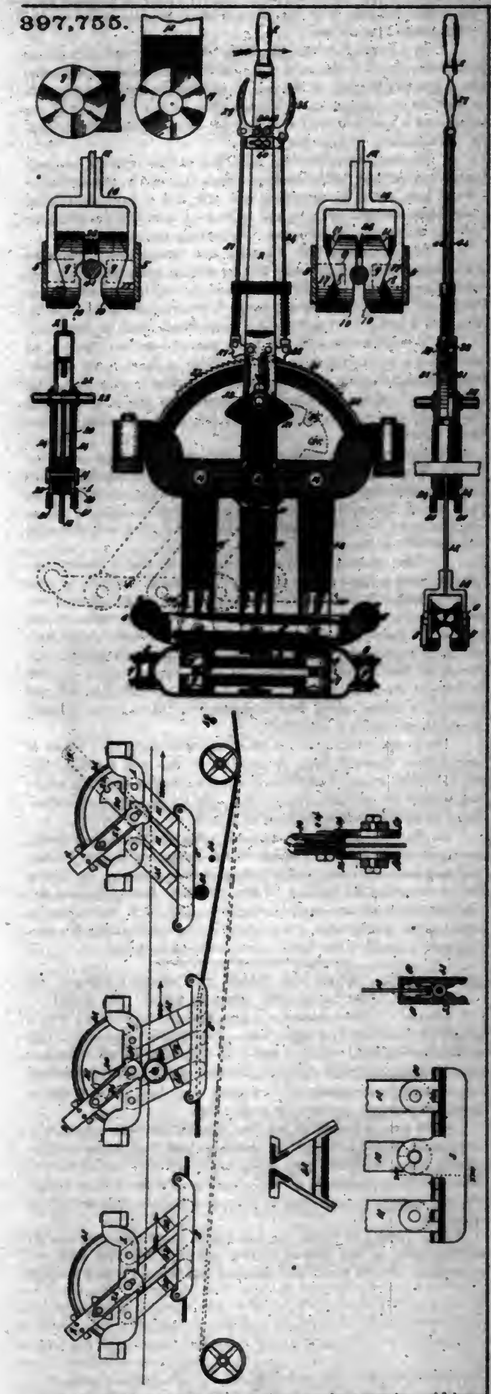
2. A sheath or casing, 1, composed of a thin inexpensive material of the substantial contour and length, or nearly so, of the arm, said sheath being closed at the sides and one end by a line of stitching and left open at the other end, and having at its closed end an attached hand-pull, substantially as described.

397,753. GOVERNOR FOR GAS-ENGINES. DANIEL S. REGAN, San Francisco, assignor to himself, and Sanford S. Bennett, Alameda, Cal. Filed Apr. 4, 1888. Serial No. 269,630. (No model.)

Claim.—1. In a gas-engine, a ball-governor having the hinged arms J and K attached to the fixed collar I, the sleeve and inside gear-wheel, A, having the collar Q, with groove R, the connecting-levers O and P, and cams B and C, in combination with the valve-levers D and E, constructed and operated substantially as and for the purposes set forth.

2. In a gas-engine, a governor having a sliding gear-wheel, A, the inside spur-gear, F, the fixed gear G on shaft S, and the intermediate gear, H, in combination with the cams B and C, for the purpose of operating the valve-levers D and E, constructed and operated substantially as and for the purposes set forth.

397,754. ELECTRIC-LIGHT CARBON. HENRY S. REBNER, Camden, N. J., assignor of one-half to David K. Joslin, same place. Filed Dec. 10, 1888. Serial No. 293,173. (No specimens.)



Claim.—1. In a carbon electrode, the combination of carbonized cocoanut-shell and marl, substantially as described.

2. A carbon electrode composed of carbonized cocoanut-shell, marl, and an adhesive material, substantially as described.

397,755. CABLE-GRIP. FRED SCHELP, Jr., St. Louis, Mo. Filed July 11, 1888. Serial No. 279,022. (No model.)

Claim.—1. In a cable-grip, plates pivoted to the main frame carrying the jaws, and allowing the same to swing parallel with the main frame and cable to close the jaws and grip the cable, substantially as set forth.

397,755.

2. In a cable-grip, the jaws and means for operating said jaws, having duplicate pivoted inclined cams moving upon each other, and thereby closing the jaws and grasping the cable.

3. In a cable-grip, the combination of the main frame, jaws, a frame in which the jaws are located, plates pivoted at their upper ends to the main frame and at their lower ends to the jaw-frame, cams on the plates and jaws, respectively, and a lever for moving the jaw-frame, substantially as and for the purpose set forth.

4. In a cable-grip, the combination of the main frame, jaws, a frame to which the jaws are pivoted, plates pivoted to the main frame at their upper ends and to the jaw-frame at their lower ends, cams having a number of inclined faces secured to the jaws, cams having a number of inclined faces secured to the plates, and a lever for moving the jaw-frame, substantially as and for the purpose set forth.

5. In a cable-grip, the combination of the main frame, jaws, a frame to which the jaws are secured, links pivoted at their upper ends to the main frame and at their lower ends to the jaw-frame, cams secured to said jaws and links, respectively, a central plate pivoted to the main frame and to the jaw-frame, and a lever engaging said central plate, substantially as and for the purpose set forth.

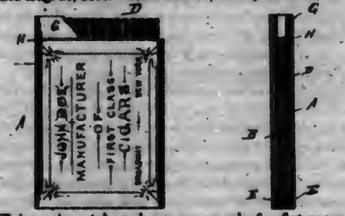
6. In a cable-grip, the combination of the main frame, jaws, a frame to which the jaws are secured, outer plates pivoting the main frame to the jaw-frame, cams on the jaws and said outer plates, respectively, a central plate pivoted to the jaw-frame and to the main frame, an extension on said central plate, and a lever pivoted to the main frame and engaging the extension of the central plate, substantially as and for the purpose set forth.

7. In a cable-grip, the combination of the main frame, jaws, a frame to which the jaws are secured, pivoted plates connecting the frames together, an extension on one of said plates, and a lever engaging said extension, substantially as and for the purpose set forth.

8. In a cable-grip, the combination of the main frame, jaws, a frame to which the jaws are secured, links connecting said frames, a notched extension on one of the links, a lever pivoted to the main frame, and a movable pin on the lever engaging the notch of the extension, substantially as and for the purpose set forth.

9. In a cable-grip, the combination of the main frame, jaws, a frame carrying said jaws, plates pivoted to the main frame and to the jaw-frame, and an extension on one of said plates forming part of an operating-lever for moving the jaws, substantially as set forth.

10. In a cable-grip, the combination of the main frame, jaws, a frame to which the jaws are secured, plates connecting the frames together, a notched extension on one of the plates, a pin engaging said notch, and links secured to the pin, said links being adapted to bear against an obstruction and raise the said pin out of the said notch to automatically disconnect the lever, substantially as and for the purpose set forth.

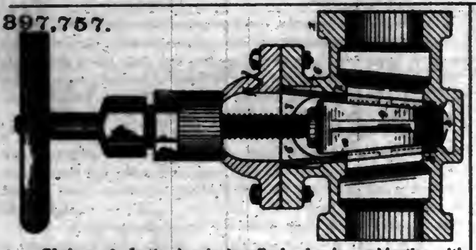


11. In a cable-grip, the combination of the main frame, jaws, a frame in which the jaws are located, plates pivoting the main frame to the jaws, a lever for operating said jaws, and an obstruction, 52, for throwing the jaws in an upward direction, substantially as and for the purpose set forth.

12. In a cable-grip, the combination of the main frame, jaws, connection between the jaws and main frame, an operating-lever provided with pawls, and a rack or bar having a toothed and a plain or smooth surface on each side of the center, substantially as and for the purpose set forth.

13. In a detachable cable-grip, the vertically-moving link adapted to be raised by an obstruction in the road, and thereby automatically detaching the lever from its connection, and an extension pivoted to the main frame and connected to the lever, substantially as set forth.

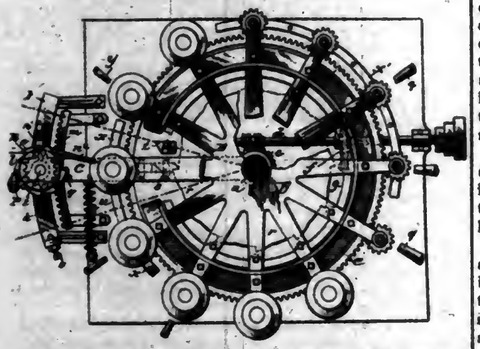
14. In a cable-grip, the combination of the jaws, a detachable lever for operating the jaws, and links 24 for coming against an obstruction and disconnecting said lever, substantially as and for the purpose set forth.



397,756. MATCH-PACKAGE. FRANK SCHILD, Milwaukee, Wis. Filed Aug. 23, 1888. Serial No. 283,589. (No model.)

Claim.—A match-package composed of a flat paper casing provided with a longitudinal partition extending from one end to within a short distance of the other end, said partition having its faces roughened at the upper end of the package and its faces inclined toward each other at the lower end of the package, the casing having a line of perforations extending around it at the top edge of the partition and matches placed between the sides of the partition and the sides of the package, the heads of the matches being at the beveled end of the partition, substantially as herein shown and described.

397,757. VALVE. FRANK W. SEAVER, Hartford, Conn., assignor to the Pratt & Cady Company, same place. Filed Aug. 23, 1888. Serial No. 283,591. (No model.)



397,757.

Claim.—1. In the herein-described valve, in combination with the body having plane inclined seat-faces adjacent to each port, grooves cut in the body underneath the seat-faces concentric with the port-openings, seats supported by said grooves, a frame-work loosely placed in the opening in the body with a portion of its lower edge resting upon the upper edges of the seats and holding them against the body, and the bonnet resting upon the frame-work and holding it down upon the top of the seats, substantially as described.

2. In the herein-described valve, in combination with the body having flat inclined seat-faces adjacent to each port and grooved rims cast integral with the body underneath the seat-faces concentric with the port-openings, seats supported by said grooved rims, a rectangular frame-work with two of its sides resting upon the upper edges of the seats and holding them against the body, and the bonnet resting upon the frame-work and holding the frame-work down upon the top of the seats, substantially as described.

397,758. SOLDERING-MACHINE. JOHN SOLTER, Baltimore, Md. Filed Dec. 7, 1888. Serial No. 292,895. (No model.)

Claim.—1. In combination with a revolving table carrying a series of revolving can-carriers, solder devices arranged in proximity to the line of movement of the carriers, a tube for directing the solder to the can, feeding devices for the solder, vertically-movable can-seats for the cans, and a cam-track opposite the solder devices for raising the can-seats to present the edge of the can to the solder-tube, substantially as described.

2. In combination with a revolving table carrying a series of revolving can-carriers, an oscillating arm, solder-feeding devices carried by said arm, intermediate connections between the main driving-shaft and the arm for moving the same, and intermediate connections between the table of the machine and the feeding devices for operating the same, substantially as described.

3. In combination with a revolving table carrying a series of revolving can-carriers, an oscillating arm supported from and operated by the machine, solder-feeding devices carried on said arm, a vertical shaft for operating the feeding devices, and rack-and-gear connections between said shaft and a stationary part of the frame, whereby said shaft is rotated in the oscillation of the arm, substantially as described.

4. In combination with a revolving table carrying a series of revolving can-carriers, an oscillating arm, means for oscillating said arm in the movement of the machine, a vertical shaft carried by the arm, rack-and-gear connections for said shaft, whereby it is rotated in the oscillation of the arm, a solder-feeding pulley carried loosely by said arm, and pawl-and-ratchet connections between the shaft and pulley, whereby the solder is fed in the oscillation of the arm in its forward movement only, substantially as described.

5. In combination with the table and carriers thereon, an oscillating arm, a vertical shaft carried thereby, rack-and-gear connections for moving said shaft, a pulley carried loosely by the shaft, pawl-and-ratchet connections between the shaft and pulley, and a spring pressure-roller for keeping the solder pressed against the periphery of the pulley, whereby it is fed forward in the rotation of the pulley, substantially as described.

6. In combination with the table and the carriers thereon, an oscillating arm, bearings on its outer end for a vertical shaft, a bracket for supporting the end of the arm, a rack on the table in mesh with a gear on the vertical shaft, a feed-pulley on the upper end of the shaft, and a pawl-and-ratchet connection between the shaft and pulley, substantially as described.

7. In combination with the table and carriers thereon, an oscillating arm carrying solder-feeding devices operated by the oscillation of said arm, means for retracting said arm, and a pawl-and-ratchet connection between said arm and a revolving part of the machine for moving the arm in one direction, substantially as described.

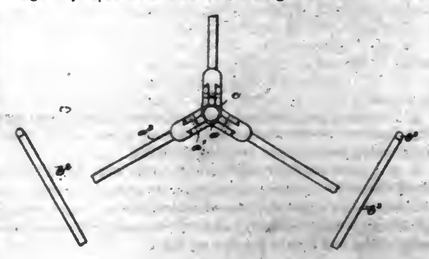
8. In combination with the table and can-carriers thereon, an oscillating arm carrying solder-feeding devices operated by the forward movement of the said arm, a pawl-and-ratchet connection between said arm and the driving-power for moving the arm in one direction, and a spring for returning said arm, substantially as described.

9. In combination with the table and can-carriers thereon, an oscillating arm carrying solder-feeding devices, a sleeve, *b*, the ratchet-wheel carried thereby, and a pawl on the oscillating arm projecting into the path of the ratchet-wheel, whereby the said arm is carried forward by said ratchet, and means for retracting said arm, substantially as described.

10. In combination with a table and can-carriers, the sleeve for driving the parts, a ratchet-wheel carried thereby, an oscillating arm carrying solder-feeding devices, a spring-pawl on the arm adapted to engage with the ratchet-wheel, a releasing-stud on the table for releasing said pawl from the ratchet, and means for retracting said arm, substantially as described.

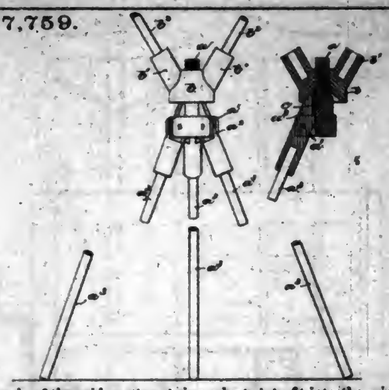
11. The combination, in a soldering-machine, of a central supporting-post, a sleeve thereon, said sleeve being driven from a main driving-shaft, a table connected with and driven by said sleeve, can-carriers supported from said table, gears on the lower ends of said carriers, a gear-wheel loosely mounted on the sleeve and driven from the main shaft, heating means for the cans, and solder devices, with means for automatically feeding solder to the cans, a raised cam-track in front of the solder devices for lifting the supporting-disks and cans thereon, whereby solder may be applied to the cans, and cooling means, substantially as described.

12. In combination with a revolving table carrying a series of can-carriers, vertically-movable can-seats for the cans, means for lifting said seats, and solder devices having a solder-directing tube above the level of the can-carrier and in line with the edge of the can when lifted by its seat, substantially as described.



13. In combination, the movable table, the can-seats thereon, arranged to be raised and lowered, the can-holders and devices for raising and lowering them, solder-feeding devices, a device for raising the can-seats at the position of the said solder-feeding devices, the said can-seats and cans being arranged to drop back automatically after passing said devices, and a second device for elevating the seats and cans for cooling the latter, substantially as described.

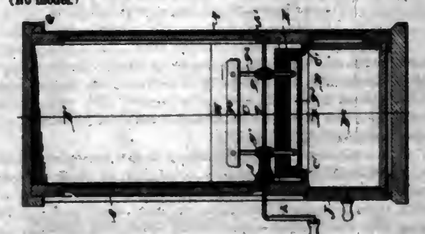
397,759. STAND FOR CHARTS, &c. LORENZO B. SOMERBY, Boston, Mass. Filed Oct. 18, 1888. Serial No. 288,446. (No model.)



Claim.—1. In a stand for charts, &c., the combination, with a spindle, *a*, provided with lugs or ears, of castings pivoted to said lugs or ears and provided with legs, and a rod-supporting sleeve, *b*, secured upon said spindle against vertical movement, substantially as described, and engaging said castings to lock them and their attached legs in operative position, substantially as described.

2. In a stand for charts, &c., the combination, with a spindle, *a*, of castings pivoted thereto and provided with legs, and a rod-supporting sleeve, *b*, secured upon said spindle against vertical movement, substantially as described, and cup-shaped at its under side to engage the said castings to lock them in operative position, substantially as described.

3. In a stand for charts, &c., the spindle *a*, provided with ears, an annular collar or hub secured thereto and provided with slots, and castings a^4, pivoted to the said ears, and legs secured to said castings,



397,759.

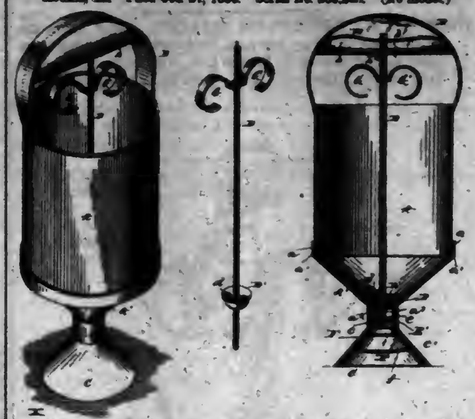
the ends of the said castings being adapted to fit into the said slots, combined with a sleeve cup-shaped at its under side and screwed upon said rod and provided with arms to receive chart-sustaining rods, substantially as described.

4. In a stand for charts, &c., a spindle, *a*, provided with screw-threads, and castings provided with legs pivoted to said spindle, combined with a threaded sleeve, *b*, cup-shaped at its under side, screwed upon said spindle, and having its bottom cup-shaped to fit over the ends of said castings, and rods to sustain the chart or like object secured to said sleeve, substantially as described.

397,760. FLOUR-BIN. CHRISTIAAN TANGENBERG, Grand Rapids, Mich. Filed Sept. 15, 1886. Renewed Jan. 16, 1889. Serial No. 296,791. (No model.)

Claim.—A flour-bin comprising a shell or case, the bearing-plates F, secured to the ends of the case, the false bottom having the concave screen and the converging sides resting on the bearing-plates, an agitator-shaft journaled in a bearing on one of the plates and passing through the shell, the arms affixed to the shaft and carrying the blades, and a shouldered stop, I, fitted loosely on the agitator-shaft and forming a cap for the bearing thereof, resting on and bearing at one end against one of the arms, as and for the purpose set forth.

397,761. FLOUR-BOLT. JAMES THOMAS, Darlington, assignor of one-half to William E. Carter, Platteville, Wis. Filed Jan. 30, 1886. Renewed Dec. 24, 1886. Serial No. 222,527. (No model.)

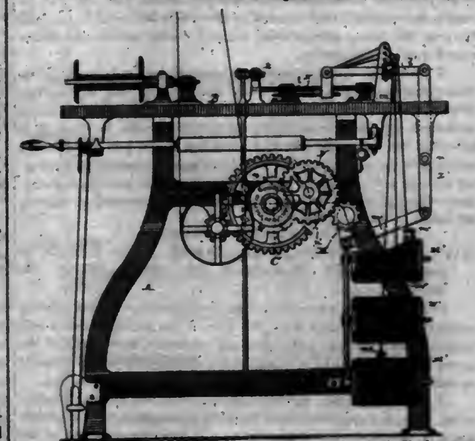


Claim.—1. In a flour-bolt, the combination of a vertical bolting-cloth and an endless-belt elevator for raising the unbolted material in contact with the said bolting-cloth and pressing the said material gently thereupon, substantially as and for the purpose set forth.

2. In a flour-bolt, the combination of an inclosing-case, a bolting-cloth arranged within the said case, and an elevator having a series of slats so related that the unbolted material is raised upward and pressed gently upon the surface of the bolting-cloth, substantially as and for the purpose set forth.

3. In a flour-bolt, the combination of an inclosing-case, a bolting-cloth, an elevator comprising a series of slats and endless bands, the partition C, and the elevator-rollers journaled in the casing above and below the said partition, substantially as and for the purpose set forth.

4. In a flour-bolt, the combination of the outer casing having openings b^3 and b^4 therein, the bolting-cloth, the elevator E, the partition C, the floor G, and the conveyer F, communicating with the opposite side of the bolting-cloth away from the elevator by the passage *g*, substantially as and for the purpose set forth.

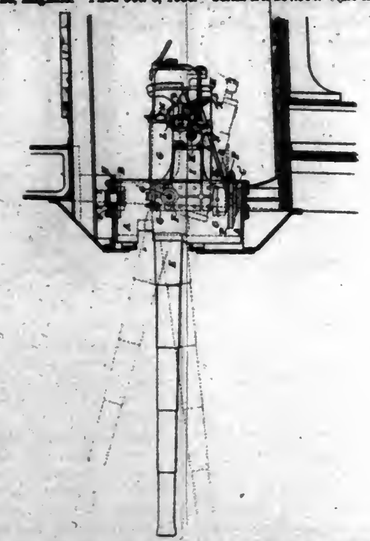


397,762. HAND WATER-SPRINKLER. GEORGE W. TRAHAN, Houma, La. Filed Oct. 27, 1888. Serial No. 289,263. (No model.)

Claim.—1. The combination, in a hand water-sprinkler, of the apertured reservoir, the rose, valve-rod, and valve for controlling the flow of water, the bail having a chamber formed therein, and the spring secured within said chamber and attached to the valve-rod, substantially as and for the purpose set forth and described.

2. In a hand water-sprinkler, the combination of the apertured reservoir consisting of the cylindrical screw-threaded body, and the screw-threaded cone-shaped bottom adapted to be removably secured to the cylindrical body, the rose removably secured to the screw-threaded end of the bottom of the reservoir, the valve-rod, valve, and collar for controlling the outward flow of the liquid from the reservoir to the rose, the valve-rod guide, the spring situated within the chamber formed upon the handle of the reservoir, and the finger-pieces secured upon the valve-rod for raising the valve, collar, and valve-rod, substantially as herein shown and described.

397,763. MACHINE FOR LACING JACQUARD CARDS. WILLIAM P. UHLINGER, Philadelphia, Pa. Filed Jan. 3, 1888. Serial No. 259,601. (No model.) Patented in England Sept. 7, 1886, No. 11,966.



Claim.—1. The combination of the frame, the shaft C, the gear N, having the series of sector-shaped projections P, having concavities in their outer or wider ends, the disk N', having the studs engaging with the side walls of the projections P, and the crank-gear, together with the needle-bars, and means connecting together said needle-bars and the crank-gear, said disk N' also having a convex portion, *a'*, contacting with the concave surface of the sector-shaped projections P, substantially as set forth.

2. The combination of the frame, the shaft C, the gear N, having the series of sector-shaped projections P, having concavities in their outer or middle ends, the disks N', having the studs engaging with the side walls of the projections P', the crank-gear, the needle-bars, means connecting together said needle-bars and the crank-gear, said disk also having a convex portion contacting with the concave surface of the sector-shaped projections P, the grooved cam D, also carried by shaft C, the rock-shaft F, having the arms E and G, the

arm E' engaging said grooved cam, the looped lever, and link *g*, connecting said looped lever to the arm G', substantially as set forth.

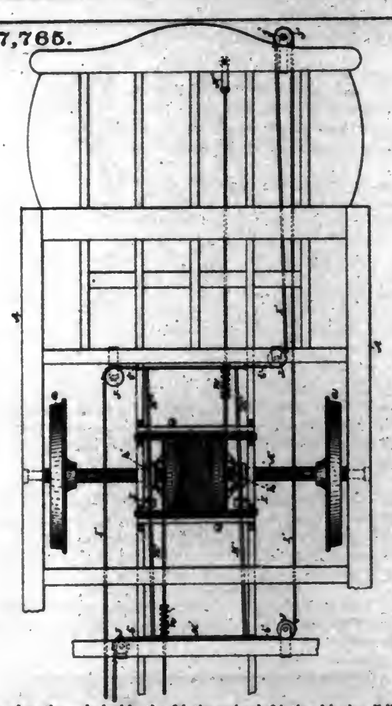
397,764. MOUNTING FOR ORDNANCE. JOHAN VAVASSEUR, London Ordnance Works, Bear Lane, Southwark, County of Surrey, assignor to W. G. Armstrong, Mitchell & Co., (Limited,) Newcastle-upon-Tyne, England. Filed Oct. 8, 1883. Serial No. 287,537. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the semi-cylindrical armor plate or shield, the top and bottom cross-pieces secured thereto, the vertical pivots connected to said cross-pieces, the gun, the cradle in which it is mounted, and the horizontal pivots or trunnions of the gun supported in bearings in the armor plate or shield.

2. The combination, substantially as hereinbefore set forth, of the semi-cylindrical armor plate or shield open at the rear, the gun, its cradle, the recoil-cylinder, carried by the cradle beneath the gun, and the gear for raising and lowering the gun, cradle, and recoil-cylinder together or simultaneously.

3. The combination, substantially as hereinbefore set forth, of the semi-cylindrical armor plate or shield open at the rear, the top and bottom cross-pieces secured thereon, the vertical pivots of the shield connected with said cross-pieces, the gun, the cradle in which it is mounted, the horizontal pivots or trunnions of the gun supported in bearings in the armor plate or shield, the gear for raising and lowering the gun and cradle and recoil-cylinder together, and the training-gear engaging with the armor plate or shield for training or moving the shield on its vertical pivots.

397,765. CAR BRAKE AND STARTER. PHILIP WEILBACH, Copenhagen, Denmark. Filed Aug. 18, 1888. Serial No. 283,162. (No model.)



Claim.—1. In a car-starter, the combination, with the winding ratchet-wheels journaled upon the axle, of the spring between said ratchet-wheels and the pawls pivotally connected to the ends of the spring and engaging with the teeth of the ratchet-wheels, substantially as and for the purpose set forth.

2. In a car-starter, the combination, with the winding ratchet-wheel journaled upon the axle, of the spring circumjacent to the ratchet wheel, a ring at the end of the spring, a link pivoting the end of the spring to said ring and permitting said spring to contract in diameter when being wound up, and a pawl pivoted to the said ring and engaging with the teeth of the ratchet-wheel, substantially as and for the purpose set forth.

3. In a car-starter, the combination of the internal friction-wheels journaled upon the axle, the spring between said friction-wheels with its ends connected thereto, the ratchet-teeth upon the outer peripheries of the friction-wheels, the pivoted stop-pawls engaging with said ratchet-wheels, the clutch-disks secured to the axle inside the friction-wheels, and the friction-blocks sliding in said clutch-disks for transmitting the rotary motion to and from the axle and spring, substantially as and for the purpose set forth.

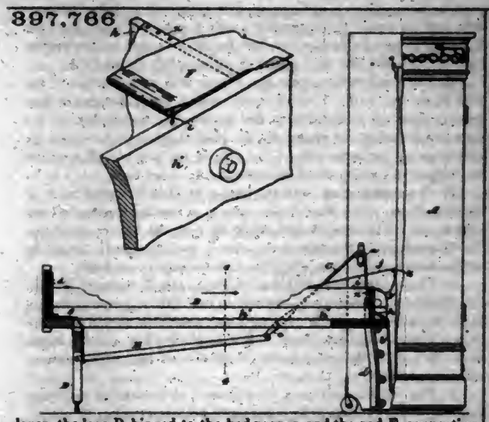
4. In a car-starter, the combination of a revoluble internal friction-wheel journaled upon the axle, a spring having one end connected to said friction-wheel and the other end held stationary, a clutch-disk

397,765.

secured on the axle inside the friction-wheel, friction-blocks sliding in said clutch-disk for communicating its motion to the friction-wheel, a collar splined to the axle, and the adjustable arms pivotally connecting the collar with the friction-blocks, substantially as and for the purpose set forth.

5. In a car-starter, the combination, with two friction-wheels having ratchet-teeth upon their outside peripheries and winding ratchet-wheels secured against their adjacent faces, of a spring between said wheels, pawls pivotally connected to the ends of the spring and engaging with the winding ratchet-wheels, friction-clutches revolving with the axle and adapted to engage alternately with the friction-wheels, and pivoted stop-pawls supported by the car-frame and adapted to engage with the ratchet-teeth upon the friction-wheels, substantially as and for the purpose set forth.

6. In a car-starter, the combination, with a wheel journaled upon the axle and provided with ratchet-teeth upon its periphery, of a cam pivoted to the car-frame and provided with a counter-balance pressing its lower end toward the ratchet-teeth, and a stop limiting the motion of the cam toward said teeth, a pawl pivoted to the lower end of said cam and engaging with the ratchet-teeth, and a disengaging-rod for operating said cam and pawl, substantially as and for the purpose set forth.



7. In a car-starter, the combination, with a wheel journaled upon the axle and provided with ratchet-teeth upon its periphery, of a cam mounted on a shaft journaled in the car-frame and provided with a counter-balance pressing its lower end toward the ratchet-teeth, and an adjustable stop limiting the motion of the cam toward the teeth, a pawl pivoted to the lower end of the cam and engaging with the ratchet-teeth, a weight pivoted to the cam and pressing said pawl against the ratchet-teeth, and a disengaging-rod for operating said cam and pawl, substantially as and for the purpose set forth.

8. In a car-starter, the combination, with a wheel journaled upon the axle and provided with two alternating rows of ratchet-teeth upon its periphery, of a stationary pivoted cam provided with a counter-balance pressing its lower end toward the ratchet-teeth, and a stop limiting its motion toward the teeth, a rod for operating the cam, and two pawls pivoted to the lower end of the cam and engaging with the ratchet-teeth, substantially as and for the purpose set forth.

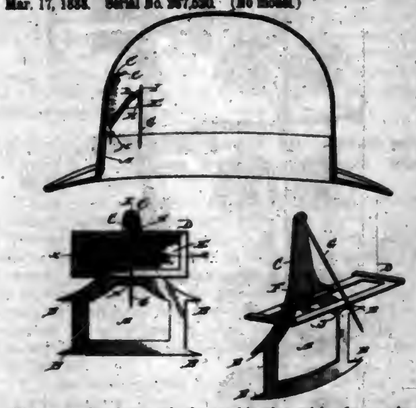
397,766. FOLDING BED OR BEDSTEAD. LYMAN W. WELCH, Sparta, Mich. Filed Feb. 21, 1888. Serial No. 264,799. (No model.)

Claim.—1. The combination, with the standard and bed proper, of the crank-lever *c*, pivotally mounted at its middle to the face of the bed-rail, the suspending chain or connector C, secured at one end to the bed proper and at the other end to one end of the said crank-

397,766.

lever, the legs D, hinged to the bed proper, and the rod E, connecting the other end of said crank-lever with the legs D, said parts being respectively arranged as shown, whereby said crank-lever is held at all times aligned with that portion of the connector to which it is attached.

2. The combination, with the standard and bed proper, of the pillow-apron, secured at one end to the bed proper, and provided with cords *j* or the like, which pass over sheaves on the standard and are attached at their other ends to the bed, substantially as set forth.



3. The combination, with the standard provided with sheaves *a* and *k*, of the bed proper, B, suspended from the sheaves *a* by chains or the like, of the apron E, secured to the bed proper at *x*, and also by hooks *i*, and provided with cords *j*, which pass over the sheaves *k* and are secured to the bed proper at their ends, as set forth.

397,767. METALLIC POLE FOR VEHICLES. FRANCIS H. WELLS, Racine, Wis. Filed Nov. 22, 1883. Serial No. 291,551. (No model.)

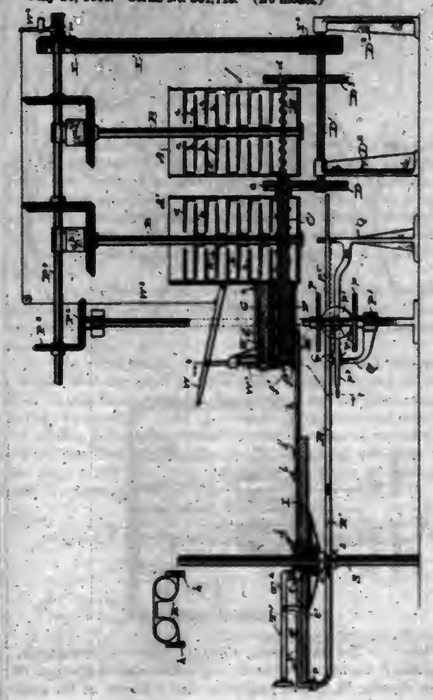
Claim.—A tubular vehicle-pole formed of one or more pieces of metal having longitudinal strengthening-ribs rolled therefrom and projecting inwardly the entire length of said pole, the edges of said metal pieces overlapping and being united by bolts or rivets.

397,768. HAT-MARK. HENRY H. WRIGHT, Paola, Kans. Filed Mar. 17, 1888. Serial No. 267,530. (No model.)

Claim.—1. In a hat-mark, the combination, with a frame adapted to be secured to the inside of a hat, of a hinged and spring-pressed name-plate carried by the said frame, and a pin for locking the name-plate in an approximately vertical position, substantially as herein shown and described.

2. In a hat-mark, the combination, with a frame provided with pins for securing the said frame on the inside of a hat, of a name-plate hinged on said frame, a spring pressing against the back of the said plate, a pin pivoted on the said name-plate and provided with a projection adapted to engage a slot in the said frame, and a hook secured on the said frame, and under which the said pin is passed, substantially as shown and described.

3. In a hat-mark, the combination, with a frame provided with pins adapted to be secured to the inside of a hat, of a name-plate hinged on the said frame, a spring pressing against the back of the said name-plate, a pin pivoted on the said frame and passing through a loop on the said name-plate, and a hook secured to the said frame, and under which the said pin is passed.



397,769. DRILL-HEAD. WILLIAM R. WRIGHT, Port Huron, Mich. Filed Sept. 28, 1888. Serial No. 286,699. (No model.)

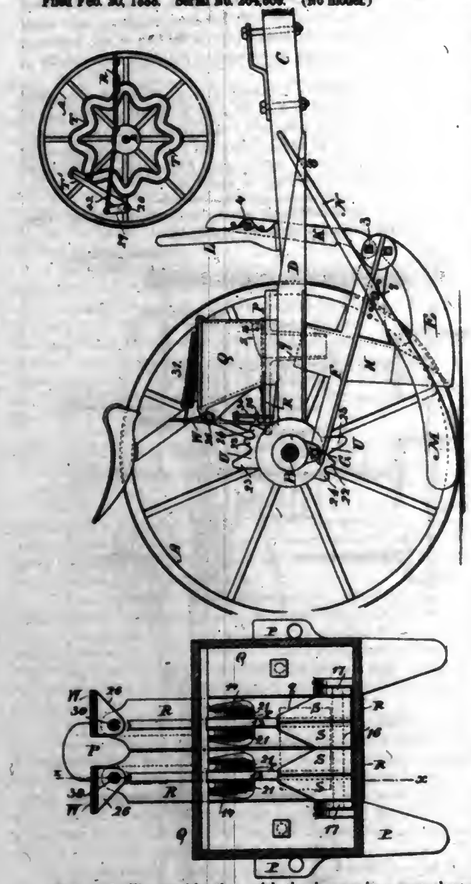
Claim.—1. In a drill-head for removing incrustations from tubes or flues, made tapering from its point to its middle part and cylindrical in rear of the middle part, said drill-head being formed with reaming-flanges extending spirally from the point to the butt, and the said reaming-flanges being provided with bevels or treads on their outer surfaces extending from the middle part to the butt of the drill-head and of gradually increasing width toward the butt, substantially as set forth.

2. The herein-described drill-head A, having the central threaded recess, *a*, in its butt, tapered from its point to its middle part, and of equal diameter in rear of said part, and provided with the reaming-flanges D, increasing in width from the point to the middle part of the drill, and provided with the cutting-edges *d*, the undercut shoulders *d'*, and the bevels *d*², substantially as specified.

397,770. TILE-MACHINE. HENRY Z. YOUNG, Seville, Fla. Filed July 30, 1888. Serial No. 281,113. (No model.)

Claim.—1. In a tile-machine, the combination, with a pug-mill for the material of which the tiles are to be formed, of a hollow conveyer running through it, a conveyer for the core running through the first-named conveyer, a former inclosing the conveyers outside of the pug-mill, a barrel for receiving the tiles as they are formed, and a yielding gate for closing the formers during the formation of a tile, substantially as described.

2. The combination, with the conveyer and former, of the barrel, a revolving table, and an arm extending from the barrel to and upon the table, substantially as described.



3. The combination, with the former or formers of a tile-machine, of a barrel or barrels, a turn-table, an arm or arms connecting the barrel or barrels with the turn-table, and a reaming-frame and reamers adapted to receive the barrel or barrels while carried by the table, and mechanism for driving the reamers.

4. The combination, with the barrel or barrels, of the revolving table, a pusher or pushers carried thereby, a bar adapted to engage an arm of the pusher or pushers, and mechanism, substantially as described, for operating said bar to cause it to advance and withdraw the pusher or pushers at the proper times, substantially as described.

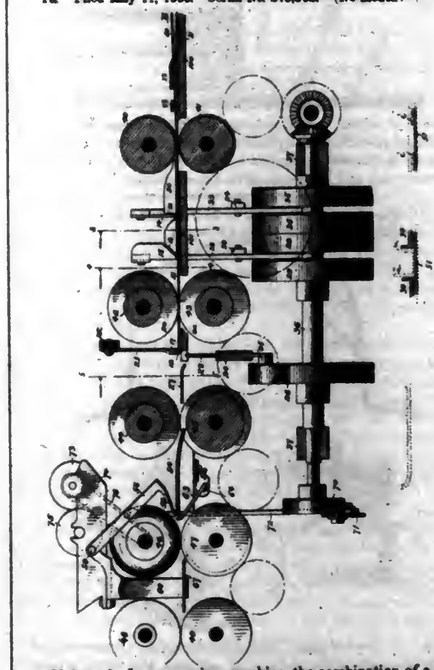
5. The combination, with the conveyers, formers, and barrels, of arms connecting the barrel with the table, and catches carried by the table and adapted to engage catch-heads on the arms, substantially as described.

6. The combination, with a pug-mill and conveyers, of a lever pivoted thereto, a knife carried by said lever, driving mechanism for the conveyers, and connections between said lever and driving mechanism, whereby when it is depressed it will throw said mechanism out of gear, substantially as described.

397,771. CORN-PLANTER. LEWIS A. ASPINWALL, Three Rivers, Mich., assignor to the Aspinwall Manufacturing Company, same place. Filed Feb. 20, 1888. Serial No. 264,609. (No model.)

Claim.—1. The combination, with the hopper in a corn-planter, of the slide R, having an incline, 14, and a downward projection, 10, with an opening, 21, in said projection that is largest on the under side, and the plate P, upon which the slide R rests, said plate having a V-shaped groove in its upper surface for the reception of the projection on the under side of the slide R, substantially as set forth.

2. The combination, with the hopper in a corn-planter, of the slide R, having a rib, 12, on its upper surface and a downward projection, 10, on the under surface, and the hole 21, passing through the slide and largest at the under side, the plate P, grooved to receive the projection on the under side of the slide R, and the cut-off S within the hopper and above the slide, substantially as set forth.



3. The combination, with the hopper Q, plate P, and chute 9, of the slide R above the plate P and passing across the bottom of the hopper, the rocker-arm W, pivoted at 25 upon the hopper, the drop-pin 30, passing into the hole in the slide R, and the cam U, for giving motion to the rocker-arm and slide, substantially as set forth.

4. The combination, with the wheels A, axle B, frame D, hopper Q, and slide R, of the cam U, secured to said axle and having fingers 22 23 24 formed therein of varying length and radial to said axle, the fingers 22 and 24 to give the slide R a rapid vibration, and the finger 23 to move the slide to the point of delivery of the grain, substantially as set forth.

5. The combination, in a corn-planter, of mechanism for dropping the corn, the plow E, for opening the furrow, the bar F, hinged to the axle of the corn-planter, a coverer, M, pivoted at about its middle to the frame F, and having a lever end passing through an opening or support in the frame of the corn-planter, a support upon said frame for the lever end of said coverer, and a movable pin for connecting the coverer with the bar F of the plow for varying the depth of the furrow, substantially as set forth.

6. The combination, with the wheels, axle, tongue, and frame in a corn-planter, of the hopper for the corn, a slide for dropping the same, a plow for opening the furrow, a bar, F, to which the plow is fastened, which bar is hinged at its rear end to the axle, a link, K, lever L, for raising or lowering the plow, a coverer, M, pivoted at about its middle to the bar F and having a forward extension or lever, N, a support for the lever portion N upon the frame, and a movable bolt for connecting the coverer to the bar F, substantially as and for the purposes set forth.

397,772. PAPER-BAG MACHINE. LORENZO D. BENNER, Peoria, Ill., assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed May 11, 1888. Serial No. 273,562. (No model.)

Claim.—1. In a paper-bag machine, the combination of a former adapted to form a web of paper into a bellows-sided tube, guides for turning the opposite upper plies of the tube at right angles to the remainder of the tube, and severing devices for severing both the upturned and flat portions, substantially as described.

2. In a paper-bag machine, the combination of a former adapted to form a web of paper into a bellows-sided tube, guides for turning the opposite upper plies of the tube at right angles to the remainder of the tube, transverse severing devices for severing said upturned portions, and diagonal creasing or folding devices for creasing or folding the ends of said severed upturned portions of the tube, substantially as described.

3. In a paper-bag machine, the combination of a former adapted to form a web of paper into a bellows-sided tube, guides for turning the opposite upper plies of the tube at right angles to the remainder of the tube, transverse severing devices for severing said upturned portions, diagonal creasing or folding devices for creasing or folding the ends of said severed upturned portions of the tube, a second severing device for severing bag-lengths from the tube, and bottom-folding devices for forming the bag-bottoms, substantially as described.

4. The combination of a former adapted to form a bellows-sided tube, guides for turning the opposite upper plies of the tube at right angles to the remainder of the tube, severing devices for severing said upturned portion, primary folders in advance of said severing devices for creasing or folding the corners of said upturned portions, and a second severing device in advance of said primary folders for completing the severing of bag-lengths from the tube, substantially as described.

5. The combination of guides for turning the opposite upper plies of a bellows-sided tube at right angles to the remainder of the tube, a pair of cutters coacting with said guides to sever said upturned portions transversely, diagonal creasing or folding devices for creasing or folding the ends of said severed upturned portions, a transverse severing device for severing bag-lengths from the tube, and folding devices for completing the formation of the bag-bottom, substantially as described.

6. The combination of guides for turning the opposite upper plies of a bellows-sided tube at right angles to the remainder of the tube, transverse severing devices for severing said upturned portions, a pair of angular creasing-edges and creasers coacting therewith for diagonally creasing or folding the ends of said severed upturned portions, a transverse severing device for severing bag-lengths from the tube, and folding devices for completing the formation of the bag-bottoms, substantially as described.

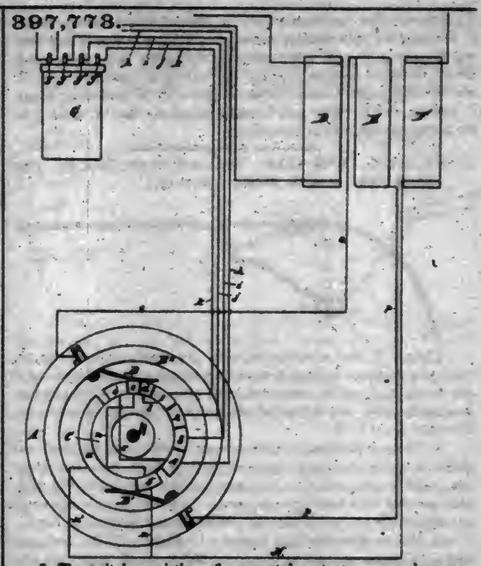
7. The combination of the former, the guides 30, independent of said former and terminating in cutting-edges, and laterally-vibrating cutters coacting with said edges, substantially as described.

8. The combination of the guides 30, severing devices, angular creasing-edges 13, and laterally-vibrating creasers or folders coacting with said edges, substantially as described.

9. The combination of the guides 30, terminating in cutting-edges, laterally-vibrating cutters coacting with said cutting-edges, angular creasing-edges 13, and laterally-vibrating creasers or folders coacting with said creasing-edges, substantially as described.

10. The combination, with tube-feeding devices and guides for turning the opposite upper plies of the tube at right angles to the remainder of the tube, of a transverse cutter provided with vertical openings 17, and a severing-blade coacting with said cutter, substantially as described.

11. The combination, with tube-feeding devices and transverse severing devices, of an oppositely-inclined table, 54, folding-rollers, and a folding-blade coacting therewith, substantially as described.

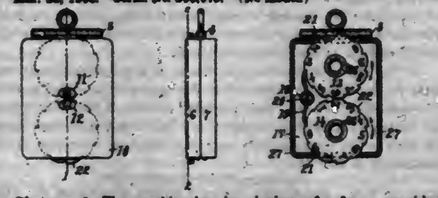


12. The combination, with tube-feeding devices and transverse severing devices, of an oppositely-inclined table, 54, folding-rollers, and a folding-blade having wings 61, coacting with said table and rollers, substantially as described.

397,773. REGULATING-SWITCH FOR ELECTRIC MOTORS. HARRY H. BLADES, Detroit, Mich. Filed Mar. 23, 1888. Serial No. 268,222. (No model.)

Claim.—1. In a manipulating-switch for electric motors, a series of contacts connected and arranged in the order of their operation, as follows: first, contacts adapted to sever the circuit through the motor or short-circuit its armature or field-magnets; second, a series of contacts, each successive one adapted to admit an increased current to the motor; third, contacts adapted to reverse the current through the armature or field-magnets while at its maximum, and, in connection with said switch, means for instantly returning the switch to its starting-point when released, substantially as and for the purpose described.

2. A manipulating-switch for motors, made in the form of a cylinder with segmental contacts and concentric sweep provided with spring-contacts adapted to ride over said segments, and a spring for returning them to the starting-point, said segmental contacts connected and arranged in the order of their operation, as follows: first, contacts adapted to break the circuit through the motor; second, a series of contacts, each successive one adapted to admit increased current to the motor; third, contacts adapted to reverse the current through the armature or field-magnets while at its maximum, substantially as described.



397,773.

3. The switch consisting of segmental contacts arranged upon a surface of a stationary cylinder, a cylindrical shield surrounding the same and having spring-contacts upon its interior surface adapted to ride over said segments, a spring for retracting the same to its initial position, and a band and treadle whereby motion may be communicated to the switch by the foot of the operator, substantially as described.

4. The combination, with a dental motor, its stand and switch mechanism, of a resistance-regulator, G, the same being in the form of a spool sleeved over the upright of the stand, substantially as described.

397,774. LOCKET. GEORGE D. BRIGGS, Providence, R. I. Filed Mar. 22, 1888. Serial No. 268,073. (No model.)

Claim.—1. The combination, in a locket, of a frame provided with two openings, one opposite the other, and a plate having integral tubular bearings, on which are mounted the ratchet-disks, part of said disks extending through the openings in the frame, a spring mounted in the boss for engaging the teeth of the ratchet-disks, and the plate having the two openings through which the face of the ratchet-disks may be seen, substantially as and for the purpose described.

2. The combination of the part 7 of a locket with the part 6, provided with the plate 17, the disks 13 and 14, and plate 10, having the openings 11 and 12, substantially as and for the purpose shown and described.

3. The combination of the part 7 of a locket with the part 6, provided with the plate 17, having the bearings 15 and 16, of the disks 13 and 14, mounted on said bearings, and the front plate, 10, having the openings 11 and 12, substantially as shown and described.

4. In a locket, the combination, with the plate 17, provided with the bearings 15 and 16, and the boss 18, for holding the spring 19, of the disks 13 and 14 and the front plate, 10, having the openings 11 and 12, substantially as set forth.

397,775. LAWN-SPRINKLER. DAVID D. BUICK, Detroit, Mich. Filed May 5, 1888. Serial No. 273,212. (No model.)

Claim.—The combination, in a lawn-sprinkler, of a hollow body, C, having a top opening, D, a rotary cap, A, open at its top and having the corrugations K and bearing on the hollow body, and a plug, L, secured in the said top opening and having a vertical passage, E, and lateral passages G, and formed integral with the projecting flange F, bearing directly upon and loosely holding the base of the cup on the body, substantially as described.

397,776. ROAD-CART. WILLIAM S. BULEIT, Delta, Pa. Filed July 25, 1888. Serial No. 280,958. (No model.)

Claim.—1. The combination, in a two-wheel vehicle, with the body and shafts, of springs pivotally connected with the front end of the former and rigidly connected with the latter, and hangers connecting the body and shafts and adjustable in bearings therefor, substantially as set forth.

2. The combination, in a two-wheel vehicle, with the body and shafts, of springs pivotally connected with the front end of the former and rigidly connected with the latter, springs secured to the body and provided with bearings, and hangers adjustable in said bearings and adjustably connected with the shafts, substantially as set forth.

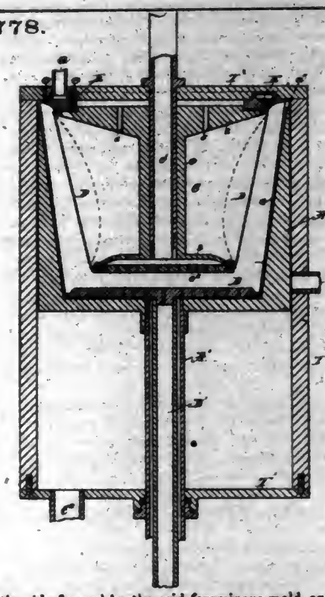
3. The combination, in a two-wheel vehicle, with the body and shafts, of springs secured to the latter and pivotally connected with the front end of the former, springs secured to the body and provided with bearings, bearings connected with the shafts, and hangers adjustable in said bearings, substantially as set forth.

4. The combination, in a two-wheel vehicle, with the body and shafts, of springs pivotally connected at their free ends with the front end of the body and having their other ends rigidly connected with the shafts, springs secured to the body and provided with bearings, brackets upon the shafts provided with bearings, and hangers connecting the body and shafts and adjustable in said bearings, substantially as set forth.

5. The combination, in a two-wheel vehicle, with the shafts, of the body pivotally connected therewith, springs secured to said body and provided with bearings at their outer ends, brackets provided with bearings, and hangers connecting the shafts and body adjustable in said bearings, substantially as set forth.

6. The combination, with the shafts, of the body pivotally connected therewith, springs secured to the body and provided at their outer ends with bearings, and hangers provided at their lower ends with rollers for adjustably engaging said bearings and at their upper ends with hooks for adjustably engaging bearings upon the shafts, substantially as set forth.

397,777. ROAD-CART. AARON S. BULGER, Martinsburg, Pa. Filed June 23, 1888. Serial No. 278,415. (No model.)

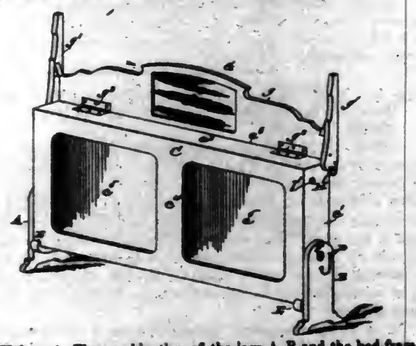


Claim.—In a road-cart, the combination of the iron axle having the downwardly-cranked ends, the shaft-clips, the rod N, secured by said clips, the blocks E on the upper main portion of the axle, the C-springs having the long arm resting on said blocks, the links *b*, the leaf-spring F, the seat, and the side bars bolted to the seat and having a hinge-connection with the cross-bar, substantially as specified.

397,778. MACHINE FOR MOLDING FIBROUS WARE. HENRY CARMICHAEL, Malden, Mass. Filed May 16, 1887. Serial No. 238,227. (No model.)

Claim.—1. In a machine for making hollow articles from pulp, a vessel or cylinder, a foraminous mold for forming one side of the article to be shaped, an independent chine or bottom plate having a stem, the said plate being movable and forming the exterior of the bottom of the article, a flexible diaphragm disconnected from the said chine or bottom plate and adapted to press that side of the article

397,778.



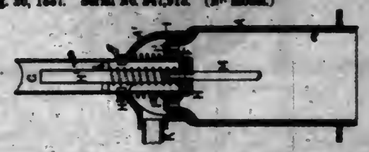
opposite the side formed by the said foraminous mold, and a foraminous plate for forming the interior surface of the bottom of the article, the said parts being in combination, as and for the purpose set forth.

2. In a machine for forming hollow articles from pulp, the combination of the following instrumentalities: a vessel or cylinder provided with a pulp-port, a foraminous mold, a former, and a chine or bottom plate adapted to be moved in the said mold and shaped to form on the bottom of the article a raised edge or chine, substantially as described.

3. The combination, with a vessel or cylinder, a foraminous mold for forming the outer side of the article to be shaped, and an independent bottom plate having a stem made movable in the said former or mold, of a former having a foraminous drainage foot or plate to come against the bottom of the article being formed opposite the bottom plate, to operate substantially as described.

4. The combination, with a vessel or cylinder having a pulp-port, of a mold fitting fluid-tight therein and having a hollow stem extended through the head of the said vessel or cylinder, the latter having an opening for the passage into it of a fluid to actuate the said mold or former, substantially as described.

397,779. FOLDING BED. THOMAS J. CHERRY, St. Louis, Mo., assignor to the Economy Folding Bed Company, East St. Louis, Ill. Filed Apr. 23, 1888. Serial No. 271,560. (No model.)



Claim.—1. The combination of the legs A B and the bed-frame C, made as described, and having bottom c^4, said legs having stops E, provided with the lips *c*, and said bed-frame being pivoted at F to said legs and having the projections c^3, which engage the stops E between the lips *c* and the sides of the leg, as and for the purpose set forth.

2. In a swinging and folding bed, the bed-frame C, having the end rails perforated at c^2, combined with the perforated legs A and B, having stops E, and pin D, adapted to engage the perforation in the

leg and bed to hold the bed in an unfolded position, substantially as and for the purposes set forth.

3. The combination of the bed-frame, the irons K, each of said irons made in two parts, *k k'*, the part *k* fastened to end rail and the part *k'* to the side rail, the tenon of one part secured in the mortise of the other by bolt k^4, and the bed-bottom, said bottom having projections *l*, which engage in slots in said irons, whereby said bottom is adjustably connected with the end rails of said frame, substantially as described.

397,780. AIR-PUMP. ALEXANDER CHARTERS, Augusta, Ga. Filed Aug. 20, 1887. Serial No. 247,913. (No model.)

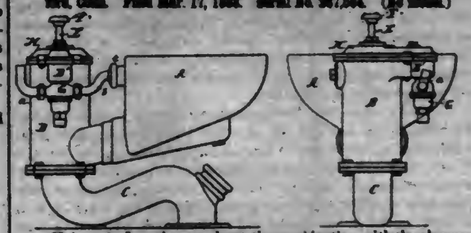
Claim.—1. The combination of the air-exhausting pumps A, a chamber, B, carrying and connected with said pumps, the pump-barrels having the longitudinal passage *a*, the connecting-rods E, and the crank-shaft C, having its bearings in said chamber, the suction-valves H, having their upper face recessed, the hollow stem H', secured to said valves and having the guide-collar *h* and spring H^3 thereon, the suction-pipes G, having the internal stops, *g*, the rod M, secured to the piston and having springs on the side thereof, the perforated diaphragm F, the annular valves I and springs thereon, the delivery-pipes K, and oil-trap L, substantially as set forth.

2. The combination of the pumps A, a chamber carrying them, a crank-shaft having its cranks therein, a perforated diaphragm in the upper end of the pump, a discharge-valve on top, and a suction-valve under said diaphragm, a hollow stem upon said suction-valve, a piston having its upper face recessed to receive the suction-valve, a rod secured to the top of said piston, and springs secured to said rod, substantially as and for the purpose described.

3. The combination of the pump-barrel and its piston, a perforated diaphragm in the upper end of said barrel, a discharge-valve or top, and a suction-valve under said diaphragm, a hollow stem upon said suction-valve, a piston, a rod secured to the top of said piston, and springs secured to said rod, substantially as and for the purpose described.

397,781. WATER-CLOSET. HOSE H. CRAMER, Stamford, Conn. Filed Aug. 20, 1887. Serial No. 247,405. (No model.)

Claim.—1. A water-closet bowl or receptacle formed with an open channel or gutter sunk in its inner surface, and extending from or near the rim to the base of the bowl and directed toward the discharge-aperture, with a water-duct arranged to discharge into said channel, substantially as set forth.



2. A water-closet bowl having a hollow flushing-rim at the top and a discharge-aperture with an open water-channel sunk in the inner surface of the bowl, and descending from the rim to the base and directed toward the discharge-aperture, with a water-supply conduit connecting to the hollow rim and a discharge-aperture leading from said rim to said channel, substantially as set forth.

3. A water-closet bowl or receptacle formed with an open vertical channel on the inner wall of the bowl descending from or near the rim, directed toward the discharge-aperture, and made of a depth increasing toward its lowest point in the bowl, substantially as shown and described.

4. In a water-closet, the combination, with the bowl or receptacle having a discharge-aperture at the base and a siphonic discharge tube or trap leading therefrom, of a water channel or gutter on the inner wall of the bowl descending the same toward and into the discharge-aperture and in line with the limb of the siphon or trap and open on the face of the bowl from end to end, substantially as herein set forth.

5. A water-closet bowl having the discharge-aperture *b*, the curved discharge-tube *c*, and the open channel *k*, arranged substantially as shown, with the bottom of the channel of continuous and coincident curve with the bottom of the tube *c*, and blending into and crossing the aperture *b*, substantially as shown and described.

397,782. PLUNGER WATER-CLOSET. HOSE H. CRAMER, Stamford, Conn. Filed Mar. 17, 1888. Serial No. 267,564. (No model.)

Claim.—1. In a plunger-closet, the combination, with the plunger-chamber and its cover and the plunger and its lifting-rod, of a self-closing flushing-valve and an operating-lever for transmitting movement to said valve, arranged within the plunger-chamber with its long arm over the plunger to be vibrated by the lifting thereof and pivoted to the under side of the cover, whereby it is removable therewith.

2. In a plunger-closet, the combination, with the plunger-chamber and its cover and the plunger and its lifting-rod, of a self-closing flushing-valve and an operating-lever for transmitting movement to said valve, arranged within the plunger-chamber with its long arm over the plunger to be vibrated by the lifting thereof, and a fulcrum-support to which the lever is pivoted, fastened to the under side of the cover and adjustable thereon in a direction longitudinal of the lever.

3. In a plunger-closet, the combination of a plunger-chamber formed with an open-topped lateral branch or pocket at its top, the cover thereof formed to close said pocket, the plunger and its lifting-rod, a self-closing flushing-valve attached to said plunger-chamber with its stem projecting into the pocket thereof, and an operating-lever arranged within the plunger-chamber with its long arm over the plunger to be vibrated by the lifting thereof and its short arm in said pocket arranged to transmit motion to said valve-stem.

4. In a water-closet, the combination, with a self-closing flushing-valve in the supply-pipe, with a plunger-chamber formed with a lateral branch or pocket into which the stem of said valve projects, and with the lifting handle and rod, of an operating-lever in said plunger-chamber arranged with its long arm over the plunger to be vibrated by the lifting thereof and its short arm in said pocket arranged to transmit movement to the stem of said valve, substantially as set forth.

5. In a water-closet, the combination, with the plunger-chamber, a self-closing flushing-valve in the supply-pipe, the plunger, and its lifting-rod, of an operating-lever having its long arm over the plunger to be vibrated by the lifting thereof and its short arm arranged to transmit movement to the stem of said flushing-valve, and a fulcrum-support to which said lever is fulcrumed, and which support is adjustable in a direction longitudinal of the lever, whereby, by the adjustment of said support, said lever is moved bodily, and the leverage with which and extent to which it acts upon the valve are correspondingly varied, and whereby any desired adjustment of the length of the flush between its extreme limits may be effected.

6. In a water-closet, the combination, with a self-closing flushing-valve in the supply-pipe, with a plunger-chamber into which the stem of said valve projects, and with the lifting handle and rod, of an operating-lever in said chamber arranged to be vibrated by the lifting of the handle, and when so vibrated to transmit motion to the stem of said valve, and a longitudinally-adjustable support for the fulcrum of the lever, whereby, by moving said support, the lever is moved bodily endwise, so that the movement for pressing in said valve-stem is derived from a point closer to or farther from its fulcrum, so that the extent to which the stem shall be pressed in by a given vibration of the lever may be varied.

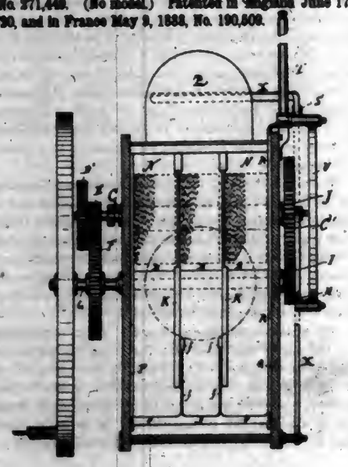
7. In a water-closet, the combination, with a self-closing flushing-valve in the supply-pipe, and with the lifting handle and rod, of an operating-lever arranged to be vibrated by the lifting of the handle, a pivoted dog arranged to bear on the valve-stem and to receive motion from said lever, and the lever and dog constructed to be adjustable relatively to each other, so that a given vibration of the lever can be made to impart more or less movement to the dog, whereby the duration of the wash can be varied.

8. In a water-closet, the combination, with a self-closing flushing-valve in the supply-pipe, and with the lifting handle and rod, of an operating-lever arranged to be vibrated by the lifting of the handle, and having its shorter arm constructed when thus vibrated to stand at an incline, a pivoted dog arranged to be depressed by said shorter arm and to transmit the motion thereof to the valve-stem, and the lever and dog constructed to be adjustable relatively to each other

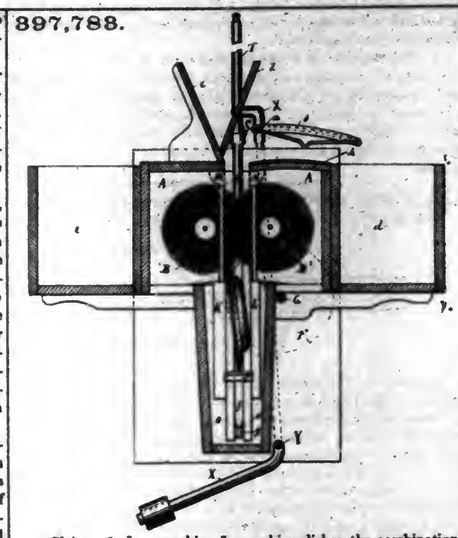
to bring a higher or lower point on the inclined face of said arm into engagement with the dog, and thereby to impart less or more movement to the valve-stem.

9. In a water-closet, the combination, with a plunger-chamber and its cover and the lifting handle and rod, of a self-closing flushing-valve in the supply-pipe arranged with its stem entering said chamber, an operating-lever within said chamber arranged to be vibrated by the lifting of the handle, and a pivoted dog within said chamber arranged to be depressed by the vibration of said lever to transmit the motion thereof to the valve-stem.

10. In a water-closet, the combination, with the plunger-chamber, the plunger, and its lifting-rod, of a self-closing flushing-valve in the supply-pipe, a pivoted dog or lever arranged to rest against the stem of said valve and approximately perpendicular thereto, whereby the pressure imparted to the stem is always in the same direction, an operating-lever arranged with its long arm extending over the plunger to be tilted by the lifting thereof and its short arm arranged to move in the plane occupied by said dog, and when so tilted to encounter and displace said dog and thereby press in the valve-stem, and an adjustable fulcrum for said operating-lever, whereby the distance between its fulcrum and its point of contact with the dog may be adjusted, thereby correspondingly varying the extent to which the stem is pressed in, and consequently the duration of the flush.



11. The combination, with the plunger-chamber and the self-closing flushing-valve arranged with its stem entering the chamber, of an operating-lever within said chamber arranged, when vibrated, to press in said valve-stem, a fulcrum-support for said lever, and the cover of said chamber having a slot in which said fulcrum-support is adjustably fastened, whereby, by an adjustment of said support in said slot, the position of the lever may be altered and the length of the flush varied.

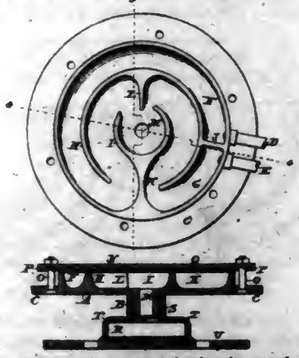


12. The combination, with the plunger-chamber having a laterally-projecting pocket and the self-closing flushing-valve attached thereto with its stem entering said pocket, of an operating-lever arranged within the chamber and a pivoted dog bearing on the valve-stem and arranged to transmit the movement of the lever thereto and constructed of U shape, whereby the operating-lever is admitted between its legs.

13. In a valve-flushed water closet, the combination with the self-closing flushing-valve and its operating-lever, of a pivoted dog bearing on the stem of the valve and arranged to transmit the movement of the lever thereto, constructed of U shape, with pivotal lugs projecting in opposite directions from its legs, and the standard for said dog having perpendicular arms perforated for the reception of said lugs.

14. The combination of the plunger-chamber constructed with a lateral pocket, the self-closing flushing-valve attached to said pocket with its stem projecting into the same, the operating-lever within the chamber having its shorter arm arranged, when vibrated, to transmit motion to said stem, the standard to which said lever is fulcrumed, the cover of the plunger-chamber having a longitudinal slot for the connection of said standard, and a screw accessible from the upper side of the cover for fastening said standard to the cover, whereby, by the adjustment of said standard in said slot, the position of the lever may be altered and the flush varied by an exterior manipulation of the parts.

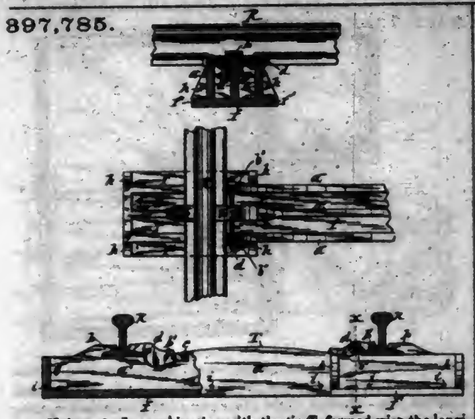
397,788. MACHINE FOR WASHING DISHES, &c. GEORGE W. R. CARR, Wingfield, County of Wilts, England. Filed Apr. 21, 1888. Serial No. 271,449. (No model.) Patented in England June 17, 1887, No. 8,730, and in France May 9, 1888, No. 190,509.



Claim.—1. In a machine for washing dishes, the combination of a box, rotary brushes supported therein, guides in said box, a dish-frame movable in said guide, and means for reciprocating said frame.

2. In a machine for washing plates, dishes, or similar articles, the combination of fixed guides, such as K L, rotating brushes, such as B B', mounted in a washing trough or receptacle, reciprocating frame, such as O, fixed guide, such as *c*, and traveling plate, such as Z, substantially as and for the purposes described.

397,784. HYDROCARBON-BURNER. JOSEPH DARBY, Springfield, Ohio, assignor of one-fourth to Elijah F. Darby, same place. Filed Feb. 25, 1888. Serial No. 265,282. (No model.)



Claim.—1. The circular retort A, having the cap-plate N and the upright curved flange H, with its ends separated, flange K, extending from the wall of the retort inward between the ends of the flange H, a central discharge-outlet, a web, J, joining the wall of the retort with the flange H, and inlets D and E on opposite sides of the web J.

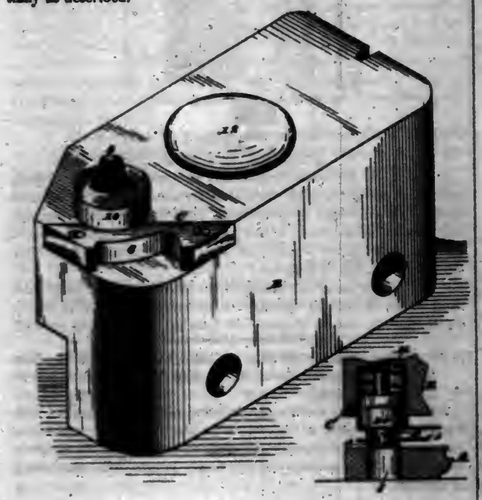
2. In a retort having the circular wall, an inner ring-like flange, H, having its ends separated, a ring-like wall, I, within but separated from the flange H, and having its ends separated, webs K and L, extending, respectively, from the retort-wall and flange H inwardly between the open ends of the ring-like walls or flanges H and I, a central discharge-outlet within the space inclosed by the wall I, a web, J, connecting the wall of the retort with the flange H to form passages F and G, inlets D E on opposite sides of said web, a cap-plate, and a burner.

3. The retort herein described, comprising body A, concentric walls H I, webs J and K, connecting, respectively, the walls H and I with the main body A, a web, L, projecting from the inner face of wall H inward between the separated ends of the curved wall J, a central discharge-outlet, M, cap N, and a burner secured to the under face of the retort, all substantially as shown.

397,785. RAILROAD-TIE. JOHN M. DAVIS, Marathon, N. Y. Filed Dec. 22, 1887. Serial No. 258,761. (No model.)

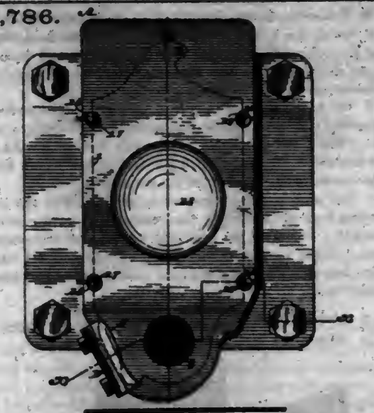
397,785.

Claim.—1. In combination with the tie T, formed with the longitudinal ribs *a a a'*, the jaws *b b*, formed integral with the central rib, *a'*, at one side of the rails, the jaws *b' b'*, detachably connected to and riding on the central rib at the opposite side of the rails and provided with the downwardly-extending flanges *c'* at opposite sides of the rib, the bolts *d d*, passing transversely through said flanges and ribs, and the shoulders *e e* on the central rib at the heels of the jaws *b' b'*, and shoulders *b''* upon ribs *a*, substantially as described and shown.



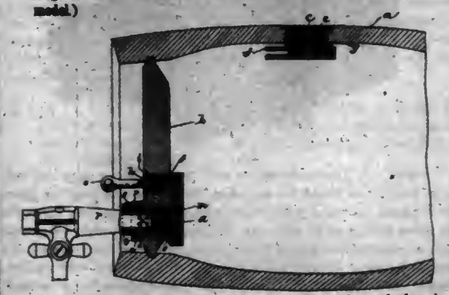
2. The tie T, composed of the base-plate *f*, formed with the widened end portions, *f' f'*, longitudinal side ribs, *a a*, rising from the base-plate, transverse ribs *g g* between the ribs *a a*, and braces *h h* on the end portions *f' f'* outside of the longitudinal ribs, all rigidly united, substantially as described and shown.

3. The improved tie T, composed of the base-plate *f*, formed with the widened end portions, *f' f'*, longitudinal side ribs, *a a*, and central rib, *a'*, rising from said base-plate, transverse ribs *g g*, uniting the longitudinal ribs and braces *h h* on the end portions, *f' f'*, outside of the ribs *a a*, all formed in one piece, the jaw *b*, rigidly secured to the rib *a'* at one side of the rail, the jaw *b'*, riding on said rib at the opposite side of the rail and having downwardly-extending flanges *c c* embracing said rib, the bolt *d*, passing transversely through said flanges and rib, and the shoulders *e e* on the rib *a'* at the heel of the jaw *b'*, substantially as described and shown.



397,786. DIE FOR THE MANUFACTURE OF LIDS FOR JOURNAL-BOXES. NATHAN H. DAVIS, Philadelphia, Pa. Filed Dec. 10, 1888. Serial No. 293,155. (No model.)

Claim.—1. Dies provided, respectively, with the shoulders C D, having the working-faces 6 and 7, for forming the lip of the lid, said parts being combined as described.



2. Dies provided, respectively, with the opening 8 and punch 9, for forming the flanged opening of the lid, and the wiper 10, for stripping the plate from said punch, said parts being combined substantially as described.

397,786.

397,787. DEVICE FOR OPENING AND CLOSING THE APERTURES OF KEGS, &c. WILLIAM DUNCAN, East Somerville, Mass. Filed Aug. 13, 1888. Renewed Dec. 11, 1888. Serial No. 293,327. (No model.)

Claim.—A keg or cask having an aperture formed therein, a bushing for said aperture, a plate on the interior of the cask provided with a neck extending into said aperture and connected with said bushing, an aperture formed in said cask to one side of said first-mentioned aperture, a gate pivoted in said plate and having its pivot extending into said second-mentioned aperture, whereby the gate may be operated, said flanged bushing being constructed to extend out from the outer surface of the keg or cask and provided exteriorly with a screw-thread, and a faucet provided with an internally screw-threaded rim, *p*, constructed to be screwed upon said exteriorly screw-threaded bushing, all constructed, combined, and arranged substantially as and for the purposes hereinbefore set forth.

397,788. MEASURING MILK-CAN. RICHARD RAGAN, Syracuse, N. Y. Filed May 21, 1888. Serial No. 274,544. (No model.)

Claim.—1. The combination of the can A, provided with measuring-receptacles depending below the bottom of the can, a valve mechanism, substantially as described, operated from the top of the can to control the flow of the milk from the can into the receptacles and from the receptacles, and a detachable cap for inclosing the measuring-receptacles, substantially as and for the purpose set forth.

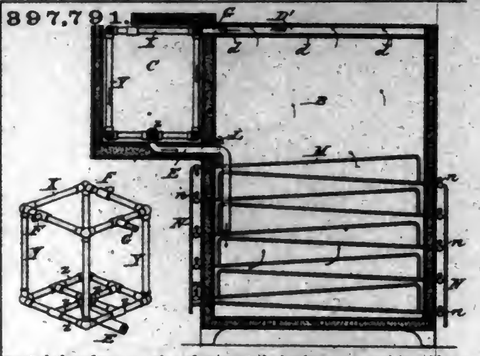
2. The can A, having rim A' and pins *m*, in combination with the cap C, having rim *o*, slots *n n*, and steps G, and the measuring-receptacles F, having valves for controlling the flow of milk from the can into the receptacles and from the receptacles from the top of the can, all, substantially as and for the purpose set forth.

3. The combination of the can A, handle H, rings *a*, having stems *b*, extending through holes *a'* in the handle H, spiral springs *s*, mounted on the stems *b*, valve-stems *c*, provided with valves *f g* in the measuring-receptacle F, the stem *c*, having ends *d* stepped in the discharge-nozzles *e*, substantially as and for the purpose set forth.

4. The combination of the can A, provided with the thread *r*, depending from the bottom B', the receptacle F, having corresponding thread, *t*, valves *f g*, the combined air-tube and valve-stem *c*, the operating-ring *a*, located in convenient proximity to the handle H, and the detachable inclosing-cap C, all constructed and arranged substantially as and for the purpose set forth.

397,789. END-GATE FOR WAGONS. SAMUEL T. BLAIR, Asterin, Ill. Filed Nov. 3, 1888. Serial No. 290,207. (No model.)

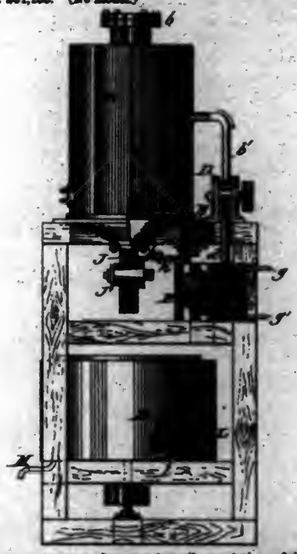
Claim.—1. The combination, with the sides of a wagon and end-gates therefor, of hinges for mounting the gates, comprising the plates for the sides, provided with projecting perforated lugs, top plates for the gates having perforated ends and provided near their other ends with downturned flanges adapted to rest and be secured against the face of the gates, bottom plates for the gates, provided with perforations in one end and having their other ends upturned and beveled, and a rod or bolt passing through the lugs and perforations in the top and bottom plates, substantially as set forth.



2. The combination, with a wagon provided upon opposite sides with vertically-disposed parallel cleats forming grooves and with oppositely-disposed vertical plates F F, having top and bottom lugs, of an extension-board provided with lugs bearing in said grooves and removable therefrom, and with lugs adapted to engage staples upon the rear cleats, and end-gates provided with top and bottom plates, G H, the outer ends of which project between the lugs of the plate F, said plates F G H, in connection with the bolts I, forming hinges, corresponding inclined plates secured to the inner faces of the gates at their lower edges and provided with lugs adapted to engage perforations in the extension-board, and plates K K', respectively secured to the gates, the former overlapping the adjoining gate, said gates being adapted to be locked against the extension-board, all arranged and adapted to operate substantially as and for the purpose set forth.

397,790. ELECTRO-MAGNETIC ATTACHMENT FOR EYE-GLASSES. FREDERICK FEAR, New York, N.Y. Filed May 1, 1888. Serial No. 272,567. (No model.)

Claim.—The combination, with the metallic frame of eyeglasses or spectacles, of the springy metallic nose-guards having their lower ends secured to and insulated from the frame and their upper ends free therefrom, each spring of said nose-guards having an insulated electrical conductor wound thereon and electrically connected therewith, and the metallic plates, one electro-positive to the other and electrically connected to their respective nose-guards, substantially as shown and described.

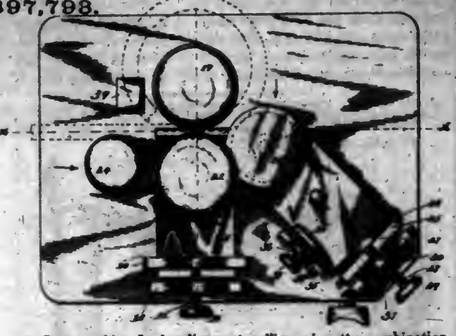


397,791. REFRIGERATOR. WALTER T. FORBES, Atlanta, Ga. Filed May 16, 1888. Serial No. 274,114. (No model.)

Claim.—1. The combination, in a refrigerator, of a provision-chamber provided with flues in its ceiling communicating through a series of perforations with the interior of the chamber, of an ice-receptacle attached to the upper portion of said chamber, but completely separated therefrom, a series of connected air-pipes arranged in said receptacle and communicating at the upper part thereof with said flues, a curved pipe connected to the lower part of said series and opening into the provision-chamber near the bottom thereof, and a tortuous drip-pipe leading from the ice-receptacle through the provision-chamber.

2. In a refrigerator to drain the ice-chamber and utilize the refrigerating properties of the water so drained from said ice-chamber, the inclined pipes M, connected to the ice-chamber, each pipe being bent downwardly at its higher end and connected to the lower end of the pipe next below, and the stop-cocks *n* on the outside of the chamber and connected with the lower ends of the pipes M, substantially as shown and described, and for the purpose specified.

397,792. PROCESS OF EXTRACTING OIL. WALTER T. FORBES, Atlanta, Ga., and GEORGE LEDER, Demopolis, Ala. Filed July 26, 1888. Serial No. 281,155. (No model.)



Claim.—1. A process of extracting oil, consisting of the following operations, namely: heating the oil-bearing material in oil of the same kind as that contained in the material, constantly circulating through said material from bottom to the top, the point of disintegration of the integument of the oil-cells, and afterward separating the oil from the refuse material by filtration.

2. In a process of extracting oil, the disintegration of the integument of the oil-cells by heating the oil-bearing material in an upwardly-flowing current of heated oil from the same kind of material.

397,793. MACHINE FOR BENDING AND COILING PIPE. EMMET R. FOWLER, New Haven, Conn. Filed June 20, 1888. Serial No. 277,269. (No model.)

Claim.—1. In a machine for bending and coiling pipe, the combination, with a grooved feed-roll, of a feed-roll having a groove of greater depth and a bending and shaping roll having its periphery extending into the periphery of said deeply-grooved roll, substantially as specified.

397,793.

2. In a machine for bending and coiling pipe, the combination, with a grooved feed-roll, of a feed-roll having a groove of greater depth and an adjustably-arranged bending and shaping roll having its periphery extending into the periphery of said deeply-grooved feed-roll, substantially as specified.

3. In a machine for bending and coiling pipe, the combination, with a pair of feed-rollers, of a bending-roller which projects into the space between said feed-rollers to a point within the periphery of one of them, and a slide which forms a bearing for said roller and is provided with a feed-screw for adjusting it toward and from said feed-rollers, substantially as described.

4. In a machine for bending and coiling pipe, the combination, with a pair of feed-rollers, of a slide provided with a screw for adjusting it toward and from the space between said feed-rollers, a plate or frame pivoted upon said slide, a screw for tilting or laterally adjusting said pivoted plate or frame, and a bending-roller which is journaled upon the inner end of said plate or frame, and, together with one of said feed-rollers, forces the pipe to follow the contour of the opposite feed-roller for a portion of its periphery, substantially as described.

5. In a machine for bending and coiling pipe, the combination of a feed-roller, an opposite feed-roller formed with a deep groove in its periphery, and a bending-roller which is journaled to project with its edge into the deep groove of said feed-roller, and, together with said roller, to force the pipe to follow the contour of said other feed-roller for a portion of its periphery, substantially as described.

6. In a machine for bending and coiling pipe, the combination of a feed-roller formed with a circumferential groove, a feed-roller formed with a circumferential groove and a deeper groove in the bottom of said groove, and a narrow bending-roller which is journaled to project into said deeper groove and formed with a circumferential groove of the same diameter as the grooves in said feed-rollers, and which, together with said deeply-grooved roller, forces the pipe to follow the contour of the opposite feed-roller for a portion of its periphery, substantially as described.

7. In a machine for bending and coiling pipe, the combination of a circumferentially-grooved feed-roller, an opposite feed-roller formed with a circumferential groove and with a deep groove in the bottom of said circumferential groove, a circumferentially-grooved bending-roller which is journaled to project into said deep groove, and, together with said deeply-grooved feed-roller, to force the pipe to follow the contour of the opposite feed-roller for a portion of its periphery, and means for adjusting said bending-roller to project more or less into said deeply-grooved roller and toward said opposite feed-roller, substantially as described.

8. In a machine for bending and coiling pipe, the combination of a circumferentially-grooved feed-roller, an opposite feed-roller formed with a corresponding circumferential groove and with a deep groove in the bottom of said groove, a slide which projects with its inner end toward the space between said feed-rollers, a screw for adjusting said slide toward or from said rollers, and a circumferentially-grooved bending-roller which is journaled at the inner end of said slide to project into the deep groove of said feed-roller, and, together with said feed-roller, to force the pipe to follow the contour of the opposite feed-roller for a portion of its periphery, substantially as described.

9. In a machine for bending and coiling pipe, the combination of the machine frame or table formed with the diagonal slot 25, the circumferentially-grooved feed-roller 19, the opposite feed-roller, 21, formed with the corresponding circumferential groove, 22, and with a deep groove, 23, in the bottom of said groove, the guide-roller 24, the oblique guide 30, the slide or block 26 in said diagonal slot, the screw 28, for adjusting said slide, the plate or block 32, pivoted upon said slide, the screw 36, for laterally adjusting said plate or block, and the narrow bending-roller 33, which is journaled at the inner end of said pivoted plate or block and projects into the groove 23 of said feed-roller 21, substantially as described.

397,794. MANUFACTURE OF WRENCHES. ALFONSO D. GATES, Cleveland, Ohio. Filed June 6, 1883. Serial No. 276,305. (No model.)

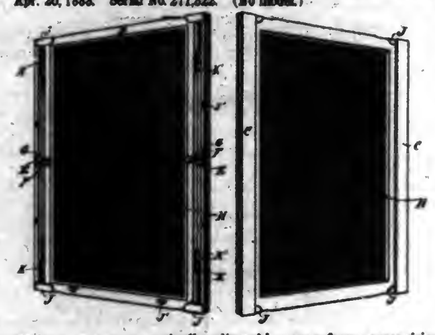
Claim.—1. In the manufacture of wrenches, the method herein described, consisting, first, in cutting the metal from which the parts are made into suitable blanks, then drop-forging or hammering the blanks into the shape of sections of the complete wrench, and then uniting the said sections, and thus finishing the wrench, substantially as set forth.

2. In the manufacture of wrenches, the method of making the same, consisting in drop-forging or hammering the blanks, forming each part of the wrench into sections having the form of longitudinal sections of the part when complete, the sections constituting the body of the wrench having cavities to form the inside chamber and projections to form the fixed jaw, substantially as set forth.

397,795. STOPPER FOR BUNGS, TAP-HOLES OF CASKS, &c. HENRY L. GATES, Milwaukee, Wis., assignor, by direct and mesne assignments, of one-half to Matthew H. Root, same place. Filed Sept. 3, 1887. Serial No. 248,678. (No model.)

Claim.—1. In a closure for bungs, tap-holes of casks, &c., the combination, with a bushing fixed in the bung or tap-opening, of a housing removably fitting therein and provided with a stop on its outer end to prevent it from being forced through the bushing into the cask, a stopper fitting in and attached to said housing, and a screw-cap for confining the housing in place, formed with an inwardly-extending peripheral flange, substantially as and for the purpose set forth.

2. The combination, in a closure for bungs, tap-holes of casks, &c., of a screw-threaded bushing, a housing loosely fitting therein and having a stop to prevent it from being forced into the cask, a stopper attached to the housing, an annular screw-cap for confining the housing in place, and a washer interposed between the screw-cap and housing, substantially as described.

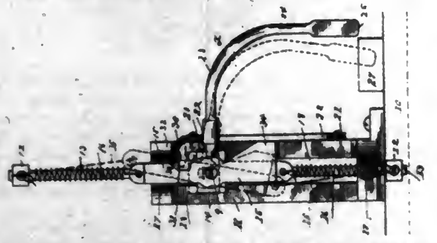


397,796. STORAGE-BATTERY PLATE. CHARLES D. P. GIBBON, New York, N. Y. Filed Oct. 18, 1888. Serial No. 288,423. (No model.)

Claim.—1. A storage-battery plate consisting of a sheet of metal having portions thereof raised above its surface in the form of loops.

2. A storage-battery plate consisting of a sheet of metal having loops raised from its surface and active material covering the surface of said plate and extending under the loops.

3. The combination of the plate A, having the rim B, the loops D, and the active material U, covering the plate and secured thereto by extending under said loops, as described.

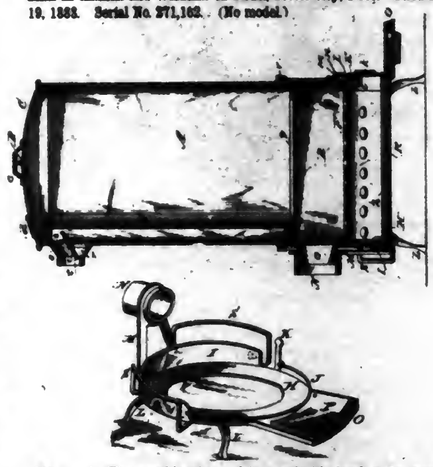


397,797. SCREEN-FRAME. HIRAM F. HALL, Toledo, Ohio. Filed Apr. 20, 1888. Serial No. 271,322. (No model.)

Claim.—1. An automatically-adjustable screen-frame comprising a rectangular screen-frame, side bars held in parallel relation therewith, and corner-pieces having winged portions secured at each side of the side bars, and which overlap and embrace the frame upon each side thereof, in combination with springs interposed between the screen-frame and side bars, as and for the purpose set forth.

2. As a new article of manufacture, a screen-frame consisting of a rectangular frame having a screen attached thereto, side bars having a portion parallel with the sides of the frame and an overlapping wing portion, springs interposed between the side bars and frame, guides secured to each end of the side bars, which cover the ends of the side bars and the corners of the frame, and a central stay and retaining-piece connected rigidly to the bars and movably to the frame, as and for the purpose set forth.

397,798. GUMMING DEVICE FOR ENVELOPE-MACHINES. ALONZO JOHNSON, Springfield, Mass., assignor, by mesne assignments, to the Springfield Envelope Company, of Massachusetts. Filed May 25, 1888. Serial No. 275,071. (No model.)



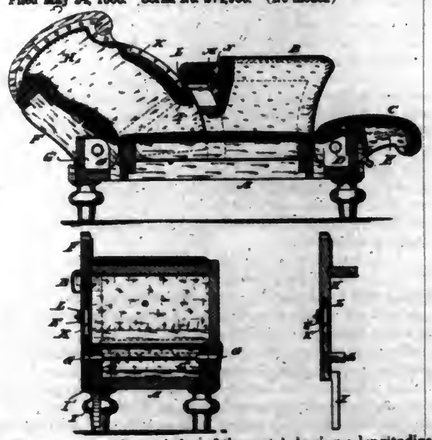
Claim.—1. The combination, with an upright, of a vertically-reciprocating slide-block moving thereon, a spring-sustained gummer pivotally hung on said slide-block, an abutment on said upright arranged in the line of travel of said gummer to secure on the upward movement of said gummer a swing or dipping motion thereof, and the gum-box, substantially as and for the purpose described.

2. The combination, with the rocker-shaft G and crank-arm 20 thereon and a supporting-upright, 11, of a slide-block, 14, vertically movable on said upright and linked to said crank-arm, a spring-sustained gummer, *x*, pivotally hung on said block 14, an abutment on said upright arranged in the line of travel of said gummer to secure on the upward movement of said gummer a swing or dipping motion thereof, and the gum-box, substantially as described, for the purpose set forth.

3. The combination, with the rocker-shaft G, the crank-arm 20 thereon, and the upright 11, provided with the slide-bearing lugs 17, and having the flange 21, provided with the vertical slot 22, and also provided at its upper end with the inward projection 30, of the slide-block 14, vertically movable on said upright and linked to said crank-arm, the slide-rod 13, centrally embraced by said block and guided in said lug-bearings 17 and having the end lugs, 12, the bar 15, intermediately pivoted to said slide-block and provided with the inclined edge 32, the springs 16 between the ends of said bar and said lugs 12, the gummer *x*, rigidly attached to said bar 15 near its pivoted point and projecting through said slot, and the gum-box, all arranged for operation substantially as and for the purpose described.

4. The combination, with the rocker-shaft G and crank-arm 20 thereon and a supporting-upright, 11, provided with the slide-bearing lugs 17 and having the vertically-slotted flange 21, of the slide-block 14, vertically movable on said upright and linked to said crank-arm, the slide-rod embraced by said block and guided in said lug-bearings 17 and having the end lugs, 12, the bar 15, intermediately pivoted to said slide-block and having the flange 34, the springs 16 between the ends of said bar and said lugs 12, the gummer rigidly attached to said bar 15 near its pivotal point, and the gum-box, all combined and arranged for operation substantially as and for the purpose described.

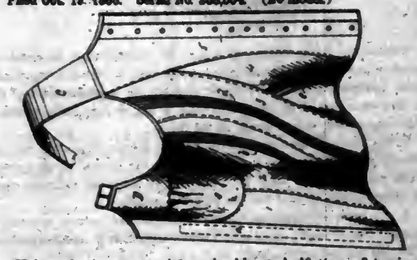
397,799. BUCKET FOR STORING AND BURNING TRASH. WILLIAM H. HARRIS and WILLIAM H. RYER, Steele City, Nebr. Filed Apr. 19, 1888. Serial No. 271,162. (No model.)



Claim.—1. The combination, with a suitable bucket for storing and burning trash, of a base for supporting said bucket, consisting of the skeleton plate supported upon legs and provided with a pivoted bail and lever for fastening the bucket in position, substantially as and for the purpose specified.

2. The combination, with a bucket for storing and burning trash provided with an opening and collar, *o*, of the supporting-base consisting of the skeleton plate H, flange I, bracket M, and pipe-section N, substantially as and for the purpose described.

3. The combination, with the detachable bucket-section A B, of the base for supporting the bucket, consisting of the skeleton plate H, supported upon legs, and the circular plate R, resting over the opening in the skeleton plate, and means for holding the bucket stationary on the base, substantially as and for the purpose set forth.



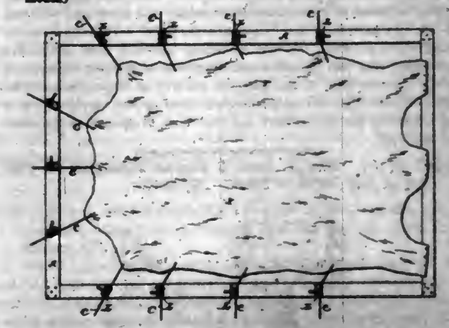
397,800. SOFA. FRIEDRICH W. HERINGHAUSEN, New York, N.Y. Filed May 24, 1888. Serial No. 274,980. (No model.)

Claim.—1. A sofa consisting of the seat A, having a longitudinal slot or recess, I', at its head, a sofa-back, B, provided with a segmental cavity in its edge nearest the sofa-head, and an adjustable pivoted head, F, having a rigid back-piece, H, provided at its base with an extension, I, offset at the front of said rigid back-piece to be substantially flush with the upholstering thereupon depending downward through the longitudinal slot or recess in the sofa-seat, and having a segmental projecting edge fitting the segmental cavity in the adjacent edge of the sofa-back, substantially as described.

2. A sofa consisting of the seat A, having a sofa-back, B, and a longitudinal slot or recess, I', near its head, and a pivoted head, F, having a rigid back-piece, H, and an extension, I, offset in front of said rigid back-piece to be substantially flush with the upholstering thereupon and depending downward through the longitudinal slot or recess in the sofa-seat when the pivoted head is swung back, substantially as described.

397,801. CORSET-WAIST. CHARLES W. HIGBY, Jackson, Mich. Filed Oct. 19, 1888. Serial No. 288,554. (No model.)

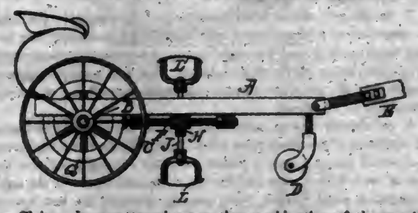
Claim.—1. A corset-waist each side or half thereof having in combination a front section extending from the top to the bottom of the waist, provided with fastenings, the oblong yoke D, attached at one end to the front section and extending across the upper side of the breast-piece, the sections 1 and 2, the former having its lateral edges substantially straight and parallel to each other and the concave upper edge, and the latter having the concave edge extending from a point near the middle of one side of the section to its top and the scroll-shaped edge at the other side, and the breast-piece *c*, with the convex lower edge, the breast-piece being inserted between the concave edges of the sections 1 and 2 and the yoke and stitched to said sections and yoke, substantially as and for the purpose described.



2. A corset-waist each side or half thereof having in combination a front section provided with fastenings, the oblong yoke D, extending across the upper side of the breast-piece, sections 1, 2, 3, 4, and 5, and the breast-piece *c*, with the convex lower edge, sections 3 and 5, extending from the top to the bottom of the waist, and sections 1 and 4 from the bottom part way to the top of the waist, section 1 having the concave upper edge and section 2 the concave edge extending from a point near the middle of one side of the section to its top, the breast-piece being inserted between the concave edges of the sections 1 and 2 and the yoke and stitched to said sections and yoke, substantially as and for the purpose described.

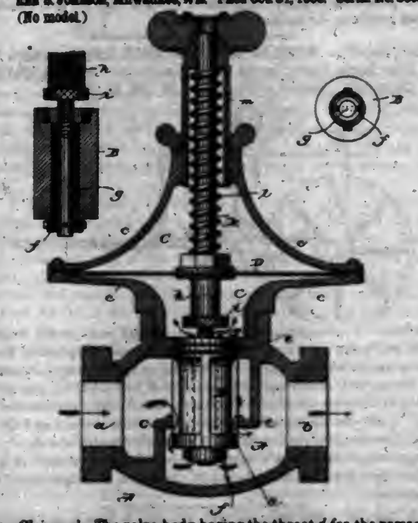
397,802. PAWL-AND-RATCHET CLUTCH MECHANISM. JOSEPH W. HOSSON, Bergen Point, N. J. Filed Feb. 7, 1888. Serial No. 263,204. (No model.)

Claim.—The combination, with the arbor *b*, having ratchet-teeth the engaging-faces of which lie parallel with said arbor, of the wheel *c*, turning on said arbor and having the recess 3, and the pawl sliding in said recess parallel with the arbor and engaging with said ratchet-teeth, substantially as described.



397,803. PROCESS OF JAPANNING LEATHER. SAMUEL C HOWELL, Newark, N. J. Filed July 3, 1888. Serial No. 278,891. (No model.)

Claim.—1. The process herein described of japanning leather, consisting of attaching to a stretching-frame a hide, stretching the same, applying a dressing or coating to the hide, stretching the same and drying it, applying another dressing or coating, and stretching the hide and drying the same, substantially as specified.



2. The process herein described of japanning leather, consisting of attaching to a stretching-frame a hide, stretching the same, applying a dressing or coating to the hide, stretching the same, and drying it, substantially as specified.

397,804. COTTON-CHOPPER. WILLIAM H. HOWELL, New York, N. Y. Filed June 16, 1888. Serial No. 277,263. (No model.)

Claim.—In a cotton-chopper, the combination of the revolving arm J, the forked heads K, and the curved knife L, secured diagonally to said forked head and having its ends projecting beyond the arms of the forked head and beveled, so as to form additional cutting-edges, as and for the purpose specified.

397,805. AUTOMATIC PRESSURE-REGULATING VALVE. WARREN S. JOHNSON, Milwaukee, Wis. Filed Oct. 31, 1888. Serial No. 289,667. (No model.)

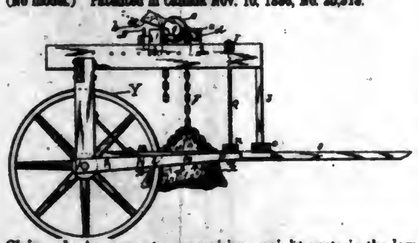
Claim.—1. The valve-body having the throat *d* for the passage of the fluid therethrough, and also an independent throat, *e*, leading from the inlet side directly to the outside of the body, the diaphragm-chamber communicating with the throat *e* on the outside of the body, the diaphragm, the valve having its upper end adapted to constantly close the throat *e* and its lower end adapted to open and close throat *d*, and having also a passage through its interior from the delivery side of the valve-body to the diaphragm-chamber, and a stem connecting the valve and diaphragm, said parts combined for joint operation, as described and shown.

2. The body, the balanced tubular valve applied, as described and shown, the diaphragm-chamber, and the diaphragm, in combination with the adjustable screw-connection to change the relations of the diaphragm and valve, and the independent adjustable spring to depress the diaphragm.

397,806. BATTERY FOR ELECTRIC BELTS. WILLIAM G. JOHNSON, London, England. Filed Oct. 9, 1888. Serial No. 287,634. (No model.) Patented in England Mar. 14, 1888, No. 3,979.

Claim.—1. An electric belt or band consisting of the folded negative elements, each having an eye or loop and inclosing a positive ele-

ment having a projecting lug, and the spiral wires connecting the lugs with the eyes or loops and serving to articulate the elements, to conduct the electric current and permit the pairs of elements to move to and fro and assume various positions, substantially as described.



2. An electric belt or band consisting of the folded negative elements strung on flexible cords and each inclosing a positive element, and the spiral wires articulating the negative elements to the adjacent positive elements, and serving to conduct the electric current and permit the pairs of elements to move to and fro and assume various positions, substantially as described.

3. An electric belt or band consisting of the negative elements, each composed of a plate folded upon itself along its median line and strung upon cords D, and the negative elements arranged respectively between the leaves of the folded plates, with the positive elements articulated to the adjacent negative elements throughout the series, substantially as described.

4. An electric belt or band consisting of the negative elements, each composed of a slotted plate folded upon itself to form two leaves, one of which has end eyes, a positive element arranged between the leaves of each folded plate and having a lug articulated to the adjacent negative plate, flexible cords passing through the end eyes of the negative elements, and terminals connected respectively with the end negative and positive elements and secured to the cords, substantially as described.

5. An electric belt or band composed of a series of negative elements, each having a positive element, and strung upon flexible cords and spiral wires connecting the positive elements with the adjacent negative elements throughout the series, and serving as conductors, and to permit the pairs of elements to move to and fro and assume various positions, substantially as described.

397,807. WHEELED STUMP OR STONE LIFTER. JOSEPH S. KEEP, Magog, Quebec, Canada. Filed June 6, 1888. Serial No. 276,179. (No model.) Patented in Canada Nov. 10, 1886, No. 26,313.

Claim.—1. An apparatus comprising upright posts, in the lower ends of which the axles *y* are mounted, a lower frame composed of the bars *l m n o*, to which the pole is connected, an upper frame mounted upon the posts K and J, and consisting of the bars *p* and *i i*, and the hoisting mechanism mounted on the bars *i*, substantially as described.

2. A wheeled stump and stone lifting apparatus comprising longitudinal bars mounted upon supporting-posts which carry the axles of the supporting-wheels, and a supporting-post, J, and straining-rod Q, mounted upon a frame connected to the axles and pole, substantially as described.

397,808. SEWING-MACHINE. CHARLES F. LITTLEJOHN, Bridgeport, Conn., assignor of one-half to R. B. Welch, Cambridge, Mass. Filed Mar. 20, 1886. Serial No. 196,098. (No model.)

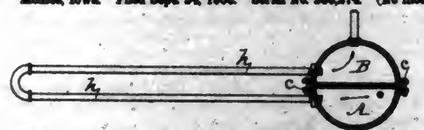
Claim.—1. In a sewing-machine, the combination, with the shuttle having a central cavity and a stud or pin projection therein, of the case *f*, secured in said cavity on said stud or pin, and the holder comprising the parallel arms *i i*, and the bar *j*, connecting the outer ends of said arms, the other ends of which are pivoted in apertures in the shuttle, substantially as shown and described, said bar being designed to bear against said case, as set forth.

2. In a sewing-machine, the combination, with the shuttle having the central cavity and two small slots or apertures and the case *f*, disposed in said cavity, of the holder comprising the parallel arms *i i*, having thickened ends pivoted in said slots or apertures, the bar *j*, connecting the outer ends of said arms and extending across said case *f*, and the springs secured to the inner side of said shuttle and having their ends bearing against the thickened ends of said arms, which project through said slots or apertures, substantially as shown and described.

397,809. DIVIDER-SHOE. CHARLES W. LOVE, Fairpoint, Ohio. Filed May 3, 1888. Serial No. 273,721. (No model.)

Claim.—1. As an improved article of manufacture, an outer divider-shoe having a detachable point, and a seat, G, for the finger-bar, narrow upwardly-projected lugs or ribs at the opposite sides of the seat, and provided at its rear end with a lug or lugs for supporting the divider-board, substantially as set forth.

2. An outer divider-shoe having a seat for the finger-bar, narrow upwardly-projected ribs or lugs, whereby by the partial cutting away of such ribs the shoe may be conveniently fitted to different-sized bars, substantially as and for the purpose specified.



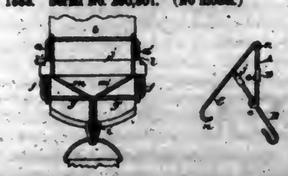
3. An outer divider-shoe having a seat, G, and narrow upwardly-projected ribs or lugs *g* on the said seat, stepped at *g'*, substantially as and for the purposes specified.

4. An outer divider-shoe having a lug or lugs at its rear end, said lugs having a plurality of bearing-faces against which the forward end of the divider-board may be secured, such faces being formed at different angles to the line of draft, substantially as described, whereby the divider-boards may be set at different angles relative to the shoe, substantially as set forth.

5. An outer divider-shoe having at its rear end vertical lugs K K', separated from each other, forming a bearing between them for the front portion or lug of the divider-board, the outer faces of lugs K K' and the inner faces or bearing between said lugs being formed at different angles to the line of draft or travel, substantially as set forth.

6. The improved outer divider-shoe herein described, consisting of the main body portion provided with a socket at its forward end, and having lugs K K', separate from each other, and heel or rest L at its rear end, and having its seat G formed with lugs *g g*, stepped at *g' g'*, and the detachable point having its stem fitted to the socket of the body portion, all substantially as and for the purposes specified.

397,810. FEED-WATER PURIFIER. FRED. V. MEHRING, Des Moines, Iowa. Filed Sept. 24, 1888. Serial No. 286,574. (No model.)

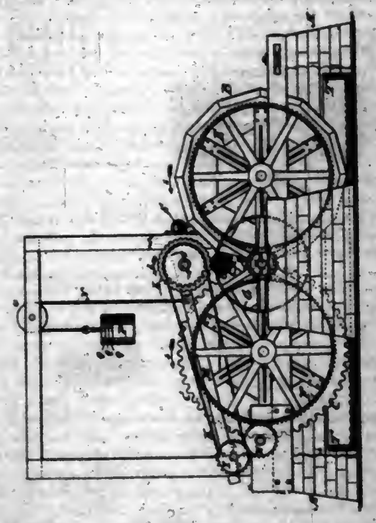


Claim.—1. A water feeder and purifier for steam-boilers, comprising a steam-tight vessel composed of two mating parts having coinciding perforated ears at their edges, integral coinciding partitions, and coinciding bearings for the ends of tubes, a series of bent tubes having their ends fastened in said bearings, a water-supply pipe having an automatic check-valve, and a branch or blow-off pipe having a stop-cock arranged and combined with a boiler to operate in the manner set forth, for the purposes stated.

2. The under part of a vessel, A, having perforated ears *c*, a partition, *d*, and bearings *g*, and the upper mating part, B, having coinciding ears *c*, partition *d*, bearings *g*, a recess, *k*, and a series of perforations, 1 2 3 4, and the tubes *h*, constructed and combined substantially as shown and described, for the purposes stated.

3. A water feeder and purifier composed of a steam-tight vessel made of two mating parts clamped together with bolts and provided with a partition, an induction-tube or supply-pipe connected with one of the apartments of the vessel and provided with an automatic check-valve, a series of tubes extending outward from one of the apartments and into the other apartment, one or more edection-ports on the opposite side of the partition relative to the induction-tube, and a branch tube having a stop-cock fixed to the supply-pipe at a point between the check-valve and the vessel, to operate in the manner set forth.

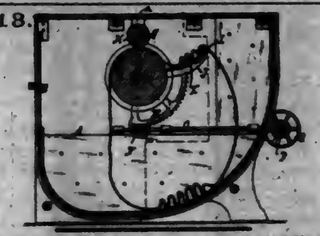
397,811. BUCKLE. HENRY R. MERRIKEN, Williamsport, Pa. Filed Nov. 14, 1888. Serial No. 290,807. (No model.)



397,811.

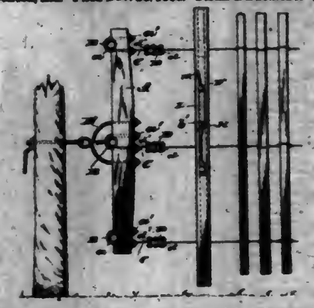
Claim.—As an improved article of manufacture, a buckle composed of the toothed bar and support A, the supporting-hook and pressure-plate B, pivoted thereto, and the locking-hook C, also pivoted to said friction or toothed bar support, substantially as and for the purposes mentioned.

397,812. FULLING APPARATUS. JOHN W. MILLER, Dolgeville, N. Y., assignor to Alfred Dolge, same place. Filed June 7, 1888. Serial No. 276,261. (No model.)



Claim.—1. In a fulling-machine, the combination of the lower rollers, B C, geared together, the gear-wheel I, driven by one of said rollers, the rising and falling frame M, pivoted at one end, the upper roller, L, journaled in the other end of the pivoted frame and suspended over and between the lower rollers, a cord or chain, K, operated by the shaft of said gear-wheel and driving the upper roll, a guide-pulley, O, and a weighted cord, N, passing over the pulley and connected with the pivoted frame to raise or lower the latter, substantially as described.

2. In a fulling-machide, the combination of the lower rollers, B C, having their shafts provided, respectively, with the gears E F, the gear D, interposed between and engaging both of said gears and having its shaft provided with a driving-pulley, G, the gear-wheel I, driven by the gear of one roller, the rising and falling frame M, pivoted at one end, the upper roller, L, journaled in the other end of the pivoted frame and suspended over and between the lower rollers, the connecting chain or cord K, the pulley O, and the weighted suspension-cord N, passing over the pulley and connected with the pivoted frame, substantially as described.



397,813. FULLING-MACHINE. JOHN W. MILLER, Dolgeville, N.Y., assignor to Alfred Dolge, same place. Filed Aug. 30, 1888. Serial No. 284,136. (No model.)

Claim.—In a fulling-machine, the combination, with the drum C and feed-roller G, of a movable plaiting-apron, and mechanism, substantially as described, for adjusting the position of the plaiting-apron according to the desired intensity of the fulling action to be produced upon the material passing through the apparatus.

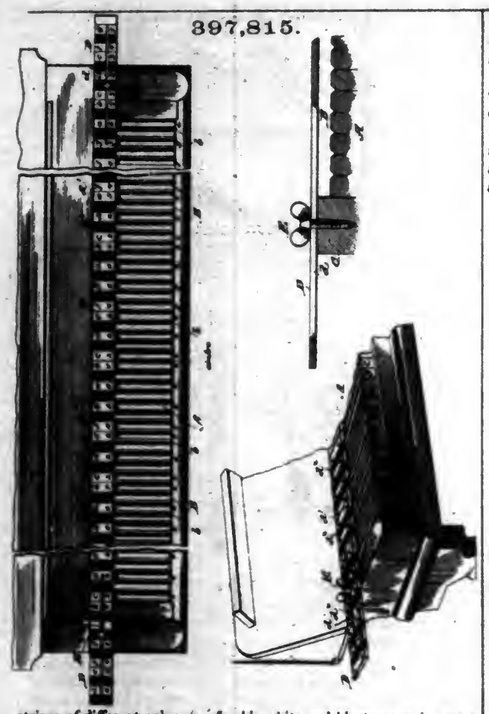
397,818.

397,814. FENCE-MACHINE. FRANK NICOLAI and MICHAEL NICOLAI, Benton, Ind. Filed Nov. 26, 1888. Serial No. 292,122. (No model.)

Claim.—1. In a machine for making picket fences, the combination of a bar, F, carrying brackets between which cog-wheels are supported, said bar having a slot through which an operating-handle passes, said handle being attached to a reciprocating bar having rack-teeth which engage with the cog-wheels, substantially as shown, whereby the reciprocating movement of the rack-bar is limited by the length of the slot, substantially as shown, and for the purpose set forth.

2. The combination, in a wire and-picket-fence machine, of a wire-twisting device, consisting of a bar, F, having a longitudinal slot, H, a spring latch-bar having catches adjacent to the upper and lower end of the slot, with which the handle-bar engages, brackets supporting cog-wheels attached to the bar F, and a reciprocating bar, I, carrying rack-bars K, and a handle having a flat shank which passes through the slot in the bar F, substantially as shown, and for the purpose set forth.

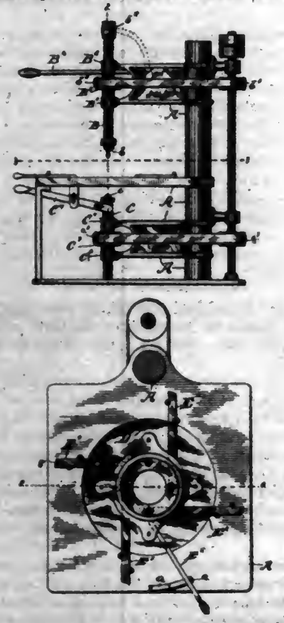
3. The combination, in a fence-machine, of a tension device consisting of a tension-bar, A, provided with semicircular recesses at its rear edge, tightener-bars B, bails *a*, embracing the bars B, eveners D, having pulleys *d* and *d'*, and a bail or loop, E, at the center of the tension-bar A, substantially as shown, and for the purpose set forth.



4. In a tension device for constructing wire fences, a tension-bar, A, provided on its rear face with semicircular recesses, tighteners B, bails *a*, passing through the tension-bar on each side of said tighteners B, and looped to hold in position the tightening-bars B, the wire or connection C, secured to the rods B on each side of the bar A, and an evener, D, secured to the loop of the wire C, the bars B being adapted to be turned by a suitable lever and held against rotation by frictional contact with the tension-bar by the bails *a*, substantially as and for the purpose set forth.

397,815. KEY-BOARD ATTACHMENT FOR PIANOS. ENOCH L. S. CROCKER, Waxahachie, Tex., assignor of two-thirds to David Monroe Neuman, same place. Filed Aug. 3, 1888. Serial No. 281,980. (No model.)

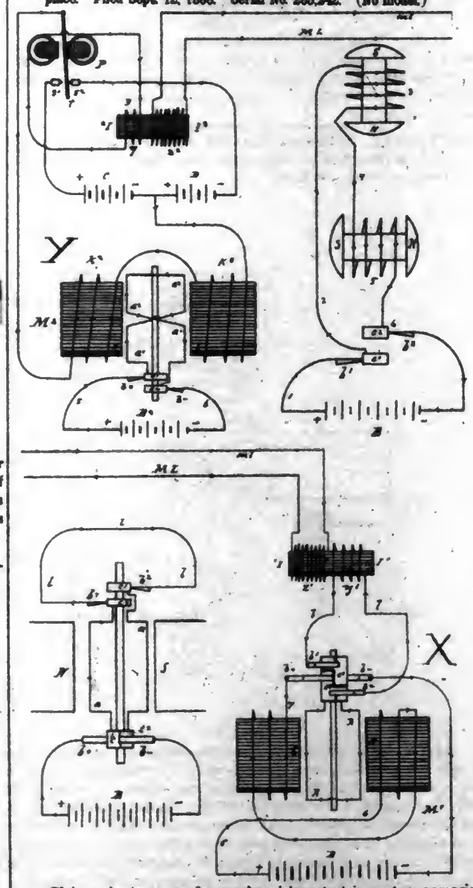
Claim.—1. The combination, with the key-board A, provided with a series of keys of uniform shape and size provided with numerals or letters on their faces, the upper ends thereof being in the same horizontal plane, of the movable plate D, arranged at the rear and above the key-board, said plate provided with stripes of different colors (preferably white and black) representing the chromatic scale, one of said stripes (white) provided with numerals or letters adapted to be brought in line with the numerals or letters on the keys, said stripes and keys being of equal width, substantially as and for the purpose described.



2. The combination, with the key-board A, provided with a series of keys of uniform shape and size, having numerals and letters placed upon the faces of said keys at intervals to indicate their position in the octaves, of the movable plate D, arranged at the rear and slightly above the key-board, said plate provided with elongated slots in its ends and thumb-screws, whereby said scale-plate may be adjusted upon the frame of the instrument, said plate provided with

397,815.

stripes of different colors (preferably white and black) upon its upper face, said stripes arranged to represent the chromatic scale, one set of said stripes (white) provided with numerals and figures, said stripes formed of a width equal to the keys B, all arranged substantially as and for the purposes described.



397,816. HUB-BORING MACHINE. DAVID M. PARRY, Indianapolis, Ind. Filed Apr. 21, 1888. Serial No. 271,408. (No model.)

Claim.—1. The combination, in a hub-boring machine, with the boring-tools and means for operating the same, of a clamp for centering and holding the wheel, consisting of a revoluble center having several arms tangentially secured thereto, the outer ends whereof are adapted to engage with the periphery of the wheel, an operating handle or lever, and means for securing it in operative position, substantially as set forth.

2. The combination, in a hub-boring machine, of the frame-work, the shaft for the boring-tool, bearings on said frame-work for said shaft, a pulley loosely mounted on said shaft between said bearings and held thereon by a spline, an operating-lever for moving said shaft, and the wheel-clamp consisting of the revoluble center having several arms adapted to engage with the wheel tangentially secured thereto, all substantially as set forth.

397,817. SYSTEM OF SYNCHRONIZING ELECTRIC MOTORS. FRANCIS J. PATTEN, New York, N. Y., assignor to J. M. Seymour, same place. Filed Sept. 12, 1888. Serial No. 285,242. (No model.)

Claim.—1. A system for synchronizing electric motors comprising two or more motors at different stations, a line-circuit connecting the stations, a transformer having one of its circuits connected to line, a current-changer for periodically changing said current on line, and a pole-changer at a station periodically actuated by the line-currents, said pole-changer reversing the current in one of the elements of a driven motor, the other element of such motor being influenced by a current of constant direction.

2. In a system for synchronizing electric motors, the combination of the line-circuit carrying a periodically-changing current, a series of motors at different stations along said line-circuit, and an induction-transformer controlled by the line-currents, the induced circuit of said transformer controlling one of the magnetic elements of a driven motor and producing periodical reversals in said element corresponding to the changes in the line-current, the other element of said motor being excited by a current of constant direction.

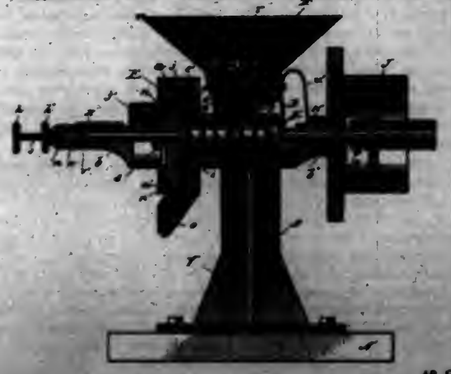
3. In a system for synchronizing electric motors, the combination of the line-circuit carrying a periodically-changing current, a series of motors at different stations along said line-circuit, an induction-transformer having its induced circuit connected to the line, and a pole-changer controlled by the induced current of said transformer, one of the magnetic elements of each driven motor having its current reversed by the pole-changer, the other element of said motor being excited by a current of constant direction.

4. In a system for synchronizing electric motors, the combination of a line-circuit connecting different stations, an induction-coil having its induced circuit connected to the line, and its inducing-current periodically varied by a current-changer, and a series of electric motors at different stations having the current exciting one magnetic element reversed at periods corresponding to the changes in the line-current and the other element excited by a current of constant direction.

5. In a system for synchronizing electric motors, the combination of a line-circuit connecting different stations, an induction-coil having its induced circuit connected to the line, and its inducing-current periodically varied by a current-changer, a pole-changer controlled by the induced currents, and a driven motor or motors, each having the current exciting one of its magnetic elements reversed by the pole-changer at periods corresponding to the changes in the line-current and the other element excited by a current of constant direction.

6. In a system for synchronizing electric motors, the combination of a line-circuit connecting different stations, an induction-coil having its induced circuit connected to the line and its inducing-current periodically varied by a current-changer, an induction transformer controlled by the line-current, a pole-changer operated by the induced currents of the transformer, and a driven motor or motors, each having the current exciting one of its magnetic elements reversed by the pole-changer at periods corresponding to the changes in the line-current and the other element excited by a current of constant direction.

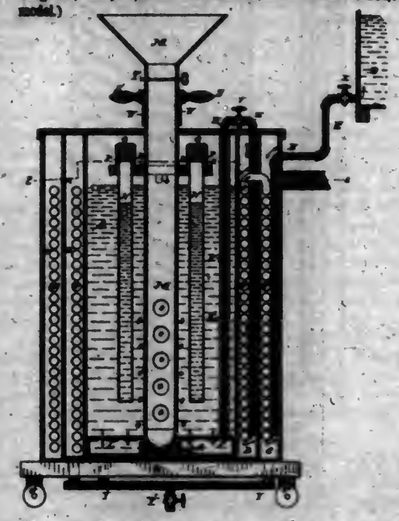
7. A direct-current electric motor, in which the armature is provided with a reversing-commutator, to the segments of which continuous insulated ring-contacts are secured, brushes bearing on said segments connected in the motor-circuit, and independent brushes bearing on said rings connected to an external shunt-circuit to said armature, said shunt-circuit forming the primary of an induction-coil, the secondary of which is connected to an independent circuit.



8. An induction-coil having its primary circuit connected in a shunt-circuit around the armature-circuit of an electric motor, the secondary thereof constituting an independent circuit whereby alternating or pulsatory currents are caused to traverse said independent circuit, having the same period or rate of change as the reversals of current in the said armature-circuit.

9. In a synchronizing device for electric motors at different stations, a main-line circuit connected to the high-resistance circuit of induction-coils at the stations, the low-resistance circuit of one such coil being connected to the motor, the low-resistance circuit of the other to the coils of a polarized relay at its station, whereby said relay is caused to vibrate in unison with the reversals of current in the armature-circuit of said distant motor.

10. In a synchronizing system, an electric motor at one station provided with an ordinary two-pole armature and field-magnet, means for transmitting periodic pulsations in a line-circuit to a distant station, said pulsations corresponding in time to the half-revolutions of said motor-armature, a current-changer at said distant station controlled by said pulsations for reversing the field-magnetism of a motor at said distant station, a four-pole armature in said motor with two coils connected both to the same insulated continuous ring-contacts, and a source of direct current in circuit with said ring-contacts.

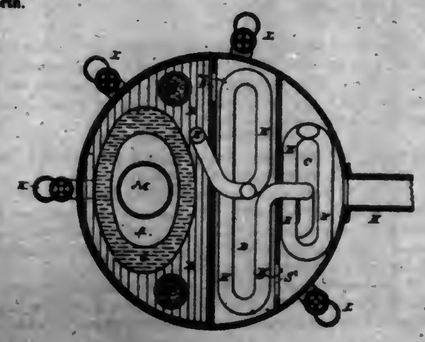


11. In a synchronizing system for electric motors, a controlling or governing motor, and a series of governed motors at distant stations having four-pole armatures excited by a continuous current of one direction and revolving in a single magnetic field the polarity of which is periodically reversed by changes in the line-circuit produced by the controlling-motor.

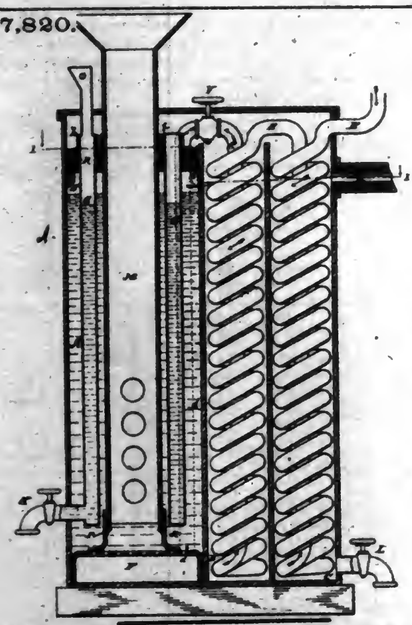
397,818. GRINDING-MILL. GEORGE RAYMOND and ALBERT RAYMOND, Chicago, Ill., assignors to the Appleton Manufacturing Company, Appleton, Wis. Filed June 11, 1887. Serial No. 241,002. (No model.)

Claim.—In a grinding-mill, the combination, with a suitably-channeled superstructure, A, of a removable hollow cylinder, B', one end of which is flanged and thereby adapted to support the stationary grinding-disk, said cylinder being also provided with an upper feed-opening, substantially as set forth.

397,819. MACHINE FOR MANUFACTURING ICE. JAMES C. ROSS, Perth Amboy, N. J., assignor, by mesne assignments, to John T. Ferguson, Memphis, Tenn. Filed June 9, 1888. Serial No. 204,573. (No model.)

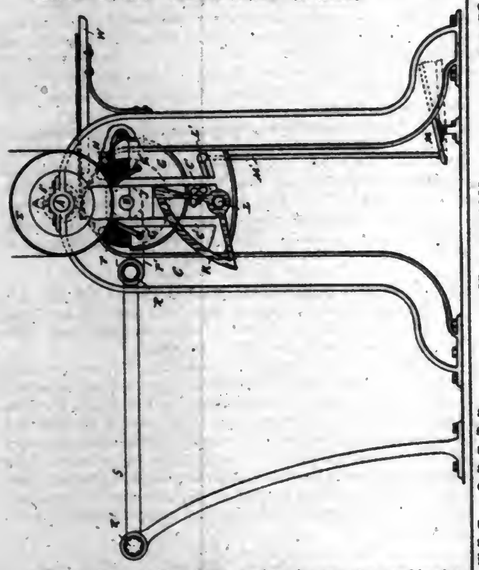


Claim.—1. In an ice-machine, the combination of the freezing-vessel A, provided with the can-holder R, resting upon supports *b* and adapted to be oscillated, the salt-feeder secured to the can-holder and provided with handles S, the block M', for supporting the lower end of the can-holder in its socket, so that the oscillation of the can-holder and cans can be effected, substantially as set forth.



2. In an ice-machine, the combination of a central freezing-vessel, A, provided with a can-holder, R, resting upon supports *b* and adapted to be oscillated, the salt-feeder secured to the can-holder and provided with handles S and block M' and surrounded by vessels B C, containing coils F F', the latter being continuations of the water-supply pipe and terminating in the pipe K at the bottom of the freezing-vessel A, with the overflow-outlets *p*, *n*, and *m*, substantially as set forth.

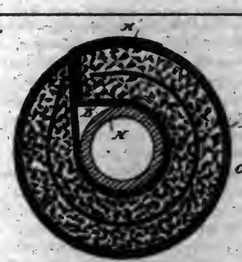
397,820. MACHINE FOR MANUFACTURING ICE AND FOR COOLING PURPOSES. JAMES C. ROSS, Perth Amboy, N. J., assignor, by mesne assignments, to John T. Ferguson, Memphis, Tenn. Filed June 9, 1888. Serial No. 204,575. (No model.)



Claim.—An ice-making device consisting of a vessel having an outlet-pipe near the top, a central vertical partition therein apertured near its top, a plate or can-holder upon one side of said partition, carrying a salt-feeder, a water-receptacle surrounding the same and the freezing-cans, the connected pipe-coils for the incoming water upon the other side of said partition, extending from top to bottom of the vessel, and delivering through a perforated plate at the bottom of the salt-feeder, and a vertical partition having an overflow-aperture near its top and separating said coils from each other, substantially as set forth.

397,820.

397,821. MACHINE FOR SMOOTHING LEATHER. FERDINAND STORCH, Chicago, Ill., assignor of one-half to John Moss, same place. Filed Nov. 30, 1888. Serial No. 291,341. (No model.)



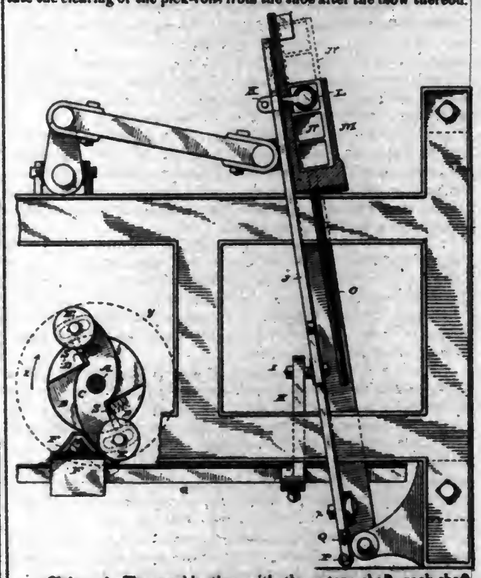
Claim.—In a machine for smoothing leather, the combination, with the threaded roller A', of the rubber roller F, the vertically-adjustable boxes J, the rock-shaft L, the cams K on the same, the cranks L' on said shaft C, the connecting-rods M', and the treadle M, substantially as herein shown and described.

397,822. COVERING. WILLIAM M. SOHR, New York, N. Y. Filed Apr. 17, 1888. Serial No. 270,936. (No model.)

Claim.—1. A pipe-covering comprising an inner and outer wall between which is placed a filling, said inner and outer walls each being made of a fire-proof material, a water-proof material, and gauze between said fire-proof material and water-proof material, substantially as shown and described.

2. In a covering, an inner and an outer wall, each made of a fire-proof material, a water-proof material, and a connecting-gauze between the two, in combination with a filling placed between the

397,822.

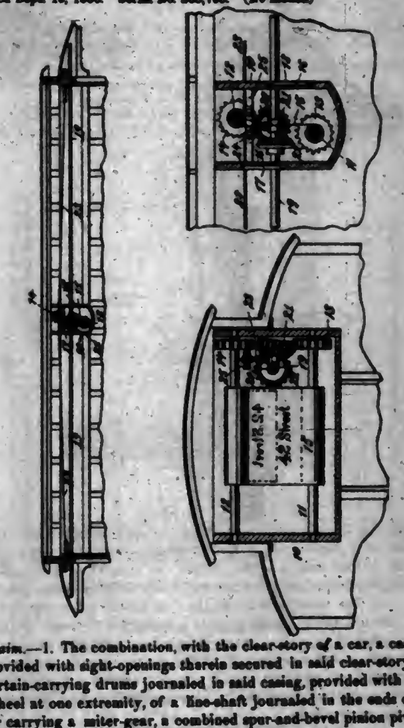


two said walls and a fabric secured on the outer wall and provided with an overlapping end, substantially as shown and described.

3. In a covering, an inner wall and an outer wall, each made of a fire-proof material, a water-proof material, and a gauze between the two, in combination with a filling placed between the said two walls and a stiffener placed in the said filling, substantially as shown and described.

397,823. SHUTTLE-MOTION FOR LOOMS. WILLIAM TUCKER, East Brookfield, Mass. Filed Aug. 1, 1888. Serial No. 281,678. (No model.)

Brief.—The yielding connections between the arms and disk permit of a "lost-motion" movement of the picker-stick and facilitate the clearing of the pick-rolls from the shoe after the blow thereon.



Claim.—1. The combination, with the rotary shaft, rock-shaft, and shoe, of a face-plate fast on said rotary shaft and provided with spring-abutments, an arm-piece carrying a pick-roll or pick-rolls and movable angularly on said shaft, and an interposed spring or springs acting in the direction of the revolution of said roll or rolls at each end of the loom, substantially as hereinbefore specified.

2. The combination, with the rotary shaft A, the rock-shaft G, a shoe, F, and a pick-roll or pick-rolls, E, of a face-plate fast on said shaft and having diagonally-opposite bosses provided with chambers in their driving-surfaces to form spring-abutments, a pair of spiral springs in said chambers, an arm-piece provided with roll-studs for said rolls and movable angularly upon said shaft as a fulcrum, means for adjusting said roll-studs, and means for preventing the longitudinal displacement of said arm-piece and for limiting its angular movement, substantially as hereinbefore specified.

3. In combination with a picker, a pick-shoe, means for re-elevating said shoe, its rock-shaft, and suitable connections, as those ordinarily employed at each end of the loom, the rotary shaft A, having at each end a face-plate, B, fast thereon and provided with spring-abutments, an arm-piece, C, movable angularly on said shaft and provided with roll-studs which carry the pick-rolls, and springs S, interposed between said abutments and the pick-arms and acting in the direction of the revolution of the pick-rolls, substantially as hereinbefore specified, whereby the clearance of the shoe by each pick-roll after each driving stroke may be more expeditiously effected, as set forth.

397,824. STATION-INDICATOR. JULIUS TALLIS, New York, N. Y. Filed Sept. 19, 1888. Serial No. 285,795. (No model.)

Claim.—1. The combination, with the clear-story of a car, a casing provided with sight-openings therein secured in said clear-story, and curtain-carrying drums journaled in said casing, provided with a spur-wheel at one extremity, of a line-shaft journaled in the ends of the car carrying a miter-gear, a combined spur-and-bevel pinion pivoted upon the line-shaft in the casing between the spur-wheels, and a pull-cord attached to the spindle of the combined pinion extending outward through the ends of the car, substantially as shown and described.

2. The combination, with the clear-story of a car, a casing provided with opposing non-aligning sight-openings secured in said clear-story, and non-aligning curtain-carrying drums journaled in said casing, provided with a spur-wheel at one end, of a line-shaft journaled in the ends of the car carrying a miter-gear, a combined spur-and-miter pinion pivoted upon the line-shaft between the spur-wheels, a pull-cord attached to the spindle of the combined pinion extending to the ends of the car, a notched bar sliding in the car-body connected with the pull-cord, and a latch engaging the notches of said bar, substantially as shown and described.

397,825. BALANCED VALVE. MORRIS WUERPEL, St. Louis, Mo. Filed Apr. 30, 1888. Serial No. 272,202. (No model.)

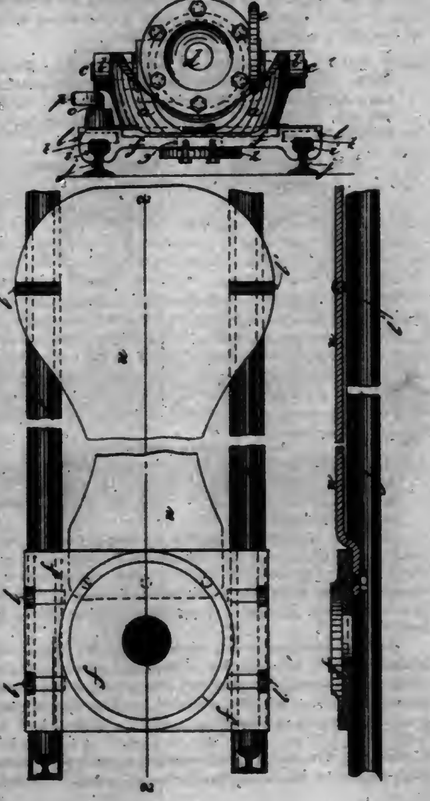
Claim.—1. The combination of the valve 11, having a disk, 15, working upon the seat 16, and having a port, 17, adapted to be brought in line with the port 18 of the seat-piece, and having a head, 12, with packing-ring bearing against the plate 7, which has apertures 9 outside the line of bearing, substantially as and for the purpose set forth.

2. The valve 11, having bearing upon its seat 16, and an expanding head, 12, with ring-packing against the plate, a cog-sector, 19, upon the valve, a cog-wheel, 20, engaging the cog-sector, and a hand-shaft carrying the cog-wheel and passing through a stuffing-box, 22, as set forth.

397,826. ELECTRIC SWITCH. A. BOWER ANDREWS, Hartford, Conn., assignor of one-half to George I. Cornwall, same place. Filed June 16, 1888. Serial No. 277,480. (No model.)

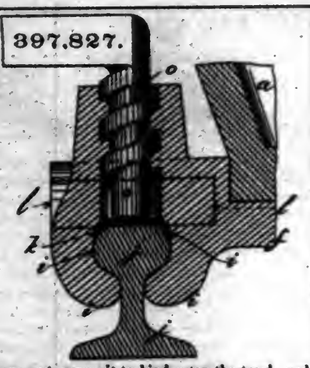
397,826.

Claim.—1. In combination with the herein-described switch, the tilting switch-block with a central perforation, from the walls of which perforation project pins, a lever passing through the perforation, and bearing lugs that during part of the movement of the lever come in contact with the pins on the block and prevent the latter from movement, substantially as described, and for the purpose specified.



2. In combination, in the herein-described switch, the tilting switch-block pivoted to one set of brushes and adapted to be tilted into contact with other brushes by means of a bent lever, one end of which terminates in a handle, while the other supports a spring whose upper end is attached to the switch-block, substantially as described.

3. In combination with the herein-described switch, the tilting switch-block with a central perforation, from the walls of which perforation project pins, a bent lever passing through the perforation, and bearing lugs that during a portion of the movement of the lever come in contact with the pins on the block and prevent the latter from movement, and a spring interposed between the end of the lever and the tilting block, substantially as described, and for the purpose specified.



4. In combination, base *a*, connections *b c*, bearing brushes *b' c'*, connections *f* and *g*, pivoted to brushes *b' c'*, block *h*, bearing pins *s*, lever *k*, bearing lugs *o*, spring *m*, attached to the lever and block, connections *d* and *e*, bearing brushes *d'* and *e'*, stop *i*, cover *r*, and storm-protector *t*, substantially as specified, and for the purpose described.

397,827. CARRIAGE FOR DIRECT-ACTING ROCK-DRILLS. GUSTAV A. BARTH, St. Louis, Mo., assignor to PIERRE CHOUTEAU, same place. Filed June 25, 1888. Serial No. 278,135. (No model.)

Claim.—1. In a coal-mining machine, the combination, with a carriage having a cylinder mounted thereon, of an operator's platform attached to and projecting from the rear thereof back of the fulcrum or center of gravity, whereby the weight of the operator

397,827.

overweights the carriage and causes it to bind upon the track and neutralize the recoil, substantially as and for the purposes described.

2. The combination of bed-plate *f*, formed with grooves or channels *i*, embracing the heads of rails *j*, rollers *l*, screw *o*, having lever *p*, and a block or cradle, *a*, having bearings *b*, with direct-acting steam or pneumatic engine provided with pivots or trunnions, substantially as shown, and for the purpose described.

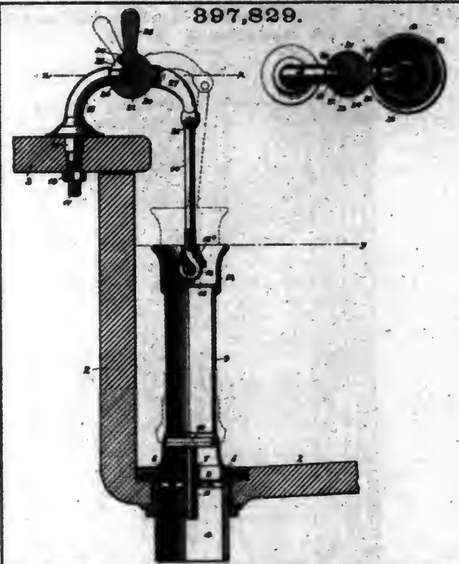
3. In a coal-mining machine, the combination, with a carriage and a track therefor, of a clamp for binding the carriage to the rail to neutralize the recoil, a cylinder-cradle pivotally mounted thereon to allow of horizontal rotary movement of the cylinder independent of the carriage, said cradle having trunnion-bearings, and a cylinder having trunnions mounted on said cradle, whereby the said cylinder is capable of vertical and horizontal oscillatory motion independent of the carriage, substantially as and for the purposes described.

4. In a coal-mining machine, the combination, with a carriage and a track therefor, of a clamp for binding the carriage to the rail to neutralize the recoil, a cylinder-cradle pivotally mounted thereon to allow of horizontal rotary movement of the cylinder independent of the carriage, and an operator's platform attached to and projecting from the rear thereof back of the fulcrum or center of gravity, whereby the weight of the operator overweights the carriage and causes it to bind upon the track and assist in neutralizing the recoil, substantially as and for the purposes described.

397,828. ATTACHMENT FOR ROCKING-CHAIRS. WILLIAM I. BUSKIRK, Chicago, Ill., assignor, by direct and mesne assignments, to the Rocker Spring Company, same place. Original application filed Nov. 3, 1884, Serial No. 147,067. Divided and this application filed Jan. 2, 1886. Serial No. 187,379. (No model.)

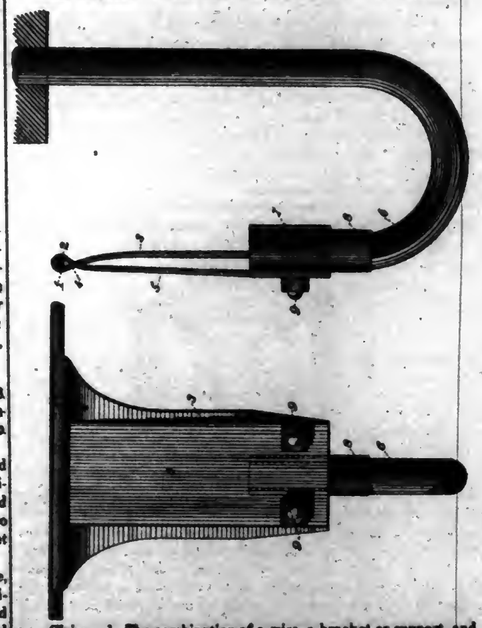
Claim.—A bracket for platform-rocking-chair attachments, comprising a main piece and a projecting portion or web extending substantially at right angles therefrom, the projecting portion being provided with a groove or channel in one of its faces, into which the end coil of a close-coiled spring may be inserted by springing it over the front edge or inclosing side of the groove or channel, the spring being secured and retained therein when in place by its own elasticity, substantially as described.

397,829. MEANS FOR RAISING AND LOWERING VALVES. WILLIAM BUSTINS, Jr., Brooklyn, assignor to the Meyer-Sniffen Company, (Limited,) New York, N. Y. Filed Aug. 15, 1888. Serial No. 282,906. (No model.)



Claim.—1. The combination, with a combined overflow-pipe and valve, of the vertically-mounted bracket 16, terminating in a horizontal direction, the horizontal plug 21, arranged transversely of said bracket and connected thereto, the shell or casing 20, mounted to turn on said plug, the arm 27 on said shell, and the link 14, as set forth.

2. The combination, with a combined overflow-pipe and valve, of the bracket 16, terminating in a horizontal direction, the horizontal plug 21, arranged transversely of said bracket and connected thereto, the shell or casing 20, having the cut-away 25 and mounted to turn on said plug, the arm 27 on said shell, and the link 14, as set forth.

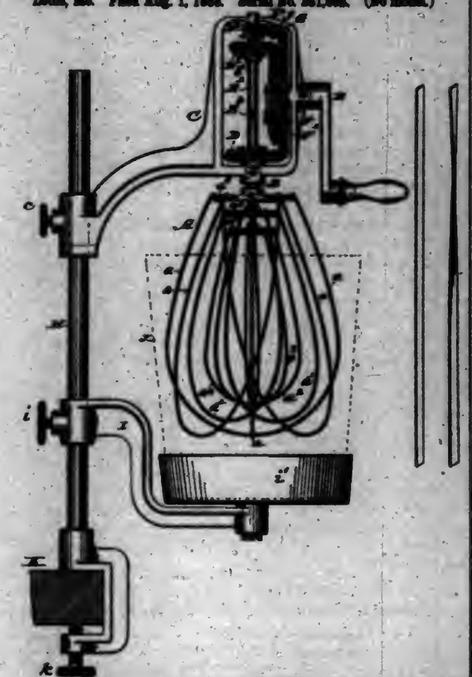


3. The combination, with the combined overflow-pipe and valve, of the bracket 16, terminating in a horizontal direction, the horizontal plug 21, arranged transversely of said bracket and connected thereto, a shell or casing, 20, having the cut-away 25 and mounted to turn on said plug, a handle, 26, and an arm, 27, on said shell, and a link, 14, connected to the arm and to the overflow-valve, as set forth.

4. The combination, with the combined overflow-pipe and valve, of the bracket 16, terminating in a horizontal direction, the horizontal plug 21, arranged transversely of said bracket and connected thereto, a shell or casing, 20, having the cut-away 25 and mounted to turn on said plug, the arm 27, the link 14, and a frictional packing between said plug and shell to overcome the weight of the suspended parts, as set forth.

397,829.

397,830. WIRE-SUPPORT. ROBERT C. CAUGHEY, Lodi, assignor of three-fourths to John F. S. Boyd, James R. Williamson, and Daniel R. Zinn, Allegheny, Pa. Filed Aug. 4, 1888. Serial No. 281,947. (No model.)



Claim.—1. The combination of a wire, a bracket or support, and a clamp provided with two pairs of movable jaws constructed to engage the wire and bracket, substantially as set forth.

2. The combination of a wire, a bracket or support, and a clamp provided with two pairs of spring-jaws formed at opposite ends of the clamp and constructed to engage the wire and bracket, substantially as set forth.

3. The combination of a wire, a bracket or support, and a clamp formed of two parts or members pivoted one upon the other, the opposite ends of said parts being constructed to engage the wire and bracket, respectively, substantially as set forth.

397,831. EGG OR CAKE BEATER. ROBERT S. CHARLES, St. Louis, Mo. Filed Aug. 1, 1888. Serial No. 281,662. (No model.)

Claim.—In an egg and cake beater, the combination, with the bracket, of a crank-shaft journaled therein provided with two bevel-gears of different diameters, a bevel-gear or idler, and three concentric shafts also journaled in said bracket, each shaft being provided with a bevel-gear at one end and a head at the other end, and each head having attached thereto wire loops forming a whip composed of three distinct sets of loops, the bevel-gears upon the crank-shaft and the bevel-gear journaled in the bracket meshing with the bevel-gears upon the concentric shafts, substantially as described.

397,832. WAGON-BOLSTER SPRING. JAMES CLOY, Scriba, assignor of one-half to Llewellyn R. Todd, Oswego, N. Y. Filed June 15, 1888. Serial No. 277,208. (No model.)

Claim.—1. The combination, with the bolster A, of the spring-hanger attachment *a*, having the adjustable jaw *c*, and a spring, *f*, secured to the attachment *a*, substantially as and for the purpose set forth.

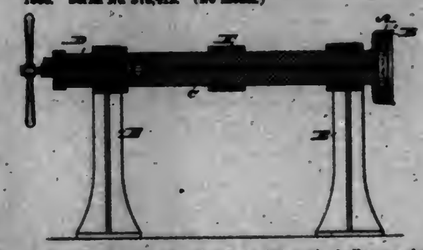
2. The combination of the spring-hanger attachment *a*, having the angular arms *a' a''*, projections *b b*, provided with flanges 1, and opening 2 in said flanges, with the torsion-springs *f*, having the eye *f'*, secured between the flanges 1 and projecting through the opening 2, all substantially as and for the purpose set forth.

3. The combination of the spring-hanger attachment *a*, mounted on the bolster A and provided with projecting arms *b*, the said arms *b* having flanges 1 and openings 2 for the reception of the eyes *f'* of the torsion-springs *f*, the torsion-springs *f f*, having eyes *f'*, bolted to the arms *b*, and eyes *f'*, bolted to the angular cross-tie *f*, and the cross-tie *f*, all substantially as and for the purpose set forth.

397,833. BRACELET. CALEB K. CLEY, Brooklyn, and WILLIAM CONVERMYER, New York, assignors to themselves and Arthur Coley, Brooklyn, N. Y. Filed Mar. 1, 1888. Serial No. 265,906. (No model.)

Claim.—1. A bracelet or the like comprising an open elastic band with overlapped ends, the one end, as *b*, being provided with a loop or keeper, as *d*, and with one or more shoulders, as *g*, and the other end, as *c*, provided with a pivotally-attached bail, as *e*, the end *b* being threaded through said bail, and the end *c* being threaded through said keeper, substantially as set forth.

2. The combination, with the band, as *c*, of a bracelet or the like having overlapping ends and a shoulder and keeper, substantially as described, of a setting mounted on the band at its middle opposite to the overlapping ends, said setting consisting of a body portion, slide-loops or keepers on said body portion through which the bracelet is threaded, and stop-collars on the band to hold said setting in place, substantially as set forth.



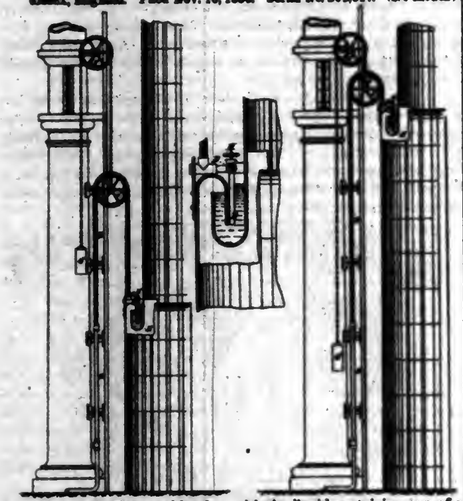
397,834. CHIP-BREAKER. FRANCIS H. CRAPO, Buffalo, N. Y., assignor to H. & R. Holmes, same place. Filed Nov. 17, 1887. Serial No. 255,265. (No model.)

Claim.—1. In a chip-breaker, the combination of a pivoted curved holding-bar provided with a curved groove, a curved adjustable chip-breaker adapted to fit in and be moved around in said groove to adjust it as it wears away, and bolts for securing it at any point when so adjusted, substantially as and for the purposes described.

2. In a chip-breaker, the combination of a pivoted curved holding-bar having a curved groove, a curved adjustable chip-breaker adapted to fit in and be moved around in said groove to adjust it as it wears away, bolts for securing it at any point when so adjusted, and a means for holding it up to its work, consisting of a weight connected with a cord passing up and over a grooved friction-roller and secured to a lug, 13, substantially as described.

397,835. PNEUMATIC CHUCK. GEORGE GUTEKUNST, Philadelphia, Pa., assignor of one-half to Robert P. Hotz, same place. Filed June 28, 1888. Serial No. 278,412. (No model.)

Claim.—1. A pneumatic chuck consisting of a hollow cup having an inner beveled edge, a tube leading from said cup, and an air-exhausting device, said parts combined substantially as described.

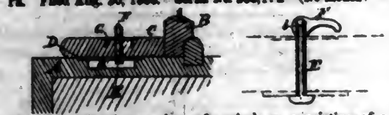


2. A cup or socket and an air-exhausting pump connected therewith, the inner side of the upper edge of said cup being beveled and having a gasket thereon, said parts being combined substantially as described, forming a pneumatic chuck for holding work or tools, as stated.

3. A pneumatic chuck consisting of a cup or socket with the inner side of its upper edge beveled or rounded, a tube connected with said cup, and a pumping device, said tube being rotatable with said cup, said parts being combined substantially as described.

4. A pneumatic chuck consisting of standards, and a tube freely mounted on said standards and having a cup or socket at one end thereof and an air-exhaust device at the other end, both cup and air-exhaust device being rotatable with said tube, said parts being combined substantially as described.

5. A pneumatic chuck consisting of a tube with a cup at one end having inner beveled edges, a gasket resting on said edges, and an air-exhaust device at the other end of the tube, said parts being combined substantially as described.



397,836. APPARATUS FOR SUPPLYING STEAM TO CUPS OF TELESCOPIC GAS-HOLDERS. SAMUEL CUTLER, Millwall, County of Middlesex, England. Filed Nov. 16, 1888. Serial No. 291,017. (No model.)

Claim.—1. The combination, with the liquid-containing cup of a rising and falling telescopic gas-holder, of a vertical pipe, A, for conveying a heating-fluid, a flexible pipe, B, connected with the upper end of said pipe and communicating with the cup, and a rising and falling pulley, C, supporting the flexible tube and taking up the slack thereof as the gas-holder rises, substantially as described.

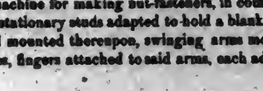
2. The combination, with the liquid-containing cup of a rising and falling gas-holder, of a vertical pipe for conveying a heating-fluid, a flexible tube connected with the upper end of the pipe and communicating with the cup, a sheave or pulley carrying a chain or rope having a weight at one end, and a pulley at the other end, which sustains the flexible tube and takes up the slack thereof as the gas-holder rises, substantially as described.

397,837. WINDOW-HEAD STOP. MARTIN A. COTTER, Allegheny, Pa. Filed Aug. 20, 1888. Serial No. 283,174. (No model.)

Claim.—A bead-stop clamp for windows, consisting of a slotted keeper, D, embedded in the window-frame, a T-headed bolt, E, a cam, F, pivoted in said bolt, and a wear-plate, G, embedded in the stop, all combined and arranged substantially as and for the purpose set forth.

397,888. ELECTRIC SIGNALING AND ALARM APPARATUS. WILLIAM L. DENIO, Rochester, N. Y. Filed Dec. 1, 1887. Serial No. 256,653. (No model.)

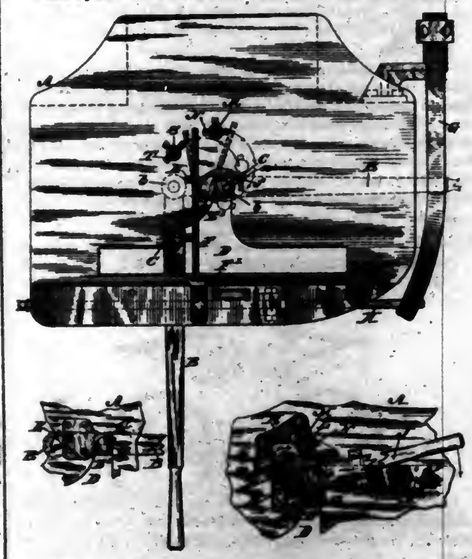
Claim.—1. A button for circuit-changers laterally extended at one end and containing a spring, a finger pressed by said spring, and a fusible seal normally holding the finger against the tension of the spring.



2. A perforated button for push-buttons flanged at one end and containing a spring and a finger pressed by said spring, said finger being held under tension by a fusible seal on the outer face of the button, whereby said button may be substituted for the customary porcelain button and automatically transmit an alarm on a definite rise in temperature.

3. In a fire-alarm or heat-detector, the combination of a barrel internally flanged at one end, a spring seated against said flange, a pin within the barrel engaging the spring, and a fusible seal for holding said spring under tension, whereby on the outbreak of a fire the seal will melt and the pin will be thrust out of the barrel.

4. The combination, with circuit electrodes, of the barrel 5, provided with flange 9, spring 6, seated in said barrel, said springs when free extending out of the barrel, and pin 7, one end of which engages the free end of the spring, the other end being secured by a fusible seal to the other end of the barrel, whereby on the outbreak of a fire the seal will melt and the pin will be thrust out of the barrel and the circuit will be changed.



5. The combination of the casing, the hollow button movably secured in the casing, a pin in said barrel, a spring held under tension by said pin, a fusible seal for holding the spring, and the electrodes engaged by the button, whereby the device may normally be operated as a push-button and on the outbreak of a fire will automatically turn in an alarm.

397,889. TAP-HOLE PLUG. CHRISTOPHER G. DODGE, New York, N. Y., assignor to John D. Brown, same place. Filed May 23, 1888. Serial No. 274,307. (No model.)

Claim.—A tap-hole plug made of wood tubular at one end and with a solid web at the other end, the side wall of the tubular portion and the central portion of the web being compressed, while the circumferential portion of the web is left in uncompressed state, substantially as set forth.

397,840. MACHINE FOR MAKING NUT-LOCKS. WILLIAM DUNN, Philadelphia, Pa. Filed Oct. 31, 1888. Serial No. 289,625. (No model.)

Claim.—1. In a machine for making nut-fasteners, in combination, a supporting-table, a stud provided with a swinging lever, means for holding a blank in such position that it lies in the path of said stud, fingers each adapted to travel in an independent path and so situated as to each operate upon one of the respective ends of the blank, a link connecting said fingers, and a handle adapted to operate said fingers, substantially as set forth.

2. In a machine for making nut-fasteners, in combination, a supporting-table, stationary studs adapted to hold a blank between them, a lever, a stud mounted thereupon, swinging arms mounted upon independent axes, fingers attached to said arms, each adapted to, when

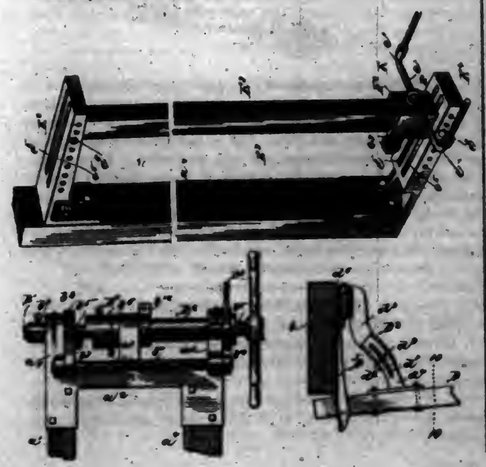
the stud is in its innermost position, move partly around the same in planes inclined to the horizon and in paths eccentric both with respect to said stud and to each other, a link connecting said swinging arms, and a handle mounted in connection therewith, substantially as set forth.

3. In a machine for making nut-fasteners, in combination, a supporting-table, stationary studs which lie on opposite sides of a blank fed to the machine, a movable stud adapted, when in its outer position, to lie adjacent to the free end of a straight blank fed to the machine and when in its inner position to lie adjacent to the blank when said blank has been bent to a V shape, a lever-arm upon which said movable stud is mounted, and means for bending the extremities of the blank about said movable stud, substantially as set forth.

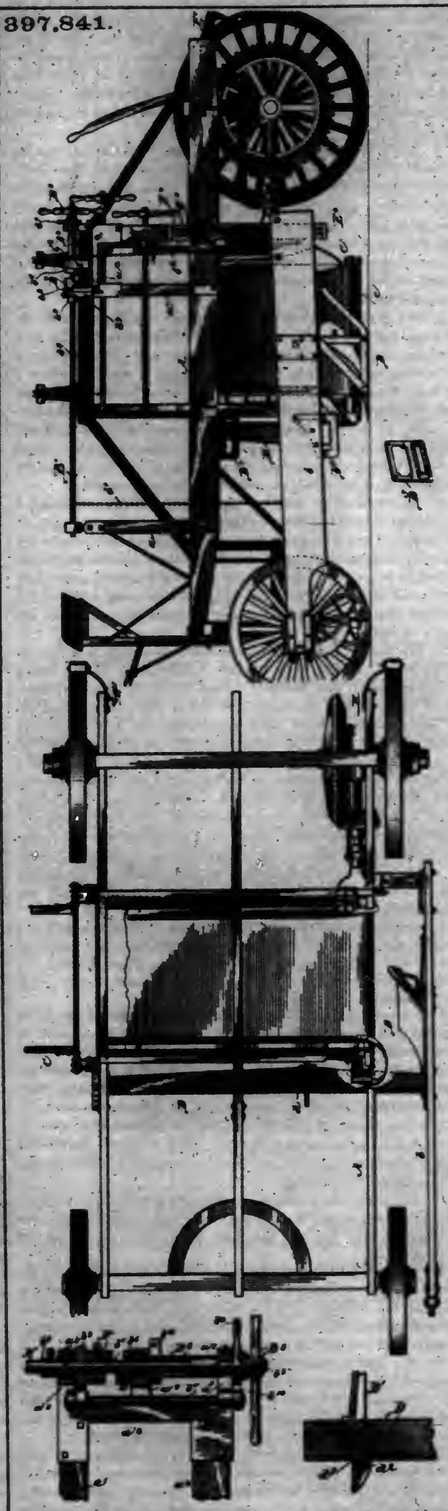
4. In a machine for making nut-fasteners, in combination, a supporting-table, a stationary stud adapted to lie adjacent to one side and near the center of a blank fed to the machine, a retaining device adapted to lie adjacent to the opposite side of the blank, a movable stud the path of travel of which intersects the blank fed to the machine, a lever-arm upon which said movable stud is mounted, a pivot beneath the table for said lever-arm, an opening in said table through which said movable stud projects, and means for bending the extremities of the blank about said movable stud, substantially as set forth.

5. In a machine for making nut-fasteners, in combination, a supporting-table, a movable stud, a lever-arm upon which said stud is mounted, projecting arms mounted upon independent axes, an arm and a finger depending from each of said projecting arms, a link connecting the projecting arms, and a lever-handle attached to one of said arms or its axis, substantially as set forth.

6. In a machine for making nut-fasteners, in combination, a supporting-table, a movable stud, a lever-arm upon which said stud is mounted, projecting arms mounted upon independent inclined axes, an arm and a finger depending from each of said projecting arms, a link by which the projecting arms are coupled, and a lever by which they are rotated, substantially as set forth.



7. In a machine for making nut-locks, in combination, a supporting-table, a movable stud, a lever-arm upon which said stud is mounted, arms mounted upon independent inclined axes in such position that they overhang the point occupied by the stud when it is moved in to its innermost position, an arm and a finger depending from each projecting arm, and a lever-arm connected to the axis of one of said arms, substantially as set forth.



8. In combination with the lever B and the stud mounted thereupon, the latch and latch-operating handle, substantially as set forth.

9. In a machine for making nut-locks, in combination, a projecting arm mounted upon an inclined axis, a projecting arm mounted upon a separate inclined axis, depending arms and fingers attached to said arms, a link connecting said projecting arms, and a lever-handle connected to one of said axes, substantially as set forth.

10. In a machine for making nut-locks, in combination, a projecting arm mounted upon an inclined axis, a projecting arm mounted upon a separate inclined axis, depending arms and fingers attached to said arms, a link connecting said projecting arms, a lever-handle connected to one of said axes, the arrangement being such that upon the throw of the handle said fingers are caused to describe arcs of circles in planes inclined to the horizon, substantially as set forth.

397,841. GRADING AND DITCHING MACHINE. GEORGE B. DURKEE, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed June 11, 1888. Serial No. 276,746. (No model.)

Claim.—1. In a grading and ditching machine, the combination, with the suspended plow-beam and the suspending cords or chains

therefor, of a raising and lowering mechanism consisting of a couple of rotary winding-shafts, respectively, for one and the other of the suspending cords or chains, and a clutch adapted to connect and disconnect the winding-shafts, whereby the shafts may be either connected in order to simultaneously wind or unwind the cords or chains, or disconnected, so as to permit either chain to be wound or unwound separately from the other, as set forth.

2. In a grading and ditching machine, the combination, with the suspended plow-beam and the suspending cords or chains therefor, of separate winding-shafts for the suspending-chains, and a shaft which is both rotative and longitudinally movable, provided with a clutch device arranged to engage either of a couple of clutch portions with which the two winding-shafts are respectively provided, whereby the shaft carrying the clutch may be connected with either winding-shaft and then turned, so as to operate the same, substantially as and for the purpose set forth.

3. In a grading and ditching machine, the combination, with the plow-beam carrying a plow and the suspending-chains therefor, of a line of sectional shafting comprising a rotary shaft, B', which serves as a winding-shaft for one of the chains, and a shaft, b^3, which is both rotative and longitudinally movable, a rotary winding-shaft from which the other suspending-chain is hung, and a double clutch member carried by the said rotary and longitudinally-movable shaft and arranged to be thrown into engagement with either of the two clutch members, respectively, upon one and the other of the said two chain-winding shafts, substantially as and for the purpose described.

4. The combination, with the suspended plow-beam carrying a plow and the suspending cord or chain b', of the rotary winding-shaft B', for said cord or chain, the shaft b^3, which is both a rotative and a longitudinally-movable shaft, and a clutch member or portion fixed upon the shaft B' in position to be engaged by a clutch member on shaft b^3, whereby the latter may by an end-thrust be either connected or disconnected from said chain-winding shaft, substantially as and for the purpose set forth.

5. The combination, with the suspended plow-beam and the suspending-chains therefor, of the rotary winding-shaft B', the rotary and sliding shaft b^3, provided with a hand-wheel, the rotary winding-shaft B^3, sleeved upon the rotary and sliding shaft, clutch members upon the opposite ends of the winding-shafts, and a double clutch member upon the rotary and sliding shaft, for the purpose described.

6. The combination, substantially as hereinbefore set forth, in a grading and ditching machine, of the suspended plow-beam carrying a plow and the two cords or chains by which the plow-beam is suspended, with the two winding-shafts, one for each winding-chain, a clutch arranged to alternately connect the winding-shafts with a rotary shaft, which can be operated by an attendant on the machine to actuate either winding-shaft, according to the position of the clutch, and pawl-and-ratchet devices, substantially as set forth, to lock the winding-shafts against rotation.

7. In a ditching and grading machine, the combination, with the suspended plow-beam and suspending-chains therefor, of a couple of separate rotary chain-winding shafts arranged in alignment with one another and supported so as to lie over and substantially parallel with the plow-beam, for the purpose described.

8. In a grading and ditching machine, the combination, with the suspended plow-beam and suspending-chains therefor, of a couple of winding-shafts, both arranged on a line substantially over and parallel with the plow-beam, one of said shafts being hollow, whereby the power may be transmitted through the hollow shaft by shafting which can turn independently of the hollow shaft, for the purpose set forth.

9. In a grading and ditching machine, the combination, with the suspended plow-beam and the draft-bar D, of a hanger attached to the plow-beam and a knuckle-joint, such as set forth, pivotally attaching the draft-bar to the hanger.

10. In a grading and ditching machine, the combination, with the suspended plow-beam and the draft-bar D, of an extensible hinged arm connecting the draft-bar with the beam, substantially as and for the purpose set forth.

11. In a grading and ditching machine, the combination, with the suspended plow-beam and the draft-bar, of the extensible hinged arm connecting the draft-bar with the plow-beam and a pivotal connection between the draft-bar and a hanger attached to the plow-beam, substantially as and for the purpose set forth.

12. In a grading and ditching machine, the combination, with the suspended plow-beam and the draft-bar D, of a bracket, D', secured to the plow-beam and having a slot wherein one end of the draft-bar is received, and a pivotal connection between the said bracket and the draft-bar, substantially as and for the purpose set forth.

13. In a grading and ditching machine, the combination, with the plow-beam, of a pivot connected with the plow-beam in the rear of the plow and movable longitudinally in a bearing connected with the body-frame, whereby both a lateral movement and tilting motion of the plow-beam is permitted, substantially as and for the purpose set forth.

14. In a grading and ditching machine, the combination, with the plow-beam, of a pivot connected with the plow-beam in the rear of the plow and movable longitudinally in a bearing connected with the body-frame, and a spring to which said pivot is subject in its movement, substantially as and for the purpose set forth.

15. In a grading and ditching machine, the combination, with the plow-beam, of a hinge-pintle attached to and parallel with the plow-beam in the rear of the plow, and an eyebolt supported from the body-frame and affording a bearing through which the said pintle is arranged to slide, substantially as and for the purpose set forth.

16. In a grading and ditching machine, the combination, with the suspended plow-beam, of a vertically-movable bearing connected with the plow-beam, with a hinge-joint and arranged to slide upon a guide that is carried by the body-frame, substantially as and for the purpose set forth.

17. In a grading and ditching machine, the combination, with the suspended plow-beam, of a vertically-movable bearing having a hinge-connection with the plow-beam, and a guide for said bearing adjustable in position toward or from the body-frame, substantially as and for the purpose set forth.

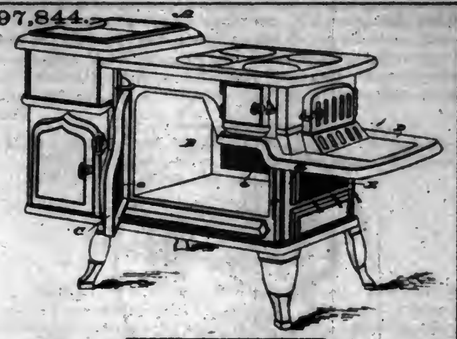
18. In a grading and ditching machine, the combination, with the suspended plow-beam, of the pintle *e*, secured to the plow-beam, the vertically-sliding bearing carrying an eyebolt that is connected with said pintle, and a guide, E^3, for said vertically-sliding bearing, substantially as and for the purpose set forth.

397,842. CULTIVATOR. WILLIAM A. DUTTON and CHARLES J. MEEK, Rural Retreat, Va. Filed Oct. 3, 1888. Serial No. 287,077. (No model.)

Claim.—1. In a cultivator, the combination, with the center beam and outwardly and rearwardly extending arms projecting from the center beam near its forward end, of side beams pivotally connected with said arms, a shovel-standard adjustably secured to each side beam near its rear end, a shovel adjustably attached to the side beams near the front ends thereof, and adjustable stay-bars for uniting the rear ends of the side beams, substantially as set forth.

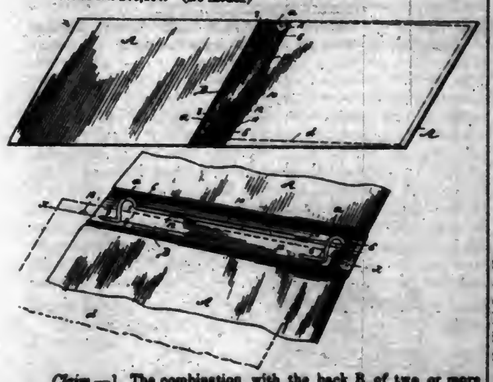
2. The combination, with the side beam, D, provided with a transverse slot at its rear end and a rectangular key or plate, *m*, secured within the slot, said key having a rib, *m'*, formed on its outer face, of a shovel-standard having its upper end constructed with a series of radial grooves, and a bolt, *k*, for securing the parts together, substantially as set forth.

397,843. EDGE-TRIMMER FOR GRASS BORDERS. CHAR EVERENDEN, Branford, Conn. Filed Nov. 5, 1888. Serial No. 289,968. (No model.)



Claim.—The combination of the handle A, terminating in a hub, *b*, a disk-cutter, B, having an opening through its center, a collar, *a*, of a diameter corresponding to the opening through the disk and so as to rest against the face of the hub of the handle, while the disk surrounds the said collar as an axle, the said collar *a* being thicker than the disk-cutter, and the collar *d*, of larger diameter than the collar *a* and arranged outside of said collar *a*, with the bolt *c*, extending through the said two collars into the hub of the handle and so as to hold the said collars firmly to the handle, the said collar *d* on one side and the hub of the handle on the other side forming the support to hold the disk upon the axle, substantially as described.

397,844. COOKING-STOVE. CHAS F. FILLEY, St. Louis, Mo. Filed May 19, 1884. Serial No. 132,104. (No model.)



Claim.—1. A cooking-stove having an opening beneath the stove-hearth leading into the oven and filled with gauze, *c*, as and for the purpose described.

2. A cooking-stove having the gauze-filled opening E beneath the hearth and the gauze-filled oven door or doors, substantially as described.

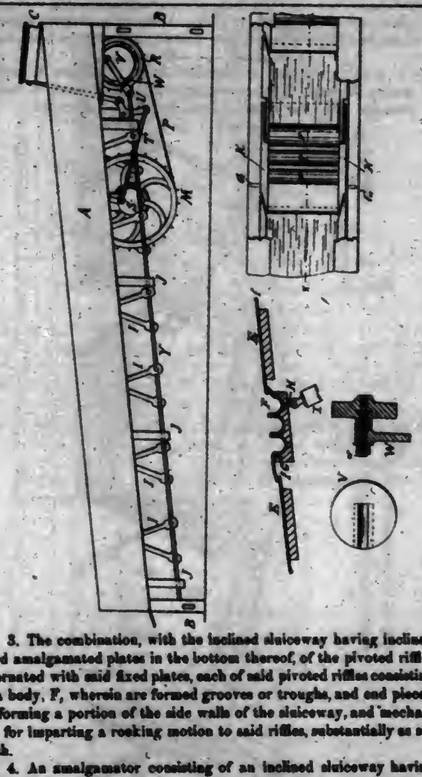
397,844.

397,845. TEMPORARY BINDER. ALFRED G. PERRIN, Springfield, Mass., assignor to Mary D. Gotting, same place. Filed June 6, 1888. Serial No. 276,197. (No model.)

Claim.—1. The combination, with the back B, of two or more transversely-arranged arch-shaped hooks, *a*, which by their one end portions are rigidly confined upon said back, and at their other end portions are provided with the angular projections 8, extending at a slight distance from and parallel with the inner surface of said back in the direction of the length and with their points toward one and the same end thereof, substantially as and for the purpose described.

2. The combination, with the back B, of two transversely-arranged arch-shaped hooks, *a a*, which by their one end portions are rigidly confined upon said back, and at their other end portions are provided with the angular projections 8, one of which is longer than the other, extending at a slight distance from and parallel with the inner surface of said back in the direction of the length and with their points toward one and the same end thereof, substantially as and for the purpose described.

3. The hook device for temporary binders herein described, the same being integrally formed and consisting of the intermediate shank-wire 10, the arch-hooks *a a* at the end portions of said shank-wire, each extended in planes at right angles thereto, and each at its end provided with a projection, 8, extending parallel with said shank and from or toward one and the same end thereof, substantially as described.



4. The hook device herein described, the same being integrally formed and consisting of the intermediate shank-wire, 10, having the flattened and perforated portions 12, the arch-hooks *a a* at the end portions of said shank-wire, each extended in planes at right angles thereto, and each at its end provided with a projection, 8, each extending parallel with said shank and from or toward one and the same end thereof, combined with and riveted to the back B, all substantially as shown and described, for the purpose specified.

397,846. AMALGAMATOR. THOMAS F. FREEMAN, Brooklyn, N. Y. Filed Feb. 3, 1887. Serial No. 226,206. (No model.)

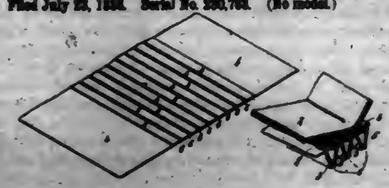
Claim.—1. In an amalgamator, an inclined sluiceway consisting of inclined fixed amalgamated plates and movable riffles, said plates and riffles alternating with each other, in combination with means for imparting motion to said riffles, substantially as set forth.

2. In an amalgamator, the combination, with the inclined sluiceway, of the riffles supported upon pivots in the main frame at each side, arms I, pivoted to the under side of each set of riffles, and a sliding bar engaging with said arms, and mechanism for imparting a longitudinal movement to said bar, substantially as set forth.

397,847.

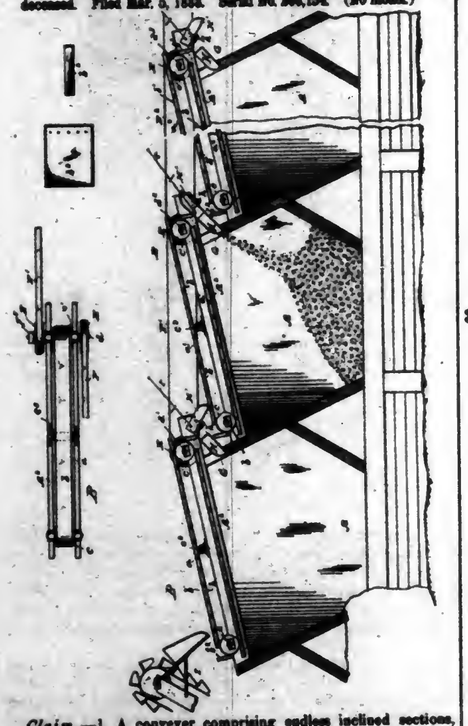
3. The combination, with the inclined sluiceway having inclined fixed amalgamated plates in the bottom thereof, of the pivoted riffles alternated with said fixed plates, each of said pivoted riffles consisting of a body, F, wherein are formed grooves or troughs, and end pieces, K, forming a portion of the side walls of the sluiceway, and mechanism for imparting a rocking motion to said riffles, substantially as set forth.

4. An amalgamator consisting of an inclined sluiceway having side walls, A, the bottom of said sluiceway being provided with inclined fixed amalgamated plates E and pivoted riffles F, alternating with said fixed plates, a sieve, C, at the upper end of said sluiceway, connected with a bell-crank, U, driven by a rod, T, crank-wheels S and V, spur-wheels N and R, chain P, rods Y, and arms I, the whole combined and arranged substantially as set forth.



397,847. COOKING UTENSIL. JOHN H. PFEIFFENBERG, Lost Haven, Pa., assignor of one-half to the St. Louis Stamping Company, St. Louis, Mo. Filed Jan. 16, 1888. Serial No. 296,402. (No model.)

Claim.—1. As a new article of manufacture, a culinary vessel having a double bottom and having an interposed sheet of non-combustible material secured at its circumferential edge between the lower bottom and the vessel, as described.



2. As a new article of manufacture, a culinary vessel provided with the double bottom and double lower sides and having an interposed sheet of non-combustible material secured at its circumferential edge between the double side and the vessel and covering the bottom and part of the sides of the latter, substantially as described.

397,848. BOOK-BINDING. RUDOLPH E. FREY and JOHN ROSENER, St. Louis, Mo., assignors of one-third to Gustave Frey, same place. Filed July 23, 1888. Serial No. 280,763. (No model.)

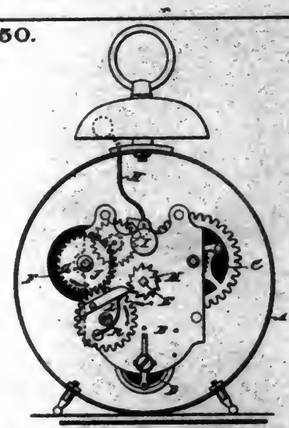
Claim.—A sewing-band for books having strips secured thereto at suitable intervals, forming folding-spaces, substantially as described.

397,849. STONE OR ORE CONVEYER. PHILETUS W. GATES, Chicago, Ill.; Ralph I. Gates administrator of said Philetus W. Gates, deceased. Filed Mar. 5, 1883. Serial No. 266,154. (No model.)

Claim.—1. A conveyer comprising endless inclined sections, every two having a discharging-space between them, and a guiding-chute arranged to swing on pivots or pins placed crosswise of the sections, said chute being adapted to close a discharging-space between two of the sections, when it is desired to carry the substances being conveyed beyond the first section of the conveyer, and adjustable on its pin or pivot to an inclined position, so as to open the discharging-space between two of the sections, and turn, guide, and discharge the said substances between and below the sections, substantially as described.

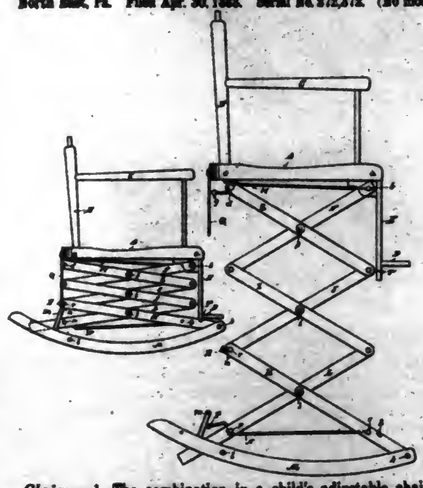
2. The combination, with a series of adjoining bins arranged beneath an endless conveyer, of a series of endless sections having a discharging-space between every two, and a series of swinging, separately-adjustable, connecting, and directing chutes constructed to lie longitudinally with the sections and occupy positions between the said sections, whereby they are adapted to close the said discharging-spaces, and also to be adjusted to backwardly-inclined positions, and thereby open said spaces and discharge the substances into bins beneath the sections, substantially as described.

3. The connecting and guiding chute formed of two parts, H H', one of which is hung on a pivot and swings and is adjustable thereon, in combination with the endless sections of a conveyer, having a space between their lower and higher pulleys, *c d*, which space is occupied by a connecting and guiding chute, substantially as described.



397,850. ALARM-CLOCK. ROBERT F. GAYLORD, New York, N.Y., assignor to James Gwathkin, same place. Filed Apr. 17, 1888. Serial No. 270,264. (No model.)

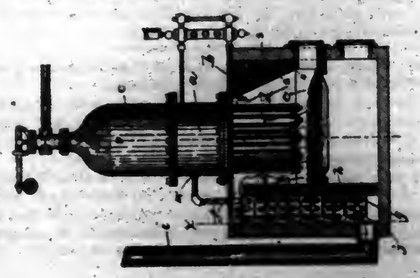
Claim.—1. In an alarm-clock, the combination of the time mechanism, the alarm mechanism, and a spring-pawl carried upon or attached to the alarm mechanism and arranged to engage an oppositely-revolving part of the time-train, substantially as set forth, whereby the alarm is alternately arrested and released as it runs down.



2. In an alarm-clock, the combination of the arbor E, carrying the detent-wheel M, and the arbor G, connected with and revolving the spring-pawl L, the said pawl being arranged to engage the said detent-wheel, as and for the purpose set forth.

3. In combination, the arbors E and G, the gears I and K, the spring-pawl L, and the detent-wheel, arranged substantially as and for the purpose set forth.

397,850.



397,851. CHILD'S ADJUSTABLE CHAIR. CYRUS P. GIFFORD, North East, Pa. Filed Apr. 30, 1888. Serial No. 272,372. (No model.)

Claim.—1. The combination, in a child's adjustable chair, of adjustable braces pivoted together for supporting the chair-seat, the upper ends of one pair of said braces being pivoted to the front of the chair-seat and the upper ends of the other engaging with a catch at the rear of the chair-seat, with rockers the front ends of which are pivoted to the lower ends of one pair of said braces and the lower ends of the other pair engaging with a catch at the rear of the rockers, and a foot-rest suspended by arms from the front end of the chair-seat and adapted to engage with notches in the braces when the chair is closed together, substantially as and for the purpose set forth.

2. The combination, in a child's adjustable chair, of a foot-rest, D, suspended from the front end of the seat A, having projecting catches T thereon, with notches S in the braces K, substantially as and for the purpose set forth.

397,852. FIRE-BOX FOR STEAM-GENERATORS. ASTON GRAF, Georgetown, assignor of two-thirds to Augustus McDuffee and Roswell Carleton, both of Haverhill, Mass. Filed Mar. 13, 1888. Serial No. 267,060. (No model.)

Claim.—The fire-box having its walls thickened at their upper ends and inclined on their inner sides, and the non-conducting material—as fossil meal—disposed within said walls, substantially as shown and described, whereby an increased thickness of the non-conducting material is obtained at the point where the heat is greatest, as set forth.

397,853. WATCH-MOVEMENT BOX. CHARLES T. GRAHAM, Philadelphia, Pa., assignor to George W. Plumley, same place. Filed Oct. 15, 1888. Serial No. 288,195. (No model.)

Claim.—1. In a watch-movement packing-box, in combination with the outer casing, A A', and the inner metal box, C, a ring or shoulder, *a*, secured to the bottom of the casing A, adapted to secure the box C in position and protect projecting parts, the internal diameter of which ring or shoulder is at least as much less than its external diameter than is the length of the stem-winding shank or other protruding parts of the watch-movement incased in the casing C, substantially as hereinbefore set forth and described.

2. In a watch-movement packing-box, in combination with the outer casing, A A', and the inner casing, C, a ring or shoulder, *a*, provided in the inside of the casing A, having an inside diameter equal to the outside diameter of the casing C, and the outside diameter of the said ring or shoulder *a* at least as much greater than its internal diameter than is the length of the stem-winding shank or other protruding part of the watch-movement incased in the casing C, and a ring or washer, *b*, provided on the inside of the lid A', the thickness of which is equal to the length of the hand-spindle or other part of the watch-movement protruding beyond the face of the dial, and the inside diameter of the said ring or washer being greater than the diameter of the said spindle and of sufficient diameter to accommodate other protruding parts beyond the face of the dial, in the manner and for the purpose as hereinbefore substantially set forth and described.

397,854. MEASURING-FAUCET. ROBERT M. GREEN and FRANK D. GREEN, Philadelphia, Pa. Filed Sept. 13, 1888. Serial No. 285,312. (No model.)

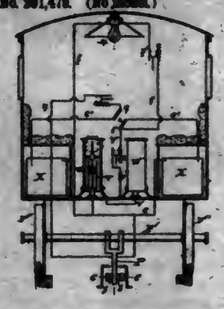
Claim.—1. In a measuring-faucet, a shell, a plug therein, and a lug connected with said plug, and a cap, said shell having a segmental flange to which the cap is screwed, and provided with shoulders at the ends thereof, substantially as described.

2. A measuring-faucet consisting of a shell having an inlet and an outlet port and an air-vent, and provided with a segmental flange, a cap secured to said flange, a hollow plug located in said shell, and having ports and vent registering with said ports and vent in said shell, and provided with a stem having a bearing in said cap, a handle on the outer end of said stem, and lugs on the stem end of said plug, said parts being combined substantially as described.

397,855. PLOW-POINT. JAMES HAWES, Long Run, Ohio, assignor of one-half to R. F. Dusk, Rino place. Filed Feb. 18, 1888. Serial No. 264,498. (No model.)

Claim.—A plow-point whose extended share *A* is slightly rounded and having a slotted socketed opening, the edges being flanged and contracted, and having a tapering sole or base extending the full length of the extended share, by means of which the point is more securely held in place, substantially as described.

397,856. METHOD OF RECORDING SPEECH. GEORGE H. HERRINGTON, Wichita, Kans., assignor to himself, and Edward H. Johnson, New York, N.Y. Filed June 13, 1887. Serial No. 241,706. (No model.)



Claim.—1. The method herein described of making a permanent record of vibrations, which consists in softening a body of material by a chemical solvent, passing the same through the recording-instrument while it is in a softened condition, and then allowing it to harden.

397,856.

2. The method of recording phonetic vibrations, which consists in covering a strip of material with a substance capable of being softened by a chemical solvent, subjecting said substance to the action of such solvent, passing it in its softened condition under the vibrating point of a phonograph, and afterward allowing it to harden to fix the phonogram, substantially as set forth.

397,857. APPARATUS FOR HEATING CARS BY ELECTRICITY. RUDOLPH M. HOSKINS, Philadelphia, Pa. Original application filed Jan. 12, 1887, Serial No. 224,150. Divided and application filed Sept. 27, 1887, Serial No. 250,542. Again divided and this application filed Nov. 21, 1888. Serial No. 291,478. (No model.)

Claim.—1. In an electric railway, an electrically-propelled vehicle, an electric motor to propel said vehicle, an electric heater to heat said vehicle, a source of electric energy, and electric circuits including said motor and heater in multiple-arc connection.

2. In an electric railway, an electrically-propelled vehicle, an electric motor to propel said vehicle, an electric heater to heat said vehicle, a source of electric energy, electric circuits including said motor and heater in multiple-arc connection, and means to control the current passing through the heater independently of the motor.

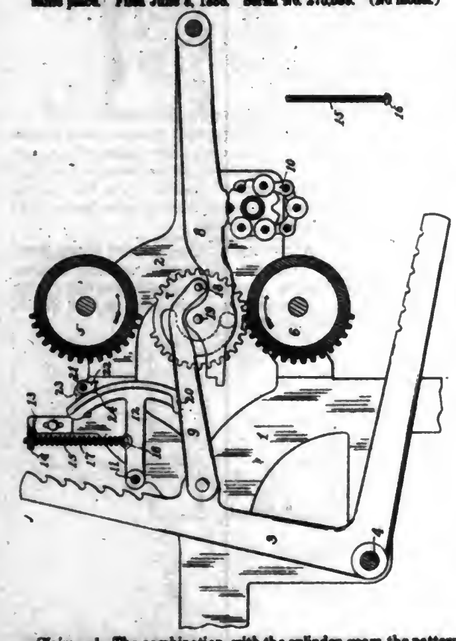
3. In an electric railway, a line-working conductor, a traveling vehicle, an electric motor to propel said vehicle, an electrical connection between said motor and working-conductor, a shunt-circuit around the motor on the vehicle, and an electric heater in said shunt-circuit.

4. In an electric railway, a line-working conductor, a traveling vehicle, an electric motor to propel said vehicle, an electrical connection between said motor and working-conductor, a shunt-circuit around the motor on the vehicle, an electric heater in said shunt-circuit, and means to regulate the current flowing through the shunt-circuit.

5. In an electric railway, a line-working conductor, a traveling vehicle, an electric motor to propel said vehicle, an electrical connection between said motor and working-conductor, a shunt-circuit around the motor on the vehicle, an electric heater in said shunt-circuit, and means to cut the heater out of circuit.

6. In an electric railway, a line-working conductor, a traveling vehicle, an electric motor to propel said vehicle, an electric heater carried by the vehicle, and an electrical connection carried by the vehicle and making contact with the working-conductor to supply electricity to both the heater and motor.

7. The combination of a source of electric energy, a circuit therefrom, and an electric heater included in said circuit and consisting of an arc lamp, a close heater-casing surrounding the arc, and an outer draft-casing to guide air around said heater-casing.

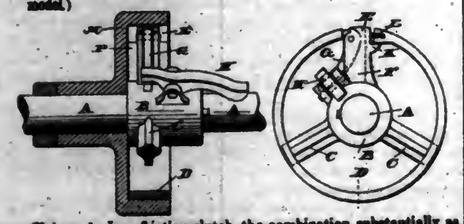


8. The combination of a source of electric energy, a circuit therefrom, and an electric heater included in said circuit and consisting of an arc lamp, a close heater-casing surrounding the arc, an outer draft-casing to guide air around said heater-casing, a circuit-breaker, and a regulator to control the current flowing through the heater.

9. In an electric railway, the combination of an electrically-propelled vehicle, two secondary batteries on the vehicle, a motor-circuit

a local heater-circuit, including a heater, and switches for coupling the motor-circuit with one battery and heater-circuit with the other battery.

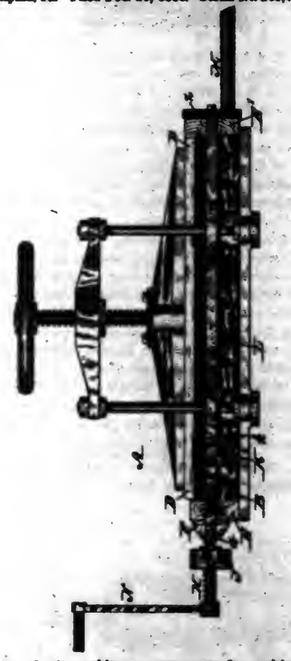
10. The combination of a car, a source of electric energy, a heater-circuit, and an electric heater consisting of an arc lamp surrounded by a draft-casing.



397,858. SHEDDING MECHANISM, &c., FOR LOOMS. George F. Hutchins, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed June 4, 1888. Serial No. 276,599. (No model.)

Claim.—1. The combination, with the cylinder-gears, the pattern-chain, the vibrator-lever, gear, and connector, and the harness-lever connected therewith, of the follower provided with a socket, the spring-rod provided with a head adapted to work in the follower-socket, coil-spring, and retaining-plate, substantially as shown and described.

2. The combination, with the cylinder-gears, the pattern-chain, the vibrator-lever, gear, and connector, and the harness-lever connected therewith, of the pivoted follower with notched face, and the retaining-latch, substantially as shown and described.



397,859. FRICTION-CLUTCH. Willis G. Jones and Winfield S. Rogers, Cincinnati, Ohio. Filed Apr. 30, 1888. Serial No. 272,385. (No model.)

Claim.—1. In a friction-clutch, the combination, substantially as set forth, of a spider-hub provided with arms, a friction-ring carried by said arms and having a gap or opening at one of said spider-arms, one wall of said gap abutting against one side of such arm, a lever pivoted to the spider-arm which is located at the gap of the friction-ring and engaging with its outer end the free wall of the gap of the friction-ring, while the other and longer end of the lever projects inwardly near the spider-hub, a lever pivoted to the spider-hub and engaging its shorter end over the longer end of said first-mentioned lever, while the longer end of said hub-spider projects outwardly beyond the spider-hub and is adapted to be engaged by a sliding cone, and a rim-piece encircling and fitting the friction-ring, and having a hub adapted to engage a shaft whose axis is coincident with the axis of the spider-hub.

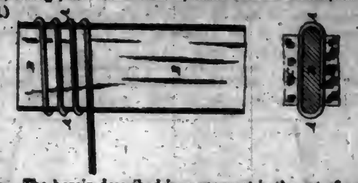
2. In a friction-clutch, the combination, substantially as set forth, of spider-hub B, having arms C terminating in tenons, and having arm F, friction-ring D, provided with mortises engaging said tenons and having a gap, one wall of which engages the arm F, lever G, pivoted to the arm F and engaging the free wall of the gap of the friction-ring, lever H, pivoted to the spider-hub and engaging with one end the lever G, and having its other end projecting outwardly beyond the hub and adapted to be engaged by a cone, a rim-piece, M, encircling and fitting the friction-ring, and having a hub with its axis coincident with the axis of the spider-hub.

397,860. MACHINE FOR MOLDING TUBES OR CYLINDERS. Henry G. Kearney, Ambler, assignor of one-half to Richard V. Mattison, Philadelphia, Pa. Filed Feb. 20, 1888. Serial No. 265,741. (No model.)

Claim.—1. A machine or apparatus for making plastic tubes, having a press with a mold therein, a reservoir, a supply-pipe leading from said reservoir to said mold, a pumping device for forcing tube material from the said reservoir to said mold, and an air-chamber communicating with said supply-pipe and between the pumping device and the mold, said parts being combined substantially as described

2. A press with a mold therein, a tail-piece with arms secured thereto, bars pivoted to said arms, a cross-bar secured to said bars, a head-piece with a plate having a socket, and a screw passing through the cross-bar and working in said socket, said parts being combined substantially as described.

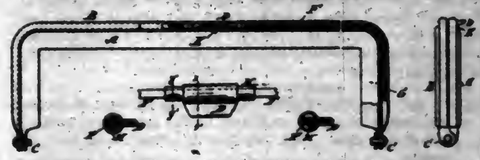
3. In a machine for making plastic tubes, the combination, with the press having the mold arranged in a case therein, of the head and tail pieces closing the ends of the mold, the head-piece being capable of a swinging movement, substantially as and for the purpose described.



4. In an apparatus for making plastic tubes, a mold consisting of an upper or top portion having the flat part *d*, the depending curved ridge *e*, and the inclined projection *f*, and a bottom portion with a curved inner face and cut-out portion *c*, said parts combined substantially as and for the purpose set forth.

5. In a machine for making plastic tubes, pipes, or cylinders, the press containing the mold, and the head and tail pieces connected together for closing the ends of the mold, in combination with the feed-pipe provided with a cock or check for supplying material to the mold, substantially as described.

6. In a machine or apparatus for making plastic tubes, the combination, with the press containing the mold, of the head and tail pieces connected together and closing the ends of the mold, devices in the head-piece for pressing the head and tail pieces firmly against the ends of the molds, and an opening in the tail-piece to receive the feed or supply pipe, substantially as and for the purpose described.

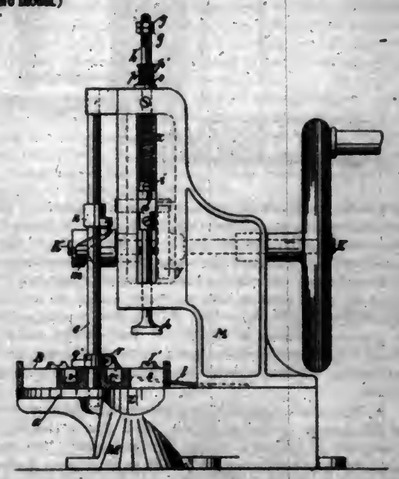


7. In a machine for making plastic tubes, the mold comprising the upper and lower part, said lower part being hinged, and both provided with longitudinal grooves or channels, substantially as described.

397,861. METHOD OF MAKING FLAT COILED SPRINGS. George Kelly, Chicago, Ill. Filed June 2, 1888. Serial No. 275,940. (No model.)

Claim.—The herein-described improvement in the art of making flattened spiral springs, the same consisting in winding the spirals upon a flat mandrel and then setting the same in their proper shape by pressure between a pair of pressure-imparting heads while such spirals are still upon the mandrel, substantially as set forth.

397,862. FRAME FOR POCKET-BOOKS OR OTHER ARTICLES. Michael Koehn, New York, N. Y., assignor to Simon Rinn, same place. Filed Nov. 30, 1888. Serial No. 292,195. (No model.)



Claim.—1. The combination, with a tubular frame and a torsional spring housed in said frame, of a catch provided with a tube extended at each end beyond the catch into a cylindrical journal adapted to turn with the catch in a part of the tubular frame, said spring extending through and secured to said tube, substantially as described.

2. The combination, with the tubular frame B of a bag or similar article, of the torsional spring F in the tubular frame, the tube H, flattened on the spring, and the catch D, mounted on the tube to leave the latter project at each end of the catch in the form of cylindrical journals, which are located and turn in parts of the tubular frame, substantially as described.

3. In combination with frame A, the frame B, formed with two parallel tubes extending down the sides, one tube containing the catch carrying torsional spring, having brace-arm G extending down one tubular side, and the other tube adapted to overlie the top and sides of frame A, substantially as described.

397,863. MACHINE FOR CRACKING AND SHELLING NUTS. Heinrich Kuhlmann, Carl Kuhlmann, and Heinrich R. Kuhlmann, Ginchstadt, Prussia, Germany. Filed Nov. 26, 1888. Serial No. 291,868. (No model.)

Claim.—The combination, substantially as herein specified, in a machine for cracking and shelling nuts, of a table, *a*, a frame or disk, B, containing chambers for the nuts, arranged upon said table, a hammer, A, the two springs *p x*, applied to the hammer, and means, substantially as herein described, for producing the rotation of the said disk or frame and for raising the hammer.

397,864. STENCIL-FRAME. Oscar W. Lindsey, Baltimore, Md., assignor of one-third to Oscar Frommel & Brother, New York, N. Y. Filed Nov. 10, 1888. Serial No. 290,453. (No model.)

Claim.—1. The combination, with the body A, having a slot, *b*, and longitudinal grooves *c* at each side thereof, of the guide-strips *d*, covering the grooves, and the hinged frame F, whereby the stencil-plates are pressed outwardly against the strips *d* and rigidly held, substantially as specified.

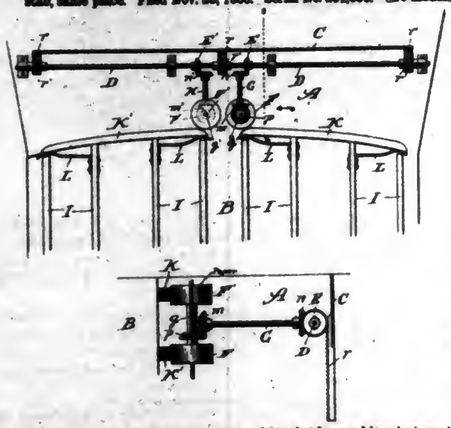
2. The combination, with the body A, having a slot, *b*, and grooves *c* at each side thereof, of the stencil-plates *a*, having flanges *a'*, adapted to fit in the grooves, the strips *d*, extending over the grooves, and the pressing-frame F and its fastening device, whereby the stencil-plates are confined in their seats, substantially as specified.

397,865. BOOK-BINDING. Thomas C. Love, Jr., Philadelphia, Pa. Filed Apr. 16, 1887. Serial No. 235,060. (Model.)

Claim.—1. In book-bindings, stitches passing obliquely through the signatures of a book from the side thereof to the back of the body and alternately on said side and back, substantially as described.

2. A book provided with stitches passing obliquely through the signatures from the sides thereof to the back of the body and alternately along said back and sides in parallel rows, substantially as described.

3. In book-bindings, stitches passing obliquely from the side of one outside signature through the same into the adjacent signature and out at the back of said adjacent signature, thence along the back of said signature and into the same, and obliquely passing through the same and the first signature and out at the side thereof, the said stitches alternating on the back and side, respectively, of said signatures and in the direction of their length, substantially as described.

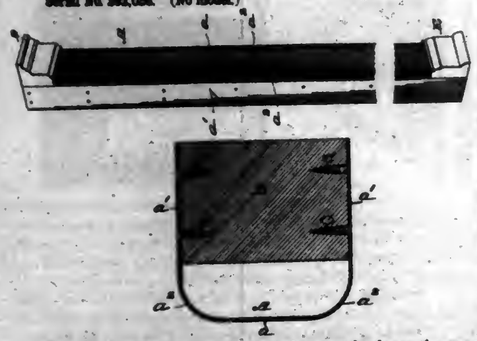


397,866. PARTITION-SUPPORT FOR PIGEON-HOLES AND DRAWERS. William Lumley, Chicago, Ill., assignor to Frances Lumley, same place. Filed Aug. 9, 1888. Serial No. 282,230. (No model.)

Claim.—1. The combination, with a desk, of a partition-support composed of sheet metal having parallel ribs struck up thereon, said ribs being flattened or struck down at the ends thereof, so as to close the spaces formed by said ribs without obstructing the grooves between the same, substantially as and for the purpose specified.

2. The combination with a desk the walls of which are provided with angular grooves, of partition-supports having ribs struck up thereon, said ribs being flattened or struck down at the ends thereof, so as to close the spaces formed by said ribs, but not obstruct the grooves therebetween, said flattened portion of the support being bent at an oblique angle thereto for insertion into the grooves in the desk-walls, substantially as described.

397,867. AUTOMATIC SAFETY-GATE FOR DRAW-BRIDGES. FERDINAND MARQUE, Austin, Ill., assignor of one-fourth to William Bodenstab, same place. Filed Nov. 23, 1888. Serial No. 291,638. (No model.)



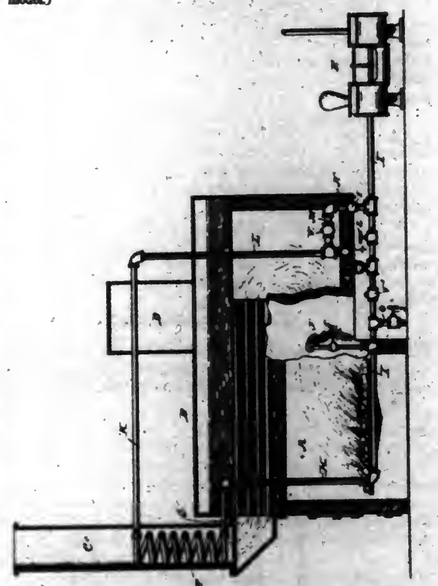
Claim.—1. In combination with a draw-bridge and its abutment, a safety-gate, and means for opening and closing it by the swinging of the bridge, comprising a barrier, C, transverse of the abutment, and having a rack, *r*, on one side, a rotary shaft, D, carrying a cog-wheel, *r'*, in mesh with the rack, friction-wheels F and F' at different horizontal planes on the abutment and geared to the shaft D, and convex plates K and K', supported on an end of the bridge, respectively at planes corresponding with those of the wheels F' and F, substantially as described.

2. In combination with a draw-bridge and its abutment, a safety-gate, and means for opening and closing it by the swinging of the bridge, comprising a barrier, C, transverse of the abutment, and having a rack, *r*, on one side, a rotary shaft, D, carrying a cog-wheel, *r'*, in mesh with the rack, friction-wheels F and F' at different horizontal planes on the abutment and geared to the shaft D, and yielding convex plates K and K', supported on an end of the bridge, respectively at planes corresponding with those of the wheels F' and F, substantially as described.

3. In combination with a draw-bridge and its abutment, a safety-gate, and means for opening and closing it by the swinging of the bridge, comprising a barrier, C, transverse of the abutment, and having at intervals on one side racks *r*, a rotary shaft, D, carrying cog-wheels *r'*, in mesh with the racks, and beveled gear-wheels E and E', friction-wheels F and F', supported on vertical axes on the abutment at different horizontal planes, beveled pinions *p* and *p'* on the same plane on the said axes, rotary shafts G and H, each carrying at opposite ends beveled gear-wheels, respectively engaging with the wheel E and pinion *p* and the wheel E' and pinion *p'*, and convex plates K and K', supported on an end of the bridge against springs and respectively at planes corresponding with those of the wheels F' and F, substantially as described.

397,868. PLATE-METAL COLUMN. FRANK MERKER, St. Louis, Mo., assignor to Merker & Brother, same place. Filed Nov. 27, 1888. Serial No. 292,026. (No model.)

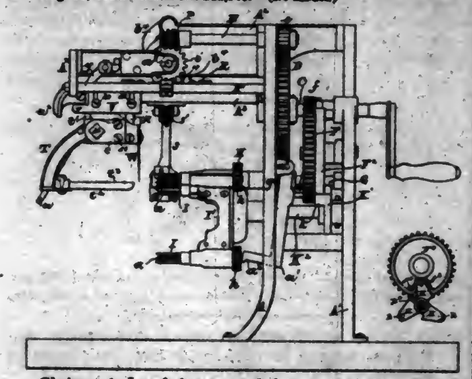
Claim.—1. The herein-described plate-metal column, the same consisting of the single plate A and the piece B, said plate forming the front and the sides of the column, and being shaped to form the rounded corners a^2 a^2.



2. The herein-described plate-metal column, the same consisting of the single plate A and the piece B, said plate being shaped to form the front and sides and rounded corners, as described, and said piece B being made to form the back of the column and to occupy the principal portion of the interior of the column, and being united to the column-sides, as set forth.

397,869. BAKING AND ROASTING PAN. JOHN R. MUNSON, Scranton, Pa. Filed May 25, 1888. Serial No. 275,083. (No model.)

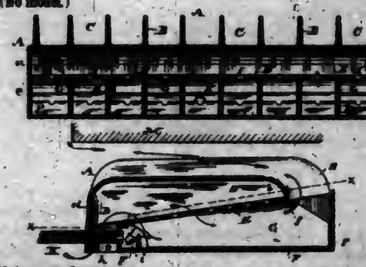
Claim.—The combination, in a baking and roasting pan, with the pan *b*, having a turned-over edge, *d*, of the pan *a*, having an L-shaped flanged edge, *d'*, and a turned-over edge at a^2, and provided with an opening at 2, the rigid wire-loop d^3, formed from the continuous stiffening-wire of the edge *d*, and a catch, *f*, substantially as specified.



397,870. FEED-WATER HEATER. WILLIAM HOSLE, Milwaukee, Wis., assignor of one-half to William H. Wolf and Thomas Davidson, both of same place. Filed July 27, 1888. Serial No. 281,317. (No model.)

Claim.—1. The combination, with the smoke-stack or chimney, the boiler, and the pump, of the coil so located in the stack or chimney as that its lower end will be below the water-line in the boiler, the main pipe leading from the pump, the feed-pipe connected with the main pipe and entering the boiler below the water-line, the pipes connecting the main pipe with the lower end of the coil, the pipe-connection placing the upper end of the coil in communication with the main pipe between the pump and the feed-pipe, a check-valve located in said pipe-connection, and a globe-valve located in the main pipe between the feed-pipe and the pipe-connection, for the purpose set forth.

2. The combination, with the smoke-stack or chimney, the boiler, and the pump, of the coil so located in the stack or chimney as that its lower end will be below the water-line in the boiler, the main pipe provided with a globe-valve and a check-valve between the feed-pipe and pump, the pipes connecting the main pipe with the lower end of the coil, the feed-pipe connected to the main pipe and entering the boiler below the water-line, and a series of pipes connecting the upper end of the coil with the main pipe between the globe-valve in said main pipe and the pump, one of the pipes of said series being provided with a check-valve and another with a globe-valve below the check-valve, for the purposes set forth.

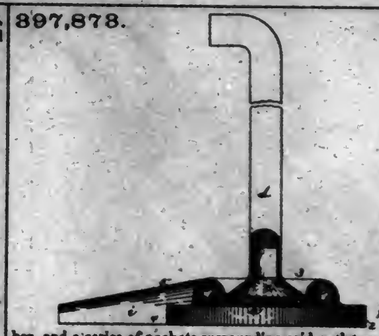


397,871. APPLE-PARER AND CORER. WILLIAM A. C. OARR, Antrim, N. H., assignor to the Goodell Company, same place. Filed Aug. 13, 1888. Serial No. 282,575. (No model.)

Claim.—1. In a fruit-parer, a fork, a paring-knife, and knife carriage, combined with the pivoted slotted cam-lever b^4 and a link, means to connect it with the knife-carriage, and with an arm or cam, *b'*, having a projection to act on the said cam-lever to move the knife-carriage positively in both directions of its movement, the return movement being the faster, substantially as described.

2. The rotating fork and the push-off rod therein, combined with the lever *a'*, having an inclined surface, as a^3, adapted to come into contact with the end of the push-off rod, and a cam to move the said lever and hasten the action of the rod, substantially as described.

397,872. HYDROCARBON-OIL BURNER FOR STOVES, &c. CHARLES H. PRENTISS, Cleveland, Ohio. Filed Jan. 3, 1888. Serial No. 259,731. (No model.)



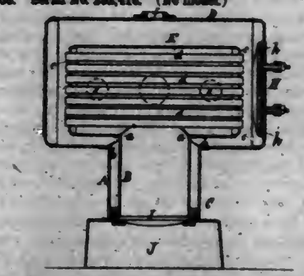
Claim.—1. In an oil-burner, the top plate, A, central perforated plate, E, the two forming an air-passage, D, said plate E having one or more partitions, G, forming flues H, in combination with the lower plate, F, having the trough J extending up therefrom, and an oil-supply pipe, substantially as described and shown.

2. In an oil-burner, the combination of the top plate, A, central plate, E, and bottom plate, F, said top plate provided with ribs B and flanges *a a* and *d*, forming a conduit, D, between A and E, said central plate perforated to form an open relation between said conduit D and an oil-trough at the inner front side of plate F, arranged substantially as and for the purpose set forth.

3. In an oil-burner, the top plate, A, central plate, E, having a series of partitions forming combustion-flues, and openings I, formed in said plate E, arranged as described, in combination with the lower plate, F, having the trough J extending up therefrom, in the manner and for the purpose substantially as set forth.

397,873. WASH-BOILER. THOMAS G. ROBINSON, Boston, Mass. Filed Apr. 2, 1888. Serial No. 269,222. (No model.)

Claim.—1. The improved fountain attachment composed of a base containing a chamber, a central outlet in the dome of said chamber, and a series of pockets surrounding said outlet and having their inner edges higher than their outer edges, whereby the pressure of steam in said pockets is directed inwardly on the water in said outlet, as set forth.



2. The improved fountain attachment composed of a base containing a chamber, a central outlet in the dome of said chamber, a series of pockets surrounding said outlet, and an elongated covered inlet-passage having its outer end lower than the inner sides of said pockets, as set forth.

3. The improved fountain attachment composed of the dome having the marginal supporting-flange, the annular arch, and the outlet surrounded by said arch, as set forth.

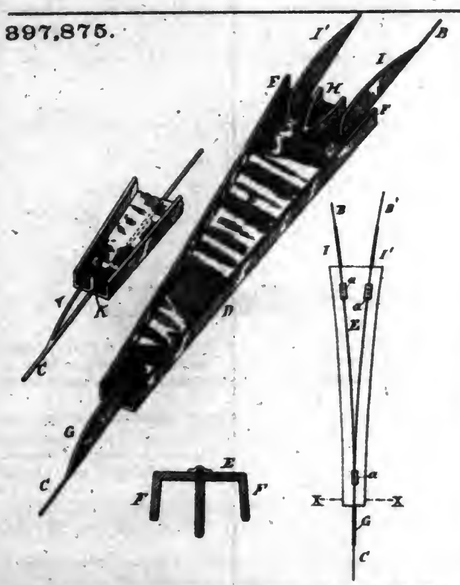
4. The improved fountain attachment composed of the dome having the marginal supporting-flange, the annular arch, the central outlet surrounded by said arch, and the inlet having its receiving end lower than the lower portion of said outlet, as set forth.

5. The improved fountain attachment composed of the dome having the marginal supporting-flange, the annular arch divided by partitions *g* into a series of pockets, the central outlet surrounded by said arch, and the inlet having its receiving end lower than the lower portion of said outlet, as set forth.

397,874. BOILER. ERGOM RUTHER, Brooklyn, N. Y. Filed Dec. 1, 1888. Serial No. 292,416. (No model.)

Claim.—The combination, in a boiler, of two upright cylinders, one of which, arranged within the other, constitutes a fire-chamber, two horizontal cylinders arranged one within the other, with the inner one in communication with the inner upright cylinder and the outer one in communication with the outer upright cylinder, a series of tubes running through the inner horizontal cylinder and opening into the outer horizontal cylinder, and an outlet-flue from the inner horizontal cylinder, the spaces between each inner cylinder and each outer cylinder and the interiors of said tubes all constituting water-spaces and the space within the inner horizontal cylinder and between the tubes constituting a combustion-chamber, substantially as herein specified.

397,875. OVERHEAD LINE FOR ELECTRIC RAILWAYS. FRANK J. SPRAGUE, New York, N. Y., assignor to the Sprague Electric Railway and Motor Company, same place. Filed Sept. 27, 1888. Serial No. 286,553. (No model.)



Claim.—1. In an electric railway, the combination, with crossing or branching overhead lines, of a switch-plate provided with depressing-ribs at its extremities, substantially as set forth.

2. In an electric railway, the combination, with crossing or branching overhead lines, of a switch-plate having guiding or deflecting ribs, and depressing-ribs at its extremities, substantially as set forth.

3. In an electric railway, the combination, with crossing or branching overhead lines, of a switch-plate having guiding-ribs at its sides and depressing-ribs at its extremities, substantially as set forth.

4. In an electric railway, the combination, with crossing or branch-

397,875.

ing overhead lines, of a switch-plate having side ribs which close it, except at points of admission or outlet for the traveling contact-wheel and depressing-ribs at such points, substantially as set forth.

5. In an electric railway, an overhead conductor having, in combination, a wire and a plate to which the wire is connected, and depressing-ribs at the ends of said plate, substantially as set forth.

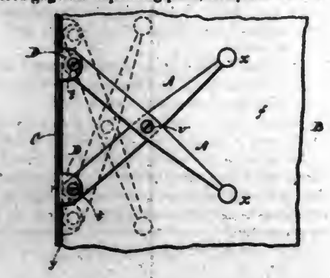
6. In an electric railway, the combination, with a continuous overhead wire, of a plate secured to said wire and provided with depressing-ribs, substantially as set forth.

7. In an electric railway, the turn-out plate for overhead conductors, consisting of a tapering flat plate having side ribs, a V-shaped deflecting-rib at its wide end, a depressing-rib at its narrow end, and two depressing-ribs at its wide end, substantially as set forth.

8. In an electric railway, the combination, with an overhead conductor for receiving an underneath contact, of a depressing-rib, substantially as set forth.

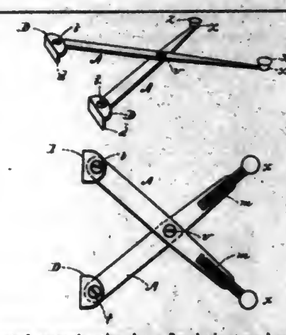
9. In an electric railway, the overhead switch-plate having deflecting-ribs which close it, except at openings for admission or outlet for the trolley and depressing-ribs at such openings, such openings being of about the same width as the trolley, substantially as set forth.

10. In an electric railway, the combination, with an overhead wire for receiving an underneath contact, of a switch-plate attached to said wire in about the same horizontal plane as said wire, and depressing-ribs at the extremities of said plate, substantially as set forth.



11. In an electric railway, the combination, with an overhead conductor for receiving an underneath contact, of a depressing-rib in line with said conductor, substantially as set forth.

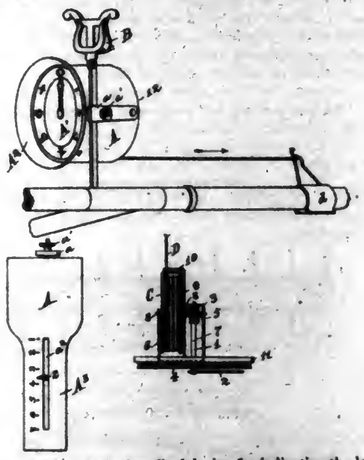
12. In an electric railway, the combination, with an overhead conductor for receiving an underneath contact, of a depressing-rib below said conductor and in line therewith, substantially as set forth.



397,876. PRINTER'S GAGE. CHARLES I. STORER, Boston, Mass., assignor to himself and Frank E. Fisk, same place. Filed May 7, 1888. Serial No. 273,090. (No model.)

Claim.—1. A feed-gage for a printing-press, composed of two arms centrally pivoted to each other by a fixed pivot and provided with attaching devices for securing them to the press.

2. A feed-gage for a printing-press, composed of two arms con-

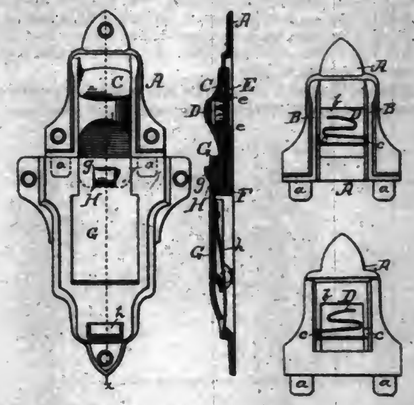


397,876.

trally pivoted to each other by a fixed pivot and provided with pivoted flanged lugs at their inner ends for attaching them to the press.

397,877. ATTACHMENT FOR MUSICAL INSTRUMENTS. EMIL W. SYLVAN, Savannah, Ga. Filed Sept. 27, 1888. Serial No. 286,624. (No model.)

Claim.—1. The within-described device for indicating the length of the withdrawal of the sliding tube of a trombone, which consists of a boxed volute spring connected to and inclosed within a drum, said spring being connected at its inner turn to the spindle of a pointer, in combination with an operating-cord wound round the periphery of the drum, said cord having a terminal clutch adapted to grasp the sliding tube of the instrument, whereby as extended the pointer will move along an indicating-scale on the face of the device, as and for the purpose intended, substantially as described.



2. As a new article of manufacture, a trombone-note indicator having on its face a visual scale and a pointer adjusted to point out on said scale the length that the sliding tube of the instrument is extended, said pointer operated by a cord having at one end a terminal clutch adapted to grasp the sliding tube externally, the opposite end of said cord being wound round an incased drum inclosing a boxed volute spring, whereby as said cord is distended the pointer will move along the indicating-scale, as and for the purpose intended, substantially as described.

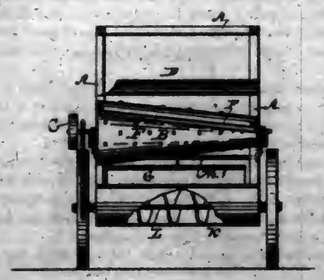
3. The within-described device for measuring the notes of a trombone by means of an indicating-scale, consisting of a casing, A, inclosing a drum, C, which surrounds a boxed volute spring, *c*, one end of said spring secured to the drum, the opposite end being fastened to the spindle 1 of a pointer, 2, said drum having wound round its periphery an operating-cord, D, led from thence outside of the casing, and having a terminal clutch, *d*, adapted to grasp the sliding tube of the instrument, all in combination with a face-scale having inscribed thereon suitable ordinals or analogous symbols that indicate the proper position the tube should rest in in order to produce a given perfect note, substantially as described.

4. The within-described device for removable attachment to a trombone, consisting of the following members, constructed, arranged, and adjusted as illustrated and described: a tubular casing, A, having an outer clip, *a*, supplied with a screw-nut, *a'*, said casing being supplied at one end with a dial, A', having peripheral indicating-scale covered with a transparent panel, A^2, and provided with a pointer. 2.

extending from the terminal end of a spindle, 1, a volute spring, *c*, inclosed within a box which is surrounded by a circumferentially-flanged drum, C, said spring fastened at its inner turn to an axial shaft, 8, screw-threaded at one end, meshing with a worm-wheel, 5, of the spindle 1, and plate 4, having parallel uprights 6 7, orificed for journaling therein the opposite ends of the axial shaft 8, substantially as described.

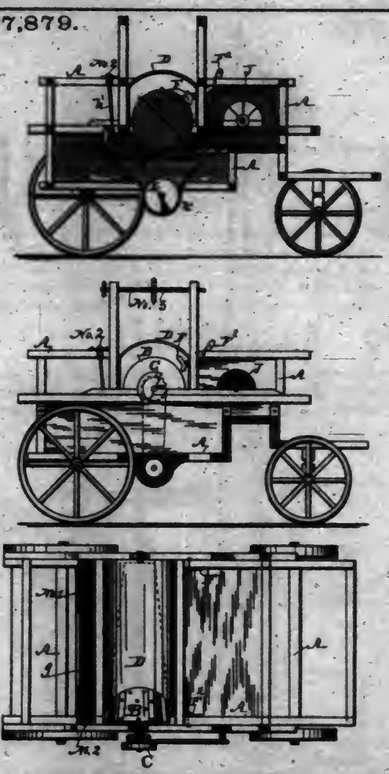
397,878. TRUNK-FASTENER. CHARLES A. TAYLOR, Chicago, Ill., assignor to John H. Sessions, Bristol, Conn. Filed Sept. 15, 1888. Serial No. 285,551. (No model.)

Claim.—1. In a trunk-fixture, the combination, with plate A, reciprocating bolt C, having a lug, *g*, projecting from its lower end, and a spring, D, of plate F and oscillating hasp G, having an opening, H, in the free end thereof.



2. In a trunk-fixture, the combination, with plate A, reciprocating bolt C, having a lug, *g*, projecting from its lower end and having a recess in its inner surface, and spring D, secured to plate A and located within said recess, so operating on said bolt as to push it toward the limit of its upward movement, of plate F and spring-actuated hasp G, hinged in the lower part thereof and having an opening in the upper end thereof, as set forth.

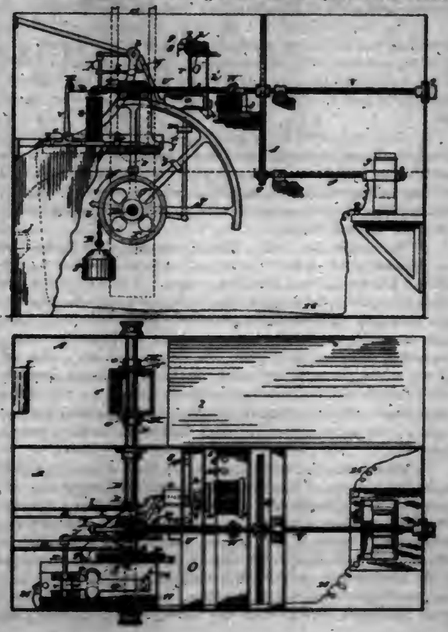
3. In a trunk-fixture, the combination, with plate A, having opening *b* therein, bolt C, having lug *g* projecting therefrom and having a recess in its under surface, spring D, secured to plate A and located within said recess, and plate E, connected to bolt C, as set forth, of plate F, hasp G, fulcrumed in the lower part thereof and having an opening, H, in its upper end, and spring A, as set forth.



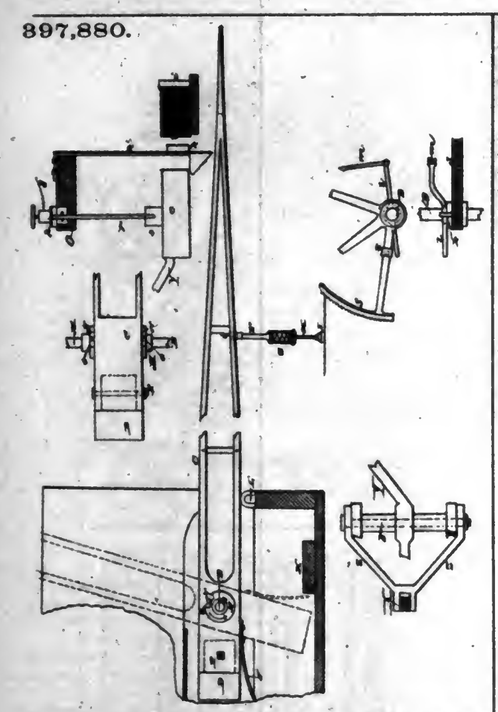
4. The combination, with plate A, provided with walls B B and a rectangular opening between them, bolt C, having lug *g* projecting from its lower end, and a recess, *d*, in the under surface thereof, spring D, secured to plate A, located within recess *d* and pressing said bolt upward, and plate E, connected to said bolt, of plate F and hasp G, fulcrumed in said plate and having an opening, H, in its upper end, and spring A, as set forth.

397,879. PORTABLE CORN THRASHER AND SEPARATOR. JAMES W. TIBBAN, New Sharon, assignor to Deere, Wells & Co., Council Bluffs, Iowa. Filed Mar. 1, 1888. Serial No. 265,894. (No model.)

Claim.—A carriage-frame having fixed sides and openings in the sides, a tapering toothed cylinder connected with said frame and the openings in said sides, an adjustable concave, and a fixed cover, arranged and combined to operate in the manner set forth, for the purposes stated.



397,879.



397,880. ELECTRICAL RAILWAY-GATE. MORTON TOULMIN, Baltimore, Md., assignor to the Toulmin Electric Railway Gate Company, same place. Filed Nov. 4, 1887. Serial No. 254,945. (No model.)

Claim.—1. The combination, with a pivoted gate-arm having a normal tendency to descend, of an electric motor, intermediate gearing connecting the motor with the gate-arm and controlling its descent and ascent, and an electric generator, circuits, and circuit-closers

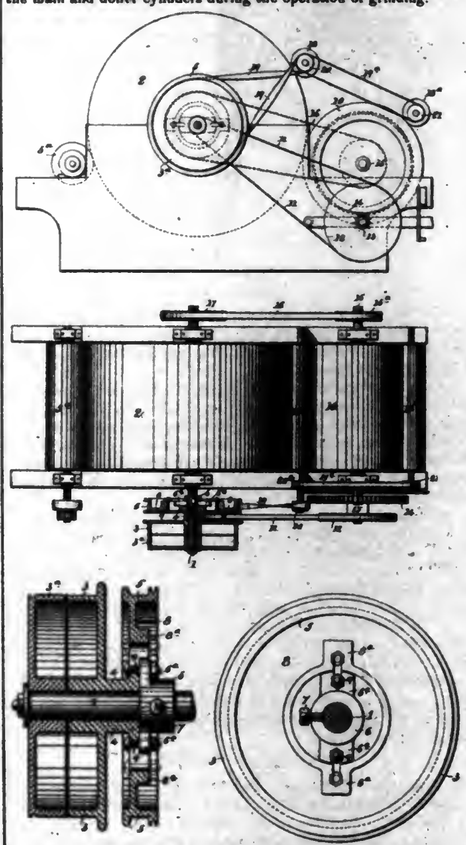
397,880.

which control said gearing and motor, whereby upon closing one of said circuits the gate-arm descends and upon closing the other the motor is actuated.

2. The combination, with the pivoted arm and means which normally tend to close it, an electric motor, and an electric generator, of gearing between the motor-shaft and the gate-shaft which elevates the gate when the motor is in operation and locks it against descent, a primary circuit, its magnet, and circuit-closer which unlock the locking parts of the gearing, a motor starting circuit and a magnet therein, a motor-circuit of which the armature of said magnet forms a part, a detent which engages said armature to maintain the motor-circuit, and cam mechanism to disengage them when the gate-arm rises.

3. The combination, with a gate-shaft, a pivoted detent, and intermediate cam mechanism which acts on the detent through the turning of the gate-shaft, of an electro-magnet, its armature, and an electric circuit maintained by said armature after its magnet has been momentarily energized until the cam mechanism releases it from the detent.

4. The combination, with a gong, a generator, and a gong-circuit, an electro-magnet, its circuit, its circuit-closer, and devices between said magnet and the gong-circuit which hold the latter open until said magnet is energized, of a pivoted gate and return mechanism actuated by said gate on its descent to act upon said intermediate devices and break the bell-circuit.



5. The combination, with a pivoted gate-arm, of an electric motor, a jointed worm-shaft, one section of which is geared to the motor-shaft and the free end of the other section of which is connected with a pivoted weighted arm, an electro-magnet whose armature sustains said arm and maintains the worm in engagement with a segment on the gate-shaft until said magnet is energized, mechanism actuated by said segment to return said arm to its position after the opening of the gate, a pivoted detent in the motor-circuit, provided with a cam-lever, an electro-magnet whose armature is also in the motor-circuit, which it completes when said magnet is energized, and a cam on the worm-segment to break said circuit as the gate-arm rises.

6. The combination, with a pivoted gate-arm and means normally tending to close it, of an electric motor, intermediate gearing connecting its shaft with the gate-shaft, devices which maintain said connection, an electro-magnet which, when energized, breaks said connection, allowing the gate to descend, a circuit and circuit-closer of said magnet in advance of the crossing, return mechanism actuated by the descent of the gate which re-establishes said connection, a detent, an electro-magnet whose armature, when said magnet is energized, electrically contacts with said detent, cam mechanism which breaks said contact as the gate-arm rises, a circuit-closer beyond the crossing, a motor-starting circuit between said closer and the last-named magnet, and a motor-circuit composed in part of said armature and detent, the circuit-closers being located near a railway-track, and an electric generator for said circuits.

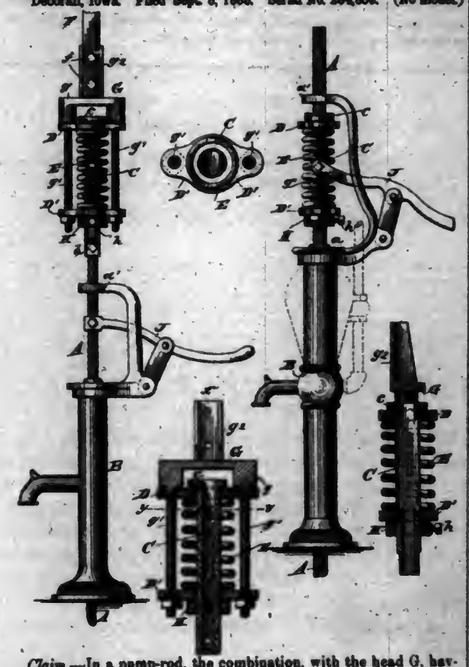
7. The combination, with a pedestal and a pivoted gate-arm mounted therein, of an electric motor and intermediate gearing between the said motor and the gate arranged to actuate the gate-arm through the motor by the application of electric currents to the motor, whereby the movements of the gate are controlled by electro-motive force through mechanical instrumentalities.

397,881. DRIVING APPARATUS FOR CARDING-ENGINES. EDMUND TWEEDALE, SAMUEL TWEEDALE, and CHARLES MILLS, Accrington, County of Lancaster, England, assignors to John Bullough, same place. Filed July 9, 1888. Serial No. 279,383. (No model.) Patented in England Apr. 27, 1886, No. 5,671.

Brief.—The object of the invention is to impart a slow motion to the main and doffer cylinders during the operation of grinding.

Claim.—1. In combination, the cylinder 2, the main driving-shaft 1, a pulley, 3, a detachable connection between said pulley and the main shaft 1, said pulley having a supplemental pulley, 4, a pulley, 17, rigidly secured to the shaft 1, and the intermediate driving-connections between the pulleys 4 and 17, whereby the main shaft and cylinder may be driven indirectly and at a slow rate of speed through the pulleys 4 and 17 and intermediate connections, substantially as described.

2. In combination, the main shaft, the pulleys 3 and 5, with the connecting boss or pulley between them, a fixed collar or boss, 6, on the main shaft having slots, and the movable bolts 9, the pulley 5 being slotted to receive the bolts, substantially as described.



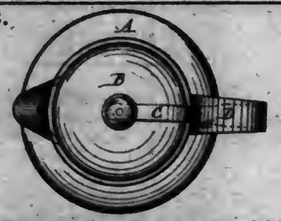
3. In combination, the main shaft, the cylinder 2, the pulley 3, a detachable connection between said pulley and the main shaft, a supplemental pulley, 4, the doffer-shaft 15, and driving-connections between the doffer-shaft and the pulley 4 and between the doffer-shaft and the main shaft 1, substantially as described.

4. In combination, the main shaft, the cylinder 2, the pulleys 3 and 5, a detachable connection between said pulleys and the main shaft, and a supplemental pulley, 4, the doffer-shaft 15, driving-connections between the doffer-shaft and the pulley 4 and between the doffer-shaft and the main shaft 1, the roller 18, and belt 19, substantially as described.

5. In combination, the main shaft 1 and shaft 15, the pulleys 3 4 5, a detachable connection between said pulleys and the main shaft, the belt 11, the pulley 12, gear-wheels 13 14, the grinding-roller 18, the belt 19, the pulleys 15ª and 17, and the belt 16, substantially as described.

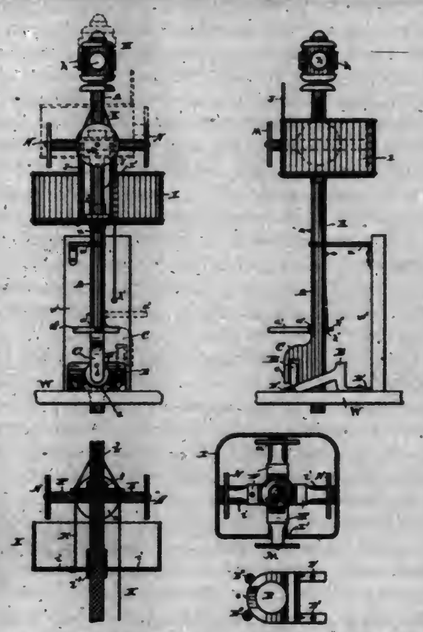
6. In combination, the main shaft, the cylinder 2, the pulleys 3, 4, and 5, a detachable connection between said pulleys and the main shaft, a pulley, 17, fixed on the main shaft, the doffer-shaft and doffer, connections between the pulleys 4 and 17 and the doffer-shaft, the grinding-rollers 18 and 18ª, and the belts 19 and 19ª, substantially as described.

397,882. PLUNGER-ROD FOR PUMPS. WALTER C. WESTAWAY, Decorah, Iowa. Filed Sept. 3, 1888. Serial No. 284,859. (No model.)



Claim.—In a pump-rod, the combination, with the head G, having a recess in its lower face and two depending rods, g' g', of the two plates D D', having end apertures through which said rods pass, and also having aligned central apertures, the nuts on the lower ends of rods g', the section C, extending up through said central apertures and having a flange, *c*, on its upper end above the top plate, D, and within the recess in the head, the collar on the section C under plate D', and a single coiled spring on the section C, between the two plates D D', and alternately compressed thereby, substantially as set forth.

397,883. COFFEE OR TEA POT. LUTHER S. WRIGHT, Groton, N. Y., assignor of one-half to Duncan McLachlan, same place. Filed Feb. 15, 1888. Serial No. 264,147. (No model.)



397,888.

Claim.—The combination, with the pot A and lid B, hinged thereto, of the handle D, fastened at both ends to the pot and provided with the slot *a*, and the lever C C', rigidly secured to the lid, passing through the aforesaid slot and curved to correspond to the under side of the handle and lie in proximity thereto when the lid is closed.

397,884. RAILWAY-SIGNAL. JOHN D. YARRINGTON, Lexington, and HENRY D. SHANKLIN, Clark County, Ky., assignors to said John D. Yarrington. Filed Sept. 29, 1888. Serial No. 286,738. (No model.)

Claim.—1. The combination of a vertically-movable rod, a supporting-roller therefor, and a cam-block, B, upon which said roller moves, with the safety and danger semaphores mounted on said rod, and the vertically-movable shield adapted to cover the danger-semaphores when raised, all constructed and arranged substantially in the manner and for the purpose described.

2. The combination of a supporting-rod and the semaphores mounted thereon, the roller supporting said rod, and the annular cam-block B, supporting said roller and having a locking-notch, *e*, with a vertically-movable shield adapted to be shifted to cover the danger-semaphores, all constructed and arranged substantially in the manner and for the purpose described.

3. The combination of the movable rod, its supporting-roller and cam-block B, substantially as described, with the semaphores on said rod, and the vertically-movable shield, all constructed and arranged substantially in the manner and for the purpose described.

4. The combination of a vertically-movable rotatory rod and its supporting-roller with a cam-block traversed by said roller, and having a notch engaging said roller to hold the rod in normal position, all constructed and arranged substantially in the manner and for the purpose described.

5. The combination of the rod A, its roller and the cam-block, with the semaphores mounted on said rod, the shield mounted thereon and having guide-rods, and the devices for operating said shield, all constructed and arranged to be operated substantially in the manner and for the purpose specified.

REISSUES.

10,985. GAS-BURNER. CORNELIUS B. TODD, Pittsburg, Pa., assignor to the Campbell Burner Company, (Limited,) same place. Filed June 19, 1888. Serial No. 277,595. Original No. 370,107, dated Sept. 20, 1887.

Claim.—1. In an illuminating-gas burner, the combination of a burner comprising a pipe for supplying gas without air, and having lateral jet-openings, and a reticulated or perforated plate situated below the jet-openings of the burner, the mesh or perforations being sufficiently fine to break the ascending currents of air and heat the same, substantially as and for the purposes specified.

2. In a gas-burner, the combination of the burner *b*, having lateral jet-openings *c*, and an air-chamber having a perforated top situate below the jet-openings of the burner, so that the air-chamber shall be adjacent to the burner and arranged to heat the air, substantially as and for the purposes described.

3. In a gas-burner, the combination of the burner *b*, having a central deflector, *i*, and jet-openings *c*, situate below the deflector, and cup-shaped perforated disks *e* and *h*, arranged below the jet-openings of the burner and the deflector, so as to form an air-chamber adjacent to the burner and arranged to heat the air, substantially as and for the purposes described.

4. In a gas-burner, the combination of the burner *b*, having a central deflector, *i*, and jet-openings *c*, situate below the deflector, separated perforated disks *e* and *h*, and interposed disk *g*, arranged below the jet-openings of the burner and the deflector, so as to form an air-chamber adjacent to the burner and arranged to heat the air, substantially as and for the purposes described.

PHOTO LITH NORRIS PETERS WASHINGTON D.C.

ANNUAL REPORT

OF THE

COMMISSIONER OF PATENTS

TO CONGRESS,

FOR THE YEAR ENDING DECEMBER 31, 1888.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., January 31, 1889.

To the Senate and House of Representatives of the United States of America in Congress assembled:

It is provided by section 494 of the Revised Statutes that—

The Commissioner of Patents shall lay before Congress in the month of January, annually, a report giving a detailed statement of all moneys received for patents, for copies of records or drawings, or from any other source whatever; a detailed statement of all expenditures for contingent and miscellaneous expenses; a list of all patents which were granted during the preceding year, designating under proper heads the subjects of such patents; an alphabetical list of all the patentees, with their places of residence; a list of all patents which have been extended during the year, and such other information of the condition of the Patent Office as may be useful to Congress or the public.

Since the date of my last report there has been little or no change in the conditions under which this Bureau existed. The country has passed through an exciting Presidential election, which, together with the consideration of political and economical questions involved, invariably attracts not only the attention of the people, but Congress itself, for months before as well as after the event, from matters of serious import in relation to many matters of public importance. Such appears to have been the result with reference to many needs of the Patent Office in relation to its business affairs as well as changes and modifications in the patent laws. The suggestions I then made were deemed pertinent to the condition of the Office, and as the conditions have changed only in becoming more pressing and urgent, I feel authorized in renewing them.

There are certain subjects which I regard as of paramount importance, to which the attention of Congress should be directed in order that appropriate legislation may be enacted, with a view to improving the law applicable to patent property and the condition of the Patent Office for the commodious and expeditious transaction of the public business.

ROOM IN THE PATENT OFFICE.

For several years past the annual reports of my predecessors have called the attention of Congress to the utter inadequacy of room and facilities for conducting the business of the Patent Office. This building, I am advised, was constructed from the fund of the Patent Office—a fund which was not raised by taxation upon the people, but was an accumulation from fees paid in by the inventors of the country, and it may not be inappropriate to say that the inventors themselves, as well as their representatives, attorneys, and others, are properly insisting upon the idea that this building ought to be at least so far devoted to the business of the Patent Office that ample room will be provided for its conduct, and facilities afforded which will secure the consideration of applications for patents and the issuance of the same without unnecessary delay, expense, or inconvenience. But the building is now occupied by the Secretary of the Interior, the Commissioner of the General Land Office, and the Commissioner of Patents. The result is, owing to the increase in business of the Government in each of these various branches, that neither the Secretary of the Interior, the Commissioner of the General Land Office, nor the Commissioner of Patents has sufficient room to conduct the business with the dispatch and promptness which the public is entitled to expect. The various divisions of the Patent Office are crowded into narrow, inconvenient, and, in many instances, unhealthy limits. The records and drawings and other material, which should be conveniently arranged and made accessible in proper rooms, are stored in corridors and by-way places, where classification is almost impossible, and where access can only be had to the particular subjects desired after long search and delay. Not only this, but great quantities of valuable records, descriptions, specifications, and drawings are constantly exposed to the danger of conflagrations involving the safety of the entire building. It needs only an examination or investigation to demonstrate the absolute necessity that exists for making some change in the arrangement between the bureaus occupying this building in order that each shall have proper room and facilities to discharge its respective functions. The force under the control of the Commissioner of Patents is scattered and located in remote parts of the building on different floors to such an extent that in order to communicate with the various divisions, transfer records back and forth, and conduct the business, much more time and a greater amount of labor are required than would otherwise be involved. If some arrangement could be made by which the force could be located conveniently and compactly, in my judgment almost if not quite enough could be saved in the curtailment of expenses and saving of time to provide for the rental of another

building which would meet the demands of either one of the other bureaus mentioned.

The Commissioner of Patents is not possessed of sufficient information to suggest what arrangement should be made, or whether it would be advisable for the Government to rent other buildings in which to locate any one of the bureaus, or whether such bureau should be transferred to some other of the public buildings; but the fact is pointed out that the Commissioner of Patents ought at least to be furnished in a building constructed out of the patent fund with sufficient room to conduct the business of the Patent Office conveniently, expeditiously, and without delay to its patrons.

I most urgently call the attention of Congress to this subject and request consideration.

OFFICIAL GAZETTE.

Under the present statute the Patent Office publishes 6,500 copies of the OFFICIAL GAZETTE, of which 2,265 copies are sold and delivered upon subscription at the price of $5 per year. Under the provisions of the act of May 18, 1872, 3,221 copies are distributed to public libraries, members of Congress, and public officers. This publication is one of the most useful and complete of the kind which has ever been published. Its usefulness and importance are well known to Congress, and need not be dwelt upon. It will not be inappropriate, however, to call attention to the mechanical features of the publication, the requirements involved for photolithography, and the method of printing the same. This work contains a complete illustrated and defined history of art, so far as covered by patents, in the United States, from the time of its first publication down to the present day. As is well known, the drawings which accompany every application for a patent are necessarily required to be reproduced and made a part of the patent itself when it is issued. Under the present system this photolithographic copy of the drawing, reduced in size, is published by the Office to meet a demand for copies coming from all parts of the United States and from foreign countries. It is not within my power at present to state the number of copies of patents, specifications, and drawings which are called for; but the demand is great, and the charges made for these copies furnish an important source of revenue to the Office. In order to meet this demand it is necessary, as just stated, that the drawing be reproduced of a size requisite to be made a part of the patent and to be conveniently sent to persons requiring copies. This involves the necessity of employing photolithography. It may not be generally known that the OFFICIAL GAZETTE, excepting the front and closing pages, containing opinions and decisions of the courts and the Commissioner and the index, is a purely photolithographic production. The pages containing the drawings and the claims in type are photolithographed.

For several years Congress has appropriated about one hundred and thirty thousand dollars per year to provide for the production of copies of patents, designs, trade-marks, pending applications, and for the reproduction of exhausted copies. This photolithographing is required by statute to be done by contract. On several occasions experiments have been made to have this work done elsewhere than in the city of Washington; but in every instance of which I am aware the experiment proved a failure, the work either not being up to the required standard of excellence or being so delayed as to practically interfere with the work of the Office and prevent the prompt issuing of patents. The inconvenience attending these experiments has been so serious that for several years Congress has inserted in the appropriation bills the requirement found in the act approved March 3, 1885, as follows:

> Said photolithographing or otherwise producing plates and copies referred to in this and the two preceding paragraphs to be done under the supervision of the Commissioner of Patents, and in the city of Washington, if it can be there done at reasonable rates; and the Commissioner of Patents, under the direction of the Secretary of the Interior, shall be authorized to make contracts therefor.

The contracts entered into for the performance of this work have generally been made to run from the beginning to the expiration of the fiscal year. Prior to the 30th of June, 1887, the present Commissioner directed an inquiry to be made, and sent an agent to the principal Eastern cities to ascertain at what rates work of this character could be done in those cities, and received what is believed to be entirely reliable and satisfactory information that the rates fixed by the present contract for doing this work are below those which would be demanded elsewhere.

To explain in greater detail the usefulness and manner of conducting this photolithographic work, I quote from the report of my immediate predecessor:

> Under the practice which now obtains in this Office, on Friday morning of each week preparations are begun for the patenting of all applications which have been allowed and in which the final Government fee has been paid during the week next preceding. To secure a proper reproduction of such cases, it is necessary that the original drawings be transmitted to the Office where the work of photolithographing is performed. On each Friday morning the drawings which are ready are sent to the photolithographer, where the proof-sheets are prepared. At noon of the same day these are returned to this Office and another lot of drawings taken. About four o'clock of the same day proof-sheets of these last-mentioned drawings are returned, and other drawings again taken; and so this work of photolithographing continues day by day. Upon the return of the proof-sheets to this Office careful comparison with the original drawing must be made by the employés here, and imperfect sheets (which amount to about five per cent. of the whole) must be corrected and returned without delay.
>
> From the fact that the *original* drawings must be sent to the photolithographer for reproduction, and when it is considered that these drawings constitute the only illustrated record in the Patent Office of the inventions involved—as under the present rules of the Office models are dispensed with—it is apparent that any loss or damage thereto would not only greatly embarrass the Office, but result in serious injury to inventors. Doubtless, in view of these considerations, a requirement was inserted in the present contract that the original drawings and corrected proofs must be returned to the Patent Office within one and one-half day from the delivery to the contractor of such original drawings.
>
> It is not absolutely impracticable that the work of preparing the OFFICIAL GAZETTE be performed elsewhere than in this city, provided the place be not too remote. This undoubtedly would be attended at times with serious inconvenience. For manifest reasons, however, the work of preparing the current issues of patents must be done in this city, and the proper reproduction elsewhere is simply impracticable, if not impossible. Inasmuch as proof-sheets of the photolithographs of the current issues are used in the preparation of the OFFICIAL GAZETTE, it need hardly be said that this work *entire* can probably be more cheaply performed by one firm than by several independent firms or contractors.
>
> I have no doubt that all this work should and will in time be done by the Patent Office itself. It should not be dependent upon contractors. When the patent system is revised, corrected, and improved, as it probably should and doubtless will be in the not distant future, this important subject will be at least carefully considered.

The appropriation of Congress for the present fiscal year was—

For OFFICIAL GAZETTE	$44,000
For copies of patents, designs, trade-marks, exhausted copies, &c.	90,000

LABORATORY.

The attention of Congress has been in former reports of the Commissioners of Patents repeatedly called to the need in this Bureau of a laboratory containing the necessary apparatus for testing inventions relating to electricity, and to conduct experiments pertaining to processes and products involving chemical results. This necessity is one which scarcely needs illustration or explanation when it is considered that many of the most important and valuable inventions relate to these two classes of art. Electrical processes and apparatus—such as the telephone and improvements in telegraphy—are so well recognized in importance and value as to require no comment, and yet the determination of whether a new invention has been made in these arts, or an improvement involving novelty and utility, can be reached only by means of proper testing apparatus. This is also especially true in the field of chemistry—processes for the treatment of iron, producing by chemical means new qualities, and resolving crude iron into fine steel. Such subjects are being continually presented, and the examiner in charge is called upon to determine whether these results are accomplished by the processes claimed. The assertions of the applicants are supported by affidavits of parties in interest and by statements which appear to be reliable, and yet, in the absence of some means of testing the truth of the facts claimed, it is impossible for the Office to determine with that degree of certainty which should exist whether the invention is novel and useful and should be covered by a patent.

I recommend that some reasonable appropriation be made to provide for the purchase, from time to time, of apparatus and material suitable for a laboratory for these purposes.

EMPLOYÉS.

The business of the Patent Office is constantly increasing. Occasionally there is a slight falling off in the number of applications for patents; but this continues for a time only, when the increase begins again. The number of patents issued, however, is not an accurate criterion of the amount of business done in the Office. The examination of an application for a patent involves an examination of the state of the art for the entire world. The issuance of patents, as well as other publications, constitute *prima facie* a bar to an application the same as the issuance of a patent for the same invention in this country does. Consequently the mass of matter to be examined by the examiner in each class of art is increased each year by the patents and publications of the year. The field to be investigated and examined grows in extent year by year, increasing the time and labor requisite for a proper examination of an application for a patent. Besides this, the demands upon the Office for certified copies of records and drawings and for copies of patents are constantly increasing. The number of assignments and other instruments sent to the Office for record is also increasing, and the correspondence is accordingly increased. The number of applications requiring examination which were received during the last year was 41,351, which, in round numbers, averages 800 per week. The number of patents and certificates of registration of labels and trade-marks during the same period was 21,892, averaging 421 per week, showing a percentage of not quite fifty per centum of rejected applications. It is evident that the number of applications will hereafter increase, as well as the general business of the Office. To transact this large and important business requires the necessary force and the requisite room and facilities. I have already referred to the crowded condition of the force in the Patent Office. The model-room, which originated in the suggestions of Thomas Jefferson, who insisted that the Government should establish a museum showing and illustrating the progress and advance of art from the beginning of the Government, has been curtailed and limited by the construction of rooms for examiners. The scientific library is packed and crowded within such narrow limits that its usefulness is greatly impaired. By the last appropriation made by Congress for the Patent Office the Commissioner was authorized to appoint two additional Principal Examiners to enable the organization of new divisions in the Office. It was not until the latter part of November that a room could be secured for carrying into effect this provision.

In my last annual report, resting under the confident expectation that the Bureau of the Land Office would be removed and additional room and facilities extended to the Patent Office, I expressed the belief that, with the increased advantages, the present force would be competent to transact the business and keep up the work; but the changes contemplated did not occur, and to-day the conditions are less favorable than before. The necessity for largely-increased room is not limited alone to the business, but the health and ordinary comfort of the employés are seriously involved. As heretofore stated, a great number of the rooms occupied by the employés are poorly ventilated, unhealthy, and are only adapted for storage.

LEGISLATION.

Attention was called in the Commissioner's last report to Congress to certain changes and modifications of the statutes relating to patents. Since such time experience has only confirmed me in the propriety of my former suggestions, and I herewith renew them in connection with others.

1. *Date of the patent.*

Section 4885 Revised Statutes provides—

> Every patent shall bear date as of a day not later than six months from the time at which it was passed and allowed and notice thereof was sent to the applicant or his agent; and if the final fee is not paid within that period the patent shall be withheld.

This provision enables an applicant who fails to pay the final fee within six months after the allowance of his application to prolong the monopoly of his patent the period of six months, and it not infrequently occurs that parties having what they regard to be valuable inventions permit their applications to forfeit in order that they may avail themselves of section 4897, which allows them to make a renewal application for the same invention upon the payment of a new fee, but without filing any new papers, the original application, specification, and drawings being used. A new allowance is thus obtained of an application for the same invention, and this allowance may remain for six months after the expiration of the intervening two years before the party takes out his patent. The result of this practice is that, unless the

application is barred by a public use which may intervene, an applicant has it in his power under these statutes to prolong the term of the patent which he may secure for an almost indefinite period.

I respectfully suggest that section 4885 be amended so as to require that the term of the patent when issued shall begin with the date on which the application was passed and allowed, and notice thereof sent to the applicant or his agent, applicant of course being allowed six months within which to pay the final fee and take out his patent, and that all renewals authorized in case of a forfeiture for non-payment of final fee be limited to the same claims, except in case of inadvertence or mistake, and that when so renewed the term of the patent begin with the date of the original allowance. The justice of this provision, as well as its wisdom, will be apparent from a consideration of the fact that in issuing the patent there arises by implication a contract between the Government on the one hand and the patentee on the other that the latter shall have the exclusive enjoyment of the patented property for a definite period, at the expiration of which period the property becomes that of the public. The United States extends to patentees more liberal protection and for a longer time than any other Government—17 years—and it is neither just nor right to the public which is thus liberal and generous that there shall be found under this legislation methods by which the inventor can defeat the provisions which contemplate a termination of the monopoly, and be able to prolong its enjoyment for many years beyond the period contemplated by law.

2. *Limitation of term of United States patent by foreign patent.*

Section 4887, after declaring that no person shall be debarred from receiving a patent in this country for his invention or discovery, nor shall any patent be declared invalid by reason of the invention having been first patented or caused to be patented in a foreign country, provides—

> But every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent, or, if there be more than one, at the same time with the one having the shortest term, and in no case shall it be in force more than seventeen years.

It is understood that the object of this legislation orginally was to prevent an inventor from allowing the people of foreign nations to come into the free enjoyment of his invention at an earlier period than was permitted the people of our country, which earlier enjoyment resulted from the fact that the term of American patents, as just stated, is much longer than any allowed by foreign governments, so that it was impossible for an American inventor to take out a foreign patent without disclosing and making public his invention after the expiration of the shorter term in such foreign country. In the meantime the American people were excluded from the free enjoyment of the invention during the period intervening between the expiration of the foreign patent and the American patent. But I believe those conversant with the subject have never seen any wisdom in this provision of the law. A great deal of trouble and annoyance have resulted from it to inventors, both American and foreign, without, so far as is known, advantaging any one.

It is evident that the American patentee is entitled to 17 years of protection under the patent granted him by this Government. There ought to be no distinction between an American inventor who takes out a patent at home but none abroad and one who takes out patents in both his own and some other country. Yet the American patentee who omits to take out a patent abroad makes his invention public and free in all the countries of the world during the entire period, because his American patent becomes a publication which discloses the invention and prevents him from taking out any patents in foreign countries under the systems existing there, so that in such cases the people of foreign countries acquire the free use of an invention from the date of its publication in America, while the people of America submit to the monopoly enjoyed by the patentee during the entire period of 17 years. The consequence of these conditions is that if the American patentee takes out his foreign patent first his domestic patent is limited in term to the short duration of the patent abroad. If, on the other hand, he takes out his American patent first, he is barred from taking out any patent under the foreign systems, which provide that any publication of a patent shall bar a patent in those countries. This inequity of the law has forced inventors both in America and abroad, at much trouble and expense, to arrange, wherever it was possible, to have their foreign and domestic patents issue on the same day, so that neither of the conditions alluded to could attach.

It is also suggested, in view of the fact that the number of Americans taking out patents abroad very largely exceeds the number of foreigners who take out patents in this country, that these conditions of law have operated much more disadvantageously to Americans than to foreigners, and that therefore there should be some modification in the law.

These difficulties and others which need not be elaborated in this connection have become so well recognized, for they not only exist between Americans and foreigners, but between the different nations of Europe as well, that for some years past representatives of various governments have met together for the purpose of adopting and establishing articles of an International Union for the Protection of Industrial Property. Conventions were held in Rome and at Paris, and finally articles of a union were adopted on the 20th of March, 1883, acceded to by Belgium, Brazil, Spain, France, Guatemala, Italy, the Netherlands, Portugal, Salvador, Servia, and Switzerland, the latter state being assigned the position of intermediary, through whom those adhering to the Union were to communicate with other States in relation to its objects. Subsequently other states gave their adhesion and became members of the Union, viz: Great Britain, Tunis, Norway, Sweden, the Dominican Republic, and the United States. (A copy of the articles and protocols constituting this Union is attached to the last annual report of the Commissioner of Patents to Congress.)

The adhesion of the United States to this Union was ratified on March 29, 1887. The purpose of this Union is to provide that persons who have made applications for patents in one of the States of the Union shall have a definite period thereafter within which to file their applications in other countries as of the same date at which their original applications were filed, and that no publication or use of the invention during that period can deprive the applicants of their right of priority in all the States in which such applications were filed. It will be seen that this provision was intended to meet one of the very difficulties existing under section 4887 of the Revised Statutes, and which was heightened by the requirement that the term of the American patent should be limited by any patent issued to the patentee in foreign countries.

The advantages to American citizens under this Union are set forth in Article 4 of the Convention, to the effect that any person who has filed an application for a patent, or who has applied for the registration of a Trade-Mark in the United States, shall be entitled to priority in other countries of the Union as against persons making similar applications within a period defined. A person having applied for a patent in this country is entitled to have his case considered, if filed in another country, the same as if filed simultaneously with the application here.

There is great advantage in this in all countries where the patent is granted to the first applicant, which is generally the case in Continental Europe and England; but it unfortunately happens under section 4887 that every patent granted in this country for an invention which has been previously patented in a foreign country is limited to expire with the foreign patent having the shortest term. It is well known that under the American system an examination of all applications must be made before the patent issues, and generally five, six, or seven months elapse after an application is filed before patent issues. The result is that the American inventor who desires to avail himself of the advantages of the treaty is in danger of having his foreign patent granted first, for the reason, as just stated, that such foreign patent issues almost immediately after the application is filed, and therefore necessarily the term of his domestic patent is abridged by it.

This is the manner in which this condition of things affects the American inventor; but the foreign inventor who comes to this country for a patent is not thus injuriously affected, because there is no provision under the European system that their patents shall be limited by the duration of an American patent; and if there were such, it would produce no limitation, because the American term, as already stated, is generally much longer than the terms provided by most of the European States. In my opinion, there is no reason for continuing this limitation contained in the last clause of section 4887. While it stands it is almost a complete bar to the enjoyment of the privileges of this Union between the various States named and the United States. The repeal of this clause has been suggested in the reports of the Commissioners heretofore. It is a source of much vexation to the inventors and of trouble to the Patent Office; it is out of harmony with the spirit of our patent law, and, in my judgment, it ought to be repealed.

3. *Caveats.*

Under section 4902 of the Revised Statutes, relating to caveats, it is provided that any citizen of the United States may file a caveat; also, that "an alien shall have the privilege herein granted if he has resided in the United States one year next preceding the filing of his caveat, and has made oath of his intention to become a citizen." Here is a denial by implication of the right of an alien who has not been a resident and made oath to file a caveat. But under the treaty or International Union, above mentioned, there is an express provision giving to citizens and subjects of foreign States the same rights and privileges with respect to industrial property that are by such foreign States, members of the Union, extended to the citizens of other States members thereof. It may well be doubted whether this treaty can effectuate itself as a law and authorize the citizen of one of these foreign States who has not resided here one year and made the oath to file a caveat, although by the law of such foreign State the privilege is freely extended to an American citizen. I recommend that section 4902 be so amended as to provide that so long as the United States remains a party to said International Union and said provision remains in force citizens of the States members of said Union which extend the same privilege to American citizens may be allowed to file caveats in the Patent Office without regard to residence or oath.

4. *Assignments of patents.*

Section 4898 provides that an assignment, grant, or conveyance shall be void as against any subsequent purchaser or mortgagee for a valuable consideration without notice unless such instrument be recorded in the Patent Office within three months from the date thereof. In my opinion, this requirement operates unjustly in providing that an assignment, if recorded after three months from the date thereof, shall have no effect as constructive notice to a subsequent purchaser or mortgagee for a valuable consideration. This provision, in my judgment, should be modified so as to declare that while the assignment should be valid without recording for the period of three months from and after its date, thereafter it should be void against any subsequent purchaser or mortgagee for a valuable consideration without notice, unless it be recorded in the Patent Office prior to the date of such subsequent purchase or mortgage, so that should the assignee fail through forgetfulness or accident to file his instrument of assignment within three months he might still file it for record at a subsequent period, and it should then give constructive notice from the date of its actual filing.

5. *Money paid into the Treasury by mistake.*

Section 4935 provides for the payment of fees to the Commissioner of Patents, or to the Treasurer, or any of the Assistant Treasurers of the United States, or to any of the designated depositories, national banks, &c. All moneys received at the Patent Office from every source whatever are required to be paid into the Treasury as received, without any deduction for any purpose. Section 4936 provides that the Treasurer of the United States is authorized to pay back any sum or sums of money to any person who has through mistake paid the same into the Treasury or to any receiver or depository to the credit of the Treasury, as for fees accruing at the Patent Office, &c.

The Commissioner of Patents has the unquestioned

authority to correct a mistake occurring in his Office, and to refund to any individual who has paid money to the financial clerk through mistake or accident if such correction be made before the money has been covered into the Treasury or placed in a depository of the Treasury. Such corrections are occurring constantly by reason of mistakes in making change and from demands made on account of applications which either are not filed or are withdrawn on account of some impropriety or irregularity in their presentment; but when the money has been covered into the Treasury the Commissioner of Patents no longer has the power to correct such mistakes, and as it frequently occurs that the mistake is not discovered until after the money has been covered into the Treasury the party in interest is required to go through the somewhat tedious process of applying to the Treasury and furnishing proofs before he can obtain the correction of the mistake. Generally all evidence of the mistake is disclosed by the records of the Patent Office, and the Secretary of the Treasury is uniformly required to make examination and reference of the matter to this Office before acting on the application. The Patent Office is thus put to the same trouble of inquiry and examination as it would be were the whole matter in the hands of the Commissioner of Patents. The amounts involved are always small sums—either the first filing-fee of $15 or the $20 final fee, or some small sum involved in making change. I can see no reason why the Commissioner of Patents should not be authorized to make all corrections of mistakes of this character which occur in his Office and to refund the money, and I recommend that authority be given for that purpose.

6. *The attorneys' fund.*

In this connection I desire to call attention to what may be regarded as equitable claims on behalf of a number of patent attorneys against the Patent Office resulting from a defalcation on the part of the late financial clerk, Mr. Levi Bacon. The claims grew out of the following facts and practice formerly prevailing in this Office: The statutes of the United States require that all payments to be made into the Patent Office for copies, records, or work to be done, shall be tendered in advance or simultaneously with the delivery of the copies, records, or work; but persons were constantly sending for such copies of records from remote parts of the country, not knowing what the cost would be, and the Office had been in the habit of responding to such requests with an estimated cost of the work. Thus the delivery of the copies or other work desired was considerably delayed. On the other hand, many parties were in the habit of remitting a larger sum of money than would be required, and directing the Office to furnish the copies of records immediately and return the change. There grew up in the Office, in consequence of the difficulties attending this method of transacting the business, the practice of extending a credit to patent attorneys in good standing and requiring them to remit the amount of their accounts once each month; but after some years' experience considerable sums of money were lost in consequence of the death, disappearance, or inability of the attorneys to pay. In 1878 Mr. Commissioner Spear issued an order authorizing persons dealing with the Office to deposit with the financial clerk a special fund, to be drawn against as they saw proper. After the issuance of this order it was the practice of the financial clerk to receive the money thus deposited and place it in envelopes, upon the back of which was kept the account between the Office and the attorney. This fund was regarded as a private fund, at all times the property of the attorney, no part of which went into the public funds or into the Treasury except as it was drawn against, and the sum then so drawn was applied and paid over into the Treasury. The balance on hand was always regarded as the money of the individual, subject to his order and liable to be withdrawn at any time he might desire to have it returned. On the death of the financial clerk, Mr. Bacon, in June, 1887, it was found that the various balances which should have been in these envelopes were gone, and that no account could be given of this so-called "attorneys' fund," or "miscellaneous fund," as it was sometimes termed. At the same time it appeared that the Office had these various attorneys charged with copies, records, and other material furnished which should have been, and but for the defalcation would have been, paid for by the sums of money in the various envelopes to the credit of the parties in interest; but the money not being found, these accounts were regarded as just and valid claims against attorneys, and it was held that the fact that each at some previous time had had in the hands of the financial clerk sufficient money to provide for the payment of these accounts could not be regarded as liquidating the same. The Commissioner of Patents entertained the view that an officer of the Government could not incur a liability without the express provision of law, and that he had no authority to receive private deposits and make the Government liable for them, or to secure such deposits either by the money of the Government or by their equivalent in work, copies, &c. In his opinion the case was very much the same as though the attorneys had come to the financial clerk with a bill of large denomination, and, instead of tendering the exact sum which was due, intrusted him with the bill, allowing him to make change, and upon his failure to return the change should attempt to hold the Government liable for the difference. No doubt there were a number of these attorneys who deposited their money without much consideration. They find themselves now indebted in small sums of money to the Office, and they naturally insist that they understood they were dealing with the Government, and that the Government ought to indemnify them for their loss. These claims have certainly strong equitable features. The practice grew up out of the order of Commissioner Spear, the money deposited by the attorneys was always made payable to the Commissioner of Patents, and all the correspondence, receipts, &c., were conducted in the name of the Commissioner. In my judgment, Congress should authorize the Commissioner of Patents to adjust these claims, subject to the approval of the Secretary of the Interior, and to pay them by the recognition of orders for copies, records, assignments, &c. This would restore the parties to all their rights without the payment of any cash by simply supplying these attorneys with what it was originally contemplated they should receive. The amount involved is about five thousand dollars.

It will not be improper in this connection to call attention to the fact that since the defalcation alluded to was discovered the Commissioner has taken careful steps to guard against any possible misappropriation of the public moneys. All money deposited by attorneys or others is now required to be at once transferred to the Treasury and placed beyond the control of the Patent Office. When this defalcation was disclosed, it was also ascertained that during the long period of Mr. Bacon's possession of the office, though millions of dollars had passed through his hands, there had never been a settlement of his accounts. The practice now prevails of requiring a quarterly and annual adjustment of the accounts of the financial clerk. In addition, an entirely new system of receiving and accounting for the funds received has been adopted, with checks and counter-checks, so that it is believed to be now practically impossible for any mistake or misappropriation to occur without being at once detected. The importance of the subject will be seen when the fact is considered that the daily receipts average about three thousand dollars.

7. *Delay in prosecuting applications.*

I desire to call especial attention to the subject of the delays which occur in the Patent Office on the part of applicants in the prosecution of their applications for patents.

Section 4894 provides—

> All applications for patents shall be completed and prepared for examination within two years after the filing of the application, and in default thereof, or upon failure of the applicant to prosecute the same within two years after any action therein, of which notice shall have been given to the applicant, they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable.

Under this section applicants who desire to prolong their applications and postpone action therein have an ample opportunity to do so. There are two classes of persons who apply for patents—*one* composed of those who are exceedingly anxious to obtain their patents at the earliest practicable moment, the *other*, of those who desire to prolong the issue of their patents and to keep the application pending in the Patent Office to the very latest date possible. The second class embraces the more powerful, rich, and influential parties, who are either the inventors or the assignees of the inventors. This section of the statute enables the second class of persons to keep their applications pending in the Office for years before their patents issue. In the meantime they are engaged in manufacturing and putting upon the market the article or improvement, but warning the public that the patent is applied for, the effect of which is to give them the absolute control and monopoly of the invention and to deter all other inventors from entering upon the same field of invention and from manufacturing the article. The manner in which this delay is effected may be briefly explained: The applicant files his application and is allowed 2 years within which to complete or perfect it. Any action of the Office requiring change or modification or some formal correction can be followed under this section by a further delay of 2 years before the applicant is required to take any action in response. At the expiration of the two years he perhaps makes some amendment or change in the character of his claims. This involves a corresponding action on the part of the Office, and however prompt and speedy this action may be the applicant is permitted another 2 years before any responsive action can be compelled from him. And so the matter may be continued. There are applications now in the Office which have been kept alive nine or ten years, and the Office is powerless to compel speedier or earlier action on the part of the applicants.

These repeated actions and these long-continued delays cannot fail to suggest that a great deal of useless and unnecessary labor and consumption of time in the Patent Office are involved. Every application stands in its proper place upon the calendar of the Office, and when reached in its order it must be examined carefully to see whether any action has been had since the last-recorded action of the Office, so that a case which has remained for 2 years without responsive action from the applicant may probably be examined twenty or thirty times simply to ascertain that nothing has been done. When it is considered that this labor is multiplied by the number of applications which are thus delayed, the amount of useless and unnecessary labor expended can be appreciated.

While calling attention to the fact that this 2 years' period in the case of original applications is too long, it will be a matter of surprise to know that in applications for reissues Congress has omitted to fix any period (except the duration of the original patent) within which they become abandoned for want of prosecution. A reissue application is always alive, and the applicant may file an amendment 10 years after it was required by the Office to be made and be entitled to have it considered and acted upon.

I earnestly recommend that section 4894 be so modified that there shall be vested in the Commissioner of Patents a discretion to declare any application forfeited for want of prosecution whenever he shall be satisfied that such order should be entered. This power is possessed by all tribunals who have the control of litigation and matters of this character. Of course the exercise of this power should be guarded by proper restrictions, so that injury or wrong cannot be done, and no order of this kind should be made by the Commissioner until ample notice had been given to the applicant to show cause why his application should not be declared forfeited. The power to reinstate a case after it had been declared abandoned should and would be preserved under section 4894 whenever, in case of death, insanity, or other good and sufficient cause, it should be made to appear to the satisfaction of the Commissioner that the want of prosecution was unavoidable, and that the party was incapable of showing cause why the case should not be declared abandoned.

8. *Renewal application where case was forfeited for non-payment of final fee.*

Section 4885 provides that after the Office has passed and allowed an application and nothing remains but the payment of the final fee to complete the issuance of a patent, if the fee be not paid within the period of 6 months the patent shall be withheld. I have al-

ready called attention to the fact that very frequently the payment of this final fee is purposely omitted in order to permit the applicant to extend the period of his monopoly; but of course this is not always the case. The provision of section 4897, which enables a party who has failed to make such payment to file a renewed application within two years from the date of the allowance of the original application and obtain his patent, is a wise and just provision; but there is very much doubt and uncertainty as to the meaning of this section, in so far as it requires that "such second application must be made within two years after the allowance of the original application." It has been held by high authority that the effect of this provision is by construction to bar the *invention* as well as the *application* if the renewed application be not filed within 2 years. On the other hand, there is also high authority that such is not the effect, and that even if 2 years have elapsed after the allowance of the original application the new application may be made and may go to patent, notwithstanding the existence of the original application, its allowance, and its forfeiture for non-payment of the final fee. This section should be amended to remove this uncertainty. I am of the opinion that the limitation should be to the invention; and not only this, but that when an application for a patent has been allowed by the Office and the applicant has failed to pay the final fee within 6 months, and has also failed to renew the application within 2 years, the invention should be made public and become public property as of the date of the original allowance. I think this should be the result from a proper consideration of the relations between the Government and the inventor. The inventor has conceived and presented a new invention. He comes into the Office for the purpose of donating that invention to the public after he shall have first enjoyed its exclusive use for the period provided by law. The Office has made a careful and thorough examination, has discharged all its part of the contract, and extended to the applicant the right to take out his patent upon paying the charges required. The public from this moment is entitled to its part of the consideration of the contract, and ought not to be deprived of it upon the failure of the inventor to fulfill his. The invention has become so far public as to be made known to the Patent Office. The law extends to the applicant the full period of 2 years within which to avail himself of all his rights and to enjoy his property. Failing in this, he ought not to have it in his power to conceal the invention as a lost art and to deprive the public of it. On the other hand, other inventors may invent the same thing and come into the Office, and by patenting the invention deprive the public of what they have already acquired the right to by virtue of the allowance of the first application. In other words, when an invention has been made and disclosed to the Office, and the application has been passed to issue, that invention should be taken out of the field of patentability as to all future inventors, and ought not to be regarded as a concealed or abandoned invention. I therefore recommend the modification of the statute so as to provide that such second application must be filed within 2 years after the allowance of the original application, and if not so filed the invention shall be regarded as abandoned to and as the property of the public.

9. *Joint inventors.*

Under the present statutes a patent may issue to a sole inventor or joint inventors, to an inventor and his assignee of a part interest, or to the assignee or assignees of the entire interest. Every patent issued to a sole inventor or to an inventor and his assignee of an undivided part, or to the assignees of the whole interest, is beyond challenge so far as an improper union of persons as patentees is concerned—that is to say, the law authorizes the patent to issue to the inventor or to any person or persons to whom he desires that it shall issue, and this is the principle which underlies the statute authorizing the assignment, grant, or conveyance, either of the original invention before patent has been granted or of the patent after it is issued; but while there is no express provision of law declaring that a patent issued to joint inventors is void, should it appear that they were not joint inventors, yet that is the well-settled law as announced by the courts. The statute also requires that the assignees of the inventor shall be such by virtue of a written formal legal assignment; but in the case of a patent to joint inventors, when it turns out that by mistake or error of law one of them was not a joint inventor, but the sole inventor, the other does not become a patentee as an assignee under a formal legal assignment, although he does become one of the joint patentees with the full consent and wish of his co-patentee. Inasmuch as it is often one of the most perplexing and difficult questions coming before the Office or before the courts to determine whether an invention is actually a sole invention or a joint invention which two or more persons contributed, there seems no reason why a patent which is thus issued to persons who supposed themselves to be joint inventors should be invalid. Under all other systems within my knowledge the patent is allowed to issue in the name of those persons who demand it in whatever capacity or relation they may make the demand, and it is only requisite that one or more of the patentees shall have been the true inventor. I am aware of no reason why such should not be the law in the United States; and when there is taken into consideration the amount of time, labor, and trouble involved in investigating the question as to whether there was or was not an actual joint invention, and other incidental questions which are constantly arising, as well as the injustice to the patentees themselves of having their patents declared void, I find ample reason for recommending a provision of law expressly providing that patents shall not be held to be invalid by reason of the fact that the persons described as joint inventors were not joint inventors, provided that either one of them thus described was in fact the true and sole inventor.

10. *Examination of applications.*

There is no occasion to refer at any length to the distinctions between the English patent system and the American. The principal and important difference consists in the examination given to an application filed in this Office to ascertain the novelty and utility of the alleged invention, the object being to secure to the inventor for a limited period the precise

subject-matter—no more and no less—of his invention, and also to protect the public against fraud and imposition which may be practiced in imposing upon them worthless and invalid patents, and in securing them against vexatious and oppressive litigation founded upon that class of patents. A patent issued under the American system gives to the inventor and the public an assurance as to its validity which cannot be secured under any other system. In the courts the patent constitutes the highest *prima facie* evidence. The Patent Office contains a vast collection of information on the state of the art which is inaccessible and unattainable elsewhere. Resort must be had to this establishment whether the examination be had before or after the patent is granted. The applicant secures this examination and the issuance of his patent for $35. It is not required that he shall be represented by attorney, though in all complicated inventions, and especially valuable ones, prudence would suggest such representation.

Under the British system the English Patent Office is little more than a registration office. The patent when issued is but a certification, and is of no value as property. No one would invest in it until it should be submitted to learned and skilled experts, who, outside of the office, bear the same relation to the merits of inventions as the examiners of this Bureau sustain. Such examinations and opinions based upon them by English lawyers are far less safe and reliable and much more expensive to the inventor than the procedure in the United States Patent Office. When it is called to mind how easily associations and corporations can be formed to promote the introduction of patent property and to foist the same upon the public, and how easily legal opinions can be secured urging and supporting the validity of the patents involved in the scheme, the danger and disadvantages of the system become apparent, so that it is beneficial neither to the inventor nor to the public. The disadvantages are not so great to a compact people occupying a limited territory like England as to our own people. A patent granted in this country without examination would be practically valueless to the inventor. He could never introduce his invention or place it on the market. The opinion of eminent counsel at Washington would not be accepted in Chicago; that of New York attorneys would not avail in San Francisco. The inventor would need a fortune to begin with in order to secure the opinions or "examination" of counsel known and recognized in every district and locality before he could succeed in availing himself of the value of his patent. However, it is believed the system is too well established and too thoroughly understood and appreciated to be shaken by any objections that can be urged against it.

It may not be out of place to call attention to the practice in the Office relating to the subject of these examinations, for there appears to exist no little misapprehension relative to it. An impression prevails that the questions of utility and novelty of an invention are passed upon and finally determined by the various assistant examiners who make the preliminary search and examination. This is erroneous. There are 30 examining divisions in the Office, to each of which are assigned certain classes of invention and art. Each division is presided over by a Principal Examiner, selected and retained in view of his long experience and supposed capacity. Under him are a certain number of assistant examiners, to whom he distributes the applications assigned to the division under his charge. These assistants make the examination and report the result to the chief. All actions affecting an application, whether of rejections, allowance, or the requirement for amendments, are submitted to the Principal Examiner for his supervision and approval, and whatever action is had is that of the head of the division. If he allows the application, it goes to patent. From his requirement for amendment, or other action relating to the form of the application, an appeal lies to the Commissioner in person, without fee. If he rejects the application, an appeal lies to the Board of Examiners-in-Chief—a board composed of three experienced persons—and they review the rejection. Should they affirm the decision of the examiner, an appeal lies to the Commissioner, and thence to the Supreme Court of the District of Columbia. Cases are argued in full before these appellate tribunals, whose action is not in any sense perfunctory. The records will show reversals by the appellate tribunals in the Office to occur with greater relative frequency than in the courts of law and equity.

It must be confessed that great power is lodged in the hands of the Principal Examiner. If he allows the patent, it issues without further question. It is certainly true, however, that the inventor, as a general rule, secures the benefit of this exercise of power. As already stated, ample provision is made for appeal if the rejected applicant feels aggrieved and believes his application has merits; but the unlimited power of the examiner is in the direction of allowing patents. If there should be any restriction, it should be in guarding against its improper or irregular use. This might be done by organizing a board of review, to revise and inspect the allowed applications, with the view of preventing the issuance of improper patents.

11. *Compensation of examiners.*

There is no doubt that the compensation allowed the corps of examiners is insufficient. Promotions are not rapid, and there is little temptation for examiners to remain in the service after mastering the practice and business of the Office. With this acquisition a bright active man can at once secure business or employment elsewhere which is much more remunerative. The members of the examining corps who have secured promotion, as a general rule, are men of education and high attainments, especially in the requisite knowledge of the sciences and the arts. In my judgment, the public interest, as well as justice to this class of employés, would be well subserved by increasing their salaries, so that they shall be commensurate with the character of their services and the responsibilities of their duties. Such an increase would tend to secure and retain men possessing high qualifications.

12. *Interference proceedings.*

There is some reasonable ground for complaint against the present system of interferences as it exists and is conducted under the statutes and Rules of

Practice of the Patent Office. An interference necessarily occasions delay, for such a proceeding is not instituted until the question of patentability has been favorably determined. In the Patent Office, just as in the courts, poor and uninfluential suitors are frequently confronted by the powerful and rich. There are the same opportunities for procuring false evidence, corruption, and exercising other evil influences which exist in other departments and in the courts. Such conditions can hardly be said to be defects, however, in the American patent system. All that can be said is that there are 30 organized divisions in the Office composed of a body of assistant examiners and clerks presided over by a principal, and consequently in the examination, allowance, and rejection of applications, or in the declaration of interferences, there are more persons who may be approached and affected by such influences. But the requirement and necessity for the number of divisions depend upon our patent system. The vast number of applications that are presented and the labor and research involved in their examination make necessary the number. These conditions are essential, or else the system itself must be abandoned. Not only this, but so long as this system is retained there must exist as incidental to it some procedure of interference. When there are pending in the Office two applications for patents for the same invention, what must be done? The very purpose of an examination is to prevent two patents being granted for the same invention, or the issuance of a patent for that which is old in the arts. Not only this, but in the supposed case, if a patent issue to the applicant who first filed his application and is denied to the later one, absolute injustice may be done. The first may have pirated the invention from the other. So, also, if an applicant is confronted by a patent already issued, he may insist that he was the first original inventor, or that the patentee stole the invention. Without some reliable mode of determining the question the later applicant would be remediless. If a remedy were to be provided which would enable him to go into courts of equity and file a bill against the patentee, vacate the patent, and then renew his rejected application and obtain a patent, this would impose hardships as great as, if not greater than, those now endured. The rejected applicant might have to prosecute his bill in equity in Maine or California—the defendant's home—while, himself a poor man, he might have to contest with powerful corporations. In the meantime the invention is made public and an opportunity afforded for the patentee, as well as others, to make a case, and the chances for fraudulent evidence, antedating his invention, and defeating him, would be greatly increased.

In every interference there are necessarily two or more persons, each claiming to be the original inventor. Their claims may be false or fraudulent, but each is entitled to the same treatment and consideration until the facts are established. Each is in the sense of the law an "inventor," and entitled to equal consideration, even though one of them may have secured the aid of a corporation or powerful assignee. Precisely the same conditions would arise if the contest were in the courts. It is doubtful if any system can be devised that would be more friendly and beneficial to poor inventors than the present. The truth is, the present system of declaring and conducting interferences, with all the objections to it and defects in it, is not the creation of any one mind, but it has been evolved from years of actual and practical experience. It is always the case in such matters that it is much easier to criticise and point out defects, selecting the rare and exceptional cases where the system has miscarried, and ignoring the infinite multitude of cases where it has succeeded, than to present a remedy or propose a better system.

It has been suggested by some who are eminent for their familiarity with procedure in the Office that instead of retaining the present interference system, which proceeds, as far as is possible, according to contested proceedings in the courts, upon pleadings and evidence, subject to cross examination, the *ex parte* procedure of the Patent Office be extended to this subject; that each applicant be required when he files his application to deposit with it his preliminary statement, under seal, not to be opened or inspected unless his application shall be put in interference; the form of the preliminary statement to be prescribed by the Office calling for a full and exact account of the applicant's conception of the invention, disclosure to others, names, places, dates, models, experiments, reduction to practice, &c. All such preliminary statements should be lodged with a single officer and kept unopened in the secret archives until called for in consequence of the declaration of an interference. Such proceedings when declared would go, as now, to be tried and determined by the Examiner of Interferences upon the preliminary statements filed by the parties, no preliminary statement to be amended except when the issue of the interference was so framed that the original statement was insufficient or not specific, when amended, to be so amended by answers to interrogatories propounded by the Examiner of Interferences and not otherwise. The decision of the Examiner of Interferences would be made without any hearing of parties, but reserving to them the right of appeal to the Board of Examiners-in-Chief and the Commissioner, and of full argument and hearing, and also reserving to the defeated party the right within a reasonable time to file a bill in equity in such United States court as might be indicated, to establish that he was the first, true, and original inventor, annul the patent issued by the Patent Office, and secure a decree adjudging him entitled to the patent. This suggestion is submitted, not recommended, as coming from persons of great experience. But here evidently, while some of the defects of the present system might be obviated it would compel the serious contests to be carried into the courts and subject the inventor to all the expense, annoyance, vexatious delays, and anxieties that attend litigations in the courts.

13. *Trade-Marks and interstate commerce.*

After the decision of the Supreme Court of the United States in the Trade-Mark cases, (100 U. S., 82,) which held that the acts of Congress approved July 8, 1870, and August 14, 1876, were unconstitutional, and that Congress had no power to legislate upon the subject of Trade-Marks *per se*, the act of March 3, 1881, was enacted under the provisions of the Constitution conferring upon Congress the power to regulate commerce. That power, it is conceded, extends to commerce with foreign nations, commerce with the Indian tribes, and interstate commerce; but for some cause not apparent in the enactment approved March 3, 1881, Congress saw proper to authorize the registration of only such Trade-Marks as were used in commerce with foreign nations or with the Indian tribes and left Trade-Marks which might be used in commerce between the States wholly unprovided for. If there be any reason why the latter class of Trade-Marks should be excluded from the protection of Federal legislation, or left to the regulations prescribed by the States, or wholly omitted, it is not apparent. The attention of Congress has been called to this subject by my predecessors, and I respectfully renew the suggestion that the provisions of that act be enlarged so as to cover Trade-Marks used in interstate commerce. This question has become more important in view of the union hereinbefore referred to for the protection of industrial property. Some additional legislation by Congress is necessary in view of the new situation resulting from this treaty. Article 6 of the Convention declares that "every trade or commercial mark deposited in the country of origin shall be admitted to deposit and so protected in all other countries of the Union." It is evident from this declaration that if the article were to be fully carried out in this country it would probably admit to registration Trade-Marks which otherwise would not be admissible under the existing laws of Congress. In other words, the provision is more liberal than the act of March 3, 1881. It is more liberal than was the common law, because under each there were limitations which excluded Trade-Marks, which were not regarded as lawful in some sense and which were calculated to mislead or were regarded as in contravention of religious ideas, morals, &c. The definition of a Trade-Mark is substantially the same in all commercial countries, but practice varies in the application of these definitions and in respect to the character of marks which may be protected. For instance, the usage in southern Europe in respect to the employment of sacred names and symbols warrants their adoption as Trade-Marks in relations which would be offensive and perhaps sacrilegious to much of the American sentiment. In a case where a representation of the Virgin Mary was claimed for soap this Office held that its use in such a connection was offensive to a great proportion of the people of the United States, and therefore that it was not entitled to protection; yet it is actually protected in France, where a different sentiment prevails. Instances of this kind are rare; but the statute should be framed to cover all cases likely to arise. If Congress, therefore, is inclined to make the law of Trade-Marks conform to the provision of the Convention, the act of March 3, 1881, should be amended so as to admit to registration any Trade-Mark already lawfully registered in any of the countries of the International Union, subject, of course, to the conditions which require preliminary examination as to prior use and employment in the class of commerce over which the legislation of Congress extends.

Another question in connection with Trade-Marks which will suggest appropriate legislation relates to the coercive features of the provisions of the treaty intended to give Trade-Mark property a protection which would be unknown to the common law or to the statutes of this country. These provisions will be found in articles 9 and 10 of the Convention, and may be briefly stated to include seizure upon importation of any article of merchandise bearing an illicit Trade-Mark or a false or fraudulent intimation of origin. Of course, it is to be understood that the practical operation of such legislation would apply in this country to goods imported from abroad, and would authorize the seizure in this country of such goods. The act of August 14, 1876, provided for the seizure by United States marshals of all appliances used for counterfeiting or the fraudulent imitation of registered Trade-Marks. Section 2496 of the Revised Statutes, as amended March 3, 1883, refuses entry at the custom-house to foreign goods bearing simulations of the Trade-Marks of domestic manufactures. Those two acts contain all the protection afforded by the United States statutes to our citizens so far as coercive measures are concerned. Of course, the common law and statutes afford a simple remedy for infringement; but in view of the fact that as between the owner of a Trade-Mark in one country and the infringer of it in another the civil remedy is so expensive it practically constitutes no protection. Every country seems to have felt the necessity of employing coercive measures to prevent fraud of this character. No act of Congress has ever contemplated the seizure of merchandise bearing counterfeit or simulated Trade-Marks, and under the present laws the courts of Federal jurisdiction have no jurisdiction to enforce such seizures. Whether such legislation should be made is submitted to the consideration of Congress.

Under Article 6 of the Constitution of the United States this Convention is now a part of the supreme law of the land. The Government may withdraw from it when inclined to do so; but until such withdrawal its provisions must be recognized, and ought to be enforced by appropriate legislation empowering the proper officers to make the required seizures and determining the due proceedings in our courts which are necessary to enforce the provisions of the treaty and protect the rights of individuals. It is true that under the general provisions of this treaty, as set forth in article 2, there is only contemplated giving to the citizens and subjects of foreign States the same protection that our own citizens enjoy; but it is to be apprehended that while it is not expected the same procedure and method will be employed, yet the same ample protection will be afforded to citizens of foreign countries which would be demanded for our own citizens.

14. *Restriction of some of the evils of the patent system.*

The growth and development of the patent system of the United States, and of inventive genius stimulated by the rewards and prospects of rewards growing out of that system, are the subjects of constant comment and public consideration. That this system has been useful and beneficial is beyond question; but it is impossible that it should not be accompanied by greater or less evils. The attention of the public has been for

years constantly called to the fact that the inventor himself rarely secures the real reward of his invention. This undoubtedly proceeds from the fact that quite as much genius is required to develop a property or manufacture and place it advantageously upon the market in so great a country as this, and to make it remunerative, as is required to make the invention, and it is the misfortune of inventors, as a general rule, not to be possessed of business habits and business faculties. The result has been that nearly all the great and most useful inventions of modern times have fallen into the hands of men of capital or corporations, who alone have the means to bring them before the public, develop their useful qualities, and enable the people directly to see that they are useful and can be produced at prices which remunerate. This condition of things cannot be remedied, and perhaps ought not to be. There should be no legislation which interferes with the right of property which is vested in the inventor from the moment he has created a new subject of invention. The entire system and theory of patent property rest upon the idea that that which a man invents, in the sense of its being a new and novel creation, is his individual property, which he owns by the right of creation and discovery. It is not the theory of the patent law that when the Government grants a patent to an inventor it confers upon him any such property as it does in the case of a patent for land, which, belonging to the Government at one moment, becomes the property of the patentee upon the execution of the instrument. But the patent in the former case recognizes the existence of the property in the individual; but in consequence of its intangible and incorporeal nature it is incapable of protection from invasion by other persons, unless some distinct and specific remedy is afforded the inventor against such invasion and infringement. Letters Patent are mere evidence of the fact that, in the opinion of the Government, the patentee has invented a new, useful, and original invention, and the Government undertakes to protect him in the exclusive enjoyment of that property for a definite term. Now, any legislation which departs from this theory and proceeds upon the idea that the patentee should not be entitled to full protection is a mistake. Many suggestions have been made as to the best method of protecting the inventor and enabling him to realize as far as possible the value of his invention, and at the same time protecting the public against vast and powerful corporations in patent property exacting greater values than can be justified upon any fair or reasonable consideration, and which by buying in all the succeeding improvements in a certain line of invention are enabled for generations to perpetuate a monopoly which ought to have more reasonable limits. It must be understood that a monopoly which erects and locates itself all over the country in every business center under the provisions of a patent is able in nearly all cases to prolong its life after the patent expires by reason of the possession which it has taken of the market. New manufactures are unable for years after the expiration of the patent to come into the market and compete with an organization which thus has such complete possession of the field of manufacture.

It has been recommended that some legislation should be had looking toward the restriction of the extension of patents and patented property. In this direction I suggest for the consideration of Congress the propriety of providing that all patents hereafter issuing shall contain a condition that they may be extinguished by the Government at any time upon the payment to the owners of the property, whether the patentee or his assigns, of a reasonable sum of money, such sum to be determined by arbitration or otherwise, as may seem appropriate to Congress. It is probably safe and accurate to say that patent property as a rule is not as valuable as is popularly estimated. The profits which are enjoyed by the owners of property of this character are rather the result of having control of the market and being everywhere firmly established in the business of manufacturing the patented article. It is well known that the licensees under patents make enormous profits in the manufacture of such articles as the barb-wire, after having paid the royalty to the patentee, and it is probably true of all the great concerns engaged in manufacturing patented articles that they would still be able to conduct a large and profitable business were the patent to be extinguished. In view of the fact already suggested that in rare instances only do the original patentees obtain any adequate remuneration for their inventions, it seems entirely proper that the Government at any time should have the power in its discretion to extinguish the patent by paying such sum as would be a reasonable consideration for the appropriation of private property for public purposes. Of course, but few inventions would be extinguished in this way, as their importance generally is not such as to justify interference by the Government.

15. *Abridgment of patents.*

I desire to call the attention of Congress to the necessity of making provision for the compilation and publication of a classified abridgment of patents. The necessity for this publication has been earnestly set forth in the annual reports of this office since 1848, when Mr. Commissioner Ewbank first called the attention of Congress to the subject. Year by year the need and demand for such a work are more and more forcibly felt. Each field of invention broadens, and the necessary examination to determine the utility, novelty, and usefulness of the invention presented becomes more intricate and difficult. No better illustration need to be cited to show that such an abridgment is almost indispensable than the publication of patents relating to electricity. Copies of all patents on this subject from the year 1790 to July, 1880, were compiled and bound for the Electrical Congress, held at Paris in 1880. This publication has since been continued. It is doubtful whether the work of the Office could keep pace with the vast number of applications which have been filed since the impetus given to inventive genius by the electric light and telephone, were it not for these volumes, whereby examinations are facilitated and accuracy secured. In 1881 Congress appropriated $10,000 to begin this work. Fourteen thousand patents relating to agricultural implements were abridged and the briefs made ready for publication. The appropriation, however, was not continued, and the material was boxed and stored away. An appropriation of not less than $20,000 will be required to continue the work of abridging patents and to publish the material already prepared. The ready sale to manufacturers and inventors of such an abridgment would speedily reimburse the Government for all moneys expended in compiling and publishing such a work, and it is believed that the revenues resulting from such sales would largely increase the receipts of the Office.

16. *Exchange of publications.*

Some provision should be made by Congress by which this Office can be furnished for publication in the OFFICIAL GAZETTE with certified copies of all decrees, decisions, and judgments made by the Federal courts in patent cases. I recommend that authority be conferred upon the Commissioner of Patents to furnish the OFFICIAL GAZETTE to the clerk of any Federal court, or to the library belonging to the court, in exchange for the decisions rendered by such Federal court.

I further recommend that the Commissioner be invested with authority to exchange the OFFICAL GAZETTE for any publication of a scientific or useful character published in this or any foreign country, which, in his judgment, would be desirable and valuable to the scientific library of the Patent Office.

17. *Charge for certified copies.*

I recommend that paragraph 12 of section 4934 of the Revised Statutes be amended so as to read:

For certified copies of patents and other papers when written copies are required, 10 cents per 100 words; but when certified printed copies of patents are required, 25 cents for the printed copy and 25 cents for the certificate thereof.

The Office now sells a printed copy of a patent at the rate of 25 cents for one copy and 10 cents each, if twenty or more are purchased at one time. There does not appear any reason why the addition of a certificate should increase the expense to the patrons of the Office, except so far as the cost of the certificate increased it.

BUSINESS OF THE PATENT OFFICE.

The following statements exhibit in detail the business received and transacted by the Office during the last calendar year:

RECEIPTS.

*Detailed statement of all moneys received for patents, for copies of records or drawings, or from any source whatever.**

Applications:		
Cash received		$902,096 13
Cash refunded		5,066 80
Net cash		956,957 33
Certificates of deposit		44,239 00
Total cash and certificates		1,001,196 33
Copies:		
Cash received		81,142 62
Cash refunded		2,190 18
Net cash		78,952 44
Certificates of deposit		366 40
Total cash and certificates		79,318 84
Recording assignments:		
Cash received		20,729 28
Cash refunded		1,518 06
Net cash		19,211 22
Certificates of deposit		271 00
Total cash and certificates		19,482 22
Subscription to Official Gazette:		
Cash received		15,577 23
Cash refunded		96 72
Net cash		15,480 51

*A large number of copies of patents are furnished to co-ordinate branches of the Government for which no charge is made. The receipts would be considerably increased if the Office received payment for these copies.

EXPENDITURES.

Amount expended by this Office under the several appropriations from January 1, 1888, to December 31, 1888.

Salaries	$635,300 28
Official Gazette	42,271 30
Photolithographing	72,856 59
Scientific library	2,336 58
Transportation of publications to foreign governments	390 80
Total	753,154 50

*Approximate amount expended by the Department of the Interior on account of this Office from January 1, 1888, to December 31, 1888.**

Stationery	$8,572 44
Postage on foreign matter	1,049 00
Printing and binding	183,921 21
Watch force	16,090 00
Furniture	2,139 84
Carpets	510 69
Ice	536 67
Telephones	468 00
Washing towels	142 71
Sundries	3,623 72
Total	219,954 28
Aggregate amount of expenditures	973,108 78

*A literal compliance with the provisions of the statute requiring "a detailed statement of all expenditures for contingent and miscellaneous expenses" is not possible, for the reason that the contingent fund for the several bureaus of this Department was consolidated by the act of March 3, 1883, and hence no part of that fund is disbursed by the Patent Office, and I am furnished only with an approximate sum, expended on behalf of the Patent Office.

RECEIPTS OVER EXPENDITURES.

Total receipts	$1,118,516 10
Total expenditures	973,108 78
Receipts over expenditures	145,407 32

Statement of balance in the Treasury of the United States on account of the Patent fund.

Amount to the credit of the fund January 1, 1888	$3,257,490 91
Amount of receipts during the year 1888	1,118,516 10
Total	4,376,007 01
Deduct expenditures for the year 1888	973,108 78
Balance January 1, 1889	3,402,898 23

SUMMARY OF THE BUSINESS OF THE PATENT OFFICE.

Number of applications for patents for inventions	34,713
Number of applications for patents for designs	971
Number of applications for reissues of patents	113
Total number of applications relating to patents	35,797
Number of caveats filed	2,251
Number of applications for registration of trade-marks	1,314
Number of applications for registration of labels	729
Number of disclaimers filed	8
Number of appeals on the merits	1,252
Total	5,554
Total number of applications requiring investigation and action	41,351
Number of patents issued, including designs	20,490
Number of patents reissued	86
Number of trade-marks registered	1,059
Number of labels registered	327
Total	21,892
Number of patents expired during the year	11,687
Number of patents withheld for non-payment of final fee	2,881

Herewith accompanying this report are lists or indexes, arranged in yearly form, of all patents granted during the calendar year 1888, properly classified under subjects of invention, and alphabetical lists of all patentees, with their places of residence. No patents were extended during the year.

Very respectfully, your obedient servant,

BENTON J. HALL, *Commissioner.*

THE

OFFICIAL GAZETTE

OF THE

United States Patent Office.

[BY AUTHORITY OF CONGRESS.]

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGiehan, No. 135 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Issue of February 19, 1889.

DESIGNS.

18,929.—BROOCH.—*Meyer Ballin*, Chicago, Ill. Application filed June 28, 1888. Serial No. 278,472. Term of patent 14 years.

18,930.—TRIMMING.—*Johann C. F. Edelmann* and *Alphonse H. Kursheedt*, New York, N. Y., assignors to *The Kursheedt Manufacturing Company*, same place. Application filed January 21, 1889. Serial No. 297,104. Term of patent 7 years.

18,931.—SYRINGE.—*Percival Everitt*, New York, N. Y. Application filed January 14, 1889. Serial No. 296,295. Term of patent 14 years.

18,932.—FLASK.—*Le Roy W. Fairchild*, New York, N. Y. Application filed January 21, 1889. Serial No. 297,006. Term of patent 3½ years.

18,933.—ORNAMENTATION OF TEXTILE FABRICS.—*George W. T. Harley*, Frederick, Md. Application filed January 17, 1889. Serial No. 296,653. Term of patent 14 years.

18,934.—LAMP.—*Franz Iffland*, Berlin, Germany, assignor to *Carl Rakenius & Co.*, same place. Application filed November 16, 1888. Serial No. 291,067. Term of patent 7 years.

18,935.—PINNACLE.—*Herbert Symonds*, St. Louis, Mo., assignor to *Mesker & Brother*, same place. Application filed November 27, 1888. Serial No. 292,032. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,277.—PLUG-TOBACCO FOR CHEWING AND TOBACCO FOR SMOKING. *Arnold, Carlton & McCord*, Atlanta, Ga. Application filed December 28, 1888. Used since April, 1886.

"The words 'JEFFERSON DAVIS.'"

16,278.—OIL OR LINIMENT.—*George T. Atkins*, Dallas, Tex. Application filed February 21, 1888. Used since September, 1880.

"The pictorial representation of a rattlesnake."

16,279.—LAUNDRY ARTICLES, SUCH AS CLOTHES WRINGERS AND DRIERS.—*Empire Wringer Company*, Auburn, N. Y. Application filed January 18, 1889. Used since November 10, 1888.

"The representation of a horseshoe."

6,280.—WIRE FENCING.—*The Gilbert & Bennett Manufacturing Company*, Georgetown, Conn., and New York, N. Y. Application filed December 28, 1888. Used since December 1, 1881.

"The word 'WORLD'S.'"

16,281.—WIRE FENCING.—*The Gilbert & Bennett Manufacturing Company*, Georgetown, Conn., and New York, N. Y. Application filed December 28, 1888. Used since December 1, 1884.

"The word 'COTTAGE.'"

16,282.—WINDOW-SCREEN WIRE-CLOTH.—*The Gilbert & Bennett Manufacturing Company*, Georgetown, Conn., and New York, N. Y. Application filed December 28, 1888. Used since January 1, 1887.

"The word 'PEARL.'"

16,283.—LAXATIVE MEDICINE.—*Robert M. Green* and *Marshall E. Ogborn*, San Francisco, Cal. Application filed December 13, 1888. Used since December 4, 1888.

"The words 'FIG REMEDY' and the representation of a single green leaf with a blue fig suspended centrally in front of it."

16,284.—KEROSENE.—*Shipton Green*, New York, N. Y. Application filed January 5, 1889. Used since July 2, 1888.

"The word 'RESPLANDOR.'"

16,285.—LADIES' AND MISSES' HATS AND BONNETS.—*Frank F. Hodges*, Boston, Mass. Application filed January 9, 1889. Used since May, 1883.

"The words 'RUSSIAN HAIR.'"

16,286.—PHOTOGRAPHIC CAMERAS.—*Edward I. Horsman*, New York, N. Y. Application filed January 2, 1889. Used since December 1, 1886.

"The word 'ECLIPSE.'"

16,287.—CHURNS.—*John C. Kearns*, Maitland, Pa. Application filed January 3, 1889. Used since December, 1888.

"The representation of a cow."

16,288.—PLAYING-CARDS.—*James W. Lewis & Co.*, New York, N. Y. Application filed January 4, 1889. Used since November 1, 1887.

"The representation of crossed fasces and the letters 'N P C Co' superimposed upon a single spot of spades."

16,289.—BANK-CHECK PUNCHES.—*Frederick J. Lockwood*, Bridgeport, Conn. Application filed December 26, 1888. Used since July 5, 1888.

"The word 'LIGHTNING.'"

16,290.—ILLUMINATING-OIL.—*Mather Brothers*, Albany, N. Y. Application filed January 14, 1889. Used since 1887.

"The word 'MONARCH' and a stag's head set in a landscape and surrounded by a circle."

16,291.—KEROSENE-OIL.—*Henry W. Peabody & Co.*, Boston, Mass. Application filed January 7, 1889. Used since October 26, 1888.

"The words 'SOUTHERN LIGHT.'"

16,292.—KEROSENE-OIL.—*Henry W. Peabody & Co.*, Boston, Mass. Application filed January 7, 1889. Used since October 26, 1888.

"The words 'DAY DAWN.'"

16,293.—KEROSENE-OIL.—*Henry W. Peabody & Co.*, Boston, Mass. Application filed January 7, 1889. Used since October 26, 1888.

"The words 'GOLDEN RAY.'"

16,294.—FINE WRITING-PAPER.—*Wauregan Paper Company*, Holyoke, Mass. Application filed January 9, 1889. Used since December 7, 1888.

"The representation of a woman seated in a chair and spinning flax from a distaff."

LABELS.

5,824.—Title: "MRS JULIA A. ACHARD'S LINIMENT."—*Julia A. Achard*, Lodi, Cal. Application filed January 26, 1889.

5,825.—Title: "PROF. JENROUX'S INDIAN HERBAL TONIC."—*Joseph Jenroux*, Detroit, Mich. Application filed December 17, 1888.

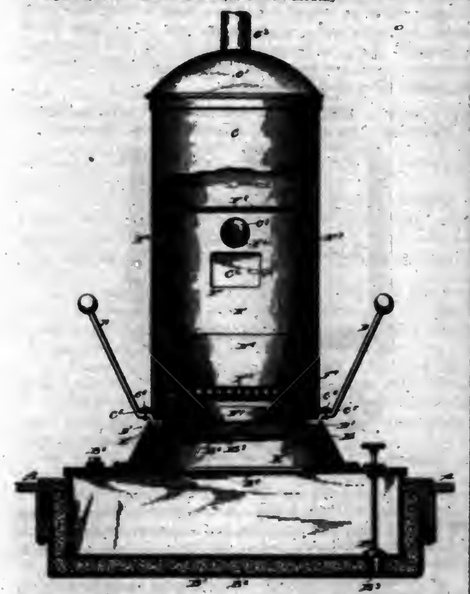
5,826.—Title: "ROCK CANDY."—*A. H. Stillwell*, trading as *William Lang & Son*, Philadelphia, Pa. Application filed January 28, 1889.

5,827.—Title: "SUNLIGHT SOAP."—*Lever Bros.*, Warrington, county of Lancaster, England. Application filed November 20, 1888.

5,828.—Title: "MINERALIZED RUBBER" (FOR RUBBER GOODS.)—*Mineralized Rubber Company*, New York, N. Y. Application filed January 24, 1889.

5,829.—Title: "RIVER'S LINIMENT."—*Frank Edward Rivers*, Charleston, S. C. Application filed December 22, 1888.

PATENTS



GRANTED FEB. 19, 1889.

397,885. SPOON-REST. HORATIO H. ABER, East Hampton, Conn. Filed Feb. 13, 1888. Serial No. 263,847. (No model.)

Claim.—The detachable spoon-rest herein described, consisting of the standard *b*, having a foot, *c*, and formed at its top with the rest-plate *f*, having on its side edges the clips *d*, adapted to receive and hold the handle of the spoon, substantially as specified.

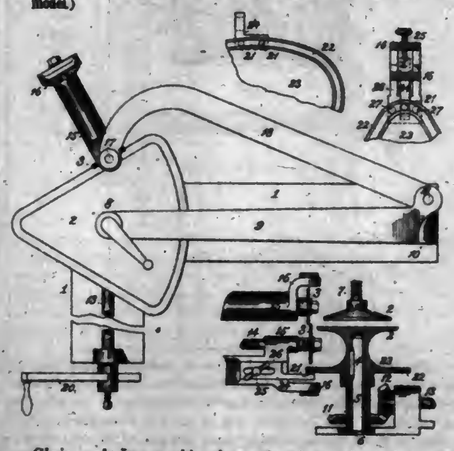
397,886. CAR-HEATER. HENRY R. ALBRIGHT, Moline, Ill. Filed Apr. 11, 1887. Serial No. 234,385. (No model.)

Claim.—1. In a car-heater, the combination of a water-tank having an outer heating-cylinder mounted thereon provided with a fuel-poke and uptake, with a fire-cylinder mounted for longitudinal movement in said heating-cylinder, and provided with apertures or openings communicating with said fuel-poke and uptake, whereby by reason of said longitudinal movement of the fire-cylinder the communication may be broken, substantially as specified.

2. In a car-heater, the combination of an outer heating-cylinder having pivoted weighted levers projecting therein, said cylinder being mounted upon and communicating with a water-tank, with an annular casting, as E, provided with a valve-seat and connecting-flange mounted on said weighted arms, and a fire-box mounted on said casting, substantially as specified.

3. In a car-heater, the combination of an outer heating-cylinder having loosely-pivoted weighted arms, as D, projecting therein, with an annular casting provided with a flange mounted on said arms, and a fire-cylinder mounted on said casting and provided with perforations at its top, substantially as specified.

4. The cylinder C, having the lugs C^3 and bolt C^4 and weighted arms D, in combination with the casting E, having the opening E^2, formed with a valve-seat, and the valve-plate E^3, substantially as specified.



397,887. ATTACHMENT-HOLDER FOR SEWING-MACHINES. RUSSEL S. BARNUM, Chicago, Ill., assignor to HARRY C. Goodrich, same place. Filed Apr. 26, 1887. Serial No. 234,941. (No model.)

Claim.—1. The combination of plate A, having hole *d*, the plate C, provided with ear *c*, fitting in the hole *d* to render said plate C detachable and adjustable, the lever B, pivoted to plate A and struck up or recessed to overlap the plate C, means for connecting the lever B and plate C, whereby said plate may be adjusted, and means for securing the lever B in the position to which it may be turned, substantially as described.

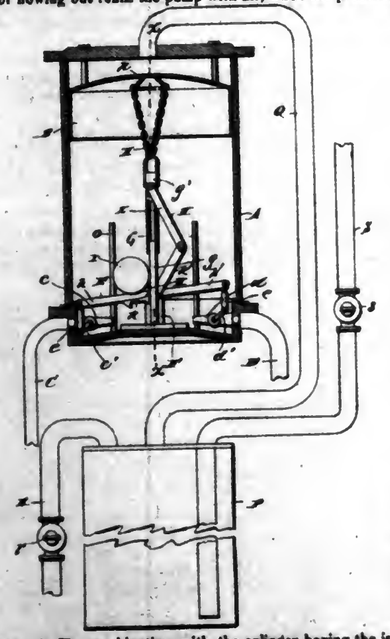
2. The combination of plate A, having hole *d* and notched edge *d'*, the plate C, provided with ear *c*, fitting in the hole *d*, said plate being also provided with pin *d'*, and the lever B, pivoted to plate A and having an opening, *b'*, to receive the pin *d'*, whereby said lever is connected with the plate C, said lever being struck up or recessed to be swung over upon and overlap the plate C, and provided with a tooth, *e*, to engage the notched edge *d'* of the plate A, whereby the lever is held in the position to which it may be turned, substantially as described.

397,888. PROFILE-CUTTING MACHINE. SAMUEL T. BARRAS, Philadelphia, assignor of one-half to William A. Cheyney, Thornbury, Delaware County, Pa. Filed May 3, 1888. Serial No. 272,656. (No model.)

Claim.—1. In a machine for cutting sheets of metal, &c., the combination of the bed-plate, the articulated frame pivoted thereto, the bearing-frame supported thereon, a pair of cutters mounted in

suitable bearings, the work-holder, the grooved pattern, and the guide-pin adapted to engage the groove of said pattern, substantially as set forth.

2. In a machine for cutting sheets of metal, &c., the combination of the bed-plate, the articulated frame pivoted thereto, the bearing-frame supported thereon, a pair of cutters mounted in suitable bearings, the work-holder, the grooved pattern, and a pair of guide-pins fixed adjacent one to the other and engaging the groove of the pattern, these members being combined for joint operation to maintain a line of direction for the cutter tangential to the cut, substantially as set forth.



3. In a machine for cutting sheets of metal, &c., the combination of the bed-plate, the articulated frame pivoted thereto, the bearing fixed thereon, a pair of journaled clamping-plates, a pair of cutters mounted in suitable bearings, the grooved pattern, and the guide-pin engaging the groove of said pattern, substantially as set forth.

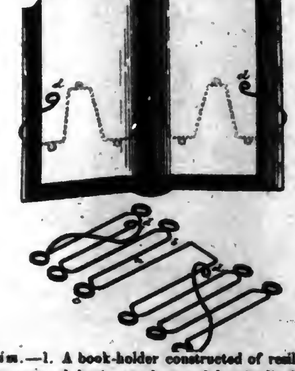
4. In a machine for cutting sheets of metal, &c., the combination of the bed-plate, the articulated frame pivoted thereto, the bearing-frame fixed thereon, a pair of cutters mounted in bearings in the articulated frame, the work-holder fitted to move in the fixed frame, the driving-shaft imparting movement to the work-holder, the grooved pattern connected to the work-holder, and the guide-pin connected to the cutter-bearings and engaging the groove of said pattern, substantially as set forth.

5. In a machine for cutting sheets of metal, &c., the combination of the bed-plate, the articulated frame pivoted thereto, the bearing-frame fixed thereon, a pair of cutters mounted in suitable bearings, the work-holder, the driving-shaft imparting movement to the work-holder, the grooved pattern connected to the work-holder, the guide-pin fixed to the frame of the cutter-bearings and engaging the groove of the pattern, and a pair of guide-pins fixed to a block fitted to slide on the frame of the cutter-bearings toward and from the work-holder and engaging the groove of the pattern on opposite sides of the fixed guide-pin, substantially as set forth.

397,889. WATER OR LIQUID ELEVATOR. DAVID C. BATTEY, Florence, Kans. Filed Aug. 13, 1888. Serial No. 282,591. (No model.)

Brief.—By shifting the weight I the inlet and outlet valves are closed and opened, so that water entering forces the air into a water-elevator or flowing out refills the pump with air, when the process is repeated.

Claim.—1. The combination, with the cylinder having the inlet and discharge pipes C D, provided with valves *c d*, of the operating-lever connected at its opposite ends to the said valves *c d*, the weighted arm adapted to bear on either arm of the said lever, the trip-lever adapted to throw the said weight from one arm of the operating-lever to the other, and the plunger or float connected to the said trip-lever, substantially as specified.



2. The combination, with the compressing-cylinder provided with inlet and outlet pipes C D, having valves *c d*, and the plunger or float operating in the cylinder, of the operating-lever pivoted at its center and connected at its ends to the said valves, the swinging arm H, provided with a weight, I, adapted to bear on either arm of the operating-lever, and the trip-lever K, connected to the plunger or float and provided with the arms *k k'*, adapted to alternately engage the weight as the plunger or float ascends and descends, to throw the same from one arm of the operating-lever to the other, substantially as and for the purpose specified.

3. The combination, with a cylinder provided with inlet and outlet pipes C D, having valves *c d*, and the plunger or float operating in the cylinder, of the operating-lever E, connected at its ends to the said valves, the weighted arm H, adapted to bear alternately on the arms of the said lever, the extensible shaft G, connected at its upper end to the plunger or float, and the trip-lever connected to the extensible shaft and adapted to engage the weighted arm to change its position, substantially as specified.

4. The combination, with the cylinder provided with the pipes C D, having valves *c d*, of the operating-lever E, connected to the said valves, the arm H, provided with a weight, I, adapted to bear alternately on the arms of the lever E, the extensible shaft G, the trip-lever connected to the said shaft and adapted to engage to change its position from one arm of the lever to the other, the weighted arm, and the plunger or float B, connected to the upper end of the extensible shaft by means of a chain or flexible connection, H, and provided with a socket, *n*, to bear on the upper end of said shaft, substantially as specified.

5. The cylinder provided with the inlet and outlet pipes C D, having valves *c d*, the operating-lever E, connected to the said valves, the weighted arm H, adapted to operate the said lever, the extensible shaft G, and the trip-lever connected to the said shaft and adapted to operate the weighted arm, in combination with the inverted-cup-shaped plunger or float B, operating snugly in the cylinder and connected to the upper end of the extensible shaft by a chain or other flexible connection, the central socket, *n*, adapted to bear on the upper end of the extensible shaft, and the vertical bars or supports O O, arranged within the cylinder and adapted to limit the downward movement of the plunger, substantially as specified.

397,890. BOOK HOLDER AND MARKER. JACOB A. BRIDLER, Lanark, Ill. Filed Apr. 9, 1888. Serial No. 270,143. (No model.)

Claim.—1. A book-holder constructed of resilient material or substance arranged in sinuous form and longitudinally extensible, so as to provide for adaptation to books of different widths, substantially as described.

2. A sinuous wire having its ends *d* elevated above the body and returned upon and over the body, substantially as described, and adapted for use as a book-holder.

3. A book-holder constructed of a longitudinally-extensible sinuous wire, having its ends returned and elevated above the body of the wire, and rendered smooth to permit the leaves to be moved freely under them, substantially as described.

4. A book-holder constructed of wire bent back and forth upon itself with integral coils interposed and extensible longitudinally, to adapt it to books of different widths, and terminating in leaf-engaging fingers, substantially as described.

5. A book-holder constructed of wire having sinuosities, the middle one of which is larger than the others, to engage the back of a book, and extensible lengthwise to fit books of different widths, and leaf-engaging terminals, substantially as described.

6. A book holder and marker constructed of resilient material or substance arranged in sinuous form, and thereby adapted to be extended lengthwise to be applied to books of different widths, and having fingers rising therefrom at each end in planes substantially at right angles to its sinuosities, substantially as described.

7. A book holder and marker constructed of resilient material or substance arranged in sinuous form and extensible lengthwise to fit books of different widths, and provided with loosely-applied non-abrading substance or material, substantially as described.

8. A book-holder constructed of coiled resilient material or substance arranged in sinuous form and provided with a cord or other non-abrading material or substance reeved through its coils, substantially as described.

9. A book holder and marker constructed of resilient material or substance arranged in sinuous form and provided with end fingers returned upon and over the body of the holder, and having non-abrading material or substance applied thereto, substantially as described.

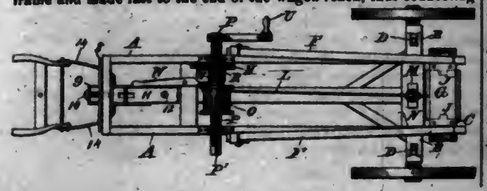
397,891. PLOW. ADOLF P. BÜRKNER, Kansas City, Mo. Filed Oct. 18, 1888. Serial No. 288,456. (No model.)

Claim.—1. In a plow, the combination, with the landside, of the adjustable guide-plate pivoted at its front side to the landside and adjustably secured thereto at its rear end, and provided with a laterally-projecting knife-plate extending under the landside, substantially as specified.

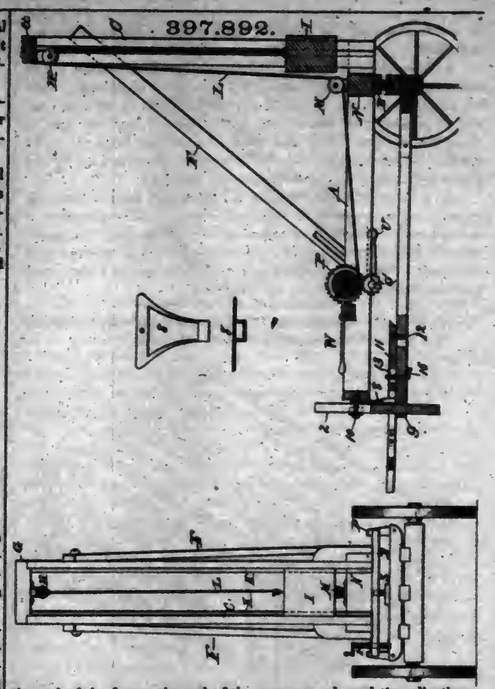
2. In a plow, the combination, with the landside, of the adjustable guide-plate pivoted at its front end to the inner side of the landside, and provided with a laterally-projecting knife-plate which extends under the landside, the said guide-plate being further provided at its rear end with a vertically-slotted arm which is arranged adjacent to a horizontally-slotted stationary arm on the plow, and the adjusting-bolt engaging the said horizontal and vertical slots, whereby the rear end of the guide-plate may be vertically and horizontally adjusted, substantially as specified.

3. In a plow, the combination, with the stationary landside, of the adjustable guide-plate pivoted thereto, and provided with a supplemental removable knife-plate, *f*, secured to its lower edge and projecting under the lower edge of the landside, substantially as specified.

4. In a plow, the combination, with the mold-board, of a wear-plate, I, pivoted at its front end to the mold-board, and provided at its rear end with a vertically-slotted ear, G, engaged by a suitable adjusting-bolt, substantially as specified.



5. The combination, with a plow, of the colter-holder U, arranged on the beam thereof, and comprising the frame U', the grooved block V, and the grooved wedge V', and the colter provided with a rounded shank fitting between the block and the wedge and held in place thereby, substantially as specified.

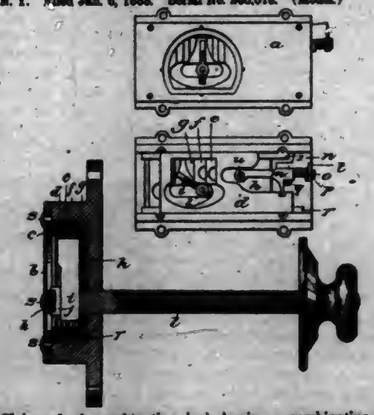


6. The colter-holder comprising the frame U', embracing the beam of a plow, and provided with a set-screw, *n*, the grooved block V and the grooved wedge V', arranged in the frame with their grooved sides opposed to each other, and the set-screws W W, bearing against the outer side of the said wedge, in combination with the colter provided with a rounded shank fitting between the block and the wedge, substantially as specified.

397,892. POST-DRIVER. IRA W. BRADSHAW, Richland Centre, Wis. Filed Aug. 16, 1888. Serial No. 282,906. (No model.)

Claim.—1. The combination, in post-drivers having a pivoted rack, clutch-windlass, trip-lever, ratchet-wheel, and pawl, of the rocking pin with the upper end secured to the false or frame bolster, while the lower end rests in the socket secured to the wagon-bolster, and the screw-bolt swiveled in a journaled plate and threaded in a journaled nut and provided with a small crank, for the purposes set forth.

2. In post-drivers having pivoted racks, the combination of the adjusting-standard and triangular brace pivoted to the end of the frame and made fast to the end of the wagon-reach, thus connecting



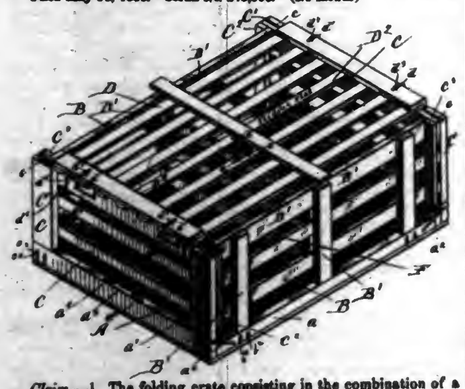
the end of the frame, the end of the wagon-reach, and the adjusting-standard securely together in such a way that the end of the frame may be raised or lowered or rocked to either side at will, as set forth.

3. In post-drivers mounted on two wheels, the thill-connector, in combination with the iron pin in front end of the wagon-reach and the reversible T on the upper end, all substantially as set forth.

397,898. COMBINATION-LOCK. HENRY C. BROWN, Jr., Brooklyn, N. Y. Filed Jan. 6, 1888. Serial No. 260,018. (Model.)

Claim.—1. A combination-lock having a combination of independent tumblers with unequal and irregular openings or apertures within or near their centers, through which openings a detached and independent spindle passes and operates upon the tumblers within the openings by means of an adjustable arm attached to the spindle, substantially as herein shown and described.

2. A combination-lock having tumblers operating independently of each other, which tumblers are operated upon and adjusted individually by means of an arm connected with a spindle and acting upon each tumbler directly and independently, substantially as herein shown and described.



3. A combination-lock having a thin plate or cap, *b*, in combination with the independent spindle *l*, adjustable arm *i*, independent tumblers *d e f g*, and dog *m*, the thin plate or cap being arranged and adjusted upon the back of the case of the lock, as described, whereby the spindle *l* and arm *i* may be driven in, removing the thin

plate or cap without destroying or injuring the other parts of the lock or case or displacing the tumblers, substantially as herein shown and described.

4. A combination-lock having an independent spindle, *l*, and arm *i*, held in position by means of the set-screw *k*, and keeper *j*, having a ratchet or teeth interlocking with like teeth in the arm *i*, arranged as described, whereby the combination of the lock may be changed and regulated by shortening or extending the arm *i* in the spindle *l*, in combination with the independent tumblers *d e f g* and dog *m*, substantially as herein shown and described.

5. A combination-lock having a dog, *m*, and head *n*, carrying-screw *p*, and set-screw *q*, as described, whereby the combination of the lock may be changed by extending or drawing back the head *n* upon the dog *m* by means of the carrying-screw *p* and set-screw *q*, in combination with the sliding tumblers *d e f g*, spindle *l*, and arm *i*, substantially as herein shown and described.

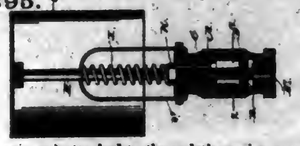
397,894. FOLDING CRATE. WILLIAM H. CADWELL, Chicago, Ill.
Filed May 31, 1888. Serial No. 275,598. (No model.)

Claim.—1. The folding crate consisting in the combination of a bottom, A, with folding sides B B, folding ends C C, and folding top D, having sliding hinges connecting the same with said ends C C, and provided with under cross-bars D^2 D^2, for the folding ends C C to abut against when the crate is folded, substantially as specified.

2. In a folding crate, the combination, with bottom A, having side and end rails, *a a'*, of folding sides B B, wire staple-form hinges $b\ b'\ b^2\ b^3$, uniting said parts, the free ends b^2 of the wire hinge part b^3 being folded around said rails *a*, folding ends C C, and wire staple-form hinges $c\ c'\ c^2\ c^3$, uniting said parts, the free ends c^2 of the wire hinge-piece c^3 being folded around said rails *a'*, substantially as specified.

3. The combination, with the bottom of a folding crate, of a folding side and a wire staple-form hinge of two pieces, *b* and b^3, said part *b* having eyes *b'* at its free end and the free ends b^2 of the part b^3 being folded around a rail on the bottom of said crate, substantially as specified.

4. The combination, with bottom A, of folding sides B B, folding ends C C, folding top D, wire hinge-rod *d*, extending longitudinally under one of the slats of said top to form a slot for the sliding hinge-pin to fit in, and a removable hinge-pin, d^2, secured to said folding end C near the top edge thereof, substantially as specified.



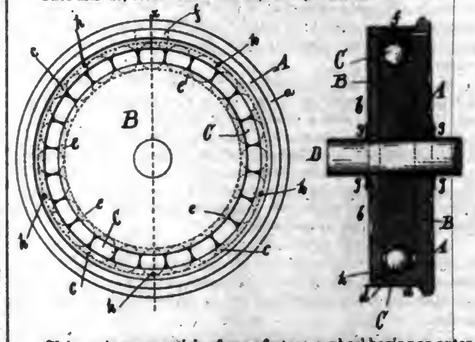
5. In a folding crate, the sliding hinged top D, having movable slat D^2, and upper and lower cross-bars, between which said slat D^2 slides, and provided with a wire hinged catch, E, consisting of two right-angled portions, one of which is stapled to an adjoining slat and the other of which is provided with a downwardly-bent end, substantially as shown, to enter a hole in said movable slat D^2, and staples *e*, substantially as specified.

6. The combination, with bottom A, having side and end rails, *a a'*, of folding hinged sides B B, folding hinged ends C C, top D, having sliding hinges connecting the same at both ends with said ends C C, partition F, formed of upright posts and cross-slats, with spaces between, and having hooks *f*, pins *f'*, and slotted guides f^2 f^3 secured to said sides B B, said partition being of less height than the crate, so that said partition may be set up or taken down without removing said folding top D, substantially as specified.

397,895. FLOAT-VALVE FOR WATER-WORKS. SHERWOOD M. CRANE, Navarre, Ohio. Filed Jan. 20, 1888. Serial No. 261,261. (No model.)

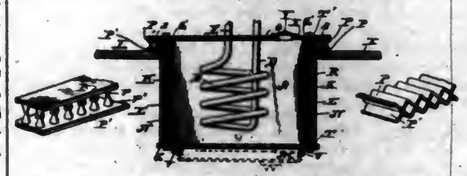
Claim.—The combination of the valve-case having the guide-yoke on its upper end, the float having its upper end closed and its lower end open, the rod depending from the top of said float and guided in the yoke, the vertically-movable downwardly-opening valve arranged

397,895.



in the valve-case and attached to the rod, the spring arranged on the latter, and bearing against the under side of the yoke, and the adjusting-nut on the said rod bearing against the lower end of the spring, substantially as described.

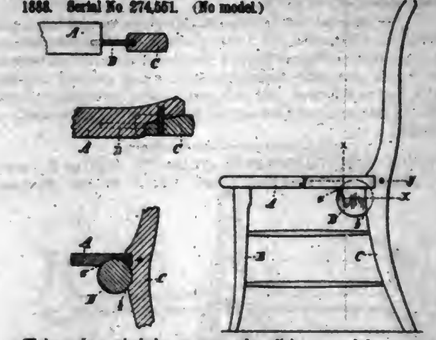
397,896. HORSESHOE-NAIL. JOHN A. COLEMAN, Providence, R. I.
Filed Apr. 21, 1887. Renewed July 25, 1888. Serial No. 281,022. (No model.)



Claim.—As a new article of manufacture, a horseshoe-nail formed of drawn wire by the process of striking up and enlarging the head of the nail therefrom and drawing down the shank and hardened-point portion therefrom without substantially impairing the hardened shell of the wire which surrounds the ductile central core portion of the nail, substantially as described.

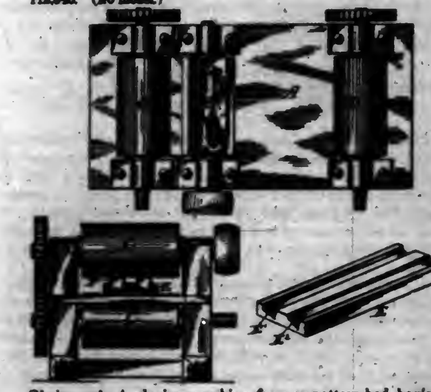
397,897. VEHICLE-WHEEL. HERMAN R. CROSS, Jersey City, N. J.
Filed Mar. 23, 1888. Serial No. 268,201. (No model.)

Claim.—As a new article of manufacture, a wheel having an outer hollow shell-like portion, as A *b*, an inner portion, as B, balls or equivalent devices working between a groove on the periphery of the portion B and a groove on the inner periphery or circumference of the shell A, and means whereby said balls may be placed in position, substantially as specified.



397,898. HEATING APPARATUS FOR STREET-CARS. LEWIS K. CURLETT, Chicago, Ill. Filed Jan. 6, 1888. Serial No. 295,734. (No model.)

Claim.—1. In a pendent car-heater, a combustion-chamber composed of an inner casing, an outer jacket, a bottom, and a top plate extending beyond the walls of the outer jacket, so as to form a circumferential flange, said bottom and top plate being connected by bolts passing through the air-space between the inner and outer casings, substantially as set forth.

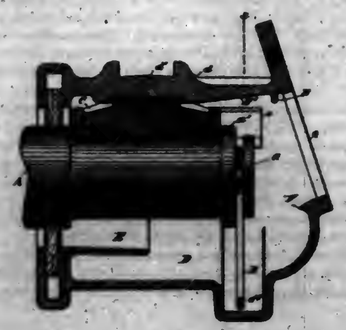


2. In a pendent car-heater, a combustion-chamber composed of an inner casing, an outer jacket, a bottom, and a top plate extending beyond the walls of the outer jacket, so as to form a circumferential flange, the whole connected by bolts, as described, said bottom and top plate being provided with openings registering with the air-space between the inner casing and outer jacket, in combination with a pair of supporting rings or guards fitting around the outer jacket under the flange of the top plate, and provided with studs or corrugations, the apices of which are placed in contact, substantially as and for the purpose set forth.

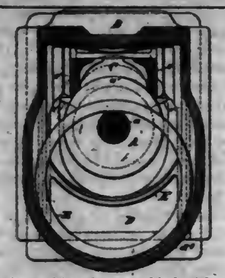
397,899. JOINT FOR CHAIRS. THEODORE CURTIS, Reading, Mich., assignor of one-half to Samuel N. Curtis, same place. Filed May 21, 1888. Serial No. 274,551. (No model.)

Claim.—In a chair-brace, a wooden disk secured in segmental circular mortises in the corners of a chair-frame, substantially as and for the purpose described.

397,900. MACHINE FOR THE MANUFACTURE OF FELLIES. JESSE W. DARK, Columbus, Ohio. Filed Nov. 21, 1883. Serial No. 112,340. (No model.)



Claim.—1. A planing-machine form or pattern-bed having a series of grooves, the bottoms and walls of each of which are inclined at different angles to each other in each groove, substantially as specified.



2. The combination, with a wood-planing machine, of a form or pattern-bed having a groove deeper on one side than on the other and an inclined bottom, and adapted to present one side of a square strip, and also a groove having a less inclined bottom and adapted to present a beveled strip angularly to the cutter thereof, substantially as shown and described.

3. The combination of the cutter-head B, feed-rolls C, bed A, and between said feed-rolls the form or pattern-bed E, having the grooves E' E^2, the angles formed by the sides and bottom of which differ in inclination, substantially as shown and described.

397,901. AXLE-LUBRICATOR. WILLIAM U. DUNBAR, Altoona, Pa. Filed June 6, 1888. Serial No. 276,942. (No model.)

397,901.

Claim.—1. A journal-bearing provided with shelves or troughs along its lower outer edges and with supplemental shelves or troughs for co-operation therewith, substantially as described.

2. A journal-bearing provided with shelves or troughs along its lower outer edges, and with an extension upon its front end which has supplemental shelves or troughs thereon for co-operation with the first-mentioned troughs, substantially as described.

3. A journal-bearing having shelves or troughs along its lower outer edges and an extension upon its front end which is divided into two projections, each of which is provided with supplemental shelves or troughs for co-operation with the first-mentioned shelves or troughs, substantially as described.

4. A journal-bearing having shelves or troughs along its lower outer edges, which are inclined on their under side from the front to the rear of said journal-bearing, substantially as described.

5. A journal-bearing having shelves or troughs along its lower outer edges and an extension upon its front which is provided with supplemental shelves or troughs for co-operation with the first-mentioned shelves, and with an orifice formed through such extension, substantially as described.

6. The combination, with a journal and a lubricating-ring mounted thereon, of a bearing having shelves or troughs formed along its lower outer edges, and with an extension upon its front end which is provided with supplemental shelves or troughs for co-operation with the first-mentioned shelves, and also with an orifice located above the lubricating-ring, substantially as described.

7. The combination, with a journal-bearing, a journal arranged within such bearing, and a lubricating-ring mounted loosely upon the journal, of a box in which the journal-bearing is disposed, provided with a chamber or well in its bottom, substantially as described.

8. The combination of a journal, a lubricating-ring loosely mounted thereon, and a journal-bearing, with a box in which the journal-bearing is arranged, provided with a chamber or well in its bottom, an orifice in its front, and a flange projecting inward beneath such orifice, substantially as described.

9. The combination of a journal, a lubricating-ring loosely mounted thereon, and a journal-bearing, with a box in which the journal-bearing is arranged, provided with a chamber or well in its bottom, and a flange extending inward from its back beneath the journal, substantially as described.

10. The combination of a journal, a lubricating-ring loosely mounted thereon, and a journal-bearing, with a box in which the journal-bearing is arranged, provided with a chamber or well in its bottom, an orifice in its front, a flange projecting inward beneath such orifice, and a second flange extending inward from the back of said box beneath and partially surrounding the journal, substantially as described.

11. A box for the reception of the journal-bearing, provided with an orifice or opening in its front, and with a flange or splash-guard located above said opening and depending in rear thereof independently of the cover to said orifice, substantially as described.

12. A box for the reception of a journal-bearing, provided with an orifice or opening in its front, a flange or splash-guard depending from its top, and with an inclined surface extending from the rear side of each flange or splash-guard backward toward the center of said top, substantially as described.

13. The combination, with a journal, a lubricating-ring mounted thereon, and a journal-bearing provided with an extension upon its front end for engaging with said journal, of a box in which such journal-bearing is arranged, having in its top a depending flange or splash-guard, and an inclined surface extending from the rear of said flange or splash-guard backward toward the center of said box, substantially as described.

14. The flange or splash-guard H, constructed with the supporting-strip *h* and depending portion *h'*, as and for the purposes set forth.

15. The combination, with the box D and the journal-bearing C, constructed with the projections *c c*, of the flange or splash-guard H, having the supporting-strip *h* and depending portion *h'*, as and for the purposes set forth.

16. A journal-bearing having its lower outer edges inclined on their under side from front to rear, and also having on its front an extension, substantially as described.

17. A journal-bearing having its lower edges inclined on their under side from front to rear, and also having on its front an extension which is provided with supplemental shelves or troughs for co-operation with the said inclined lower edges, substantially as described.

18. A journal-bearing having its lower edges inclined on their under side from front to rear, and also having on its front an extension which is provided with an orifice formed through the same, substantially as described.

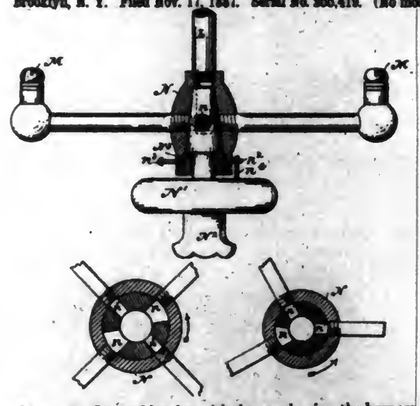
19. A journal-bearing having its lower edges inclined on their under side from front to rear, and also having on its front an extension which is provided with an orifice formed through the same, and also with supplemental shelves for co-operation with the said inclined lower edges, substantially as described.

397,902. RAILROAD-CAR. WILLIAM R. ELLIOTT, Chicago, Ill. Filed May 29, 1888. Serial No. 275,479. (No model.)

Claim.—1. The combination, with the adjacent cars, of a yielding connection between and secured at both extremities to said cars and extending obliquely to their length, substantially as and for the purpose described.

2. The combination, with the adjacent cars, of a continuous yielding connection between and attached directly to said cars at both extremities and extending obliquely to their length, substantially as and for the purpose described.

3. The adjacent cars and the coupling-plates secured to the ends thereof, in combination with a pair of rods extending between said coupling-plates and connecting said cars, a sliding connection between said rods, lugs or collars on said rods, and a coiled spring sleeved upon said rods and confined between the collars thereon, substantially as described.



4. The adjacent cars and the coupling-plates secured to the ends thereof at opposite sides of the center, in combination with rods connecting said coupling-plates and extending obliquely between said cars, a sliding connection between said rods, lugs or collars upon said rods, and a coiled spring sleeved upon said rods and confined between said collars, substantially as described.

5. The adjacent cars and the coupling-plates secured to the ends thereof at each side of the center, in combination with rods connecting each pair of coupling-plates on opposite cars and extending obliquely to said cars and to each other, a sliding connection between said rods, lugs or collars on each of said rods, and coiled springs sleeved on each of said rods and confined between the said collars, substantially as described.

6. The adjacent cars, the coupling-plates secured to the ends thereof, and rods connected to said coupling-plates and extending obliquely between said cars, in combination with a pair of lugs on each of said rods, disks sleeved upon and constituting a sliding connection between said rods, said disks being confined between each pair of lugs, and a coiled spring sleeved upon said rods and confined between the disks, substantially as described.

7. The adjacent cars and the coupling-plates secured to the ends thereof, in combination with a pair of rods extending between said coupling-plates and connecting said cars, a sliding connection between said rods, a detachable connection between said rods and coupling-plates, lugs or collars on said rods, and a coiled spring sleeved upon said rods and confined between the collars thereon, substantially as described.

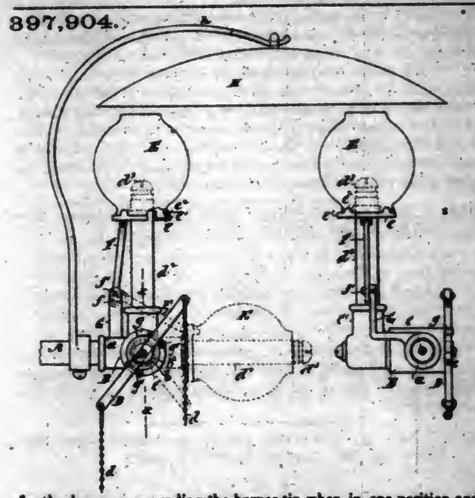
397,903. ILLUMINATING APPARATUS. WILLIAM F. FOLKER, Brooklyn, N. Y. Filed Nov. 17, 1887. Serial No. 255,419. (No model.)

Claim.—1. In combination with the supply-pipe, the burners, and the shell, the plug having the central vertical recess communicating directly with the supply-pipe, opposite ports of a capacity equal to the burner-pipes, and a port between the opposite ports of a greater capacity than the burner-pipe, whereby the two opposite ports may be turned out of communication with their burner-pipes, and the wider port having communication with its burner-pipe, substantially as specified.

2. In combination with the supply-pipe, the burners, and the shell, the plug provided with a central vertical recess communicating directly with the supply-pipe, the opposite ports having a capacity equal to the burner-pipes, the intermediate opposite ports having a greater capacity, whereby two or more alternate burner-pipes may be supplied with gas, or all of the burner-pipes may be supplied, substantially as specified.

3. The combination, with the shell and the plug having the hand-piece provided with a pin or projection, of the hollow screw-plug in the lower end of the shell, securing the plug in place, and the stop-screw passing through a portion of the shell and impinging against the screw-plug and locking the same, substantially as specified.

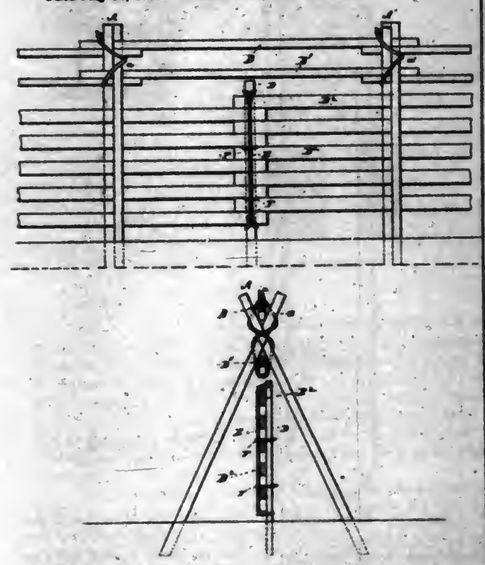
4. The combination, with the supply-pipe, the burner-pipes, and the shell, of the hollow plug having ports equal to the capacity of the burner-pipes and intermediate ports of a greater capacity than the first-named ports, whereby one or more ports may be turned out of communication with their burner-pipes, leaving others in full communication when the plug is turned in one direction, and whereby all of the burner-pipes may receive a full or a reduced supply of gas, substantially as specified.



397,904. GAS-BURNER FOR BILLIARD-TABLES. WILLIAM F. FOLKER, New York, N. Y., assignor of one-half to Walter E. Schwing, same place. Filed July 27, 1888. Serial No. 281,209. (No model.)

Claim.—1. The combination, with a gas-supply pipe, of a gas-cock having a rotary plug, and a gas-burner secured to said plug and moving therewith to occupy substantially vertical and horizontal positions, and a globe connected to said gas-cock and sliding on the burner as it is moved from one position to the other, substantially as specified.

2. The combination, with a gas-supply pipe, of a gas-cock having a rotary plug, a gas-burner secured to said plug and having a movement therewith to occupy approximately vertical and horizontal positions, a globe for the burner, a rigid support, and a swinging connection between the globe and said support, whereby when the burner occupies a vertical position the globe will surround the burner-tip, and when the burner occupies a horizontal position the globe will be moved from over the burner-tip, substantially as specified.

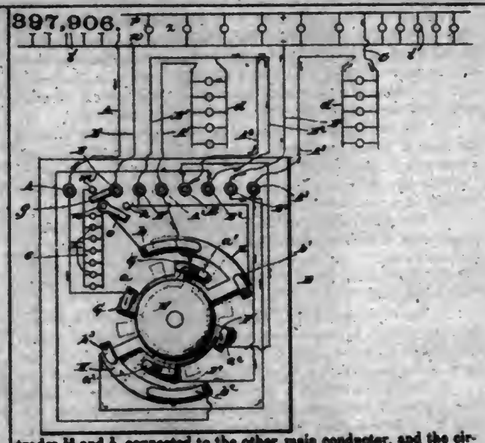


3. The combination, with a gas-supply pipe, of a gas-cock having a rotary plug, a gas-burner secured to said plug and moving therewith to occupy approximately vertical and horizontal positions, a globe

397,904.

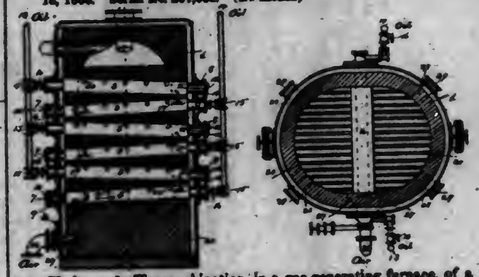
for the burner surrounding the burner-tip when in one position and removed from said tip when in its other position, a rigid support, and a link having a pivotal connection with said globe near one end and having a slotted connection with said support near the other end, substantially as specified.

397,905. FENCE. CHARLES F. FOWLER, North Springfield, Mo. Filed July 30, 1888. Serial No. 281,262. (No model.)



Claim.—In a fence, the combination, with the driven posts, the lapped fence-rails, the binding-wires secured at their upper and lower ends to the driven posts, and the tie-wires engaging the binding-wires and driven fence-posts, of the crossed stakes having their lower ends seated in the ground intermediately of the driven posts, the riders resting in the crotches of said crossed stakes, the auxiliary rails, and the crossed wires *a a'*, connecting the crossed stakes, riders, and auxiliary rails together, substantially as specified.

397,906. ELECTRIC-LIGHTING SYSTEM. JAMES A. GALVIN, Stockton, Pa. Filed Apr. 16, 1888. Serial No. 270,790. (No model.)



Claim.—1. The combination of the main conductors having the lamps in multiple arc, the branch conductors having the lamps in multiple arc, and having one terminal connected to one main conductor and the other connected to an electrode, a^3, the similar branch conductor with multiple-arc-lamps, and having one terminal provided with an electrode, a', and the other connected to electrodes b', b^2, and a^3, the electrode a, connected to the same main conductor, the electrodes b^2 and b, connected to the other main conductor, and the circuit-closers between the electrodes $b\,b'\,b^2\,b^2$ $a\,a'\,a^3\,a^3$, substantially as described.

397,906.

2. The combination of the main conductors having the lamps in multiple arc, the branch conductors having the lamps in multiple arc and having one terminal connected to one main conductor and the other terminal connected to an electrode, a^3, the similar branch conductors with multiple-arc lamps and having one terminal provided with an electrode, a', and the other connected to electrodes b', b^2, and a^3, the electrode a, connected to the same main conductor, the electrodes b^2 and b, connected to the other main conductor, the circuit-closers between the electrodes $b\,b'$, $b^2\,b^2$, $a\,a'$, and $a^3\,a^3$, and the shunt-circuit with multiple-arc lamps, and the switches to connect the terminals of said shunt-circuit to the electrodes $b\,b'$, for the purpose set forth, substantially as described.

397,907. GAS-GENERATING FURNACE. JAMES GILBERT, Omaha, Nebr., assignor of one-half to Charles R. Lee, same place. Filed Mar. 12, 1888. Serial No. 267,063. (No model.)

Claim.—1. The combination, in a gas-generating furnace, of a central partition having fire-grates upon its opposite sides, a series of inclined retorts being made to communicate with each other and each being provided with a separate oil-supply pipe at its upper end, a gas-tight cover at its opposite end and having orifices extending into the furnace-chamber along their upper parts, a valve located in each of said oil-supply pipes, an air-blast located below said grates, outlet-pipes located at the top of the furnace, and the valves for sealing the furnace, all arranged and adapted to operate substantially as described.

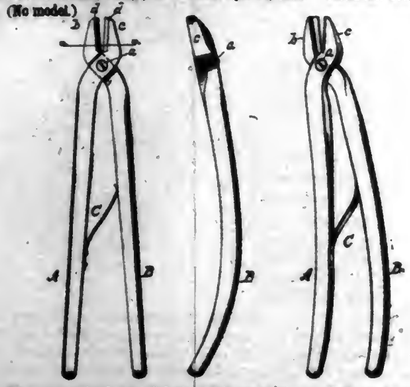
2. The herein-described gas-generating furnace having a central partition provided with inclined retorts communicating with each other, each retort having a separate oil-supply pipe at its upper end and a gas-tight cover at its lower end, and a series of openings leading into the furnace-chamber along the upper part, in the manner and for the purpose substantially as described.

397,908. RUFFLER AND GATHERER FOR SEWING-MACHINES. HARRY C. GOSSMER, Chicago, Ill. Filed Jan. 24, 1887. Serial No. 225,272. (Model.)

Claim.—1. The combination, with the presser-foot and ruffling-blade, of the plate B, located on the under side of the presser-foot and having on its under side a projection, *b*, and the compensating-block C, connected with said plate B, and having an apex, *c*, and inclines *c'*, said apex being in contact with the projection *b* of plate B, whereby said block can rock transversely, substantially as described.

2. The combination, with the presser-foot and ruffling-blade, of the plate B, having projection *b*, and the compensating-block C, provided with an apex, *c*, and inclines *c' c'* on its upper face, and having its lower face provided with inclines *c² c²*, bearing-point *c³*, and a front bearing-edge, substantially as and for the purpose specified.

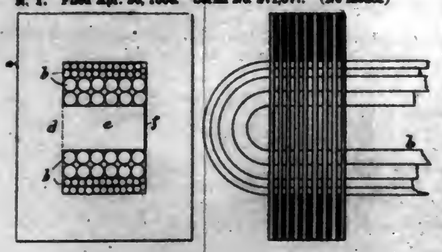
3. The combination, with a reciprocating ruffling-blade and the presser-foot, of the compensating-block C, having apex *c*, inclines *c' c'*, inclined faces *c² c²*, and apex *c³*, and a connecting-screw, D, for attaching the compensating-block to the presser-foot to rock in all directions, substantially as and for the purpose specified.



4. The combination of a reciprocating ruffling-blade, a presser-foot, the plate B, having a bearing-point, *b*, and ears *b'*, the compensating-block C, having apex *c*, inclines *c' c'*, inclined faces *c² c²*, and apex *c³*, and the pivot D, substantially as and for the purpose specified.

5. The combination of a reciprocating ruffling-blade, a presser-foot, a plate, B, having an extension, B', provided with a turned portion, B'', to form a guide for the upper band, the compensating-block C, and the pivot D, substantially as and for the purpose specified.

6. The combination of the presser-foot, the swinging arm J, having an opening, J', provided with leaves *j'*, the ruffling-blade G, the plate K, the ring K', having leaves *k'* and arms *k² k³*, the plate L, having ears *l' l³*, and the actuating-lever M, substantially as and for the purpose specified.



7. The combination of the presser-foot, the ruffling-blade, the swinging arm J, having an opening, J', provided with leaves *j'*, the plate K, having a ring, K', provided with leaves *k'* and arms *k² k³*, the plate L, having slot *l*, recess *l'*, and ears *l' l³*, the lever M, having notched extension N, and the plate O, having point *o'* and catch *o²*, for changing the position of the plate L to regulate the throw of the ruffling-blade, substantially as described.

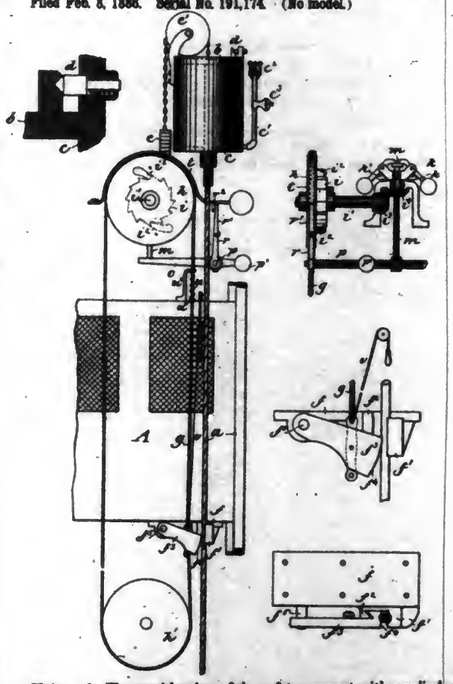
397,909. NIPPERS FOR CUTTING PEGS FROM BOOTS OR SHOES. JOHN C. GREEN, Peoria, Ill. Filed Apr. 14, 1888. Serial No. 270,643. (No model.)

Claim.—A nipping-tool designed for removing nails from the interior of boots or shoes, consisting of two sections pivoted together, forming handle and jaw portion, the jaw portion being provided with side cutting-edges, each section being curved from the handle end to the pivot on a long arc of a circle, and the jaw portion being curved on a short arc of a circle, whereby the introduction of the tool is facilitated and a bearing-surface for the cutting-jaws readily obtained, substantially as described.

397,910. ELECTRIC CONVERTER. LUDWIG GUTMANN, New York, N. Y. Filed Apr. 26, 1888. Serial No. 271,577. (No model.)

Claim.—1. An element for the core of an electric converter, consisting of an iron plate provided with two openings which contain the coil and with a cut or slit which connects the two openings.

2. An electric converter consisting of the combination of a coil surrounded by an uncut iron plate perpendicular to the axes of the conductors forming the coil and an iron cross-piece passing through the center of the coil and connected at one end to the said iron plate.



3. An element for an electric converter, consisting of a sheet of iron suitably perforated and provided with a single cut between the perforations for the entrance of the converter's coil.

397,911. CAR-MOVER. JOSEPH P. HALPIN, Wyandotte, Mich. Filed May 21, 1888. Serial No. 274,523. (No model.)

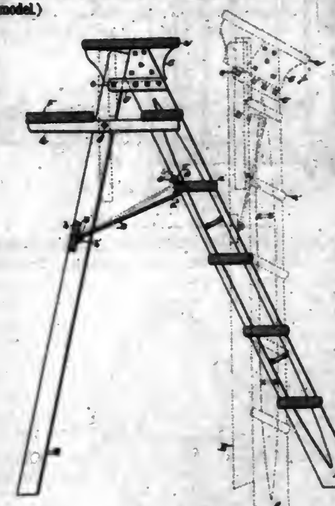
Claim.—In a car-mover, a gripper-wheel formed with circumferential groove having inclined gripping-walls, and with sprocket-teeth upon each side of said groove, substantially as and for the purpose specified.

397,912. ELEVATOR. MELANCTHON HANFORD, Malden, Mass. Filed Feb. 8, 1888. Serial No. 191,174. (No model.)

Claim.—1. The combination of the safety-support with a cylinder and piston therein connected with said support, and a clutch or gripping device for connecting the car with the safety-support, and a retaining device by which the piston is held at one end of the cylinder until operated upon by the weight of the car applied to the safety-support, substantially as described.

2. The combination of the safety-support and yielding cushion for said support, and for the car and its load when connected with said support, with a clutch or gripping device connected with the elevator-car, and the automatic actuating mechanism therefor, comprising a rope or band, a speed-governor actuated thereby, and a checking device for said rope or band controlled by the said governor, substantially as described.

3. The safety-support and a cylinder and piston therein connected with said support, the said cylinder being provided with an escape-passage, combined with a safety-valve in said passage, and a clutch for connecting the car with the safety-support, substantially as described.



4. The combination of a safety-support with a clutch or gripping device connected with the elevator-car, a rope or band connected with and actuated by the elevator-car, a speed-governor actuated by said band, a checking device for said rope, and a detent for the check-

ing device, and connecting mechanism between it and the speed-governor, arranged to be operated only by an increase of speed of the said governor, substantially as described.

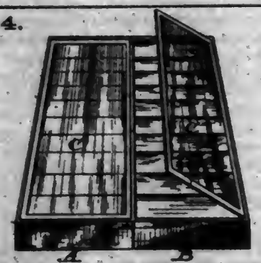
5. The combination, with a safety-support, of the clutch or gripping device consisting of a plate provided with a shoulder forming one member of the gripping device, and with a shoulder for engaging the co-operating movable member of the gripping device, combined with the movable member consisting of the pivoted arm provided with an eccentric gripping-face, and a shoulder which receives the pressure when the gripping device is engaged with the safety-support, substantially as described.

6. The combination of the safety-support and clutch or gripping device and its operating rope or band, with a governor and operating-shaft therefor, and pulley loose on said shaft that supports and is operated by the said rope or band, and a ratchet and pawl, one connected with said governor-shaft and the other with the pulley loose thereon, as set forth, whereby the pulley operates the governor-shaft when rotated in one direction, but turns upon said governor-shaft when rotating in the other direction, substantially as described.

397,913. STEP-LADDER. GEORGE W. HATCHER and SUMLETON D. HATCHER, Cleveland, Ohio. Filed May 25, 1888. Serial No. 275,048. (No model.)

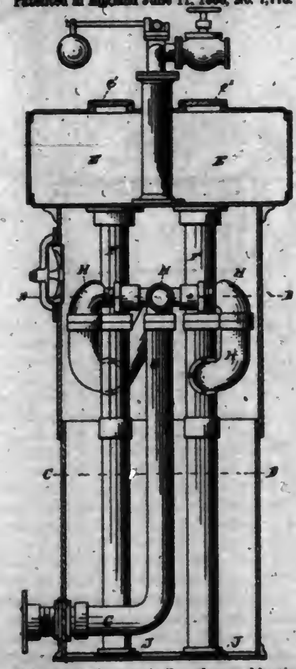
Claim.—1. In a step-ladder, the combination, with side rails and treads, of legs pivoted or hinged to the side rails or an attachment of the latter, the sections of the side rails and legs above the pivotal line of the legs engaging each other when the legs are distended to limit such distention, a rod pivoted to a cross-bar on the legs, the opposite end of this bar having an offset extending loosely through a notch in one of the treads, said offset having a hook on its end to limit its downward movement, and a staple spanning the notch of the tread, substantially as set forth.

2. In a step-ladder, the combination, with sides, treads, strap projecting from the sides, and legs pivoted to the ends of the strap with their ends in position to abut against the ends of the sides when the ladder is distended, of a rod pivoted to a cross-bar between the legs, said rod having an offset at the opposite end and a hook on the end of the offset, the latter adapted to pass through a notch in one of the treads, a staple to hold said offset slidingly within the notch, and a folding shelf secured to arms, the latter being pivoted near their center to the legs with their opposite ends extended beneath one of the treads, all of these parts being arranged to operate simultaneously with the opening or closing of the ladders, substantially as set forth.



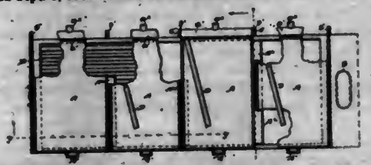
397,914. FOLDING CASE OR PACKAGE. CHARLES T. HESSE, Cleveland, Ohio. Filed Sept. 28, 1886. Serial No. 206,607. (No model.)

Claim.—A folding case or package consisting of two halves, A and B, hinged so as to fold together, and provided with glass lids C C,



hinged to shut within their margins, which rest on the ledges *a*, whereby the package and contents form protecting-cushions to the glass lids, substantially as and for the purpose specified.

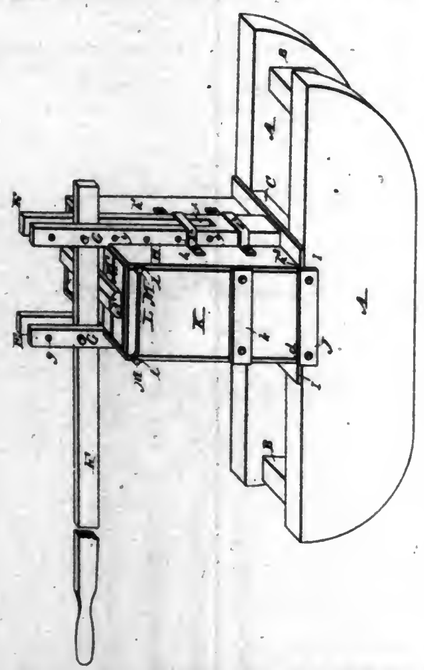
397,914.



397,915. BOILER. REGINALD W. HEWETT, Birmingham, County of Warwick, England. Filed Dec. 1, 1887. Serial No. 256,672. (No model.) Patented in England June 11, 1886, No. 7,773.

Claim.—In a vertical steam-boiler, the combination of the fuel-chamber E, having doors or lids *e'* and *e²*, the fire chambers or flues F, leading from said fuel-chamber and provided with the perforated plates J, the branch pipes H, and the air-chamber G, all arranged and operating as herein shown and described.

397,916. EVAPORATOR. HENRY HILL, Chester Cross Roads, Ohio. Filed Sept. 5, 1888. Serial No. 284,606. (No model.)



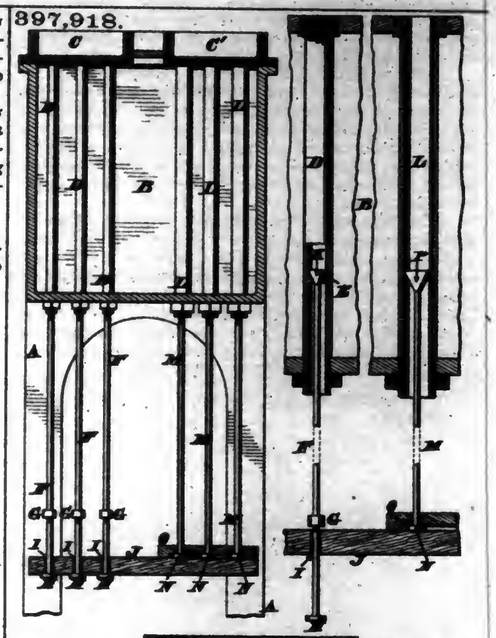
Claim.—1. The combination, with a series of evaporating-pans, of hollow trunnions projecting from said pans, the trunnions of one pan telescoping with the trunnions of the next adjacent pan, and a tube passing through the trunnions and projecting at one end into the pan, substantially as set forth.

2. The combination, with a series of evaporating-pans, of hollow internally-tapering trunnions projecting from said pans, the trunnions of one pan telescoping with the trunnions of the next adjacent pan, and a bent tube having its short arm adjustably secured within said trunnions, substantially as set forth.

3. The combination, with a series of evaporating-pans, of hollow trunnions projecting from said pans, the trunnions of one pan telescoping with the trunnions of the next adjoining pans, and flanges projecting from one bottom edge of each pan and extending beneath the bottom of the next adjacent pan, substantially as set forth.

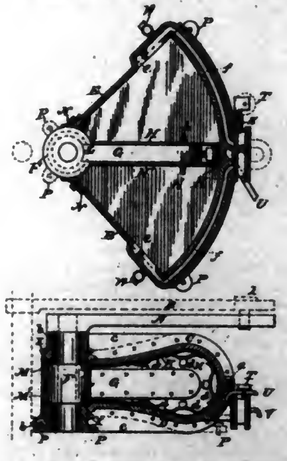
4. The combination, with evaporating-pans connected by hollow trunnions, substantially as indicated, of circulating-tubes adapted at one end to fit and turn in the respective hollow trunnions, such circulating-tube having an elbow, the free end of said tube extending toward the end of the pan opposite the hollow trunnions, substantially as set forth.

397,917. BALING-PRESS. WILLIAM HILLMAN and JOSEPH P. RIFFLE, Schulenburg, Tex. Filed Aug. 4, 1888. Serial No. 281,962. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the runners, the bed-plate mounted thereon, the bifurcated uprights having apertures, as described, the pins that fit in the apertures, the independent removable side pieces H, and the independent removable side pieces K, the removable connections for securing the side pieces, H and K, together at the top, the follower, and the lever extending centrally across the follower for depressing it and projecting laterally through the bifurcated uprights and bearing upon the pins.

2. The combination, substantially as hereinbefore set forth, of the bed-plate, the side pieces H, made in two parts, *h h'*, the straps h^3, for securing them together, the uprights straddled by the straps h^3, the side pieces K, the tie-rods for securing the side pieces, H and K, together at the top, the follower M', the cross-bar N, secured to the top of the follower and made narrow at the top to form a bearing for the operating-lever, the bifurcated uprights, the operating-lever extending through the bifurcated uprights centrally across the cross-bar N, and the pins against which the operating-lever bears.

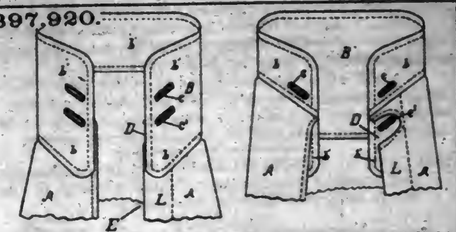


397,918. CANDLE-MOLDING MACHINE. LOUIS HOMAN, Cincinnati, Ohio, assignor to Homan & Co., same place. Filed Aug. 31, 1888. Serial No. 284,382. (No model.)

Claim.—The combination, in a candle-molding machine, of chest B, provided with two sets of molds, D L, traversed, respectively, by pistons F K and M P, the pistons M P being connected to the follower J, so as to travel therewith, and the pistons F K being passed loosely through holes I in said follower, and being provided with bearings G and heads H, and stops, as E, being arranged within the short-candle molds D, for the purpose described.

397,918.

397,919. STEERING APPARATUS. JULIUS L. HORNIG, Jersey City, N. J. Filed Apr. 9, 1888. Serial No. 270,041. (No model.)



Claim.—1. In steering apparatus, the combination, with the rudder, of a motor consisting, essentially, of a stationary inclosing-case; a fan or piston swinging within such case, and means for varying fluid-pressure within such case, said fan or piston being connected with the rudder, whereby the rudder is moved positively in either direction, substantially as set forth.

2. In steering apparatus, the combination, with the rudder, of a pivoted body connected therewith, a stationary case inclosing said body, and means for varying fluid-pressure within said case, whereby said body is made to swing within the case and move the rudder, substantially as set forth.

3. In steering apparatus, the combination of the motor, consisting, essentially, of an inclosing-case, a fan or piston pivoted within said case, and means for varying fluid-pressure within said case with the arm connected with the pivot of said fan or piston, the tiller-arm connected with said pivot-arm, and the rudder connected with said tiller-arm, substantially as set forth.

397,920. SHIRT-WRISTBAND. WILLIAM R. HOWELL, Los Angeles, Cal., assignor of one-half to George S. Marygold, same place. Filed Aug. 16, 1888. Serial No. 282,876. (No model.)

397,920.

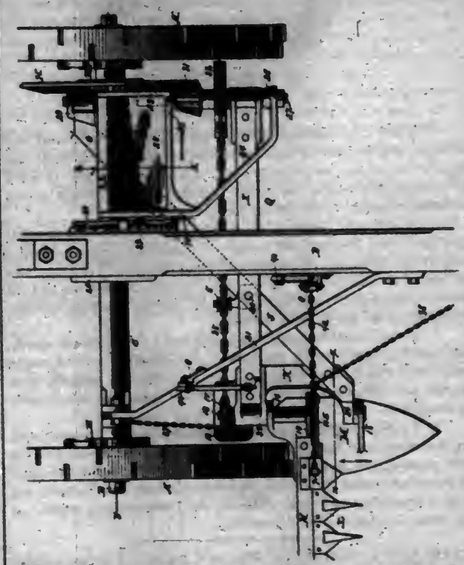
Claim.—The combination of the double wristband provided with the four button-holes *c c' c' c'*, and the sleeve provided with the slit and having its end attached to one side of the double wristband between the button-holes *c c* and *c' c'*, and provided with an opening, D, in the outside lap of the slit arranged at such a distance from the point of attachment of the sleeve with the wristband that when the wristband is folded upon the outside of the sleeve the button-holes in the wing of the wristband folded against the sleeve will coincide with the opening D.

397,921. CHURN. JOHN C. KEARNS, Maitland, Pa. Filed Oct. 20 1888. Serial No. 288,613. (No model.)

Claim.—The herein-described churn, consisting of a rectangular body or receptacle having the bearings *C e* fixed to its end walls at points below the horizontal center of said body, a flat imperforate rectangular dasher arranged horizontally and longitudinally therein and corresponding in width nearly to the transverse diameter of the body, as described, a flat plate fixed to one end of said dasher and having a flanged trunnion which is journaled in the bearing C, and another flat plate, D, fixed to the opposite end of said dasher and having an integral shaft, E, which passes through the bearing *e*, all arranged and combined for service as described.

397,922. HIP REIN-SUPPORT. AUGUSTUS KEMPLEY, San Francisco, Cal. Filed Dec. 3, 1888. Serial No. 292,564. (No model.)

Claim.—A rein-support consisting of a bar bent upward at its middle portion and at each end bent upon itself to form open spaces for the reception of the reins, the end bent upward, leaving a space between said ends through which the reins may be passed to said open spaces, the under side of said bar being also provided with loops, for the purpose set forth.

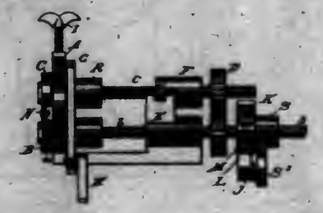


397,923. LAMP-LIGHTING DEVICE. HENRY LANDON, Massillon, Ohio. Filed Sept. 12, 1888. Serial No. 285,196. (No model.)

Claim.—1. In a lamp-lighting device, the combination of the tubular case A, having inwardly-bent and serrated jaws at one end and a radial pin, a^2, at the other, and a tubular case, D, having a socket and angular groove at one end and a head, D^2, at the other, with a plunger, E, permanently retained in said case, and a removable plunger, B, within the case A, substantially as and for the purpose described.

2. In a lamp-lighting device, the combination of the tubular case A, having inwardly-bent and serrated jaws at one end, a tubular case, D, a socketed joint uniting said cases, a plunger, E, permanently retained in the case D, and a removable plunger in the case A, substantially as and for the purpose described.

397,924. MOWER. SAMUEL D. MADDIN, Sarnia, Ontario, Canada, assignor to Mary Maddin, same place. Filed Mar. 31, 1887. Serial No. 233,202. (No model.)



Claim.—1. The combination of a main frame supported upon the main axle, the rocking frame, also supported thereon independently of the main frame, the cutting apparatus, the yoke in which is supported the inner end of the cutting apparatus, having the bearings 33 34 therefor, the intermediate frame consisting of the bar I, pivotally connected with the rocking frame in front of the main axle at one end and at its opposite end connected to the rear end of the yoke, and the bar J, pivotally connected to the rocking frame in rear of the main axle and to the yoke near the front end thereof, the said bars I and J crossing each other and being connected at their point of intersection, and the adjusting devices for the rocking frame and for the intermediate frame, substantially as described.

2. The combination, with the yoke K, provided with a recessed bearing, 33, and a separate bearing, 34, in line with the bearing 33, of a shoe pivotally supported in said bearings and carrying a sleeve, 19, adapted to the recess in the bearing 33, and with a bearing for the crank-shaft for driving the pitman, substantially as described.

3. The combination, with the yoke K, provided with bearings 33 34 for pivotally supporting the shoe, and the shoe provided with a sleeve adapted to one bearing and an ear for the other, so as to be detached from both by a forward movement of the crank-shaft supported by the bearing 33, and having secured to its opposite ends a sprocket-wheel and a crank-disk, whereby the shoe and frame are held together, substantially as described.

397,925. BARB-FEEDING MECHANISM FOR BARB-WIRE MACHINES. GEORGE W. MCKINNEY, Marshalltown, Iowa. Filed Sept. 19, 1887. Serial No. 250,059. (No model.)

Claim.—A barb-feed mechanism for barb-wire machines, which consists of feed-rolls, one of which is grooved to receive the barb-wire and the other of which is provided with a broken periphery, which forces the wire during the process of feeding into the shape desired for forming the barb, and mechanism for operating the same, substantially as described, and for the purposes specified.

397,926. CURRY-COMB. HENRY MCPHERSON, Troy, N.Y., assignor to the Sweet & Clark Manufacturing Company, same place. Filed Mar. 2, 1888. Serial No. 265,898. (No model.)

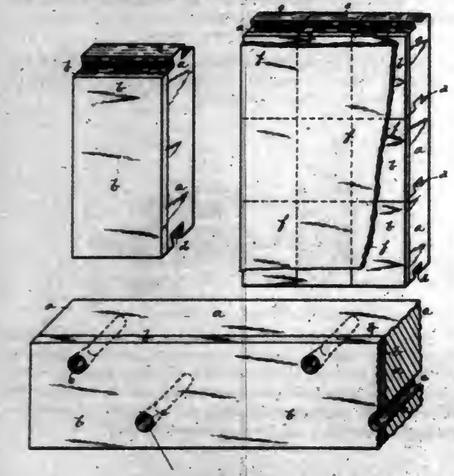
Claim.—1. A comb-bar having two of its edges bent down and serrated, and the portion between said edges provided with three contiguous intersecting incisions, two of which are parallel and the other at right angles thereto, and the portion thus loosened turned up and serrated, substantially as and for the purpose described.

2. A curry-comb having one of its parts provided with two edges bent down and serrated, and the portion adjacent to one of said bent down edges provided with three contiguous intersecting incisions, two of which are parallel and the other at right angles thereto, and the portion loosened by said incisions turned up and serrated, substantially as and for the purpose described.

3. A curry-comb having a side handle and a forked frame branching therefrom and loops at the ends of its branches, in combination with comb-frames, each having a pivot-pin projecting centrally from its side and concave receivers at the ends of said side, substantially as described.

4. A curry-comb having a side handle and a forked frame branching therefrom and loops at the ends of its branches, in combination with comb-frames, each having a pivot-pin laterally projecting from its center and concave receivers projecting laterally from its ends, and a carrying-surface on the top different from the carrying-surface on the bottom, substantially as described.

397,927. CAR-WHEEL. WILLIAM H. MELANEY, Pittsburg, assignor of one-half to Robert C. Totten, Allegheny, Pa. Filed May 19, 1888. Serial No. 274,364. (No model.)



Claim.—1. A car or locomotive wheel having the rim or tire thereof formed of steel and a facing of chilled cast-iron formed on the wearing-surface of the tire, substantially as and for the purposes set forth.

2. A car or locomotive wheel having the rim or tire and the flange thereof formed of steel and a facing of chilled cast-iron formed on the wearing-surfaces of the tire and flange, substantially as and for the purposes set forth.

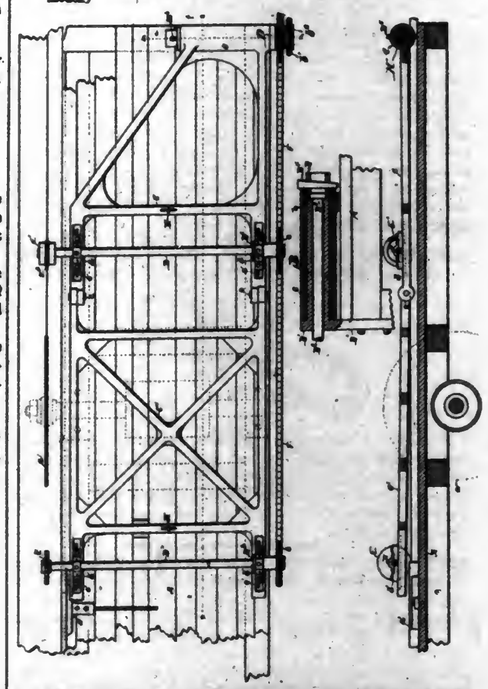
3. A car-wheel having the body, the rim or tire, and the flange formed of steel, and a facing of chilled cast-iron formed on the wearing-surfaces of the rim and flange, substantially as and for the purposes set forth.

397,928. SAFE OR ARMOR PLATE. WILLIAM H. MELANEY, Pittsburg, assignor of one-half to Robert C. Totten, Allegheny, Pa. Filed June 9, 1888. Serial No. 276,594. (No model.)

Claim.—1. As a new article of manufacture, a safe or armor plate having a body of steel and a facing of chilled cast-iron united thereto by fusion, substantially as and for the purposes set forth.

2. A safe or armor plate having a body of steel and a facing of chilled cast-iron united thereto by fusion, said plate being formed in sections connected by interlocking joints formed of and in the steel body of the plate, substantially as and for the purposes set forth.

397,929. HAMMER OR LIKE DIE. WILLIAM H. MELANEY, Pittsburg, assignor of one-half to Robert C. Totten, Allegheny, Pa. Filed June 13, 1888. Serial No. 276,963. (No model.)

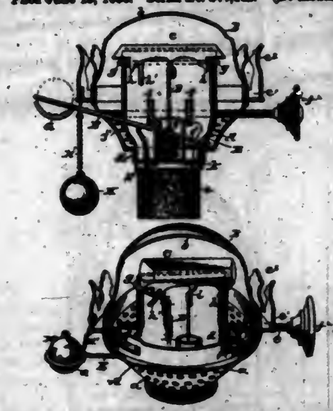


Claim.—1. As a new article of manufacture, an anvil, hammer, or like die having a body of cast-steel and a facing of chilled cast-iron united thereto, substantially as and for the purposes set forth.

2. As a new article of manufacture, an anvil having its body and horn formed of cast-steel and a facing of chilled cast-iron on the face of the anvil united to the body, substantially as and for the purposes set forth.

3. As a new article of manufacture, the anvil having its body formed of cast-steel and a facing of chilled cast-iron on the face thereof united to the body, and a horn or beak formed of forged steel, substantially as and for the purposes set forth.

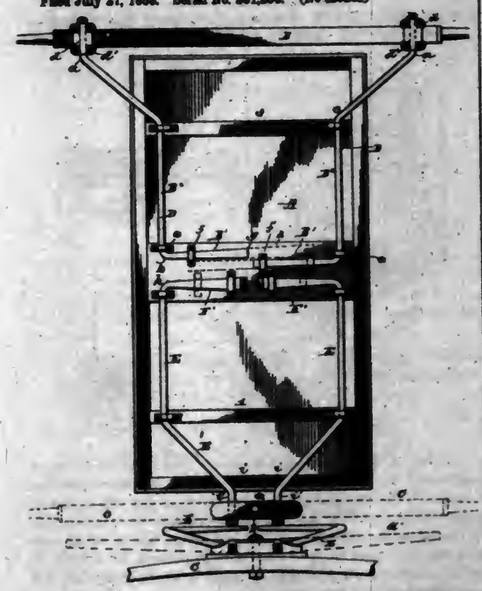
397,930. FEED MECHANISM FOR SAW-TABLES. CHARLES B. MORGAN, Akron, Ohio. Filed Apr. 30, 1888. Serial No. 272,241. (No model.)



Claim.—1. The combination, with a saw-table, of a jointed frame pivotally connected at one end to the table, shafts journaled in each section away from the joining-point, and rollers on said shafts, substantially as set forth.

2. The combination, with upright arm rigidly connected with the saw-table, said arm being integral with an overhanging sleeve extending crosswise of the table, of jointed frame removably mounted on the said sleeve, and feed mechanism journaled in said jointed frame, substantially as set forth.

3. The combination, with upright arm, a laterally-projecting sleeve integral therewith, a jointed frame mounted on the sleeve, and feed mechanism journaled in said jointed frame, of a shaft journaled in the bore of such sleeve, said shaft being operatively connected with the feed mechanism and with the jointed frame, substantially as set forth.



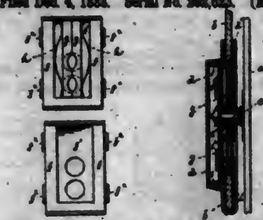
397,931. LAMP-EXTINGUISHER. JAMES H. PAINE, Louisville, Colo. Filed June 15, 1888. Serial No. 277,123. (No model.)

Claim.—1. In a lamp, the combination, with an air-chamber and a wick-tube, of a wire bent around the latter near its top, a cap pivotally supported by said wire, a tube secured in the chamber and having a spring therein, a lever pivoted above said spring and extended outside the chamber, a weight-receptacle at the outer end of the lever, a rod connecting said lever and cap, and a weight adapted to be inserted in the receptacle at the end of the lever, substantially as set forth.

2. In a lamp, the combination, with an air-chamber and a wick-tube, of a wire bent around the latter near its top, a cap pivotally supported by said wire, a tube secured to the chamber, an integral arm projecting from the tube and serving as a pivotal bearing for a lever, a weight-receptacle at the free end of said lever, a weight to be inserted in the receptacle, a spring in the tube beneath the lever, and a rod connecting said lever and cap, substantially as set forth.

397,932. VEHICLE-GEAR. FRANKE L. PERRY, Brooklyn, N. Y. Filed July 27, 1888. Serial No. 281,230. (No model.)

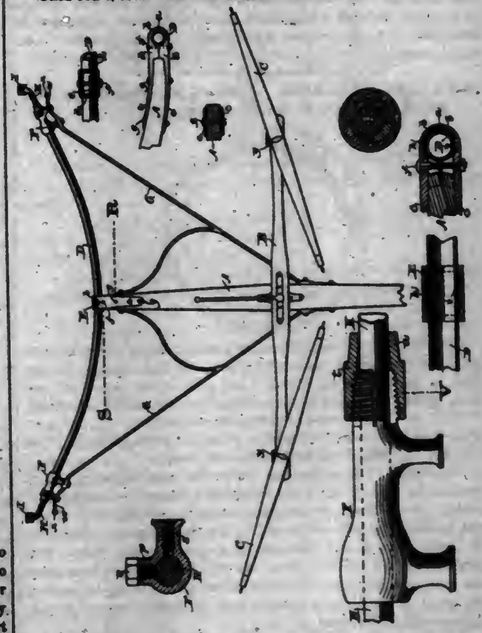
Claim.—1. The combination, with a body and a rear axle, of two torsional rod-springs that are bent diagonally outward in a plane to properly engage the rear axle, and are flattened in their bodies nearer the front ends, where they are loosely clipped to the vehicle-body, and coact by flexure with the torsional springs to yieldingly support load strains, substantially as set forth.



2. The combination, with a vehicle-body and a front axle, of two torsional springs loosely held to the body, and having their forward ends bent diagonally forward and inward to engage a center plate, and their bodies flattened nearer their other ends to afford integral plate-springs, which are adapted to flex when weight is thrown on the torsion-springs, substantially as set forth.

3. The combination, with a vehicle-body and a front axle, of two torsional rod-springs loosely held to the body, and having their forward ends bent to engage a center plate and their other ends flattened to produce plate-springs, which are bent at an angle to the integral rod-springs, and a center plate secured to the ends of the rod-springs and swivel-connected to the axle, substantially as set forth.

4. The combination, with a vehicle-body and a front axle, of two torsional springs loosely secured to the lower side of the body, having their forward portions bent diagonally to engage a cross-bar, a cross-bar, and a swivel-connection for the cross-bar to the axle, substantially as set forth.



5. The combination, with a vehicle-body, a rear axle, a front axle, and a center plate, of two torsional rod-springs bent to form braces and be engaged to the center plate, having their other ends flattened to produce flexible plate-springs, and a second set of torsional rod-springs bent outward and rearward near their rear ends to engage the rear axle, and having their other ends flattened and bent inwardly to afford flexing plate-springs, the flattened ends of both sets of springs being loosely clipped to the under side of the vehicle-body, substantially as set forth.

397,933. POCKET-BOOK CLASP. CARL G. PFINGSTEN, New York, N. Y. Filed Dec. 4, 1888. Serial No. 292,623. (No model.)

Claim.—The combination of pocket-book with stud *c*, having double conical head *c'*, and with a lock secured to flap *b* of the pocket-book, and consisting of box-shaped clasp *d d'* and of notched spring-plates *g*, the flap *b* being perforated for the admission of the stud-head, substantially as specified.

397,934. VEHICLE-POLE. THOMAS W. PORTER, Chelsea, Mass. Filed Oct. 6, 1888. Serial No. 287,364. (No model.)

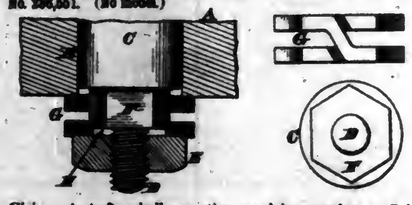
Claim.—1. In a vehicle-pole, a metallic coupling formed to receive the end of the cross-bar, and with an axial passage therethrough to

receive the shank of the draft-eye, and having a locking device to rigidly secure said shank in position as adjusted, substantially as specified.

2. The metallic coupling F, formed to receive a cross-bar, and with a diminished axial passage to receive shank H, and having a transverse passage consisting of slot *l* and hole *m* to receive an eye-bolt, substantially as specified.

3. The combination of bar D, coupling F, having an axial passage, draft-eye I, having shank H, adjustable in the coupling, and a locking device whereby the draft-eye is rigidly secured in said coupling when adjusted, substantially as specified.

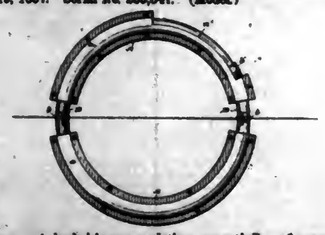
4. The combination of cross-bar D, coupling F, draft-eye shank H, and eyebolt *k*, provided with nut *n*, all substantially as specified.



5. In a vehicle-pole, the combination, with cross-bar D and stays G, of a tubular coupling the axis of which is an extension of that of said bar, and having an offset or offsets to receive said stays, substantially as specified.

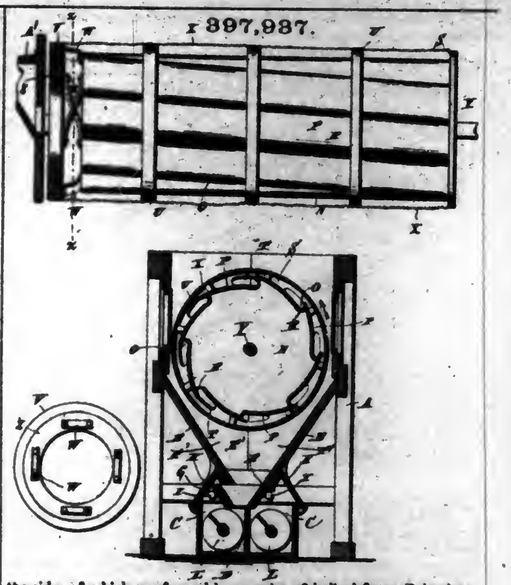
6. The combination, with bar D and stays G, of coupling F, having the hollow threaded offsets to receive the stays and securing-bolts, substantially as specified.

7. The combination, with pole A and cross-bar D, of coupling E, formed in two parts, with an eye, *b*, to receive said bar, a recess or chamber, *c*, to receive the rear end of the pole, the perforated securing-strape *e* to receive bolts *g*, and a transverse passage near eye *b* to receive the bar-clamping bolt *d*, substantially as specified.



8. The divided coupling E, formed to receive the pole, and with a circular transverse passage to receive bar D, as described, and pin *i*, formed integrally with one of the halves of said coupling and adapted to interlock with and secure said bar D from rotary or lineal displacement, substantially as specified.

397,935. DEVICE FOR PREVENTING THE LOOSENING OF NUTS. JAMES POWELL, Cincinnati, Ohio. Filed Sept. 27, 1888. Serial No. 286,551. (No model.)

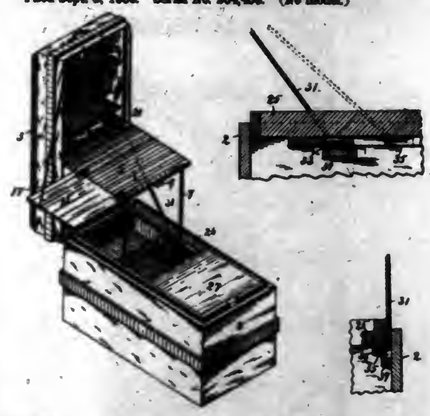


Claim.—A shaft, spindle, or other revolving member, as C, journaled within a suitable bearing, as A B, and having a screw-threaded stem, D, and non-circular shank F, which shank is located between said shaft and stem, in combination with a nut, E, and split spring-ring washer G, which washer has a non-circular eye, H, engaged with said shank F, for the purpose of compelling said spring-washer G to turn in unison with said revolving member C, as herein described.

397,936. LOCK-HINGE. THADDEUS C. READ, Fostoria, Ohio. Filed Apr. 19, 1887. Serial No. 235,347. (Model.)

Claim.—A lock-hinge consisting, essentially, of separate plates adapted to be fastened, respectively, to the door and casing, and a ring made to turn circumferentially in a seat made in said plates, said ring being made of two members hinged together, substantially as set forth.

397,937. BOLTING-REEL. DANIEL G. REITZ, Berlin, Pa. Filed Mar. 13, 1888. Serial No. 267,117. (No model.)

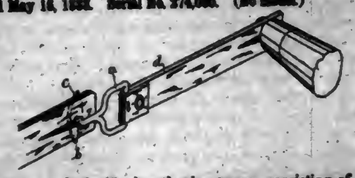


Claim.—1. The bolting-reel having the imperforate cylindrical portion, the sides of which are formed by a series of helical flutes, P, having the curved convex tangential sides P, extending in the direction in which the reel rotates, and having the concave shoulders R at the inner edges of said convex sides, the convex side of each flute merging into the concave side of the next adjacent flute throughout the series, the said imperforate cylindrical portion being arranged in the center of the reel at a distance from the head of the cylindrical portion of the reel, substantially as described.

2. The bolting-reel having the imperforate cylindrical portion the sides of which are formed by a series of helical flutes, P, having the curved convex tangential sides P, extending in the direction in which the reel rotates, and having the concave shoulders R at the inner edges of said convex sides, the convex side of each flute merging into the concave side of the next adjacent flute throughout the series, substantially as specified.

3. The reel having the imperforate cylindrical portion arranged within the screen or bolting-cloth and provided on its sides with the helical flutes having the convex tangential sides P and the concave shoulders R, the ring V, arranged at a distance from the head of the cylindrical portion of the reel and revolving therewith, and the curved arms W, connecting said ring V with the head of the cylindrical portion of the reel, substantially as described.

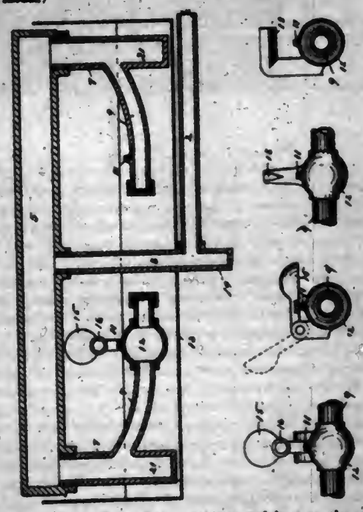
397,938. TRUNK. INGRAHAM G. RICHARDSON, Minneapolis, Minn. Filed Sept. 3, 1888. Serial No. 284,453. (No model.)



Claim.—1. The combined trunk and writing-desk comprising, in combination, the body 2, the lid 3, hinged to the end thereof, the leaf 5, hinged to the under side of said lid and provided with a suitable support adapted to hold it in a horizontal position, the auxiliary leaf 15, hinged to the side of the leaf 5 and adapted to be turned over upon said leaf when the lid is in an upright position, the drawer 19, and the compartments 21 and 23, arranged in the lid 3 above the leaf 5, all substantially as described.

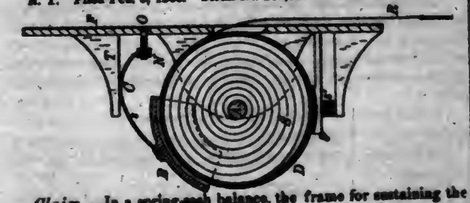
2. The combined trunk and writing-desk comprising, in combination, the body 2, the lid hinged to the end thereof and provided with the folding leaf 5, and the auxiliary leaf 15, hinged to the edge of the leaf 5 and adapted to fold over upon said leaf, and the sliding seat 27, arranged upon the body 2, substantially as described.

3. In a combined trunk and writing-desk, the lid 3, the leaf 5, hinged thereto, the U-shaped support 7, pivoted to the under side of said leaf, and the sliding bolt 9, provided with a hook, 13, adapted to engage the support 7, for the purpose specified.



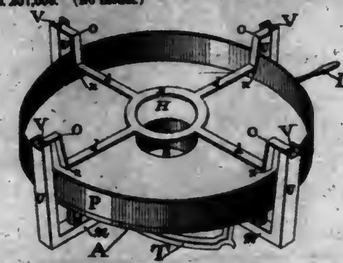
4. In a combined trunk and writing-desk, the combination, with the lid 3, having the folding leaf 5, of the brace-rod 31, pivoted to said lid and having its opposite end pivoted to the sliding block 33, and the runway 35, having a slot in the bottom thereof, for the purpose set forth.

397,939. TUG ATTACHMENT. FRED A. ROBBINS, Waterville, Me. Filed May 16, 1888. Serial No. 274,026. (No model.)



Claim.—A device for lengthening traces, consisting of a strap provided at or near one end with an eye and at the opposite end with a loop, a shank projecting from said loop and extending at right angles, or nearly so, to its face, and an oblong button at the end of said shank extending transversely to the length of said strap and at right angles to said shank, in combination, substantially as shown.

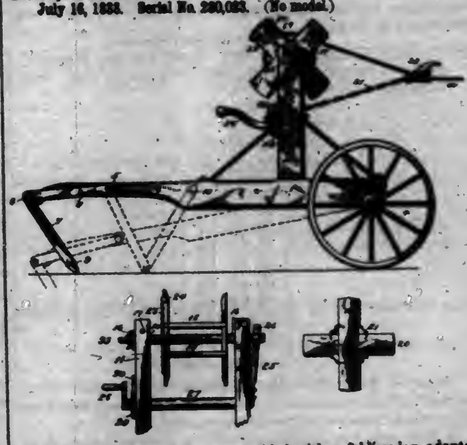
397,940. HYDROCARBON VAPORIZER AND BURNER. CHARLES G. ROLLINS, Minneapolis, Minn. Filed May 23, 1888. Serial No. 274,549 (No model.)



Claim.—In a hydrocarbon vaporizer and burner, the combination, with the retort, of the burner-pipe arranged beneath said retort and provided with the hollow globe having the nipple, as shown, and the weighted lever hinged upon said globe and provided with a cap adapted to cover the end of the nipple, substantially as shown and described.

397,941. SASH-BALANCE. FRANK L. ROSENFELDER, Cleveland, Ohio, assignor, by mesne assignments, to Wm. H. Caldwell, Rochester, N. Y. Filed Feb. 3, 1888. Serial No. 262,886. (No model.)

Claim.—In a spring-sash balance, the frame for sustaining the parts in their proper relations, the spring-drum and spring contained therein for rotating the same, and the sash-supporting ribbon attached to both drum and sash, in combination with a brake acting upon the sides of the drum and a secondary brake acting upon the ribbon, one of said brakes being actuated by an adjustable spring, substantially as shown and described.



397,942. MACHINE FOR COOLING WAGON-TIRES. WILLIAM X. RUFF and KIMRY RAMSBURG, Ills, W. Va. Filed Dec. 5, 1887. Serial No. 257,059. (No model.)

Claim.—1. The combination of the base having the central socket, F, the rollers mounted on the base, the tank, the pin depending from the tank and engaging the said socket, the inclined rails secured to the tank and bearing on the rollers, and the bench supported on the base and over the tank, as set forth.

2. The combination of the base having the radial arms and the standards at the ends of the arms, the rollers on said arms, the vertically-movable tank arranged over the arms, the inclined rails secured to the tank and bearing on the rollers, the lever secured to the tank and projecting beyond the side of the same, and the bench arranged over the tank and having radial arms, the ends of said arms being secured to the standards and provided with vertical portions adjacent to said standards, as specified.

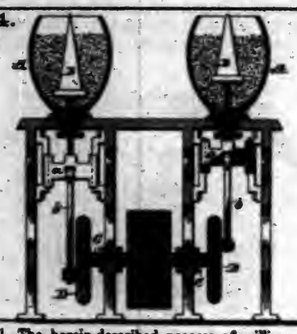
397,943. WIRE-REEL. OTTO SAAR, Council Bluffs, Iowa. Filed July 16, 1888. Serial No. 280,093. (No model.)

Claim.—1. A truck-frame provided with a folding leg adapted to be driven in the ground to form an anchorage, substantially as specified.

2. A truck-frame provided with a folding leg adapted to be driven in the ground to form an anchorage and to be bent to form a support, substantially as specified.

3. The combination, with a shaft, of a removable wire-reel, and a reel-embracing pin inserted through the shaft, substantially as specified.

4. The combination of a truck-frame having opposite standards with a removable shaft, a removable wire-reel mounted on the shaft, and a reel-embracing pin inserted through the shaft, substantially as specified.



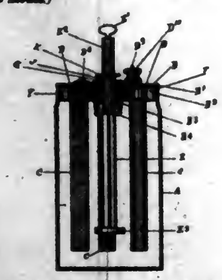
5. The beams 1, in combination with the links 6, pivoted as at 5, and the legs 7, pivoted to the links, as at 8, substantially as specified.

6. The beams 1, having the pin 10, in combination with the links 6, pivoted, as at 5, to the beams, and the legs 7, pivoted to the links, as at 8, and provided with the perforation 9, adapted to take over the pin 10, substantially as specified.

7. The shaft 15, perforated, as at 22, in combination with the reel-sections 19 and 20, and the pin 23, inserted through the shaft and having the head 22 for embracing one of the sections, substantially as specified.

397,944. PROCESS OF MILLING RICE. JOHN L. SHEPPARD, Charleston, S. C., assignor of one-half to Wilmot D. Parsons, same place. Filed Nov. 16, 1888. Serial No. 291,044. (No model.)

397,944.



Claim.—1. The herein-described process of milling grain, consisting in mixing salt with the grain and then pounding the mixture, substantially as set forth.

2. The herein-described process of milling rice, consisting in removing the hull some time in advance of further milling, then mixing in common salt, and finally pounding the mixture, substantially as set forth.

3. The herein-described process of milling rice, consisting in removing the hull some time in advance of further milling, then mixing in common salt, pounding the mixture, and finally polishing it, substantially as set forth.

4. The herein-described process of milling rice, consisting in removing the hull some time in advance of further milling, then mixing in a quantity of common salt when the hulled rice is sufficiently hardened, beating and pounding the mixture, separating the meal or flour from the rice, and finally separating the salt from the polished rice, substantially as set forth.

397,945. ELECTRIC BATTERY. ELMER A. SPERRY, Chicago, Ill., assignor to Frank S. Terry, same place. Filed Mar. 24, 1888. Serial No. 268,447. (No model.)

Claim.—1. In a battery, the combination of a jar with a cover, a series of carbons, and carbon-securing rings, said carbons and rings being secured to and entirely beneath the cover.

2. In a battery, the combination of a jar with a cover, a series of carbons, carbon-securing rings attached to the lower side of the cover, and a body of insulating material on the under side of said cover, in which the carbon-securing rings are entirely submerged.

3. In a battery, the combination of a jar with a cover provided with a pendent rim, a series of carbons, carbon-clamping rings secured to said cover within the rim, and a body of insulating material filling the space inclosed by the rim and submerging the clamping-rings.

4. In a battery, the combination of a jar with a cover provided with a pendent rim and a somewhat longer pendent zinc-guide, a series of carbons, and carbon-supporting rings secured to the cover in the space between the rim and the guide.

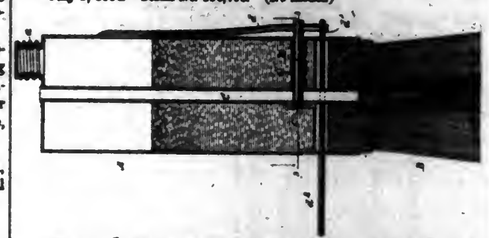
5. In a battery, the combination of a jar with a cover provided with a pendent rim and a somewhat longer pendent zinc-guide, a series of carbons and carbon-supporting rings secured to the cover in the space between the rim and the guide, and a body of insulating material in the space between the rim and the guide and submerging the clamping-rings.

6. In a battery, the combination of a jar, a cover provided with a pendent rim inside the jar, and a zinc-guide internally enlarged at its lower end, with a series of carbons and clamping-rings secured to said cover, a zinc passed through the guide, and a body of insulating material between the cover and guide and submerging the carbon-clamping rings.

7. In a battery, a carbon-clamping device consisting of a series of contractible rings.

8. In a battery, a carbon-securing device consisting of a series of contractible rings provided each with a clamping device.

9. In a carbon-securing device, a series of contractible rings provided each with a clamping device and all secured to a central supporting-piece.



10. In a battery, a carbon-securing device consisting of a central ring with a series of contractible rings secured thereto, in combination with a jar-cover, on the lower side of which such carbon-securing rings are secured.

11. In a carbon battery, the combination of a jar with a cover provided with a pendent rim and a somewhat longer central pendent zinc-guide, the inner surface of which is enlarged toward its lower end, carbon-securing rings attached to the cover between the rim and guide, insulating material in which rings are submerged, and a zinc of such size as to engage the cover near the top of the guide only, so as to prevent the liquid in the jar from making a short circuit on the lower side of the cover between the zinc and carbons.

12. In a carbon battery, the combination of a carbon-securing device with a cover, said cover provided with apertures and said carbon-securing device with projecting chambered pieces which pass through said apertures, so as to provide a long bearing for the securing-screws on top of the cover.

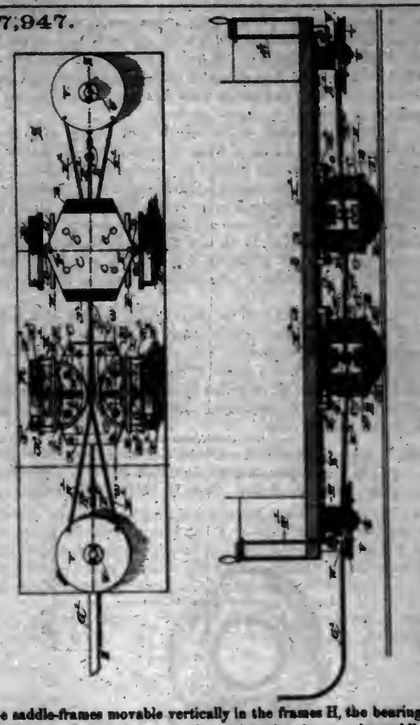
13. In a carbon battery, a zinc, round at its upper end, provided with straight longitudinal corrugations extended along its lower portion to afford increased contact-surface with the liquid.

397,946. FOUNTAIN-BRUSH. JOHN STEVENS, Neenah, Wis. Filed July 5, 1884. Serial No. 136,798. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, in a fountain-brush, of a reservoir, a brush or distributer, a fluid-tube passing from the reservoir into the body of the brush or distributer, and having an inwardly-flaring opening through its wall within the reservoir to admit the contents of the latter, a lateral tube entering the fluid-tube opposite said opening, and extending thence through the wall of the reservoir, a valve and valve-plunger playing in said lateral tube and across the fluid-tube, and a spring pressing upon the valve-plunger to force the valve against said feed-opening.

2. The combination, substantially as hereinbefore set forth, in a fountain-brush, of a reservoir, a brush or distributer, a fluid-tube leading from the external air through the reservoir into the brush or distributer, and having a lateral feed-opening into the reservoir, a guide-tube connecting said fluid-tube opposite the feed-aperture with the wall of the reservoir, and a spring-pressed valve-plunger within said guide-tube adapted to normally close the feed-aperture and fluid-tube.

3. The combination, substantially as hereinbefore set forth, in a fountain-brush, of a reservoir, a brush or distributer, a straight fluid-tube passing entirely through the reservoir and into the body of the brush, open at one end to admit air and receive a clearing-rod and at the other to discharge fluid, and having a lateral feed-aperture opening into the reservoir, a guide-tube entering the fluid-tube opposite said aperture and extending through the exterior wall of the reservoir, a valve-plunger playing through said guide-tube and across the fluid-tube to close it and the feed-aperture, a spring connected to said plunger to hold the valve closed, and means whereby the valve may be opened by the finger.



4. The combination, substantially as hereinbefore set forth, in a fountain-brush, of a reservoir, a brush or distributer, the tube C, with aperture *c*, the cross-tube C', valve-plunger D, spring *d*, and rod *d'*, passing from said spring across the under side of the reservoir to the opposite side thereof, whereby the pressure of a finger may open the valve.

397,947. STREET-CAR. EDWARD R. TAYLOR and WILLIAM S. TAYLOR, Newport, R. I. Filed Nov. 28, 1883. Serial No. 291,591. (No model.)

Claim.—1. The combination, in a car-truck, of the curved guides E, the pivoted truss-frames H, having the bearings N, the axles journaled in the bearings N and in the bearings O, and means, substantially as set forth, to turn the truss-frames on their pivots, for the purpose set forth, substantially as described.

2. The combination, in a car, of the trucks having the pivoted frames H, the curved guides E, the bearings O, movable on the guides

397,947.

E, the saddle-frames movable vertically in the frames H, the bearings N, pivoted in the saddle-frames, the springs bearing on the saddle-frames, and the independent axles journaled in the bearings N and having their inner ends journaled in the bearings O, substantially as described.

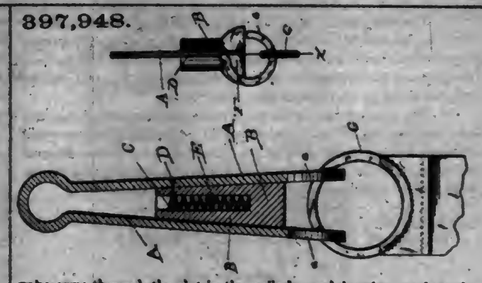
3. The combination, in a railway-car, of the trucks having the pivoted bearings for the axles, the pivoted tongue, the disk V, connections between the latter and the inner ends of the axles, and means, substantially as set forth, to lock the tongue to the disk V, whereby the latter may be operated by the tongue, substantially as described.

4. The combination, in a car, of the trucks having the pivoted axles, the disk V, connections between the same and the inner ends of the axles, whereby the latter may be turned on their pivots, for the purpose set forth, the disk W, having the notch Z, the tongue secured to the said disk, the bolt Y, guided on the disk V and adapted to engage the notch Z, the notched arms D', rigidly secured to the car, the pivoted plate A', adapted to engage and operate the bolt Y, and devices to operate the said plate, substantially as described.

5. The combination, in a car, of the truck having the pivoted axle-bearings, the brake-levers pivoted to the said bearings, the endwise-movable rod, and connections between the latter and the brake-levers, substantially as described.

6. The combination, in a car, of the truck having the pivoted axle-bearings, the brake-levers pivoted to the said bearings, the endwise-movable rod, and the chains connecting the said rod to the brake-levers, and guiding-sheaves for the said chains, substantially as described.

7. In a car, the plates A B, arranged apart and having the guides E, the frames H, pivoted between the plates, the independent axles, and the bearings O for the axles, turning on the guides E, as set forth.



8. In a car, the trucks having the pivoted frames H, the curved guides E, the bearings O, movable on the guides, and the independent axles journaled in the bearings O and also connected to the frames H, as set forth.

9. In a car, the frames having the guides E, the pivoted frames H, the bearings N in the frames H, the bearings O, turning on the guides E, and the independent pivoted axles journaled in the bearings N O, as set forth.

397,948. SNAP-HOOK. ROBERT R. WADDELL, Hillsborough, Ohio. Filed May 23, 1888. Serial No. 274,780. (No model.)

Claim.—1. A snap-hook comprising a wire yoke, the lower ends of which are reversely turned, forming hooks, a hollow side grooved cylinder fitted between the yoke-arms, a spring fitted in said hollow portion of the cylinder, and a pin extending inwardly from one of the

397,948.

yoke-arms through the slot in the cylinder and bearing against the spring, substantially as described.

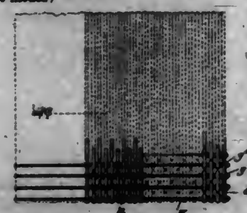
2. A snap-hook comprising a wire yoke, the lower ends of which are turned up, forming reversed hooks, and a cylinder fitted between the yoke-arms, a spring suitably situated in said cylinder, and a pin extending inwardly from the yoke-arms through the slot in the cylinder and bearing against the spring.

397,949. HANDLE FOR SURGICAL INSTRUMENTS. WILHELM WALB, Heidelberg, Germany. Filed Oct. 17, 1888. Serial No. 288,206. (No model.)

Claim.—1. In a separable haft or handle for bistouries or other surgical instruments, the combination of the two halves or scales provided at their upper ends with suitable means for holding a blade and having at their lower ends, respectively, a longitudinal opening, A, and a projection for engaging therein to form the combined hinge and slide joint, substantially in the manner and for the purpose described.

2. In a separable haft or handle for bistouries or other surgical instruments, the combination of the two halves or scales provided at their upper ends, respectively, with the headed pin S and the corresponding slotted aperture, F, whereby the blade is held, and having at their lower ends, respectively, a longitudinal opening, A, and a projection for engaging therein to form the combined hinge and slide joint, substantially in the manner and for the purpose described.

397,950. VACUUM-ARROW. FRANK WHITE, Philadelphia, Pa., assignor to Philip W. Pratt, Boston, Mass. Filed July 30, 1888. Serial No. 281,485. (No model.)



Claim.—1. The combination of an arrow-shaft and a vacuum (or pneumatic) arrow-head secured to one end thereof.

2. The combination of a vacuum arrow-head, an arrow-shaft, and a connecting-shank fixed in one end of the arrow-shaft and having a disk-head secured in the vacuum arrow-head, as set forth.

3. The combination of a vacuum arrow-head, an arrow-shaft, a shank connecting the same, and a ferrule surrounding the head of the arrow-shaft, as set forth.

4. An elastic arrow-head having a concave front side, a yielding level edge and an attaching device whereby it may be secured to a shaft, as set forth.

397,951. SLACK-BURNING FURNACE. THOMAS WILKINSON and JOHN GLENDENNING, Kansas City, Mo. Filed July 30, 1888. Serial No. 281,368. (No model.)

Claim.—1. The combination, with a suitably-mounted endless carrier-grate, of an endless carrier ash-remover mounted beneath said grate and provided with scoops, substantially as set forth.

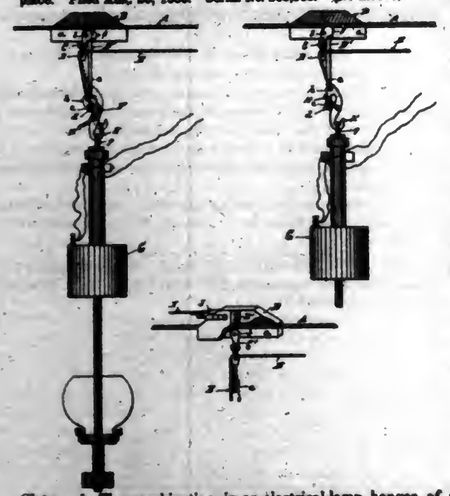
2. The combination, with a grate-supporting frame and the endless carrier-grate mounted in the frame, of an endless carrier ash-remover supported in the frame beneath the grate, substantially as set forth.

3. The combination, with the grate-supporting frame and the inclined ash-pit wall at the rear of the grate, of the endless carrier-grate supported in the frame, and the ash-remover consisting of a series of traveling scoops arranged to travel in proximity to the said inclined wall below the grate, substantially as set forth.

4. The combination, with the grate-supporting frame, the endless grate supported therein, and means for actuating the endless grate, of an ash-remover supported by the frame, and a connection between the ash-remover and the grate, whereby the motion of the grate imparts motion to the ash-remover, substantially as set forth.

397,952. CHALK-HOLDER. DAVID WILLIAMSON, New York, N.Y.

Filed Sept. 12, 1888. Serial No. 285,218. (No model.)



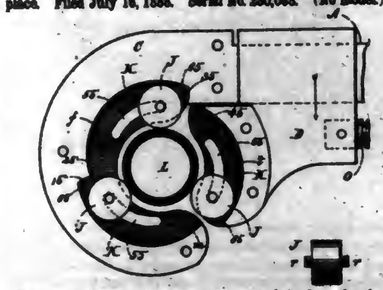
Claim.—1. The combination, with a marking substance, as crayon, in the form of a plate or tablet, of a pair of clamping-plates between which the said marking substance is held, and a spring pressing the clamping-plates against the substance, as set forth.

2. In combination with a marking substance, as crayon, in the form of a plate or tablet, a pair of clamping-plates between which the said marking substance is held, and a spring pressing the clamping-plates against the substance, the said clamping-plates being pressed upon the marking substance to their extremities and along the whole width of the substance, as and for the purpose set forth.

3. The combination, with a pair of spring clamping-plates hinged to each other and a marking substance between the two, of a screw-piece behind the said marking substance, the said screw-piece having an incline at one portion, the said incline co-operating with a projection on one of the clamping-plates to press the two apart, as set forth.

4. The combination, with a pair of clamping-plates and a spring forming the hinge thereof, of a screw-rod having a bearing in the said spring and extending along a groove in one of the clamping-plates, the said screw-rod also traversing a movable screw-piece, as and for the purpose set forth.

397,953. ELECTRIC-LAMP HANGER. MONTRAVILLE M. WOOD, Erie, Pa., assignor of one-half to the Erie County Light Company, same place. Filed Aug. 23, 1888. Serial No. 283,585. (No model.)



Claim.—1. The combination, in an electrical-lamp hanger, of a block adapted to slide and rest upon a supporting-cable with a hook having a cam-shaped shank pivoted in said block and adapted to be turned on its pintle so as to clamp the supporting-cable against said block, a pulley suspended from said hook, and a rope operating in said pulley for raising and lowering a lamp suspended therefrom, substantially as and for the purpose set forth.

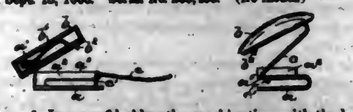
2. The combination, in an electric-lamp hanger, of a block adapted to slide and rest upon a supporting-cable, a hook pivoted in said block, and a pulley suspended thereon with a stirrup secured to said block and projecting downward therefrom, a rope passing through said pulley and downward through said stirrup, and an S-hook on the lower end of said rope adapted to support a lamp, and a tongue pivoted to said S-hook so as to close the upper half of said S-hook and prevent its engagement with said stirrup when the lamp is being lowered, substantially as and for the purpose set forth.

3. The combination, in an electric-lamp hanger, of a grooved supporting-block, B, having a hook, C, pivoted therein, with a rigid stirrup, B', secured to said block B and having an insulator, *d*, in the lower end thereof, a lamp raising and lowering rope, E, passing through a pulley suspended from said hook C and through the stirrup B', an S-hook, F, secured to said rope and adapted to suspend a lamp to the stirrup B', and a tongue, H, on said S-hook F, adapted to close up against the upper half of the hook F when it is lowered past the lower part of the stirrup B', substantially as and for the purpose set forth.

4. The combination, in an electric-lamp hanger, of a grooved block, B, adapted to rest upon a supporting-cable, A, having a lamp-supporting stirrup, B', thereon, with an eccentric clamping-hook, C, pivoted in said block B, a pulley, D, and an S-hook, F, thereon, provided with a tongue, H, supported by said hook C, and a lamp raising and lowering rope, E, operating in said pulley D, substantially as and for the purpose set forth.

397,954. WRENCH. WILLIAM C. WORTHEN and GORDON PRENDERGAST, Jr., Boston, Mass., assignors of one-third to John D. Walworth, same place. Filed July 16, 1888. Serial No. 280,068. (No model.)

Claim.—1. The combination of a wrench-body, a fixed segmental jaw attached thereto, a movable segmental jaw thereon, said jaws being provided with evolute recesses in their inner faces, and movable projections disposed within said recesses and extending beyond the inner faces of the jaws.



2. The combination of a wrench-body, a fixed segmental jaw attached thereto, a movable segmental jaw thereon, said jaws being provided with evolute recesses in their inner faces and with arc-shaped grooves, and movable projections disposed within said recesses and provided with trunnions which move in said grooves, said projections extending beyond the inner faces of the jaws.

3. The combination of a wrench-body, a fixed segmental jaw attached thereto, a movable jaw thereon, said jaws being provided with evolute recesses in their inner faces and with arc-shaped grooves, movable projections within said recesses provided with trunnions which move in said grooves, said projections extending inward beyond the inner faces of the jaws, and springs which tend to force said projections toward the narrow ends of said recesses.

4. The combination of a wrench-body, a fixed segmental jaw attached thereto, a movable jaw thereon, said jaws being provided with evolute recesses in their inner faces and with arc-shaped grooves, roll-shaped projections within said recesses provided with trunnions which move in said grooves, the peripheries of the roll-shaped projections extending beyond the inner faces of the jaws, and springs which tend to force said projections toward the narrow ends of said recesses.

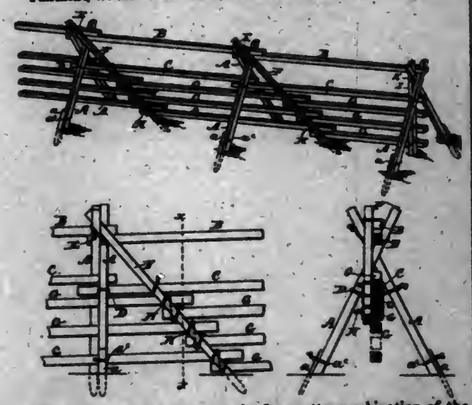
397,955. SCARF-HOLDER. GEORGE B. ADAMS, Irvington, N. J.

Filed Sept. 15, 1888. Serial No. 285,452. (No model.)

Claim.—1. In a scarf-holder, the combination, with the body portion consisting of clamping-jaws having arms on each side thereof, of a claw-plate pivotally secured between said arms and co-operating with said jaws to grasp the bosom-band of a shirt, a head or button pivotally arranged on an arm extending up from said body portion, and a spring operating to cause the holding-contact of said head and body portion, for the purposes set forth.

2. In a scarf-holder, the combination, with the body portion consisting of holding-jaws to grasp the bosom-band of a shirt, of a head

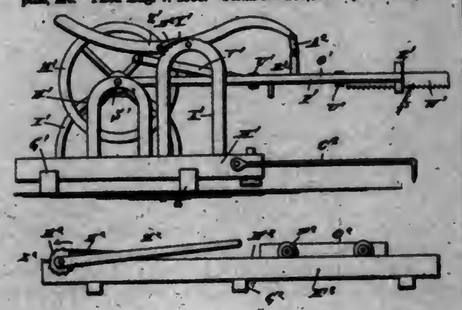
or button secured to said body portion by means of an arm projecting up into the upper clamping-head, which consists of a casing, as set forth, and engaging with a spring arranged in said casing and operating to cause the holding-contact of the head and body portion, for the purposes set forth.



3. In a scarf-holder, the combination, with the body portion consisting of clamping-jaws having arms on each side thereof, of a claw-plate pivotally secured between said arms and co-operating with said base-plate to grasp the bosom-band of a shirt, and a head or button arranged on the opposite end of the claw-plate, said head consisting of a casing, as set forth, into which the end of the claw-plate extends and engages with a spring arranged in said casing and operating to cause the holding-contact of the head and body portion.

4. A scarf-holder composed of a body portion consisting of holding-jaws having arms on each side thereof, a claw-plate pivotally secured at one end thereof between said arms to grasp the bosom-band of a shirt, and a head or button pivotally arranged on said claw-plate at the opposite end thereof, for the purposes set forth.

5. In a scarf-holder, the combination, with the body portion consisting of a pair of jaws, of a claw-plate hinged to one of said jaws, so as to act upon the other jaw to grasp the bosom-band of a shirt, and a head or button pivotally arranged on the opposite end of said claw-plate, for the purposes set forth.

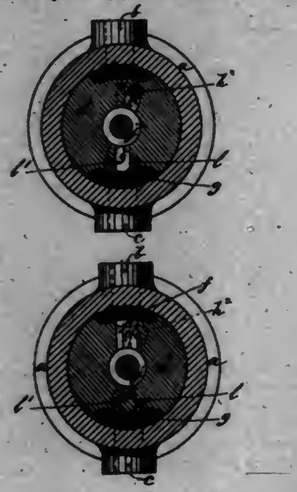


6. In a scarf-holder, the combination, with the body portion consisting of a pair of jaws, of a claw-plate hinged to one of said jaws, so as to act upon the other jaw to grasp the bosom-band of a shirt, a head or button pivotally arranged on the opposite end of said claw-plate, said head consisting of a casing, as set forth, into which the end of the claw-plate extends and engages with a spring arranged in said casing and operating to cause the holding-contact of the head and body portion, substantially as and for the purposes set forth.

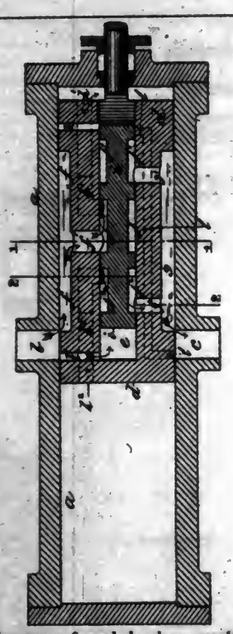
397,956. FENCE. WILLIAM R. ARNETT and GEORGE M. PRICE, Fairmont, W. Va. Filed Jan. 3, 1889. Serial No. 295,236. (No model.)

Claim.—As an improvement in fences, the combination of the crossed stakes A and short inclined posts *a*, lying upon the outer inclined face of said stakes, the wire lashings uniting said posts and stakes, the under crotch-rails, C, the upper crotch-rails, B, the lashings E, surrounding the ends of the rails B and of the stakes A, the diagonal lever-brace F, having its lower end driven in the ground, the rails G, having their spliced portions opposite said brace F, and the lashings H, passing around and between the rails, uniting the rails G in pairs and to the lever-brace, substantially as shown and described.

397,957. FIRE-WOOD DRAG-SAW. FRANCIS M. ATLWARD, Memphis, Mo. Filed Aug. 7, 1888. Serial No. 282,131. (No model.)



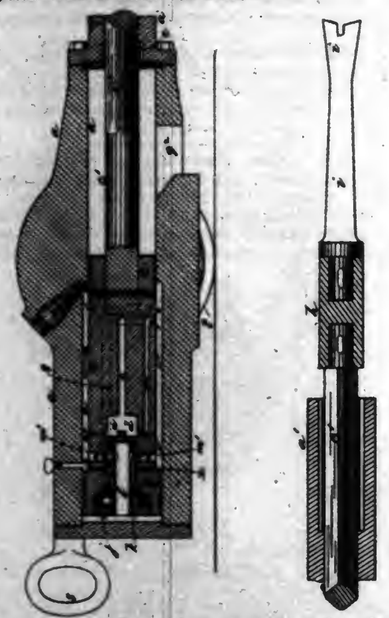
Claim.—1. The combination, in a drag-saw, of the supporting-frame having the brackets or standards, the shaft K', journaled therein and having the crank-wheel, the frame O', having one end pivoted in line with the axle of shaft K', the cross-head guided in the said frame, the pitman connecting the cross-head to the crank-wheel, the saw attached to the cross-head, the bracket X', having ratchet-teeth Y', the lever fulcrumed to the said bracket, the link A^3, connecting the lever to the free end of frame O', and the pawl B^3, pivoted to the lever and engaging the teeth Y', for the purpose set forth, substantially as described.



2. The drag-saw having the driving-shaft K', provided with the knuckle L', and the coupling-shaft D^2, secured to the knuckle L' and having the sleeve or socket F', said sleeve or socket F' being designed to be coupled to the end of either shaft of a horse-power, so as to run the drag-saw at a greater or less speed, as set forth.

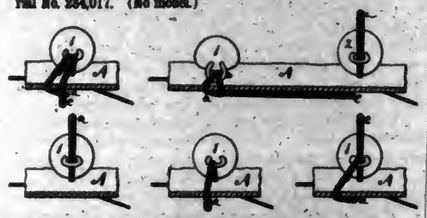
397,958. DIRECT-ACTING STEAM OR PNEUMATIC ENGINE. GUSTAV A. BAETZ, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Aug. 27, 1888. Serial No. 283,995. (No model.)

Claim.—The combination of a cylinder, *a*, having inlet and exhaust ports *b c*, a piston, *d*, having an internal chamber, *e*, and inlet and outlet spaces or pockets *f g*, communicating-ports *f'* and *g' g²*



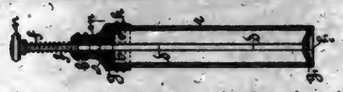
397,958.

between the respective spaces *f g* and chamber *e*, combined inlet and outlet passages *k' k²* in piston *d* between chamber *e* and cylinder *a*, inlet relief-passages *k k'*, and outlet relief-passages *l l'* in piston *d*, opening into each end of the chamber *e* and on the outside of piston *d*, with the distribution-valve *i*, having circumferential depressions or passages *j j j³*, substantially as shown, and for the purpose described.



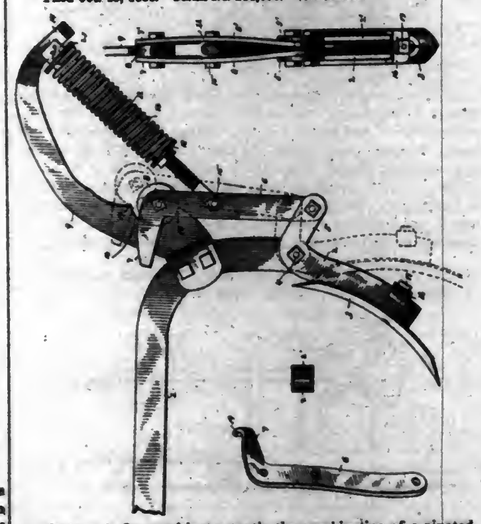
397,959. DIRECT-ACTING ENGINE. GUSTAV A. BARTH, St. Louis, Mo., assignor to Pierre Ghoutean, same place. Original application filed Aug. 20, 1888, Serial No. 283,220. Divided and this application filed Nov. 27, 1888. Serial No. 291,950. (No model.)

Claim.—1. In a direct-acting steam or pneumatic engine, the combination of the cylinder having inlet ports or passages and an outlet port or passage, said passages opening into a chamber closed at both ends and containing a valve, with the inlet-passage in piston-rod to the chamber containing the distribution-valve, substantially as shown, and for the purpose described.



2. The combination of inlet ports or passages and valve *y* in closed chamber *z*, with outlet-passage *b'* from cylinder *a* and inlet-passage *c* in piston-rod *c*, substantially as shown, and for the purpose described.

397,960. METHOD OF ATTACHING SHANK-BUTTONS TO FABRICS. WALTER H. BENNETT, Boston, Mass. Filed Aug. 28, 1888. Serial No. 284,017. (No model.)



Claim.—The method of attaching shank-buttons to fabrics herein described, the same consisting in first forcing a loop of thread up through the fabric and button-eye, then bending it over the shank of the button, then drawing said loop down through a second hole in the fabric outside the button-eye, then forcing a loop of a second thread up through a third hole in the fabric and through the button-eye, then bending it over the shank of the button, then drawing the loop of the second thread down through a fourth hole in the fabric outside the button-eye, then passing it through the loop of the first thread under the fabric, and then exerting sufficient strain upon the first thread and said second loop under the fabric to bring the shank of the button in contact with the fabric to draw all the threads snugly through the button-eye and holes in the fabric and to make the loop of second thread long enough to receive and interlock with the first loop of the succeeding button-stitch, as shown and set forth.

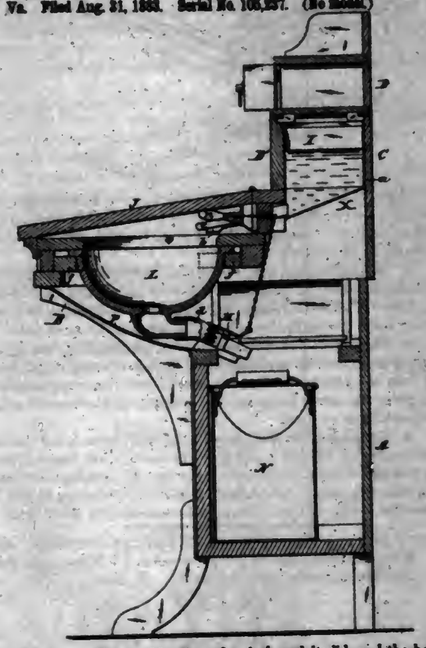
397,961. ASSAYING-GLASS FOR TESTING WINE. THEODOR F. BERNHARD, Lilienstein, near Konigstein, Saxony, Germany. Filed Oct. 10, 1888. Serial No. 287,721. (No model.)

Claim.—In an assaying-glass for proving the purity and genuineness of wine, the tube *r*, perforated cap *k*, carried by said tube and apertured, threaded stem *s*, and the cover *m*, that is carried by the stem *s* and adapted to close the apertures in the cap, combined with the rod *d*, that passes through the cover *m*, cap *k*, and tube *r*, spring *s*, button *n*, and cap *h*, carried by the rod *d*, substantially as described.

397,962. CULTIVATOR-TOOTH. JOSEPH C. BIRD, Rising Sun, Md. Filed Oct. 13, 1888. Serial No. 288,050. (No model.)

Claim.—1. In a cultivator-tooth, the combination of a pivoted plow-support, a bar pivotally connected to said support, a guide-roller secured to the bar, a fixed guide co-operating with the roller, an obstruction on the guide over which the roller must ride when the plow yields, and a spring engaging the bar and holding the roller and plow in their normal positions.

2. The combination of the drag-bar 1, angle-lever pivoted thereto, bar 6, roller 8, guide 9, retaining-hook on bar 7 to prevent dislodgement of the roller, and a spring co-operating with bar 6 for maintaining the parts in their normal positions.

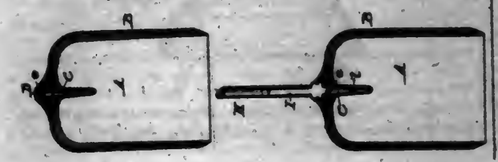


3. In a cultivator-tooth, the combination of drag-bar 1, plow-support pivoted thereto, a crank-arm on said support, bar 6, pivoted thereto, said bar being provided with a retaining-hook co-operating with a guide, 9, a roller carried by the arm engaging the guide, rod 11, adapted to pass through a slot in guide 9, and spring 13, co-operating with said rod.

4. The combination of a pivoted plow, pivoted bar 6, co-operating therewith, roller 8, guide 9 for said roller, a spring to hold the roller and plow in their normal positions, and a recess in the guide in which the roller normally rests.

5. The combination of the elbow-lever 2, a plow carried by one arm, bars 6 6', pivotally secured to the other arm, guide 9, arms 7 7', bent to meet over the guide, roller 8, pivoted between the bars, and a spring for holding the roller against the guide.

6. The combination of a slotted guide-bar, 9, rod 11, having one end mounted on a movable pivot, 15, the other end entering the slot of the guide-bar, spring 13, washer 21, against which the spring is seated, and lugs 20, on which the washer bears, as and for the purpose set forth.



397,963. WASH-STAND. NATHAN O. BOSH, Fairfax Court-House, Va. Filed Aug. 31, 1888. Serial No. 285,237. (No model.)

Claim.—1. The combination of a desk and its lid, and the back portion, C, above and at the rear of the lid and consisting of the lower fixed case, D', the water-receptacle located therein, and the upper case, D, the two cases being constructed substantially as described, whereby the upper portion may slide across the desk to uncover the lower portion, substantially as described.

2. The combined desk and wash-stand provided with the back portion, C, having the detachable backing-plate *a*, in combination with receptacle I, attached to the same, as set forth.

397,964. SHOVEL. HARRISON BEARD, Elon, N.Y., assignor of one-half to Albert M. Rose, same place. Filed Dec. 12, 1888. Serial No. 293,251. (No model.)

Claim.—1. As an improvement in shovels, the blade A, having the loop D formed integral therewith by cutting a slit in the metal and then swaging or bending the severed portion of the metal outward or backward, as shown and described.

2. The shovel-blade A, provided with the loop D at its upper end, and the longitudinal groove or recess C for the reception of the handle, substantially as herein set forth.

3. In combination with the blade A, provided with the loop D, the strap I, provided with the lateral projections *e* and the longitudinal projection *a*, substantially as shown and described.

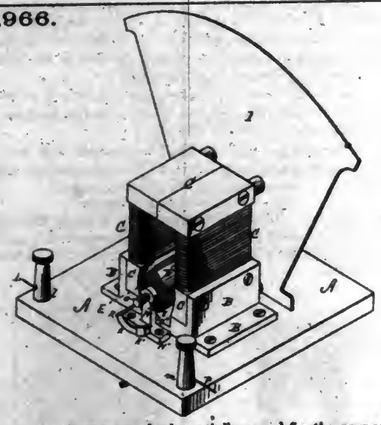
397,965. ELECTRICAL BATTERY. WILLIAM BERKLEY, North East, assignor of two-thirds to Samuel A. Davenport, Erie, and Charles A. Hitchcock, North East, Pa. Filed June 11, 1888. Serial No. 276,771. (No model.)

Claim.—1. The combination, in an electrical battery, of a permeable sack secured to and suspended from an opening in the jar-cover, with carbons and depolarizing material inclosed within said permeable sack, and non-conducting material filling and sealing the opening in the jar-cover and the mouth of said sack around the carbons therein, substantially as and for the purpose set forth.

2. The combination, in an electrical battery, of the carbon element having a metallic head or collar thereon, with a screw-threaded plug passing through said metal head and contacting with the carbon element, substantially as and for the purpose set forth.

3. The combination, in an electrical battery, of a permeable sack sealed into an opening in the jar-cover with a non-conducting material, and containing the carbon and depolarizing elements of said battery, and non-conducting material filling and sealing the mouth of the sack around the carbon element, with a cylinder of zinc surrounding said permeable sack, and a jar inclosing and containing said zinc cylinder and said elements, and an attacking-liquid, substantially as and for the purpose set forth.

4. The combination, in an electrical battery, of a negative element consisting of a number of carbon pencils secured together at their upper ends by passing through a metallic disk or plate, and a metallic screw-plug passing transversely through said disk or plate and contacting with all of the pencils secured therein, a permeable sack for retaining the depolarizing material between and surrounding the said carbon pencils, and non-conducting material filling and hermetically sealing the mouth of said sack around said carbons with a positive element consisting of a cylinder of sheet-zinc surrounding the negative element of said battery, thereby presenting the maximum surface for the generation of electrical currents, substantially as and for the purpose set forth.



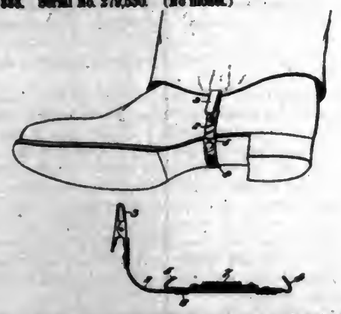
5. The combination, in a hermetically-sealed electric battery, of an outside jar, A, provided with a screw-cap, C, and gasket *b*, with a cover, B, adapted to fit the top of the jar A, and having openings D and H therein, and non-conducting material, P and A, filling and sealing said openings around the carbons I and the binding-post N therein, substantially as and for the purpose set forth.

6. The combination, in an electrical battery, of a retaining-jar, A, with a cover, B, having openings H and D therein, and a downwardly-projecting sleeve, *d*, surrounding the opening D, and a groove, *c*, around said sleeve *d*, substantially as and for the purpose set forth.

397,966. ELECTRIC-CURRENT INDICATOR. WILLIAM A. CAREY, Malden, Mass. Filed Oct. 20, 1887. Serial No. 253,570. (No model.)

Claim.—The hereinbefore-described improved instrument for measuring electrical currents, consisting, essentially, of the electro-magnet C, support A', core D, and armature E, pivotally secured in the standards H H', spindle E', dial I, and pointer J, spindle E'', and weighted lever or arm K, bent into substantially the shape shown, said instrument being provided with suitable electrical connections

397,966.



and arranged and constructed substantially as and for the purpose set forth.

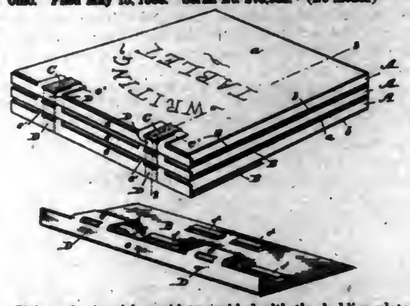
397,967. SANDAL. ALFRED L. CARROLL and BRADNER J. CARROLL, New Brighton, N. Y., assignors to the American Patents Company, of Pennsylvania. Filed Oct. 20, 1888. Serial No. 289,417. (No model.)

Claim.—As an improved article of manufacture, a sandal consisting of a flat sole, A, flexible from end to end and provided with a toe-piece and a heel-piece and having a fastening-strap connected with the heel-piece and with the sole in front of the heel, whereby when the sandal is applied to the shoe the said strap will bend the sole up under the instep and thus shorten and retain it in place, substantially as set forth.

397,968. TROUSERS-STRAP. GEORGE T. CARTER, Pittsburg, Pa., assignor of one-half to Wendell M. Smith, Rochester, N. Y. Filed July 10, 1888. Serial No. 279,530. (No model.)

Claim.—1. An improvement in trousers-straps herein described, which consists in a strap or band which detachably engages the trousers, and a detachable fastening which engages the sole of the shoe and connects the band therewith, substantially as and for the purposes described.

2. An improvement in trousers-straps, which consists in the combination, with a clamp which is adapted to clasp the under side of the sole of the shoe and to engage the opposite edges of the sole, of a strap or band which extends from said clamp, and a clasp which detachably engages the strap with the trousers, substantially as and for the purposes described.

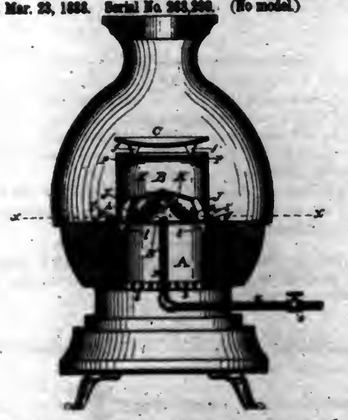


3. An improvement in trousers-straps, which consists in the combination, with a clamp which is adapted to clasp the under side of the sole of the shoe, of a strap or band which extends from said clamp, a clasp which detachably engages the strap with the trousers, said clamp consisting of two hooks adapted to engage the opposite sides of the sole of the shoe and connected by a spring by which they are rendered separable, substantially as and for the purposes described.

397,969. SALVANIC BATTERY. EBEN D. CROSS, Chicago, Ill. Filed Dec. 10, 1888. Serial No. 293,216. (No model.)

Claim.—In a galvanic battery, the combination, substantially as hereinbefore set forth, with a couple of cells and suitable electrodes and excitants therein contained, of a third supply-cell, a fume-conducting passage arranged to conduct the fumes from one of said cells and discharge the same into the supply-cell, and a fluid contained within the supply-cell and capable of being charged by said fumes, for the purpose described.

397,970. WRITING-TABLET. JOHN C. CRESPENING, Springfield, Ohio. Filed May 15, 1888. Serial No. 273,923. (No model.)

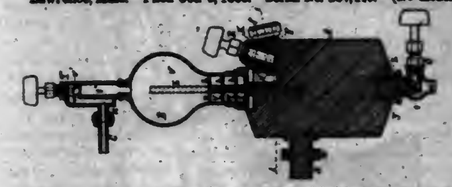


Claim.—1. A writing-tablet provided with the holding-plate and the laterally-extending retaining piece or pieces D on the back of the holding-plate, and forming an opening or openings closed at each end, substantially as set forth.

2. The combination, with two or more writing-tablets having the holding-plates and the retaining-pieces D, of the flexible strip C, passing from one tablet to another and beneath said retaining-pieces, the tablets being detachable from the strips, substantially as set forth.

3. The combination, with two or more writing-tablets having the holding-plates and the retaining-pieces D, of the flexible strip C, passing from one tablet to another and beneath said retaining-pieces, and the protecting-covers P, the tablets being detachable from the strips, substantially as set forth.

4. A writing-tablet provided with the back cover, *b*, and the stiff holding-plate B, secured to said cover by means of the fingers *f*, passing through and bent down upon the cover, the holding-plate being provided with means, substantially as described, whereby it may be connected and hinged with other tablets, substantially as set forth.



397,971. COAL-OIL BURNER OR HEATING APPARATUS. JOHN M. CLARK, Dayton, Ohio, assignor of one-half to C. L. Hinton, same place. Filed Mar. 23, 1888. Serial No. 268,298. (No model.)

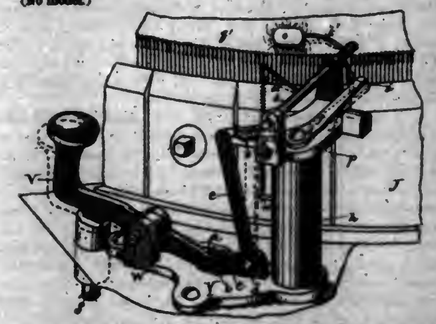
Claim.—The combination, with a stove or furnace, of a coal-oil burner consisting of a shell, A B, provided with outside rim, *g*, inside

rim, *p*, and lugs *l*, a cone, E', having upturned rim A, with lugs *l'*, and corrugated circular depressions K, surrounding the same, said cone forming an oil-receptacle, D, the jokers J, and hood C, with lugs *f* and oil-supply pipe, as shown and described; and for the purpose set forth.

397,972. STEAM-ENGINE LUBRICATOR. WARREN H. CRAIG, Lawrence, Mass. Filed Oct. 6, 1888. Serial No. 287,449. (No model.)

Claim.—1. A sight-feed lubricator provided in its water-space with one or more partitions, each having a small opening or hole, whereby pulsation is prevented, as set forth.

2. A lubricator provided with a duplex oil-reservoir, a water-pocket located at the upper part thereof, the tubular projections F F, and the conduits I I, leading from the pocket into the projections and each projection communicating with one side of the duplex oil-reservoir, whereby each part of the oil-reservoir is supplied with condensed-water independent of the other, as set forth.



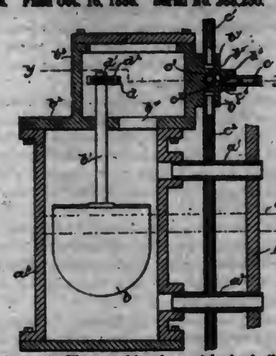
3. A lubricator provided with a duplex oil-reservoir, a water-pocket located at the upper part thereof, the projections F F, provided with a glass pane or window, and the conduits I I, leading from the pocket into the projections and having the passages close to the panes or windows and leading into each side of the oil-reservoir, as set forth.

4. A lubricator provided with a duplex oil-reservoir, a water-pocket, a sight-feed for each part of the oil-reservoir, and a conduit connecting the pocket with each sight-feed chamber and being connected with each part of the oil-reservoir, as set forth.

5. In a sight-feed lubricator, the sight-feed chamber and projection, in combination with the conduit I, having its outer end located close to the glass of the projection, such outer end being widened and concaved at its top, front, and bottom, forming a chamber, as set forth.

6. A lubricator provided at the top of its condenser with the trap consisting of the chamber *s'* and passage *t*, alongside each other and communicating with each other, the chamber having the branch pipe *x*, and the passage being adapted to the top of the condenser, as set forth.

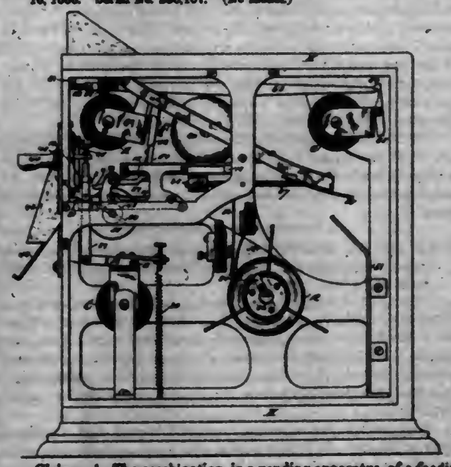
397,973. STOPPING DEVICE FOR KNITTING-MACHINES. JOHN S. CRANE, Lake Village, N. H. Filed Aug. 9, 1883. Serial No. 103,234. (No model.)



Claim.—1. The combination, with a needle-cylinder having one or more stops projecting from its periphery, of a block turning on a vertical pivot secured to a stationary part of the machine, a lever mounted on the said block, turning on a horizontal pivot of the same, and weighted to tilt outward and downward, a thread-guide mounted upon the said lever and adapted to tilt with the same, a ring or hoop adapted to be engaged and moved by the pivoted block, and a belt-shipping mechanism constructed to be operated by the said ring or hoop, substantially as herein specified.

2. The combination of a needle-cylinder, J, having stops *k' k'* upon its periphery, horizontally-swinging block *b'*, vertically-tilting lever *d'*, mounted on the swinging block, thread-guide *f'* mounted on the tilting lever and tilting with the same, ring or hoop *i'*, adapted to engage with the said swinging block and provided with the arm *o'*, lever *f*, adapted to engage with the said arm, lever *c*, adapted to engage with the said lever *f*, lever V, adapted to engage with the said lever *c*, stop S, bearing on the said lever V, springs R and T, lever O, and clutch B, substantially as and for the purpose herein specified.

3. The combination of a needle-cylinder provided with one or more stops or projections, a block pivoted vertically on a bed or stationary part of the machine near the cylinder, a lever pivoted horizontally upon the said block, a thread-guide mounted upon the said lever, a presser-wheel, a lifting device connected with the standard which carries the presser-wheel, and means connecting the said lifting device and the said lever, the lever being adapted to be tilted when the thread breaks or runs out and to engage with the connection between it and the presser-wheel lifter, for the purpose herein set forth.



397,974. FEED-WATER REGULATOR. JOHN P. CUMMINS, Beverly, Mass. Filed Oct. 16, 1888. Serial No. 288,230. (No model.)

Claim.—1. The combination, with the boiler, of an automatic feed-water regulator to control the supply of water to the boiler, it consisting of a vessel independent of but connected to the boiler, a float in said vessel, a valve-casing provided with a water-inlet port, a water-outlet port communicating with the boiler, and a second water outlet or discharge port, and a valve operatively connected to the float in said vessel to control the said inlet and outlet ports, the inlet-port by one movement of the float being connected to the boiler, and by the movement of the float in the opposite direction being connected to the discharge-port, substantially as and for the purpose specified.

2. The combination, with the boiler, of an automatic feed-water regulator to control the supply of water to the boiler, it consisting of a vessel connected by its upper and lower ends to the boiler, a float in said vessel, a valve-casing provided with a water-inlet port, *c*, a water-outlet port, c^2, communicating with the boiler, and a second water outlet or discharge port, *c'*, connected to the storage-tank, and a hollow valve operatively connected to the said float and provided with ports c^4 c^5 c^6 to register with the ports of the valve-casing, the said valve-ports being arranged with relation to each other, as described, whereby the water-inlet pipe is alternately connected to the water-outlet pipe leading to the boiler and the discharge-outlet leading to the storage-tank, substantially as described.

397,975. VENDING APPARATUS. CONSTANT F. DE REDON, New York, N. Y., assignor to Francis L. Wellman, same place. Filed July 16, 1888. Serial No. 280,107. (No model.)

Claim.—1. The combination, in a vending apparatus, of a feeding

mechanism for advancing a strip comprising the articles to be vended, a feeding-magnet for controlling said feeding mechanism, an electric circuit including said feeding-magnet and controlled by a coin, and a chute for receiving a coin and directing it into proper position to control the circuit, substantially as described.

2. The combination, in a vending apparatus, of a pin arranged to enter an opening in a strip comprising the articles to be vended, a releasing-magnet for withdrawing said pin, and an electric circuit controlled by the deposit of a coin to control the releasing-magnet, substantially as described.

3. The combination, in a vending apparatus, of a feeding mechanism for advancing a strip comprising the articles to be vended, a pin arranged to enter an opening in the strip, a releasing-magnet for withdrawing the pin, a feeding-magnet for operating the feeding mechanism, and an electric circuit controlled by the deposit of a coin to energize said magnets, substantially as described.

4. The combination, in a vending apparatus, of a feeding mechanism for advancing a strip comprising the articles to be vended, a feeding-magnet for controlling said feeding mechanism, an electric circuit including said feeding-magnet, a circuit-closer for said circuit arranged to be operated by the deposit of a coin, and a chute for receiving a coin and directing it to said circuit-closer, substantially as described.

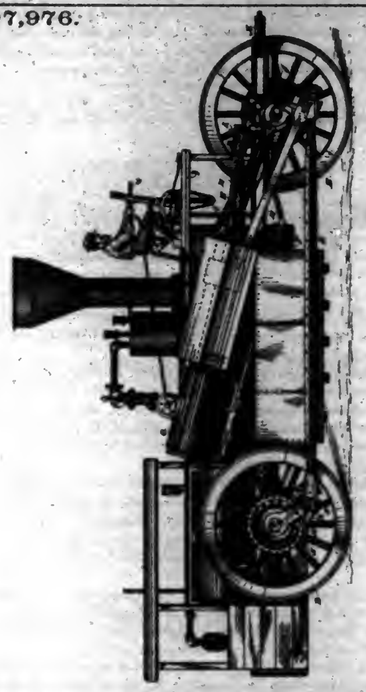
5. The combination, in a vending apparatus, of a pin arranged to enter an opening in a strip comprising the articles to be vended, a releasing-magnet for withdrawing said pin, an electric circuit including said magnet, and a circuit-closer for said circuit operated by the deposit of a coin, substantially as described.

6. The combination, in a vending apparatus, of a feeding mechanism for advancing a strip comprising the articles to be vended, a pin arranged to enter an opening in the strip, a releasing-magnet for withdrawing the pin, a feeding-magnet for operating the feeding mechanism, and a circuit-closer operated by the deposit of a coin to control said magnets, substantially as described.

7. The combination, with the case having the opening 41, of the gate 61, for closing the opening, the magnet G, for controlling the position of the gate, and a circuit-closer controlled by the strip comprising the articles to be vended to operate the magnet and close the opening when the strip is nearly or quite exhausted, substantially as described.

8. The combination, with the case having the opening 41, of the gate 61, for closing the opening, the magnet G, for controlling the position of the gate, the spool B, having the spring 24, the ring 66, co-operating with the spring to form a circuit-closer, and an electric circuit including the spring, ring, and magnet, substantially as described.

9. The combination, with the pins 5, adapted to pass through openings in the strip comprising the articles to be vended, of the springs 15, arranged to be engaged by said pins and forming a number of circuit-closers in an electric circuit, substantially as described.



10. The combination, with feed-rolls 47 48, of the blade 45, the feeding-magnet for operating the rolls, the chute 40 and tilting table 38, and the circuit-closer 33, operated by said table to energize the feeding-magnet, substantially as described.

11. The combination, with the feed-rolls for advancing the strip comprising the articles to be vended, of the pins 5, arranged to pass through perforations in said strip, the springs 15, acted on by said pins and forming circuit-closers, the plate 26 and magnet C, for simultaneously raising all of the pins, the magnet E, for operating the feed-rolls, electric circuits including the magnet C, the magnet C and springs 15, and the springs 15 and magnet E, and the circuit-closer 33, normally closing the circuit through the magnet E and springs 15, and operated by the deposit of a coin to temporarily close the circuit through the magnet C, substantially as described.

12. The combination, with the springs 15, of the pins 5, the feed-rolls 47 48, the magnet C, for raising the pins, the magnet E, for operating the feed-rolls, and an arm, 20, carried by one of the rolls, for releasing the pins after the feeding has commenced, substantially as described.

397,976. ROAD-ENGINE. RILEY R. DOAN, Sacramento, Cal., as signor of one-half to John H. Roberts, same place. Filed Oct. 11, 1888. Serial No. 287,980. (No model.)

397,976.

Claim.—1. A traction-engine having rear wheels mounted upon the ends of a driving crank-shaft journaled upon the engine-frame, and a single front wheel fitted with a ball-and-socket joint, with grooves and keys, upon the center of a second driving crank-shaft journaled upon the engine-frame parallel with the first shaft, and having power transmitted to it from the engine, substantially as herein described.

2. A traction-engine having parallel horizontal shafts turning in boxes at the front and rear ends of the frame, respectively, cranks upon the ends of the shaft through which motion is transmitted from an engine carried upon the frame, loosely-turning wheels fitted upon the rear shaft, and a pawl-and-ratchet mechanism by which they are connected therewith, in combination with a front wheel fitted to the front shaft by means of a ball-and-socket joint and driving-keys, and a steering mechanism connected with said front wheel, so that it may be turned from side to side independent of the rotary motion of its shaft, substantially as herein described.

3. A traction-engine having its rear end supported upon bearing-wheels, the shaft of which turns in boxes upon the engine-frame, a forward shaft parallel therewith, and cranks by which power is transmitted to said shafts from the engine, in combination with a ball fixed to the center of the forward shaft, having keys projecting from its periphery, a forward wheel having the hub formed with a socket, and transverse channels which fit to the ball any keys and allow the wheel to be moved from side to side while power is transmitted to it from the shaft, substantially as herein described.

4. In a traction-engine, the parallel crank-shafts journaled upon the engine-frame and receiving power through the cranks from an engine carried upon said frame, wheels fitting the outer ends of the rear crank-shaft and connected therewith by pawl-and-ratchet mechanism, a front wheel, the hub of which forms a globular socket fitting a corresponding ball secured to the front shaft, keys projecting from the periphery of said ball and entering transverse slots in the hub, through which power is transmitted to drive said wheel, and disks fitting in circular grooves in the outer ends of the hub, with horizontal openings from side to side, having boxes through which the shaft passes, said boxes traveling from side to side on guides with the horizontal openings of the disks, substantially as herein described.

5. An engine-frame having the parallel bearing and driving shafts at the front and rear of the frame, wheels mounted upon the rear axle with pawl-and-ratchet connections, as shown, and a single front wheel having the spherical socket with transverse channels, a ball secured to the shaft fitting said socket and having radial keys projecting and fitting into the channels, funnel-shaped hubs projecting outwardly from the spherical socket and having concentric grooves or channels with curved guides *b*, and boxes *z*, within which the wheel-shaft turns, said boxes having groove *a*, fitting upon the guides *b*, substantially as and for the purpose herein described.

6. The forward driving-shaft journaled upon the frame, the ball-and-socket connection, and driving-keys and channels, whereby the wheel is propelled by the shaft, the projecting funnel-shaped hubs having the disks C, fitted to turn in concentric channels in their outer ends, and the guiding-boxes Z, fitting the shaft and traveling on horizontal guides within the disks, in combination with the arms *c*, the segmental rack *g*, and the steering-wheel and pinion, substantially as herein described.

7. The forward driving-shaft journaled in boxes upon the engine-frame and having the ball fixed to its center with projecting keys, as shown, the wheel having the spherically-socketed hub with transverse channels fitting the ball and the keys, the horizontal traveling guiding-boxes, and guides in the outer ends of the funnel-shaped hub of the wheel, in combination with the horizontal sliding doors *j*, whereby the openings at the ends of the hubs are kept closed, substantially as herein described.

8. The doors *j*, traveling in guides and having their inner ends secured to the segments *k*, which fit the driving-shaft, said segments having grooves or channels *l*, in combination with the clasps or latches *m* and the links *n*, substantially as herein described.

9. The ball or sphere secured to the forward driving-shaft having the countersunk holes made radially in its periphery, in combination with the keys U, having the shanks W, and the enlargements or heads X, fitting into the radial holes and countersunk openings, substantially as herein described.

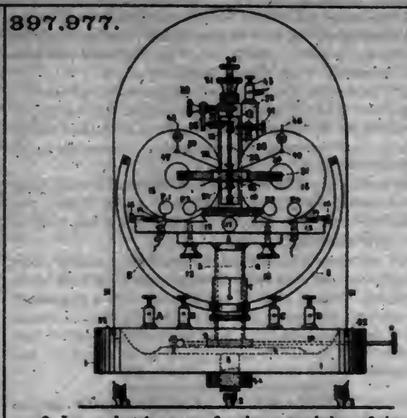
10. The wheel-hub composed of two sections bolted together, having the spherical channeled socket formed between said sections to fit and inclose the ball secured to the driving-shaft, with keys fitting the channels in the hub, radial semi-sockets upon the exterior of the hub-sections, into which the inner ends of the wheel-spokes are introduced, and bolts whereby the sections are secured over the ball and spokes locked in place, substantially as herein described.

11. An engine-frame having the forward shaft journaled upon it, a forward guiding and driving wheel with ball and socket, keys and horizontal guides and steering mechanism, the rear wheel-shaft journaled upon the frame parallel to the front shaft, and the wheels D, fitting loosely upon the ends of said shaft, having their outer ends countersunk to fit over the hubs of the cranks J, in combination with the ratchet-wheels M, clamped to the wheel-spokes, as shown, the pawl R, and the springs S, substantially as herein described.

12. The rear wheels of a traction-engine, turning loosely upon the rear crank-shaft, which is journaled upon the engine-frame, and the ratchet-rims clamped to the wheels, as shown, in combination with cranks having crank-pins projecting outwardly to receive the ends of the connecting-rods from the engine and the inner ends projecting inwardly and carrying pawls R, together with the springs S, fixed to the cranks and acting upon the pawls, substantially as and for the purpose herein described.

13. The side and connecting rods composed of angle-iron bars riveted together, with the angles meeting on a common axial line, substantially as herein described.

14. The side and connecting rods composed of angle-iron bars riveted together, with the interior angles upon a common axial line, the filling-pieces, and the stub ends welded thereto, substantially as herein described.



15. A road-locomotive consisting of a frame having rotary parallel axles and rigid connections between them, whereby said axles may be driven in unison and remain parallel, wheels on said axles, and a pivotal connection between a wheel or wheels and one of the axles, whereby the former may be turned from side to side on the axle to guide the machine while still receiving power and being driven by the axle, substantially as herein described.

16. A road-locomotive consisting of a frame with parallel shafts or axles journaled thereto, cranks, and connecting-rods by which said axles receive power from the engine and are united to move in unison, wheels mounted upon said axles so as to be propelled by them, and a mechanism whereby the steering-wheel may be turned from side to side upon one of the axles, so as to guide the machine, while receiving motion from the axle whose plane of rotation is unchanged, substantially as herein described.

17. A road-locomotive consisting of a frame having rotary parallel axles, cranks, and connecting-rods uniting the axles, whereby they may be driven in unison and remain parallel, a wheel on each end of one axle, a single wheel pivotally connected with the other axle, whereby it may be turned from side to side to guide the machine, and a power-connection between said single wheel and its axle, whereby the wheel is driven by the axle without regard to its angle with said axle, substantially as herein described.

397,977. TELEGRAPHY. CHARLES R. DREHER, New York, N. Y. Filed May 28, 1887. Serial No. 239,476. (No model.)

397,977.

Claim.—1. In an electric system for the transmission of sign or sound communications, whether graphic, vocal, or articulate, in combination with a primary voltaic battery, a second or relay voltaic battery, and a receiving-instrument operated by said relay-battery, a galvanometer consisting of a coil or coils of insulated wire and a magnetic needle pivoted to oscillate between the terminals of said relay-battery and provided with a spring or springs forming the conducting element between said needle and one terminal of the relay-battery when the needle closes circuit with the other terminal of said battery, whereby said needle is caused to transmit said communications through the circuit of said relay-battery, substantially as and for the purposes set forth.

2. In an electric system for the transmission of sign or sound communications, whether graphic, vocal, or articulate, in combination, with a transmitting-instrument for controlling its operation, a galvanometer consisting of a coil or coils of insulated wire and a magnetic needle provided with a torsional spring secured to said needle and with a spring radially secured to said needle, and a receiving-instrument in a relay-circuit, whereby said needle is caused to transmit the signals or sounds affecting it to said receiving-instrument through the relay-circuit, substantially as and for the purposes set forth.

3. A magnetic galvanometer-needle mounted in insulated bearings and provided with an electric terminal, in combination with an electric conductor-spring opposed to said needle's movement from its neutral position, and electric terminals in a relay-battery circuit, whereby when the circuit is closed between said terminals said spring-conductor forms part of the circuit between the poles of the relay-battery, substantially as and for the purposes set forth.

4. A curved magnetic galvanometer-needle provided with an electric terminal, in combination with an electric terminal in a relay-circuit and a spring opposed to said needle's movement from its neutral position, substantially as and for the purposes set forth.

5. In combination with a galvanometer consisting of a coil or coils of insulated wire devoid of magnet-cores and a magnetic needle provided with a spring opposed to said needle's movement from its neutral position, a horseshoe-magnet, all combined and arranged so that the resistance of said spring to said needle's movement is diminished by the field energy of said magnet and the field energy of said coil or coils augmented by the field energy of said magnet, substantially as and for the purposes set forth.

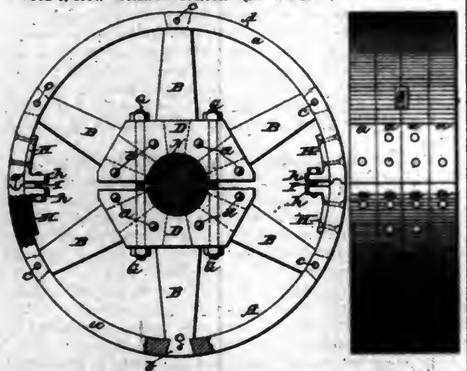
6. The combination of a magnetized galvanometer-needle provided with an electric terminal, a positive field-energy coil, and a negative field-energy coil, said coils devoid of magnet-cores and energized the one by a main circuit and the other by a different circuit, and an electric terminal in a relay-circuit, whereby should said terminals in the relay-circuit stick or adhere after the main circuit is broken one of said coils is thereby immediately energized to break said contact by its opposing field force, substantially as and for the purposes set forth.

7. The combination of a magnetized galvanometer-needle, a positive field-energy coil or coils, and a negative field-energy coil or coils, said needle pivoted to oscillate within the magnetic fields of said coils, and said coils devoid of magnet-cores and energized by different voltaic circuits and annularly located one within the other, substantially as and for the purposes set forth.

8. A magnetized galvanometer-needle provided with a spring of conducting material and with one or more contact-terminals in a relay-circuit, in combination with one or more field-coils positively energized and one or more field-coils negatively energized, all of said coils devoid of magnet-cores, whereby said needle is adapted to operate in the magnetic fields of said coils, substantially as and for the purposes set forth.

9. A laminated galvanometer-needle built up of separate magnetized lamine of like polarity superposed upon each other and secured together, as and for the purposes set forth.

10. In combination with galvanometer-coils, a curved magnetized galvanometer-needle composed of two laminated arcs built up of magnetized lamine superposed upon each other and secured together with their poles facing each other, and said coils between said facing-poles, whereby a galvanometer-needle of increased magnetic power is obtained for deflection by the united field force of said coils, substantially as and for the purposes set forth.



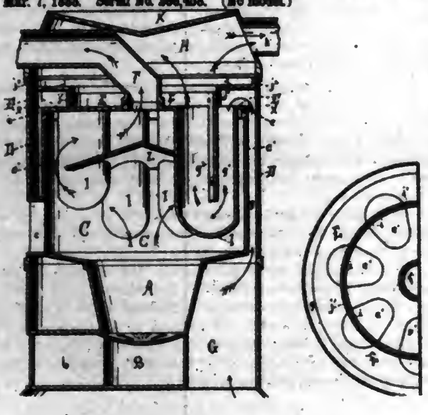
11. A magnetized galvanometer-needle composed of curved arcs adjustably connected to the arms of an oscillatory shaft, whereby the leverage of said arcs and the equilibrium of the needle are accurately adjusted, substantially as and for the purposes set forth.

12. In combination with a magnetized galvanometer-needle a friction apparatus, whereby said needle is prevented from moving by the brake action of said apparatus until the force of the field energy acting upon the needle exceeds such brake action, substantially as and for the purposes set forth.

13. In combination with the oscillatory shaft of a magnetized galvanometer-needle, one or more friction rods or bars, whereby the oscillations of said needle are steadied and controlled, substantially as and for the purposes set forth.

14. In a machine for transmitting electric energy, one or more adjustable galvanometer-coils of insulated wire provided each on its periphery with a dovetail piece, in combination with a magnetized needle composed of two curved arcs and a supporting frame or frames dovetailed to receive said piece or pieces, whereby said coil or coils are adjustably set in position relatively to the opposite poles of said arcs, substantially as and for the purposes set forth.

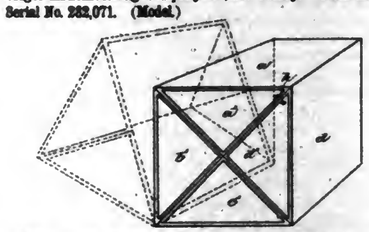
397,978. PULLEY. WALLACE I. FIELD, Menasha, Wis., assignor, by direct and mesne assignments, to John Strange, same place. Filed Oct. 8, 1887. Serial No. 251,861. (No model.)



Claim.—1. The combination, in a separable wooden pulley, of semicircular rim-sections formed with dovetailed mortises, hub-sections formed with dovetailed mortises and divided transversely to the axis of the pulley through said mortises, spokes formed at the ends with dovetailed tenons, which are inserted and secured in the mortises of the hub and rim sections, tie-bolts passing through and connecting said hub-sections transversely to the axis of the pulley, and coupling-bolts connecting the ends of the rim-sections, substantially as and for the purposes set forth.

2. The combination, with a pulley, of a sectional bushing composed of independently-removable concentric cylindrical sections of paper, substantially as and for the purposes set forth.

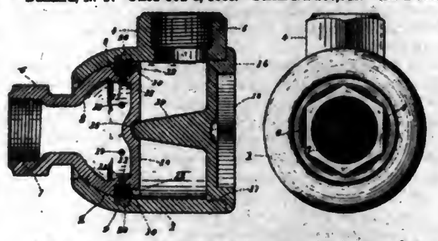
3. The combination, with a pulley composed of separable sections, of a sectional bushing composed of independently-removable concentric cylindrical sections divided to correspond with the sections of said pulley, substantially as and for the purposes set forth.



397,979. HOT-AIR FURNACE. JOSEPH GRAY, Chicago, Ill. Filed Mar. 7, 1888. Serial No. 266,458. (No model.)

Claim.—1. In a hot-air furnace, the combination of the combustion-chamber, with a series of pockets projecting into the same through which the air circulates, and with a deflector located above the fire-pot and between these pockets to throw the heated products of combustion out between and around the same before passing off up the chimney, as and for the purpose stated.

2. In a hot-air furnace, a series of pockets through which the air circulates projecting downward into the combustion-chamber, in combination with a deflector located above the fire-pot and between these pockets, and an escape-flue for the smoke centrally located above said deflector, whereby the greater portion of the heated gases from the fire will be made to pass outward between said pockets and back again between the same before passing off up the chimney, as and for the purpose stated.



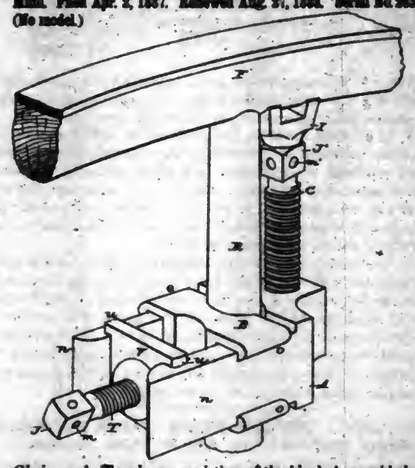
397,980. BOX. JOHN M. GRIBBY, Bayonne, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed Aug. 6, 1888. Serial No. 282,071. (Model.)

Claim.—1. A box composed of a plurality of side pieces flexibly jointed together so as to fold out flat, and end pieces or heads each composed of matched segments equal in number to the number of side pieces and secured to such side pieces, the adjacent edges of such segments abutting to form the heads of the box when folded, substantially as set forth.

2. A box composed of a plurality of side pieces flexibly jointed together so as to fold out flat, and end pieces or heads each composed of matched segments equal in number to the number of side pieces and secured to such side pieces, the adjacent edges of such segments abutting to form the heads of the box when folded, combined with a fastening device to keep the box closed, substantially as set forth.

397,981. UNIVERSAL METAL JOINT. JOTHAM C. HAGGETT, Dunkirk, N. Y. Filed Oct. 8, 1888. Serial No. 287,549. (No model.)

Claim.—1. The combination of the case 1, having a socket-seat, 2, a cover, 16, adapted to screw onto the head of the case, and having an inwardly-projecting piece, 19, and a semi-spherical hollow portion, 3, adapted to fit the seat 2 and provided with a cross-bar having a depression, 15, to receive the end of the projecting portion 19, and having a screw-thread at the opposite end for attachment to a pipe, substantially as described.



2. In a universal metal joint, the combination of a socket-case having a socket-seat at one end and a cover at the opposite end provided with a projecting piece, 19, to keep the ball portion in place, a ball portion having at the large end a cross-bar provided with a depression to receive the projecting piece from the cover, and a packing-ring secured in a groove surrounding the ball portion, substantially as and for the purposes described.

3. In a universal metal joint, the combination of a socket-case having a projecting internal screw-threaded portion on one side, a socket-seat at one end, and a screw-threaded portion at the opposite end to receive the cover, a semi-spherical ball portion adapted to fit the socket-seat, having at one end an internal screw-threaded portion and at the ball end a cross-bar provided with a recess or depression, and a cover having an inner projecting portion reaching down into the recess in the cross-bar, substantially as described.

4. In a universal metal joint, a socket-case having a socket-seat at one end and a cover at the opposite end provided with a projecting piece to keep the ball portion in place, in combination with a ball portion having at the large end a cross-bar provided with a depression

to receive the projecting piece from the cover, and a packing-ring secured in a circular groove between the seat and the ball portion, a supplementary groove leaving an opening between the side of the packing-groove and packing, and holes for admitting steam thereto, substantially as and for the purposes described.

397,982. TIRE-TIGHTENER. CLARENCE D. HARMON, Delavan, Minn. Filed Apr. 2, 1887. Renewed Aug. 27, 1888. Serial No. 283,995. (No model.)

Claim.—1. The clamp consisting of the block A, provided with the arms a a, having recesses w w, the sliding block B, provided with the projections o, to hold it in place on the arms a, and the detachable nut V, provided with the screw T, all arranged to operate substantially as and for the purpose set forth.

2. In a tire-tightener, a clamp for securing the device to a spoke, provided with a reversible clamping-block, B, having concavities of different sizes in its opposite faces, and the detachable nut V, provided with a screw, T, all arranged to operate substantially as shown and described.

3. The combination, in a tire-tightener, of the clamp consisting of the bifurcated concave block A, with the concave movable block B and screw T, with the screw-rod C, provided with a square or holes for turning it, and the concave push-block I, swiveled upon the end of the same, all arranged to operate substantially as described, whereby the device can be held upon a spoke without bruising the same, and the spoke be forced to its seat in the hub with the same degree of force that is used to raise the felly from the spoke.

397,983. INKSTAND. BENJAMIN F. HEBKLE, Woodensburg, Md. Filed Sept. 5, 1887. Renewed Oct. 11, 1888. Serial No. 287,857. (No model.)

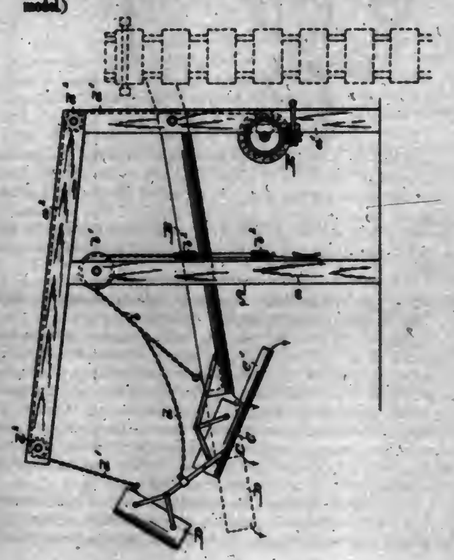
Claim.—1. In an inkstand, the combination, with the reservoir and top having a dip-opening, of a gage-plate situated beneath the opening and within the ink-reservoir proper above its bottom and held from rotation, a nut carrying said plate, a screw-shaft engaging the nut by its thread, and having a bearing in a portion of the stand in which the shaft rotates and is held from vertical movement, and an external thumb-nut or handle for rotating the shaft, whereby the plate may be adjusted vertically within the body of the fluid, substantially as set forth.

2. The combination, with the reservoir and top having a dip-opening, of a gage-plate situated within the reservoir and beneath the opening and held from rotation, a nut carrying said plate, a screw-shaft engaging the nut by its thread, and having a bearing in a portion of the stand in which the shaft rotates and is held from vertical movement, a gear-wheel carried by the shaft, and a toothed sleeve surrounding the dip-opening and engaging said wheel, the outer end of the sleeve being adapted to be turned to actuate and adjust the gage-plate, substantially as described.

3. The combination, with the reservoir and top having a dip-opening, of a gage-plate within the reservoir and beneath the opening, a plurality of nuts carrying said plate, corresponding screw-shafts engaging said nuts by their threads, and having bearings in a portion of the stand in which they may revolve but are held from vertical movement, gear-wheels carried by the shafts, and a toothed sleeve situated in the opening and engaging said wheels, substantially as set forth.

4. The combination, in an inkstand, with the reservoir, of a vertically-adjustable gage-plate situated beneath the dip-opening and having one or more nuts secured therein, and forming also projections upon its under surface, whereby it is arrested at a predetermined distance above the bottom of the reservoir, substantially as set forth.

397,984. REFRIGERATOR. EDWARD B. HEIS, New York, N. Y., and WILLIAM K. STEVENS, Washington, D. C.; said Stevens assignor to said Heis. Filed Sept. 1, 1888. Serial No. 284,255. (No model.)



Claim.—1. The combination of a chamber having openings, a perforated support for ice in the upper portion of the chamber, grooved pans located in the chamber below the ice-support and in line of the drippings therefrom, and close covers fitted to the grooves in the pans, substantially as shown and described.

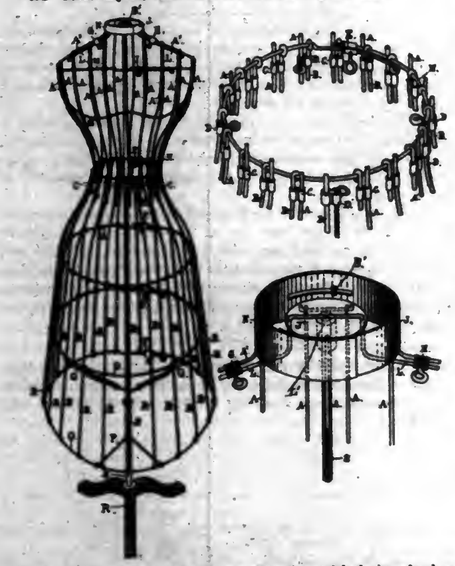
2. The combination of a chamber having openings, a series of vertical sockets secured to the inner face of the walls of the chamber, and a series of bracket-shelves provided with vertical pivots to engage the said sockets independent of the chamber-door, substantially as shown and described.

3. The combination of a refrigerator-chamber having a series of vertical sockets on the inner face of its walls, a series of grooved bracket-shelves provided each with a vertical pivot to fit the said sockets, and a series of covers fitted to the said shelf-grooves, substantially as shown and described, whereby one shelf may be swung to one side from over another within the chamber to permit the removal of covers within the chamber, as set forth.

397,985. CHUTE FOR DREDGING-MACHINES. MICHAEL HERRON, Bordentown, N. J., assignor of one-half to John Herron and James Herron, same place. Filed July 2, 1888. Serial No. 278,289. (No model.)

Claim.—1. In a delivery-chute, the combination, with the vertically-adjustable main section, of a section hinged thereto having an inwardly-extending tail or guide, substantially as described.

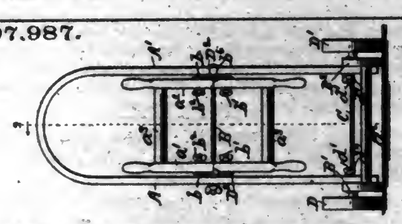
2. In a delivery-chute, the combination of a main section, a section hinged thereto having a tail or guide, and a section hinged to said section, all of said sections being adjustable with relation to each other, substantially in the manner and for the purpose described.



3. In a dredging-machine, a sectional chute having its main part pivoted at or near one end, a section pivotally connected to the main part and having a tail portion, C', mechanism for raising and lowering the main portion, and a chain connected to the section and to the said raising and lowering mechanism, said parts being combined substantially as and for the purpose set forth.

4. In a dredging-machine, a sectional chute having a main portion pivotally secured to standards, a section with a tail portion pivotally connected to the main portion, and an end section pivotally secured to the section having the tail portion, and independent mechanisms for raising and lowering said main portion and sections, said parts being combined substantially as described.

5. A delivery-chute composed of hinged sections, one of said sections being provided with a tail below the main body of the chute, substantially as and for the purpose described.

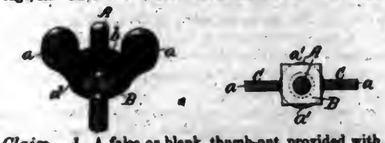


6. A delivery-chute for a dredging-machine, consisting of a main portion and sections, the main portion and adjacent section having projecting arms, to which projecting arm of the main section the adjacent section and its arms are pivotally attached, and mechanism for raising and lowering said sections, said parts combined substantially as described.

397,986. DRESS-FORM. WILLIAM A. JOHNSON, San Francisco, Cal. Filed July 22, 1887. Serial No. 244,967. (No model.)

Claim.—In a dress-form, the combination, with the standard and the adjustable bust and skirt wires, of the adjustable collar-band, the adjustable shoulder-wires, the wire L, carried along said shoulder-wires and connected thereto by the brackets G H, the plate sustaining said wire L, and the loose sleeve connected to the said plate and carried by the upper end of the said standard, substantially as described.

397,987. HOSE-REEL. CHARLES W. KIMBALL, Chicago, Ill. Filed Mar. 27, 1888. Serial No. 268,647. (No model.)



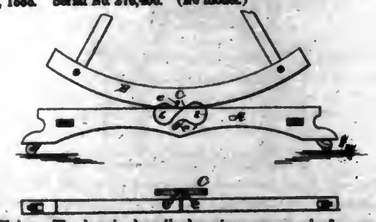
Claim.—1. In a folding hose-reel, the combination, with the side standards, of an axial or pivot shaft having the respective ends inserted in said standards, the continuous cross arm or arms *a*, mounted on said shaft, the divided arms $a' a^2$, abutting against said cross-arms, the connecting-plates D^2, provided with the curved lugs b^2 b^3, and the clamping-bolts adjustably securing said plates to the short arms $a' a^2$, whereby said latter arms may be folded parallel to the standards and cross-arms or secured in a fixed position at right angles to said cross-arms, substantially as and for the purpose set forth.

2. In a folding hose-reel, the combination, with the divided arms $a' a^2$, of the joining plate or plates D^2, provided with lugs which are adapted to overlap the inner ends of said arms, and the pivotal clamping-bolts b b', whereby the two parts comprising said arms may be secured in a fixed rigid position to form a continuous arm or folded in a parallel plane, substantially as and for the purpose set forth.

3. In a folding hose-reel, the combination, with the side standards, of the horizontal foot-pieces adjustably secured to the lower ends of said standards, the truck-axle upon which one end of said foot-pieces is mounted, and the truck-wheel mounted on the respective ends of said axle, whereby said axle and truck-wheels may be set at right angles to said standards or folded in a plane parallel therewith, substantially as and for the purpose set forth.

4. In a folding hose-reel, the combination, with the side standards provided with slots in the lower ends, of the horizontal foot-pieces, the bolt or bolts d', inserted in said slots and adjustably securing said standards and foot-pieces, and the rounds d^3 d^3, connecting said foot-pieces and arranged closely to and on each side of said standards, said slots providing for a vertical movement of said standards for the purpose of throwing the same into and out of engagement with said rounds, substantially as and for the purpose set forth.

397,988. THUMB-NUT WRENCH. CHARLES W. KIMBALL, Chicago, Ill. Filed June 5, 1888. Serial No. 276,134. (No model.)

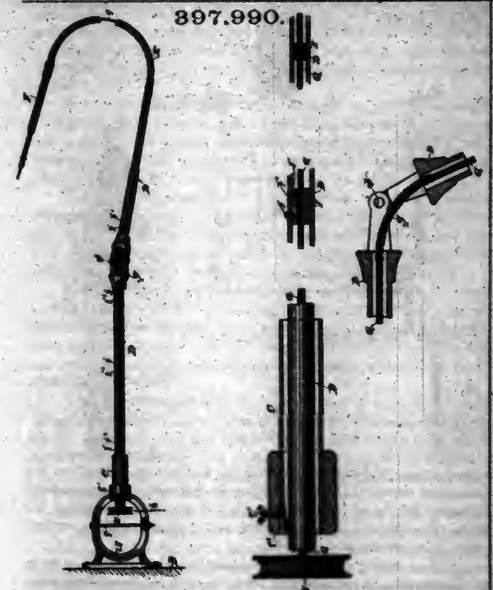


Claim.—1. A false or blank thumb-nut provided with a rectangular aperture opening in from the two sides at right angles to the wings for the loose insertion therein of a screw-threaded nut from either side, substantially as set forth.

2. A false or blank thumb-nut consisting of the wings *a a* and the body *d'*, said body being provided with an aperture extending through from side to side and adapted to loosely retain a screw-threaded nut therein, substantially as and for the purpose set forth.

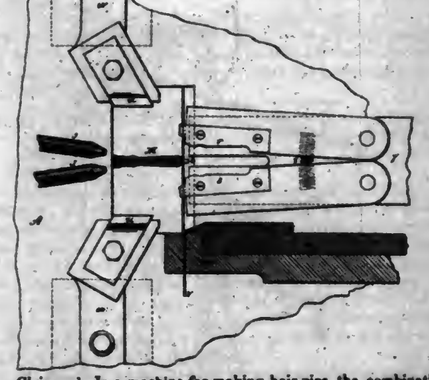
3. A false or blank thumb-nut provided with a rectangular opening extending through from side to side, in combination with a screw-threaded nut, whereby the threaded nut may be loosely inserted and removably retained in said thumb-nut, substantially as and for the purpose set forth.

397,989. SPRING. FREDERICK LATOUR, Syracuse, N. Y., assignor to Charles S. Hutting and Lucy A. Williams, same place. Filed June 7, 1888. Serial No. 276,408. (No model.)



Claim.—The herein-described spring, composed of a continuous spring metal bar curved in the shape of an S, and having its opposite ends turned at right angles on the same side of the bar and bent laterally into a plane beyond the edge of the bar, each turned end being provided with one or more transverse apertures, as set forth.

397,990. DENTAL ENGINE. IRA G. LEEK, San Francisco, Cal. Filed Feb. 16, 1888. Serial No. 264,235. (No model.)

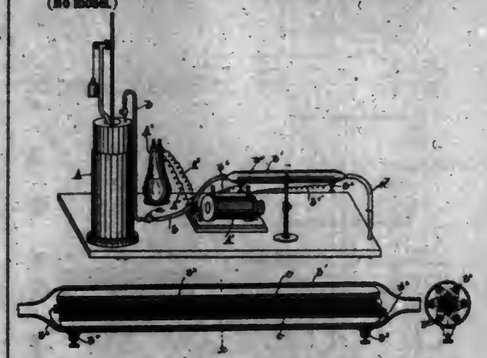


Claim.—1. In a dental engine, the hand-piece and flexible power-conveyer, in combination with the fixed bracket, the sleeve connected therewith by a vertical pivot, the arm carrying the hand-piece and conveyer at one end and fitted at the other end in the sleeve and axially rotary therein, and the hinge-joint in the arm, substantially as described.

2. In a dental engine, the hand-piece and the flexible power-conveyer, in combination with the fixed bracket, the vertically-pivoted sleeve, the tubular axially-rotary arm fitted in the sleeve and carrying the hand-piece and power-conveyer, said arm having a hinge-joint, *d*, the rods G within the tubular arm, connected with the power-conveyer at one end and having a pulley at the other end, and the flexible coil or piece connecting the rods at the hinge of the arm, substantially as described.

397,990.

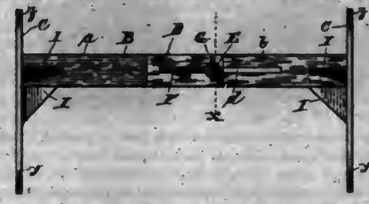
397,991. MACHINE FOR MAKING HAIR-PINS. GEORGE W. MARSH, New York, N. Y., assignor to the Self Retaining Hair Pin Company, same place. Filed June 11, 1888. Serial No. 276,704. (No model.)



Claim.—1. In a machine for making hair-pins, the combination of the former M, around one edge of which the blank is adapted to be bent, the sides of the former near the opposite edge of like irregular shape, and the said sides of the said irregular shape toward the said opposite edge diverging, the sliding swinging jaws *r s*, arranged to pass one each side of said former, and the sides of the said jaws adjacent to the said former of a shape corresponding to the sides of the said former, and transverse side pressers, *u u*, arranged to bear said jaws toward said former, with a pair of revolving mandrels, 3 3, the said mandrels diverging and in line with the diverging sides of the said former, with mechanism, substantially such as described, to impart longitudinal movement to said mandrels, substantially as and for the purpose described.

2. The combination of the former M, the clamp *l*, the sliding and swinging jaws *r s*, side pressers, *u u*, and diverging, revolving, and longitudinally-reciprocating mandrels 3 3, all substantially as and for the purpose described.

3. The combination of the former M, mechanism, substantially such as described, to impart a vertical reciprocating movement to said former M, a feed mechanism adapted to deliver the wire to the machine, clamp *l*, sliding and swinging jaws *r s*, transverse side pressers, *u u*, and diverging, revolving, and longitudinally-reciprocating mandrels 3 3, all substantially as and for the purpose described.

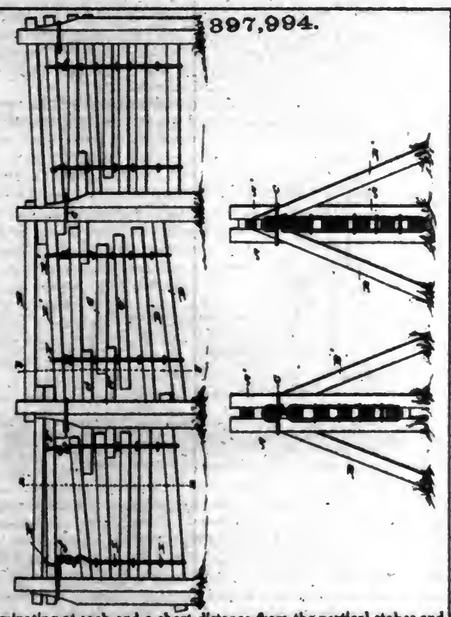


397,992. APPARATUS FOR MANUFACTURING OZONE. GOTTFRIED H. MERKEL, Boston, Mass. Filed May 23, 1888. Serial No. 275,377. (No model.)

Claim.—1. In an apparatus for the production of ozone, the combination, with an ozonizing-chamber, *b'*, of the herein-described continuous electric conductor bent or coiled to extend longitudinally the length of the said chamber two or more times to form through the said chamber a complete continuous circuit of substantially high resistance, the said coils being insulated from one another, substantially as and for the purpose specified.

2. In an apparatus for the production of ozone, a gasometer to contain oxygen, an ozonizing-chamber, *b'*, connected thereto, the herein-described continuous electric conductor or wire and carrier therefor located in said chamber and composed of coils or tubes of glass or non-conducting material, through which the said continuous wire is passed, combined with an induction-coil connected to the opposite ends of the said electric conductor, and a current-generator connected to said induction-coil, substantially as described.

397,993. PILLOW OR HEAD-REST. WALTER L. MILLER, Winneconne, Wis. Filed July 5, 1888. Serial No. 279,050. (No model.)



Claim.—In a head-rest or pillow, the combination of the endless apron or fabric A, fabric-supporting pieces C C, adjustable connecting-pieces *a* and *b*, said piece *a* being rigidly connected with one of the cross-pieces C and provided with an adjusting-screw, E, and a guide-stud, F, said connecting-piece *b* being provided with an elongated slot, *d*, for the reception of said screw E, hand-nut G, operating upon said screw E and adapted by turning to secure said connecting-pieces *a* and *b* firmly together at any desired point of adjustment, all substantially as and for the purpose specified.

397,994. FENCE. JOHN P. MOSHETT, Bucyrus, Ohio. Filed June 27, 1888. Serial No. 278,265. (No model.)

Claim.—1. A fence consisting of the vertical stakes, the top and bottom rails fitted at their ends between said vertical stakes, the inclined stakes, the binding-wires C, passing around the vertical and inclined stakes to cause the vertical stakes to bind tightly on said rails, two vertical wire loops, F, for each panel of the fence, located near the vertical stakes and passing around the bottom and top rails, the intermediate rails, G G', varying in length with respect to the top and bottom rails and fitted in the vertical loops, and the filling-in pieces H H, fitted between the intermediate rails of two adjoining panels of the fence and passing between the vertical stakes, substantially as and for the purpose described.

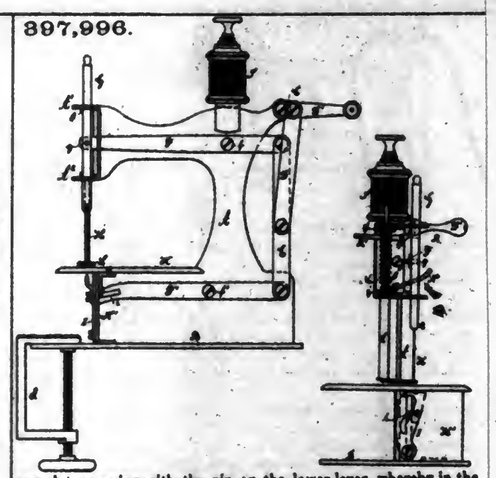
2. A fence consisting of the top and bottom rails fitted at their ends between vertical stakes, wires C, clamping said stakes tightly upon the ends of the rails, two vertical wire loops, F, for each panel of the fence, located in close juxtaposition to said vertical stakes and passing around the top and bottom rails, the intermediate rails, G G',

397,994.

terminating at each end a short distance from the vertical stakes and fitted in said vertical loops, the open links I, fitted around the vertical loops, between the rails, to draw the loops tightly upon said rails, and the filling-in pieces H H', arranged between adjoining panels of the fence and passing between the vertical stakes, with their ends fitted in adjoining vertical wire loops, substantially as described.

397,995. SPOKE-TENON. WILLIAM P. MORTON, New Haven, Conn., assignor of one-half to Holcomb Brothers & Co., same place. Filed Apr. 4, 1888. Serial No. 269,577. (No model.)

Claim.—1. A compressed spoke-tenon made to gradually increase in thickness from the shoulders of the spoke to a point about midway of its length, and made straight from that point to its outer end, whereby a bulky parallel-sided retaining end remains after the outer end of the tenon has been cut away in boxing the hub, substantially as set forth.



2. The combination, with a mortised hub in which one of the end walls of each mortise is inclined inward, of a compressed spoke-tenon having a straight edge and a beveled edge, one or both edges of the tenon being corrugated for forming retaining-points which are forced into the hub, when the tenon is driven, by the leverage secured by the beveled edge of the tenon and the inclined wall of the mortise, and form corresponding retaining-points therein, the retaining-points of the tenon interlocking under its edgewise expansion with those of the hub and forming a long series of interlocking points holding the tenon in place, substantially as set forth.

397,996. SEWING-MACHINE. FRIEDRICH W. MÜLLER, Jr., Berlin, Germany. Filed June 16, 1888. Serial No. 277,411. (No model.)

Claim.—1. In a sewing-machine, in combination with the frame, an upper lever pivoted thereto, a needle-bar secured to the front end of said lever, a lower lever, also pivoted to the frame, a thread-catcher pivoted to the supporting-frame and oscillated by one end of the lower lever, a connecting-rod between the upper and lower levers, and means for operating the same, whereby said levers are simultaneously operated in vertical plane, substantially as described.

2. In a sewing-machine, in combination with the frame, a lower supporting-plate, H', having a vertical slot formed therein, an upper lever pivoted to said frame, a needle-bar secured to the front end thereof, a lower lever, also pivoted to said frame, having a pin attached to its forward end projecting through the vertical slot in the plate H', a thread-catcher pivoted to said plate and provided with a

397,996.

cam-slot engaging with the pin on the lower lever, whereby in the movement thereof the thread-catcher is oscillated, a connecting-rod between said upper and lower levers, and means for operating the same, whereby said levers are operated simultaneously in vertical plane, substantially as described.

3. In a sewing-machine, in combination with the frame, a lever pivoted thereto, a needle-bar secured to the front end thereof and actuated thereby, a presser-bar carrying a feed-plate, a swinging plate pivoted to the frame of the machine and bearing against the presser-bar, a lever, N, pivoted to said plate, and having one end projecting into the path of the needle-bar-actuating lever and the other in engagement with the presser-bar, a spring for keeping said presser-bar normally down, and a shoulder secured to the swinging frame and projecting into the path of the needle-bar-actuating lever, whereby on the upward movement of the same the presser-bar is swung forward to feed the work, substantially as described.

397,997. TILE-DITCHING MACHINE. ROBERT R. NEVIN, Enon Valley, Pa. Filed Sept. 30, 1886. Serial No. 214,963. (No model.)

Claim.—1. In a ditching-machine, the combination of a vertically-adjustable plow, a vertically-adjustable sled pivotally secured to the

beam of the plow and supported by means of bell-crank levers, mechanism for adjusting the plow and the sled, a trough pivotally secured to the plow at its front end and to the rear axle of the machine, and an endless belt provided with swinging buckets, substantially as described.

2. In a ditching-machine, the combination of a plow, a trough, a longitudinally-adjustable beam above and parallel with the trough, and an endless belt having elevators attached thereto provided with friction-rollers which engage with the under side of said beam while passing through the trough, substantially as described.

3. In a ditching-machine, the combination of a plow, a trough, an endless belt having buckets provided with pintles on their sides and an arm supporting a friction-roller, and a beam above and parallel with the trough, against which the rollers bear to hold the buckets in working position in the trough, substantially as described.

4. In a ditching-machine, the combination of a plow, a trough, an endless belt provided with buckets, a beam separate from the trough and seated at one end on a frame, and having a shaft supporting the front wheels over which the belt passes connected to the other end, and means for adjusting the beam longitudinally, substantially as described.

5. In a ditching-machine, the combination of a plow, a trough, an endless elevator, a beam above, parallel with, and supported by the trough at its front end and supporting the front wheels over which the elevator travels, a socket on the rear frame to receive one end of the beam, and an adjusting-screw for moving said beam longitudinally, substantially as described.

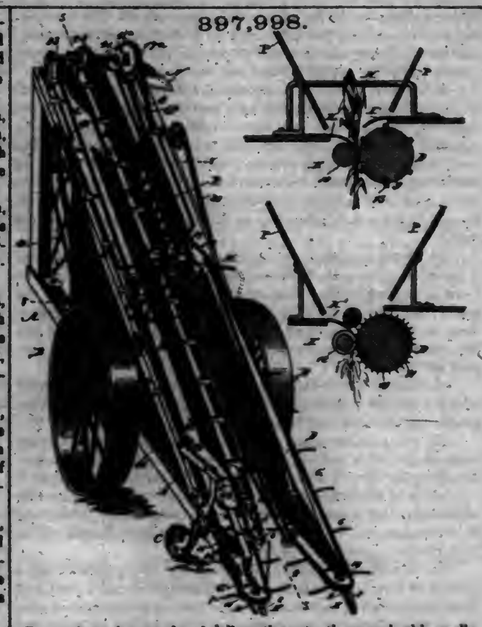
6. In a ditching-machine, the combination of a plow, a trough, an endless belt provided with pivoted buckets, a scraper supported by the rear frame, extending across the path of the buckets, and constructed to clean their working-surfaces and turn them in the plane of the belt as they cross the rear supporting-wheels, substantially as described.

7. In a ditching-machine, the combination of a plow, a trough, an endless chain elevator, a beam above the trough and supporting a track at its front end, and front and rear chain-supporting wheels, substantially as described.

8. In a ditching-machine, the combination of a plow, a trough, an endless chain elevator, a beam above the trough and supporting a track at its front end, and an arm for turning the elevator-blades into position for crossing said track, substantially as described.

9. In a ditching-machine, the combination of a plow, a sled or wheel secured to the beam thereof, rocking levers connected by a link, a screw, and an operating-rod for adjusting said sled, substantially as described.

10. In a ditching-machine, the combination of a plow, a sled attached to the front end thereof, rocking levers pivotally connected to the sled and to a link, an adjusting-screw, a swivel connected to one end of said screw, and a rod surmounted by an operating medium, substantially as described.



397,998. CORN HARVESTER AND HUSKER. LUKE W. OSBORN, Joliet, Ill., assignor to Daniel Robertson, Irving D. Stevens, and Lloyd Eberhart, all of same place. Filed Aug. 17, 1887. Serial No. 247,167. (No model.)

Claim.—1. In a corn harvesting and husking machine, the combination, substantially as hereinbefore set forth, of a pair of parallel rotary snapping-rolls for drawing the stalks between them and snapping off the ears in an unhusked condition, a pair of parallel rotary husking-rolls for husking such snapped-off ears, arranged in alignment with and extended back from the rear terminals of the snapping-rolls, and an endless conveyer chain or belt provided with fingers to take the ears at points where they are snapped off along the snapping-rolls and convey them back to and along the rear husking-rolls, where the ears are finally stripped of their husks.

2. The combination, substantially as hereinbefore set forth, with a pair of forwardly-arranged parallel rotary snapping-rolls, of a guard or shield extending along and parallel with the rolls at such a distance from the rolls as to provide between the rolls and the guard a stalk-passage of a width to pass the stalks, but not the ears, and a pair of rearwardly-arranged parallel rotary husking-rolls which from their forward ends extend back from the rear terminals of the snapping-rolls, one of said husking-rolls being uncovered to husk such ears as have been snapped off along the snapping-rolls and brought back to the husking-rolls.

3. The combination, substantially as hereinbefore set forth, with a pair of forwardly-arranged parallel rotary snapping-rolls and a pair of rearwardly-arranged parallel husking-rolls extending back from the rear terminals of the snapping-rolls, of a guard or shield extending along and parallel with the rolls at such a distance from the rolls as to provide between the snapping-rolls and the guard a stalk-passage of a width to pass the stalks, but not the ears, and an endless conveyer chain or belt provided with fingers to take the ears at points where they are snapped off along the snapping-rolls and carry such snapped-

397,998.

off ears along the guard and deliver them to the rear husking-rolls, one of which said husking-rolls is uncovered to husk the ears.

4. The combination, substantially as hereinbefore set forth, with a pair of parallel rotary snapping-rolls, of a guard or shield extending over and along one roll and having one edge portion depressed toward the line of separation between the rolls to provide between said depressed edge portion and the opposite roll a stalk-passage which is of sufficient width to admit the stalks, but not the ears, and which is within such close proximity to the line of separation between the two rolls as to permit the rolls to pinch the stalks close up to the butt-end of the ears, for the purpose set forth.

5. The combination, substantially as hereinbefore set forth, with a pair of parallel rotary snapping-rolls having relatively-different diameters, of a guard or shield extending over and along the larger roll and having its longitudinal edge portion that is nearest the smaller roll bent downwardly both toward the line of separation between the rolls and toward the smaller roll, so as to leave a stalk-passage which is of sufficient width to admit the stalks, but not the ears, and which is within such close proximity to the line of separation between the rolls as shall permit them to pinch the stalks close up to the butt-ends of the ears, for the purpose set forth.

6. The combination, substantially as hereinbefore set forth, with a pair of rotary snapping-rolls whereof one is ribbed and both arranged for conjointly operating to draw the stalks between them, of a guard or shield, I, extending over and along the ribbed roll, and having one edge inclined downwardly toward the line of separation between the rolls to an extent to provide between its lower longitudinal edge portion and the roll that is alongside said ribbed roll a stalk-passage which permits the passage of the stalks and allows the ribs of the roll to engage the same close up to the butt-ends of the ears, but which prevents the ears from being engaged by said ribs, for the purpose set forth.

7. The combination, substantially as hereinbefore set forth, with a pair of rotary snapping-rolls, of the guard or shield I, arranged over and along one roll, and having one edge depressed toward the line of separation between the rolls and extended toward the opposite roll to an extent to provide between its depressed edge and the said roll that is opposite the roll covered by the guard or shield a stalk-passage somewhat to that side of a vertical plane coincident with and passing through the line of separation between the two rolls opposite the guard, whereby when the stalks are drawn between the rolls the ears will be deflected to one side by the guard, and the snapping off of the ears thereby facilitated.

8. The combination, substantially as hereinbefore set forth, with a pair of rotary snapping-rolls for drawing the stalks between them, of a pair of inclined guards or shields respectively arranged over and along the two rolls, and having their opposing longitudinal edge portions depressed toward the line of separation between the rolls, but leaving between their depressed edge portions a stalk-passage of sufficient width to admit the stalks, but not the ears, and within such

close proximity to the line of separation between the rolls as to permit the rolls to pinch the stalks close up to the butt-ends of the ears, said guards being also arranged to provide between their inclined sides a trough for the snapped-off ears, for the purpose described.

9. The combination, substantially as hereinbefore set forth, with a pair of rotary snapping-rolls, of a pair of guards or shields respectively arranged over and along the two rolls, and having their opposing longitudinal edges depressed to form a trough, but leaving space between their edges to form a bottom passage in the trough of sufficient width to admit the stalks, but not the ears, and an endless elevator-chain or belt provided with fingers which traverse the trough formed between the sloping sides of said guards, for the purpose set forth.

10. The combination, substantially as hereinbefore set forth, with a pair of snapping-rolls of relatively-different diameters, of the guards I and K, depressed along their opposing longitudinal edges, with the guard I standing higher than the guard K, and an endless conveyer chain or belt provided with fingers which during the travel of the belt traverse a path over and adjacent to the guard K, for the purpose set forth.

11. In a corn-harvester, a pair of parallel rotary snapping-rolls whereof one roll is provided with spring-backed ribs arranged with relation to the other roll to pinch the different sizes of stalks.

12. In a corn-harvester, a pair of parallel rotary snapping-rolls whereof one roll is provided with a series of longitudinally-arranged flexible spring-ribs, 13, substantially as and for the purpose described.

13. In a corn-harvester, a pair of parallel rotary snapping-rolls whereof one roll is provided with a series of longitudinal grooves and flexible spring-ribs, 13, backed by springs that are arranged within such grooves, substantially as described.

14. In a corn-harvester, a pair of parallel rotary rolls having a portion of their length constructed as snapping-rolls and a portion of their length adapted as husking-rolls for husking the snapped-off ears, one of said rolls having its snapping portion provided with ribs, and one of said rolls being along its husking portion provided with husking-teeth, for the purpose set forth.

15. In a corn harvesting and husking machine, the roll D, provided along a portion of its length with longitudinal ribs and along another portion of its length with annular rows of husking-teeth, combined with the roll E, having along a portion of its length grooves for receiving the teeth of the oppositely-arranged roll, for the purpose set forth.

16. The combination, substantially as herein set forth, with a pair of husking-rolls whereof one roll is provided with sets of husking-teeth alternating with grooves 22 and the opposite roll provided with peripheral projections which register with the grooves of the toothed roll, of the guard or shield K', arranged over the untoothed roll and provided with gaps for the passage of the peripheral projections upon such roll, for the purpose described.

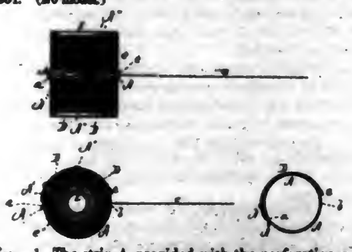
17. The combination, substantially as herein set forth, with a pair of husking-rolls, one of which is provided with husking-teeth and made larger in diameter than the opposite roll, of a guard or shield arranged over the smaller roll and depressed along one edge toward the line of separation between the two rolls, for the purpose described.

18. The combination, substantially as herein described, with the roll D, ribbed along the forward portion of its length, and along the rear portion of its length provided with husking-teeth, and the roll E, arranged parallel with said ribbed and toothed roll, of a guard extending along and over the ribbed-roll portion, but terminating short of the toothed-roll portion, so as to expose the husking-teeth, and a guard arranged over the length of the roll E, that is alongside the toothed-roll portion, for the purpose described.

19. The combination, with a pair of parallel rotary snapping-rolls and a pair of parallel rotary husking-rolls extending back from the snapping-rolls, of a raised check or stop, H, arranged over the rolls adjacent to the point of separation between the husking-rolls and the snapping-rolls and in position to insure the snapping off of ears from stalks of unusual height, substantially as described.

20. The combination, substantially as herein set forth, with a pair of parallel rotary snapping-rolls, of an endless conveyer chain or belt provided with fingers arranged to traverse a path adjacent to the line of separation between the rolls, so as to engage and carry back the snapped-off ears, and an endless chain or belt, G, provided with stalk gathering and conveying fingers which traverse a plane parallel with and above the plane traversed by the fingers of the conveyer L, for the purpose described.

21. The combination, substantially as herein set forth, with a pair of snapping-rolls, of an endless chain or belt, G, on one side, provided with stalk-gathering fingers which traverse a path in advance of and back over the snapping-rolls, a short oppositely-arranged endless chain or belt, G', provided with gathering-fingers which co-operate with such of the gathering-fingers of the chain G as are in advance of the snapping-rolls, and an endless conveyer, L, which is arranged on the same side of but in rear of the belt or chain G', and provided with gathering-fingers to take the snapped-off ears and convey the same up along the snapping-rolls, said conveyer L being arranged so that at the point where the stalk-gathering fingers of the endless belt or chain G' leave the stalks the fingers of said conveyer L shall engage the stalks and prevent the fingers of said chain or belt G' from drawing the stalks away from the fingers of the opposite chain or belt, G, substantially as described.

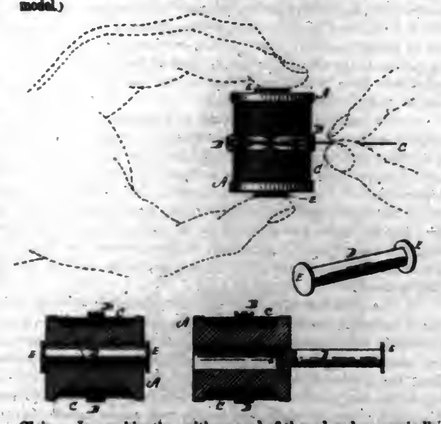


22. In a corn-harvester, the combination, with a wheel-supported main body-frame, of a frame or support carrying devices for harvesting the corn and adjustably held upon an inclined support with which the main body-frame is provided, whereby the height of such corn-harvesting devices may be varied without change of angle relatively to the ground.

23. In a corn harvester and husker, the combination, with the main body-frame, of a frame carrying husking-rolls and adjustably held upon an inclined support with which said main body-frame is provided, whereby the height of the husking-rolls can be varied without change of angle relatively to the ground, substantially as set forth.

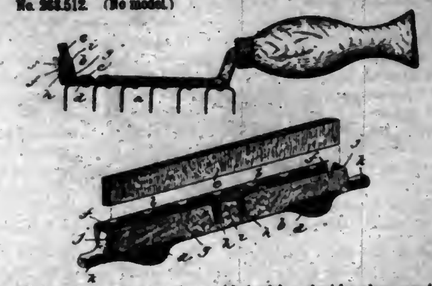
24. In a corn harvesting and husking machine, the husk-gathering receptacle R, combined with and arranged below the husking rolls and having its bottom formed with a longitudinally-extending raised middle portion providing along the under side of such receptacle a passage for the upper ends of the standing stalks, substantially as set forth.

25. The husk-gathering receptacle R, combined with and arranged below the husking-rolls and having its bottom formed with a longitudinally-extending raised middle portion, combined with the tilting husk-deflector 29, for deflecting the husks into either of the receptacle-spaces between the raised bottom portion and the sides, substantially as set forth.



397,999. THREAD-HOLDER FOR SPOOLS. SAMUEL B. PRATT and CLARA B. PRATT, Boston, Mass. Filed Oct. 12, 1888. Serial No. 287,881. (No model.)

Claim.—1. The strip A, provided with the perforation *a*, hook *c*, narrow hooked end A', and perforation *b*, in combination with an elastic connection secured to said strip by means of said hooks *c* and A', substantially as and for the purpose described.



2. The strip A, provided with the perforation *a*, hook *c*, narrow hooked end A', lips A'', and perforation *b*, in combination with a double-looped elastic connection, D, secured to said strip by means of said hooks *c* and A', substantially as and for the purpose set forth.

398,000. SPINDLE FOR SPOOLS OF THREAD. SAMUEL B. PRATT, Boston, Mass. Filed Nov. 17, 1888. Serial No. 291,175. (No model.)

Claim.—In combination with a spool of thread and an unwinding attachment, the spindle D, placed in the spool-hole and extending through the same, and the end pieces, E E, larger in diameter than said spool-hole, rigidly secured to the ends of the spindle, substantially of disk shape, whereby they are adapted to be held between the thumb and finger of one hand, as shown, and one of said disk-shaped end pieces being flexible, whereby it will fold upon itself sufficiently to be drawn through the spool-hole, all constructed substantially as and for the purpose set forth.

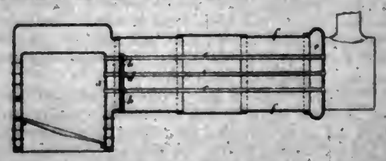
398,001. CURRY-COMB. WILLIAM RAINWHELER, Akron, Ohio, assignor to Nathan H. Bennett, same place. Filed Mar. 26, 1888. Serial No. 268,512. (No model.)

Claim.—1. A curry-comb provided with a shedder-clasp consisting of a single piece of metal, having knockers and pliable jaws cast integral therewith, substantially as described.

2. In a curry-comb, a shedder-clasp composed of a single piece of metal provided with securing-flanges, knockers, and pliable jaws cast integral therewith, substantially as described.

3. The combination, in a curry-comb, of a shedder-clasp consisting of a single piece of cast metal provided with clamping-jaws, knockers at the opposite ends of said clasp, flanges provided with holes for securing it to the body portion of the comb, and an elastic shedder held between said jaws, in the manner and for the purpose described.

398,002. BOBBIN. JOHN SCOTT, Willimantic, assignor to the Willimantic Linen Company, Hartford, Conn. Filed July 13, 1888. Serial No. 279,908. (No model.)



Brief.—The object of the invention is to produce a paper bobbin simple and cheap in construction, and strong enough for use in the mill and for transportation with the thread on it.

Claim.—1. A spool or bobbin consisting of a central tube of paper, a conical base of like material secured to the center, and the disk-shaped crosswise-brace that extends across the lower part of the base and is secured to the tube and the base, all substantially as described.

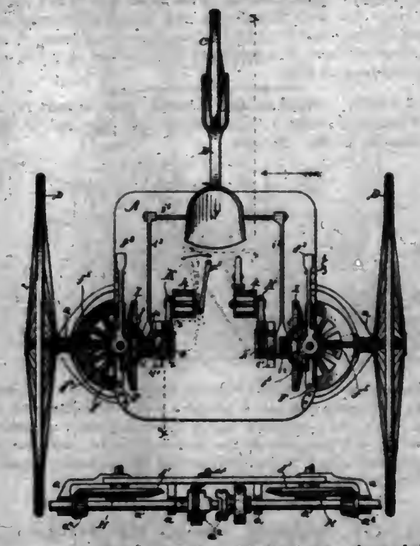
2. As an improved article of manufacture, a paper cone-bobbin made up of a central tube of paper, a paper cone into which the said tube extends to a plane near the bottom of the base, and the disk-shaped braces extending transversely of and within the base and secured to the base and to the tube, all substantially as described.

398,003. TUBULAR BOILER. JEAN P. SERVE, Givors, France. Filed Dec. 4, 1888. Serial No. 292,610. (No model.)

Claim.—1. In a multitubular boiler, the combination, with the fire-box tube-plate and the boiler-tubes, of a rigid abutment plate or plates, *b*, pierced with holes for the passage of the tubes, and of a series of ferrules or projections, *d*, fixed to the said tubes and each adapted to abut against the inner face of the said abutment plate or plates, whereby the strain of the longitudinal expansion of the tubes on the fire-box tube-plate is transferred to the rigid abutment plate or plates, substantially as described.

2. In a multitubular boiler, a series of boiler-tubes furnished with rings or projections abutting against a fixed abutment plate or plates, *b*, at the fire-box end of the boiler, in combination with a smoke-box tube plate of a different diameter from that of the body of the boiler and fixed to the said body by curved or arched flanges arranged around its inner or outer circumference and capable of permitting a certain amount of elasticity in the said tube-plate, substantially as described.

3. In a multitubular boiler, the combination, with the fixed abutment plate or plates *b* and the tubes *c*, having projections abutting against the same at the fire-box end, of a boiler-shell provided at the smoke-box end with a slightly-elastic circumferential collar united with the smoke-box tube-plate, substantially as set forth.



398,004. METALLIC RAILROAD-TIE. ROBERT U. SMITH, Chatham, N. Y., assignor of one-half to Alonzo I. Wilcox, same place. Filed Dec. 9, 1887. Renewed Aug. 22, 1888. Serial No. 283,512. (No model.)

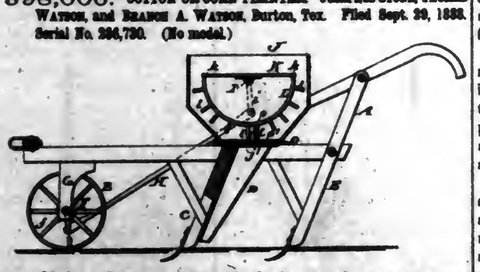
Claim.—1. A metallic tie provided with a projection over which an expansion-bar rests, the said bar having two lips and two horizontal extensions leading therefrom which rest in boxes in the outer ends of the tie, within which legs are fastened against the rails, as and for the purpose described.

2. A metallic tie provided with a projection over which an expansion-bar rests, the said bar having lips and horizontal extensions leading therefrom and resting in boxes in the ends of the tie, and legs having their rear edges beveled, which fit corresponding bevels in the said box, as and for the purpose described.

398,005. TRICYCLE. WILLIAM R. SMITH, near May, Ark. Filed Nov. 1, 1888. Serial No. 289,777. (No model.)

Claim.—1. The combination, with the frame, axles, and drive-wheels of a tricycle, substantially as shown, of the beveled cog-pinion a^4, rigidly secured to the driving-axles a', gearing-frame G, secured to the frame A, shafts F, their upper ends working in sockets in said gearing-frame, and their lower ends working in bars H under said frames, drive-wheels f', rigidly secured on the lower ends of said shafts, meshing with said pinions, ratchet-wheels f^2, rigidly secured on the upper ends of said shafts, and hand-levers and pawls f^3, operating said ratchet-wheel and driving said gearing, substantially as shown and described.

2. The combination, with the frame, axles, and drive-wheels of a tricycle, substantially as shown, of the beveled cog-pinions a^4, rigidly secured to the driving-axles, gearing-frames G, secured to the frame A, shafts F, their upper ends working in sockets in said gearing frames and their lower ends in bars H, secured to the under side of said frame, drive-wheels f', rigidly secured on the lower ends of said shafts, meshing with said pinions, ratchet-wheels f^2, rigidly secured on the upper ends of said shafts, hand levers and pawls f^3, operating said ratchet-wheel, pinion f, rigidly secured on said shaft, drive-wheel I, journaled in the gear-frame G and meshing with said pinion f, axle i, rigidly secured in the neck of said drive-wheels I and journaled in the boxing in the posts i', ratchet-wheels i^2, secured on said shaft, sent levers and pawls i^3, operating said ratchet-wheels and having



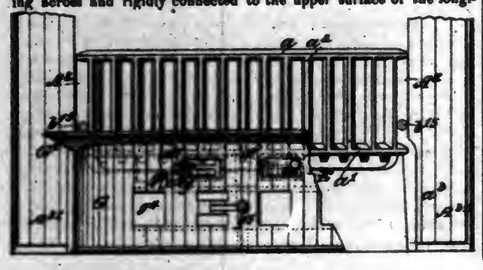
secured on their cross-rod i^4 a seat, J, and spring j, its lower half secured to the frame A and its upper half to the lower part of the said seat, substantially as shown and described.

3. The combination, with the frame, axles, and drive-wheels of a tricycle, substantially as shown, of the beveled cog-pinions a^4, rigidly secured to the driving-axles, gearing-frames G, secured to the frame A, shafts F, their upper ends working in sockets in said gearing-frames and their lower ends in bars H, secured to the under side of said frame, drive-wheels f', rigidly secured on the lower ends of said shafts, meshing with said pinions, ratchet-wheels f^3, rigidly secured on the upper ends of said shafts, hand levers and pawls f^5, operating said ratchet-wheel, pinion f, rigidly secured on said shaft, drive-wheel I, journaled in the gear-frame G and meshing with said pinion f, axle i, rigidly secured in the neck of said drive-wheels I and journaled in the boxing in the posts i', ratchet-wheels i^3, secured on said shaft, seat levers and pawls i^5, operating said ratchet-wheels and having secured on their cross-rod i^4 a seat, J, and spring j, its lower half secured to the frame A and its upper half to the lower part of the said seat, ratchet-wheel k', rigidly secured to the inner ends of said axle i', foot levers and pawls K, bearing the pedals k, and springs k^3, set in proper openings in the post i', one end secured to said posts and the other to said foot-levers, substantially as shown and described, and for the purposes set forth.

4. The combination, with the frame, axles, and drive-wheels of a tricycle, substantially as shown, of the beveled cog-pinions a^4, rigidly secured to the driving-axles a', gearing-frames G, secured to said frame A, braces f^2, their lower ends secured to the bearings a, and their upper ends receiving shafts F and bracing the same, shafts F, their upper ends working in said braces f^2 and in sockets in said frames, and their lower ends working in bars H, drive-wheels f', rigidly secured on the lower ends of said shafts, meshing the said pinions, ratchet-wheels f^3, rigidly secured on the upper ends of said shafts, hand levers and pawls f^5, operating said ratchet and driving said gearing, circular brace f^6, secured to gear-frame G and brace f^2, and supporting said lever f^5, substantially as shown and described, and for the purposes set forth.

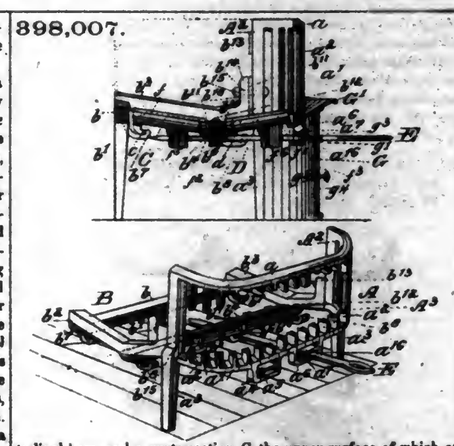
398,006. COTTON OR CORN PLANTER.

JOSEPHUS STONE, THOMAS WATSON, and BRANCH A. WATSON, Burton, Tex. Filed Sept. 29, 1888. Serial No. 286,730. (No model.)



Claim.—In combination with the hopper of a corn or cotton planter, a vibrating sector, K L, provided with two median pins, l l, on the part L, and a seed-slide having the vertical stud o projecting up between said pins, whereby the seed-slide will be intermittently and alternately struck by the two pins and reciprocated in opposite directions, as set forth.

398,007. FIRE-GRATE.



EPHRAIM J. STORY, Washington, D. C. Filed Aug. 6, 1888. Serial No. 173,099. (No model.)

Claim.—1. The combination, in a grate, of a rear longitudinal supporting-bar, a longitudinal supporting-bar opposite to and parallel with the rear longitudinal supporting-bar, transverse end bars which overlap such longitudinal supporting-bars and are rigidly connected thereto, and a grate-section which at its ends is overlapped by the transverse end bars.

2. The combination of the rear longitudinal supporting-bar, b, the central longitudinal supporting-bar, b^4, the end bars, b^3 and b^5, extending across and rigidly connected to the upper surface of the longi-

398,007.

tudinal bars, and a grate-section, C, the upper surface of which at its ends is overhung by the end bars, substantially as and for the purposes set forth.

3. A grate-frame which consists of a front longitudinal bar, a rear longitudinal bar, an intermediate longitudinal bar, and end bars which extend across each rear and intermediate longitudinal bars, in combination with grate-sections which are supported by bottom projections upon the rear and intermediate longitudinal bars and by rear projections upon the front and intermediate longitudinal bars, whereby when the grate-sections are reciprocated coals, clinkers, and ashes are cleared from the sections at their ends.

4. The combination of the grate-frame embracing bar a', having a support, f^2, bar b, having support b^1, bar b^4, having supports b^2 and b^6, and end bars, b^3 and b^5, with the grate-sections C and D, provided, respectively, with the bottom hooks, c and d, for the purposes specified.

5. A rear longitudinal supporting-bar, transverse end bars which rest upon and are rigidly connected to the rear longitudinal supporting-bar, a longitudinal supporting-bar which at each end is connected to the under surface of the transverse end bars, hooks or sockets which project from the under surface of the longitudinal supporting-bars, and a grate-section having engaging-hooks, in combination, substantially as described.

6. A fire-place grate the frame of which embraces a longitudinal supporting-bar, b, transverse end bars, b^3 and b^5, which rest upon and are rigidly connected to the longitudinal supporting-bar, a longitudinal supporting-bar, b^4, which at each end is connected to the under surface of the transverse end bars, b^3 and b^5, and downwardly and upwardly turned hooks or sockets b^7 b^7, which project from the under surface of the longitudinal supporting-bars b and b^4, as and for the purposes set forth.

7. A front grate-section which consists of end vertical standards the lower portions of which are curved outwardly, as described, an upper curved horizontal connecting-bar, and a series of vertical bars which extend from the upper horizontal connecting-bar to the lower horizontal connecting-bar, in combination with a rear grate-frame which embraces two lower longitudinal supporting-bars and two upper transverse bars, the rear longitudinal supporting-bar having a single bottom support placed at about its mid-length, as described.

8. The front grate frame or section, A, which consists of the standards A^2, curved outwardly, as shown, the upper connecting-bar, a, the lower connecting-bar, a', and the series of vertical bars a^3, in combination with the rear grate-frame, B, which embraces the two longitudinal supporting-bars b and b^4, the transverse superposed bars b^3 and b^5, and the single bottom support, b', upon the longitudinal supporting-bar b, substantially as set forth.

9. The combination of a front grate-frame and grate-section embracing a vertical basket portion and vertical outwardly-bent end standards, and a rear horizontal grate-frame, the front vertical grate-frame and grate-section and the rear horizontal grate-frame being secured together, substantially as described.

10. The combination, with the rear horizontal grate-frame and grate-section, of the front vertical grate-frame or basket-section provided with the left and right operating-loops, a^4 and a^6, substantially as and for the purposes set forth.

11. A fire-place grate which embraces a rear horizontal grate frame and grate-section and a front vertical grate-frame or basket-section which is provided with the right operating-loop, a^6, and with left operating-loop, a^4, whereby the grate-section upon such rear horizontal grate-frame may be dumped, as described.

12. In a fire-place grate, a front vertical grate-frame or basket-section, A, which is provided with left and right operating-loops, a^4 and a^6, as and for the purposes described.

13. The combination of the front section, A, having vertical portions a^3, longitudinal portions a and a', and operating-loops a^4 and a^6, with the rear section, B, having grate-supporting hooks and connected to the front section, substantially as described.

14. The front section, A, having vertical bars a^3, longitudinal bars a and a', and loops a^4 and a^6, in combination with the rear frame, B, and with the rear and front grate-sections, C and D, substantially as and for the purposes specified.

15. A fire-place grate which embraces a front section, A, which has vertical portions a^3, longitudinal portions a and a', and operating-loops a^4 and a^6, a rear grate-supporting frame, B, and rear and front grate-sections, C and D, which are provided with engaging-lugs.

16. The combination, with the front frame and section, A, having the loops a^4 and a^6, of the pivoted locking-stops a^8 and a^7, whereby the limit of movement of the operating-lever may be either enlarged or restricted at the will of the operator, substantially as and for the purposes specified.

17. The combination, with the front section, A, of the grate-frame, of the outwardly-bent supports or standards A^2, located at the extremities of the grate, as described, and curved beyond the planes of such extremities, whereby space is afforded in a self-supporting grate for the insertion and removal of an ash-pan which has greater width than the grate.

18. The front A, having connecting-bar a', provided with loops a^4 a^6, the casing G, having openings g and g', and the grate having bottom lugs, in combination, as set forth.

19. The combination, with a fire-place grate, of a detachable air casing, G, provided with an ash receiving and discharging chute, G' and resting upon the hearth or floor, substantially as shown and set forth.

20. The combination, with a fire-place grate, of a detachable air-casing, G, having at the top a chute, G', for receiving and discharging ashes, and having also a series of registered openings, g^3, for the admission of draft-air.

21. The combination, with a fire-place grate, of the detachable air-casing or dust screen G, provided with ash-chute G', operating-openings g and g', and registered draft-openings g^4, substantially as and for the purposes specified.

22. The combination, with the front section, A, having connecting-bar a' and loops a^4 and a^6, of the dust-screen or air-casing G, having operating-openings g and g', provided with closing-plates g^6 and g^5 and corresponding with the loops a^4 and a^6, substantially as set forth.

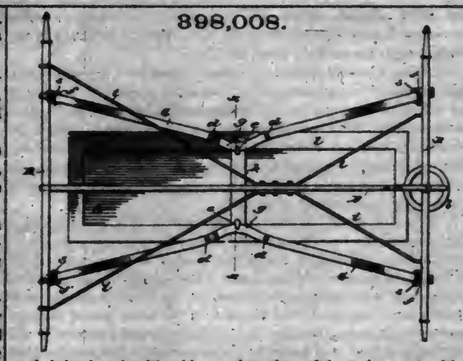
23. The combination, with the grate consisting of the self-supporting frame-sections and the front and rear grate-sections, of the detachable air-casing G, having openings g, g', and g^4, and closing-plates g^6, g^5, and g^3, substantially as and for the purposes specified.

24. The combination, in a fire-place grate, of a front vertical grate-frame and a rear horizontal grate-frame, which is fitted to the front grate-frame, an arm or knee upon one of the grate-frames extending along the other grate-frame, and a securing-bolt extending through one of the grate-frames and through the arm or knee upon the other grate-frame.

25. The combination of the front grate-frame and basket-section, A, the rear grate-frame, B, having upwardly-extending arm or knee b^{10}, and the securing-bolt b^{11}

26. The combination, with the grate, of the grate-frame having the outward bend in the plane of the grate and the inward projection extending over the ends of the grate, substantially as shown and described, and for the purposes set forth.

27. The combination, with the grate, of the rear grate-frame having end bars, b^3, overhanging the rear grate-section and a portion of the front grate-section, and the front grate-frame having projection A^2, overhanging a portion of the front grate-section, substantially as and for the purposes specified.

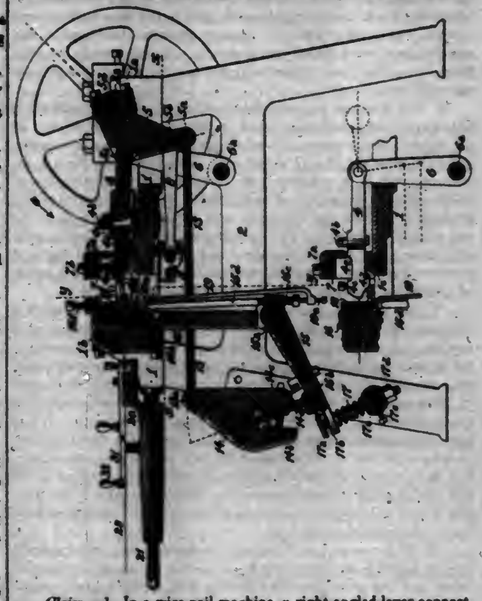


28. The front grate-frame having the outward bend and the inward projection, in combination with the rear grate-frame having overhanging end bars in continuation of the inward projection upon the front grate-frame, the rear grate-section supported upon the rear grate-frame, and the front grate-section supported in part upon the rear and in part upon the front grate-frame.

398,008. SIDE SPRING FOR VEHICLES.

JAMES F. THOMAS, Alexandria, Ky. Filed Nov. 3, 1888. Serial No. 289,916. (No model.)

Claim.—The combination, with the vehicle-body and its front and rear axles, of the side springs, G G, bowed laterally inward and constructed with an inwardly-curving central portion, g, thence diverging in straight lines outward and clipped to the head-block and rear axle, the bolts d d, and the central hook-shaped bolts, e e, arranged upon the exterior of the apex sides of the curved portions g g and engaging



398,008.

at their hook ends with said curved portions of the springs and uniting them with the frame-work of the body of the vehicle, substantially as and for the purposes specified.

398,009. NAIL-MACHINE.

JOSEPH W. THOMPSON, Salem, Ohio, assignor of one-half to the Buckeye Engine Company, same place. Filed Sept. 3, 1888. Serial No. 284,933. (No model.)

Claim.—1. In a wire-nail machine, a right-angled-lever connecting-block having a bearing for a heading-ram connecting-rod at the junction of its arms, and having bearings for a crank-pin and for a gripping-lever connecting-rod, respectively, at the opposite ends of its arms, substantially as set forth.

2. In a wire-nail machine, the combination of a driving-shaft, a gripping-die, a pair of cutting-levers, each carrying a cutting and pointing knife, a heading-ram, a right-angled-lever connecting-block having one of its arms coupled to a crank-pin on the driving-shaft and to the heading-ram, and suitable known mechanical connections coupling the gripping-die and cutting-levers to the other arm of the connecting-block, substantially as set forth.

3. In a wire-nail machine, the combination of a driving-shaft, a gripping-die, a heading-ram, a right-angled-lever connecting-block having one of its arms coupled to a crank-pin on the driving-shaft and to the heading-ram, suitable known mechanical connections coupling the gripping-die to the other arm of the connecting-block, and a pair of cutting-levers, each carrying a cutting and pointing knife and actuated by suitable known mechanical connections to which movement is imparted by the driving-shaft, substantially as set forth.

4. In a wire-nail machine, the combination of a driving-shaft, a pair of cutting-levers, each carrying a cutting and pointing knife, a right-angled-lever connecting-block having one of its arms coupled to a crank-pin on the driving-shaft and to the heading-ram, suitable known mechanical connections coupling the cutting-levers to the other

arm of the connecting-block, and a gripping-die actuated by suitable known mechanical connections to which movement is imparted by the driving-shaft, substantially as set forth.

5. In a wire-nail machine, the combination of a driving-shaft, a right-angled-lever connecting-block having its upper arm coupled at one end to a crank-pin on the driving-shaft, a heading-ram coupled to the opposite end of said upper arm, a guide adapted to control the direction of traverse of said upper arm, and a suitable known mechanical connection coupled to the lower arm of the connecting-block and transmitting power therefrom to a pressure-exerting member of the machine, substantially as set forth.

6. In a wire-nail machine, the combination of a driving-shaft, a right-angled-lever connecting-block having its upper arm coupled at one end to a crank-pin on the driving-shaft, a heading-ram coupled to the opposite end of said upper arm, a fixed gripping-die, a movable gripping-die, a gripping-lever coupled to the movable die, an intermediate lever coupled to and vibrated by the lower arm of the connecting-block, and a vibrating lever coupled to and actuated by the intermediate lever and adapted to intermittently transmit pressure therefrom to the gripping-lever, substantially as set forth.

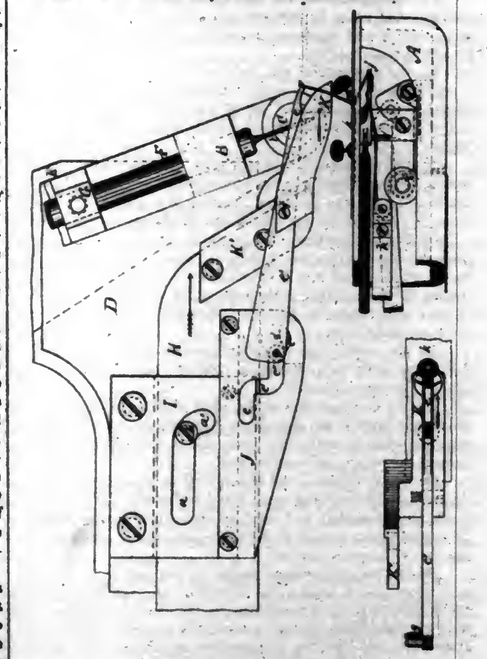
7. In a wire-nail machine, the combination of a driving-shaft, a right-angled-lever connecting-block having its upper arm coupled at one end to a crank-pin on the driving-shaft, a heading-ram coupled to the opposite end of said upper arm, a fixed gripping-die, a movable gripping-die, a gripping-lever coupled to the movable die, an intermediate lever coupled to and vibrated by the lower arm of the connecting-block, a vibrating lever coupled to the intermediate lever and adapted to intermittently transmit pressure therefrom to the gripping-lever, and a spring acting upon the gripping-lever in opposite direction to the pressure imparted thereto by the vibrating lever, substantially as set forth.

8. In a wire-nail machine, the combination of a driving-shaft, a right-angled-lever connecting-block having its upper arm coupled at one end to a crank-pin on the driving-shaft, a heading-ram coupled to the opposite end of said upper arm, a fixed gripping-die, a movable gripping-die, a gripping-lever coupled to the movable die, an intermediate lever coupled to and vibrated by the lower arm of the connecting-block, a vibrating lever coupled to the intermediate lever and adapted to intermittently transmit pressure therefrom to the gripping-lever, and a cam or eccentric device for increasing the degree of pressure applied to the gripping-lever during a portion of each period of application of pressure thereto, substantially as set forth.

9. In a wire-nail machine, the combination of a driving-shaft, a right-angled-lever connecting-block having its upper arm coupled at one end to a crank-pin on the driving-shaft, a heading-ram coupled to the opposite end of said upper arm, a fixed gripping-die, a movable gripping-die, a double-armed gripping-lever having one of its arms coupled to the movable die, an intermediate lever coupled to and vibrated by the lower arm of the connecting-block and provided with a pair of oppositely-inclined lower jaws or bearing-faces, and a vibrating lever or tongue pivoted to the intermediate lever between its jaws in position to be alternately pressed against and moved off a bearing on the arm of the gripping-lever opposite that which is coupled to the movable die in and by the movements of the jaws of the intermediate lever, substantially as set forth.

10. In a wire-nail machine, the combination of a driving-shaft, a right-angled-lever connecting-block having its upper arm coupled at one end to a crank-pin on the driving-shaft, a heading-ram coupled to the opposite end of said upper arm, a fixed gripping-die, a movable gripping-die, a double-armed gripping-lever having one of its arms coupled to the movable die, an intermediate lever coupled to and vibrated by the lower arm of the connecting-block and provided with a pair of oppositely-inclined lower jaws or bearing-faces, and a vibrating lever or tongue pivoted to the intermediate lever between the jaws and eccentrically to the pivotal axis thereof in position to be alternately pressed against and moved off a bearing on the arm of the gripping-lever opposite that which is coupled to the movable die in and by the movements of the jaws of the intermediate lever, substantially as set forth.

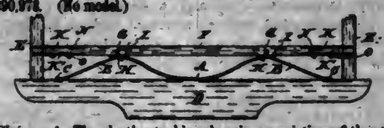
11. In a wire-nail machine, the combination of a driving-shaft, a right-angled-lever connecting-block having its upper arm coupled at one end to a crank-pin on the driving-shaft, a heading-ram coupled to the opposite end of said upper arm, a fixed gripping-die, a movable gripping-die, a double-armed gripping-lever having one of its arms coupled to the movable die, a friction-roller mounted in the opposite arm of the gripping-lever, an intermediate lever coupled to and vibrated by the lower arm of the connecting-block and provided with a pair of oppositely-inclined lower jaws or bearing-faces, a vibrating lever or tongue pivoted to the intermediate lever between its jaws in position to be alternately pressed against the friction-roller of the gripping-lever in line with the pivot of said roller and relieved from pressure thereon in and by the movements of the jaws of the intermediate lever, a fixed stud passing freely through the arm of the gripping-lever which carries the friction-roller and having a stop to limit the movement of said lever, and a spring bearing against said arm in opposite direction to the vibrating lever or tongue, substantially as set forth.



12. In a wire-nail machine, the combination of a driving-shaft, a heading-ram coupled to a crank-pin thereon and provided with a lower sole or projection, a heading-punch fixed in the ram, and a fixed lower bearing over which the sole of the ram is adapted to traverse during a portion of each of its reciprocating movements, the face of said bearing being located in a plane above that in which the face of the sole traverses during the remaining portion of the movements of the ram, substantially as set forth.

13. In a wire-nail machine, the combination of a driving-shaft, a heading-ram coupled to a crank-pin thereon and provided with projections on its upper and lower sides, a heading-punch fixed in the ram, a fixed lower bearing over which the lower projection of the ram is adapted to traverse during a portion of each of its reciprocating movements and below which it is free to traverse during the remainder of said movements, and an upper guide fixed to the frame of the machine in position to abut against the upper projection of the ram near the terminal of the working stroke of the ram, substantially as set forth.

14. In a wire-nail machine, the combination of a driving-shaft, a rock-shaft having an arm coupled to a crank-pin on the driving-shaft, a cutting-lever pivoted to the frame of the machine and carrying a cutting-knife adjacent to its free end, and a removable link coupling the cutting-lever to an arm on the rock-shaft, said link having cylindrical ends fitting freely in segmental recesses in the cutting-lever and arm, respectively, substantially as set forth.

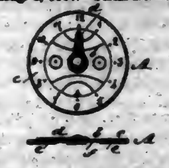


15. In a wire-nail machine, the combination of a driving-shaft, a feed-carriage fitted to reciprocate on guides fixed to the frame of the machine, a feed-dog and a releasing-lever journaled on independent pivots on the feed-carriage, and a spring bearing at its ends against the feed-dog and releasing-lever, respectively, substantially as set forth.

398,010. LOOP REMOVING AND SPREADING MECHANISM FOR BUTTON-SEWING MACHINES. ROSEWELL THOMPSON, Bridgeport, Conn. Filed Apr. 13, 1888. Serial No. 270,555. (No model.)

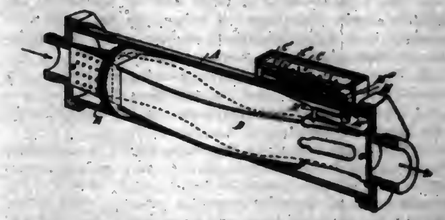
Claim.—In a button-sewing machine, and in combination with its double-barbed needle and complementary stitch-forming mechanism, the loop-spreading device K, consisting of two substantially-parallel plates united at one end to form a point and having an opening at that end to receive the button, the loop-removing device *e*, pivoted between the plates of the loop-spreading device, and also consisting of two plates united at one end to form a point, the space between said plates being wide enough to receive the needle, and suitable mechanical means for operating these devices, all substantially as set forth.

398,011. VEHICLE-SPRING. ELLIS M. VAN VALKENBURG and FRANK L. WOOD, Union Grove, Wis. Filed Nov. 16, 1888. Serial No. 290,978. (No model.)



Claim.—1. The elastic steel band-spring consisting of the straight flat part A, secured movably at its ends to a false bolster which rests thereon throughout the entire length of the flat part of the spring in its normal condition, and the downwardly-bent or thereto-inclined ends B B, resting at their free extremities movably on a bolster, the ends B B being each about one-half the length of the straight part A, substantially as described.

2. The flexible band-spring consisting of a straight part, A, and thereto-inclined ends B B, in combination with a false bolster, F, and clevises G G, pivoted in the false bolster and located and retaining the spring at or near the extremities of the straight part A, substantially as described.



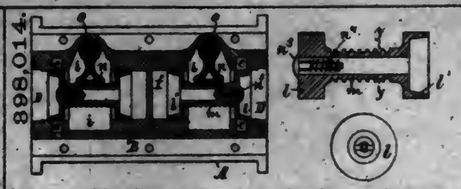
3. A flexible band-spring having a straight part, A, provided with recesses H H, and the thereto-inclined ends B B, in combination with the false bolster F, the clevises G G, and the bolster D, substantially as described.

398,012. INDICATOR FOR BOTTLES. HENRY R. WEAVER, Burlington, N. J. Filed Aug. 6, 1887. Serial No. 246,260. (No model.)

Claim.—A dial or label for a bottle, consisting of a body portion with dial thereon, and an index or pointer rotatably connected therewith, and a gasket or annulus secured to the outer back portion of said body and having an adhesive substance on its face, the said gasket being of sufficient thickness to permit the rotation of the index-fastener therewith, said parts being combined substantially as described.

398,013. LIQUID OR GAS METER. LOUIS G. WELKE, Toledo, Ohio. Filed May 3, 1888. Serial No. 272,968. (No model.)

Claim.—1. In a fluid-meter, a casing, a shell inclosed within the same, and a spring immovably secured to the shell at each end, secured in the path of the passing fluid, and adapted to measure the same in compartments formed by the undulatory movement of the spring, as and for the purpose set forth.



2. In a fluid-meter, a shell having a spring of greater length immovably secured at each end thereof, in combination with a casing inclosing the shell, as and for the purpose set forth.

3. In a fluid-meter, a spring connected with a fluid-receptacle, undulations formed therein by the rigid attachment of each end of the spring, and a lever connected with the spring and indicator mechanism, as and for the purpose set forth.

4. In a fluid-meter, an outer casing having egress and ingress ports for liquid, a shell within the casing provided with openings for admission of fluid, and a spring immovably attached at each end to the shell and impinging upon opposite sides of the shell, in combination with an indicator mechanism connected with the spring, as and for the purpose set forth.

398,014. TRIP-VALVE GEARING. WILBUR M. WHITLOCK, Newark, N. J. Filed Oct. 11, 1883. Serial No. 267,942. (No model.)

Claim.—1. A cylindrical valve having one end applied to an annular cylinder induction-port and the other end fitted to a compression-chamber provided with a steam-inlet in its side to introduce the steam under pressure, and the induction-port and the steam-inlet being arranged in relation to the valve so that the steam-inlet is closed as the induction-port is opened, as and for the purpose set forth.

2. A cylindrical valve having one end applied to an annular cylinder induction-port, an opposite end of smaller diameter fitted to a compression-chamber provided with a steam-inlet in its side, a rock-shaft for shifting the valve to open the induction-port and compress the steam in the compression-chamber, and cut-off mechanism to release such rock-shaft at a suitable point, substantially as herein set forth.

3. A cylindrical valve having one end applied to an annular cylinder induction-port and the other end fitted to a compression-chamber provided with a steam-inlet in its side to introduce the steam under pressure, and the induction-port and the steam-inlet being arranged in relation to the valve so that the steam-inlet is closed as the induction-port is opened, and an outlet-valve from the compression-chamber to limit the pressure therein, as and for the purpose set forth.

4. A cylindrical valve having one end applied to an annular cylinder induction-port and the other end fitted to a compression-chamber provided with a steam-inlet in its side to introduce the steam under pressure, and the induction-port and the steam-inlet being arranged in relation to the valve so that the steam-inlet is closed as the induction-port is opened, a passage leading from the compression-chamber through the piston-valve, and a relief-valve seated upon the outer side of such passage, as and for the purpose set forth.

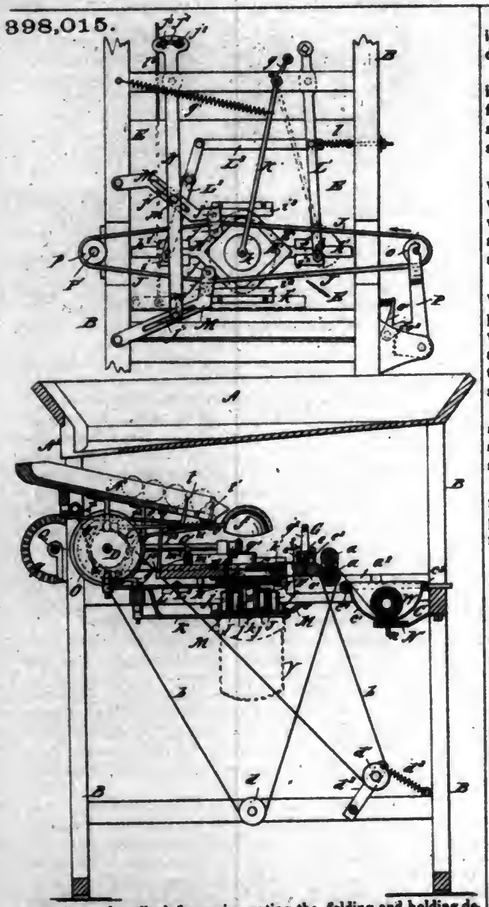
5. The combination, with a steam-cylinder valve-chest, of two cylindrical compression-chambers in the middle of the chest with steam-inlets in their sides, two cylindrical valve-seats with annular induction-ports near the ends of the chest, a steam-supply to such valve-seats and steam-inlets, an exhaust-passage intermediate to each of the said compression-chambers and valve-seats, and two valves provided at their opposite ends with pistons fitted, respectively, to such chambers and valve-seats, the whole arranged and operated substantially as herein set forth.

6. The combination, with a steam-cylinder valve-chest, of two cylindrical compression-chambers in the middle of the chest, with steam-inlets in their sides, two cylindrical valve-seats with annular induction-ports near the ends of the chest, a steam-supply to such valve-seats and steam-inlets, an exhaust-passage intermediate to each of the said compression-chambers and valve-seats, two valves provided each with pistons at their opposite ends, and with an intermediate shank having a rack formed thereon, and rock-shafts provided with segments to reciprocate such valves, and cut-off mechanism for actuating such rock-shafts, substantially as herein set forth.

7. In a steam-engine, the combination, with a port operating as an induction and eduction port, of a piston-valve fitted thereto and connected with a rock-shaft, an eccentric arm fitted loosely upon said shaft, a dog to engage the arm in one direction and a crank-arm attached to the shaft and provided with a latch to engage the arm in the opposite direction, and mechanism for tripping the latch, as and for the purpose set forth.

8. In a steam-engine, the combination, with a balanced piston-valve, of a steam dash-pot and a relief-valve discharging from the interior of such dash-pot into the steam-space of valve-chest, as and for the purpose set forth.

398,015. MACHINE FOR WRAPPING ORANGES, &c. HUMPHREY J. WILLIAMS, New York Mills, N. Y., assignor, by mesne assignments, of one-half to Grace C. Warner, Pasco, Fla. Filed May 13, 1884. Serial No. 131,494. (No model.)



Claim.—1. In a wrapping and twisting machine, a contracting and expanding folder and holder, in combination with a contracting and expanding twister for twisting and releasing the article wrapped.

2. In a wrapping and twisting machine, an automatically contracting and expanding folder and holder, in combination with an automatically contracting and expanding twister for twisting and releasing the article wrapped.

3. In a wrapping and twisting machine, the platform having an aperture, in combination with a contracting and expanding folder and holder and a contracting and expanding twister for twisting and releasing the article wrapped.

4. In an orange-wrapping machine, the folding and holding devices H H' and an orange revolver or twister, J, arranged below the folding and holding devices H H', in combination with means, sub-

398,015.

stantially as described, for reciprocating the folding and holding devices for gathering the paper over the orange and holding the folded portions of the paper, and means, substantially as described, for revolving the revolver or twister J while the wrapping-paper is so held for forming the twist to the paper, substantially as described.

5. The combination, in an orange-wrapping machine, of an apertured table for supporting the wrapping-paper, folding and holding devices H H' below the table, revolver or twister J, arranged below the folding and holding devices H H', and a support, *k*, below the revolver or twister J, substantially as and for the purpose set forth.

6. In an orange-wrapping machine, the combination, with the horizontally-placed twister J, of the support *k* and folding and holding devices H H', the twister J being placed between the said support and folding and holding devices and held upon pulleys connected with the main shaft by shaft and gears for revolving the twister J, substantially as described.

7. In an orange-wrapping machine, the twister J, being a horizontally-placed elastic belt, in combination with opening devices M, applied to the twisting-belt, and means, substantially as described, for operating the devices M to and from each other, the twister being placed upon the vertically-arranged pulleys *o p*, substantially as described.

8. The folding and holding forks H H', in combination with the cam L and intermediate levers and connections for reciprocating the forks simultaneously to and from each other, substantially as and for the purposes set forth.

9. The combination, with the twisting or traveling belt J, of the cam O, lever N, and arms M, connected to the lever N and to the opposite sides of the belt J, for opening and closing the belt, substantially as described.

10. The combination, with the devices H H', for folding and holding the wrapping-paper over the orange, and twisting-belt J, for revolving the orange, of the platform E, having aperture E' formed in it, through which the orange and wrapping-paper may be dropped, substantially as described.

11. The combination, with the paper-folding and orange-revolving mechanism, of the pivoted arm K, for receiving the oranges when dropped into the machine, substantially as described.

12. The combination, with the apertured platform E, paper-folding devices H H', and traveling belt J, for revolving the orange, of feed-rollers *a*, for feeding the wrapping-paper upon the platform E, and paper-cutter G, for cutting the paper into sheets, substantially as and for the purposes described.

13. In an orange-wrapping machine, the apertured table E, through which the orange is dropped, and feed-rollers *a a*, arranged parallel with the table for feeding the wrapping-paper thereon, in combination with the jointed cutter G, blade *c*, and slotted bar or cross-piece F, arranged between the feed-rollers and the table E, substantially as and for the purposes described.

14. In an orange-wrapping machine, the apertured table E, through which the orange is dropped, the feed-rollers *a a*, for feeding the wrapping-paper upon the table, and the jointed cutter G, in combination with the slotted bar or cross-piece F, arranged between the table E and rollers *a a*, the spring G', attached to the bar F, the circular cutting-blade *c*, and the rollers c^2, all arranged to operate substantially as and for the purposes set forth.

15. The combination, in an orange-wrapping machine, of the apertured platform E, rollers *a a*, pivoted cutter G, shaft R, crank a^3, spring *r*, pinion *r'*, and mutilated worm R', all arranged to operate substantially as and for the purposes described.

16. The combination, with the feed-rollers *a*, and apertured platform E, of the reciprocating bar *k'*, for folding down the wrapping-paper below the upper surface of the platform E, substantially as and for the purposes set forth.

17. The bar *k'*, placed in the slot f^3 of the apertured platform E, in combination with the spring k^3, rod k^2, arm k^1, and eccentric J', all arranged to operate substantially as and for the purposes set forth.

18. The belt J, for revolving the orange placed upon vertically-pivoted pulleys, in combination with the pivoted arm P, holding one pulley, and pawl *o'*, adjusted to engage with ratchet o^3, formed upon arm P, substantially as and for the purposes set forth.

19. The combination, with the feeding-rollers *a* and cutter G, of the apertured platform E, folding and holding forks H H', traveling belt J, and reciprocating lever and plate K *k*, all arranged to operate substantially as and for the purposes set forth.

20. The combination, with apertured platform E, devices H H', for folding and holding the wrapping-paper over the orange, and the device J, for revolving the orange, of the dropping-cups *f*, held above the platform E, for dropping the oranges one by one into the machine, substantially as described.

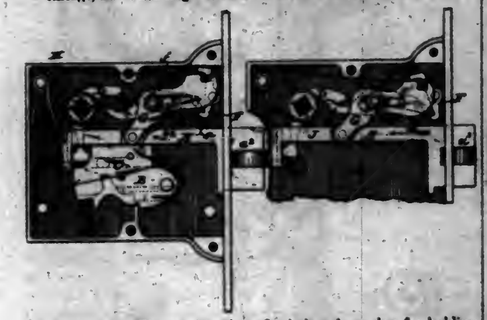
21. The dropping-cups *f*, arranged over the aperture E' and adapted to receive the oranges one by one from the trough A', in combination with means, substantially as described, for opening and closing the cups, as and for the purposes set forth.

22. The cups *f f*, secured upon the spring-actuated rods *v v*, in combination with the cam T and the projections *v' v'*, secured upon the rods *v* to run against the edges of the cam, substantially as and for the purposes set forth.

23. The trough A', to which the oranges are fed, in combination with the alternately-reciprocating rods t^3 t^3, provided with vertical fingers *t t'*, extending up through the trough one in advance of the other, and the cam T, the rods t^2 exteading across the upper surface of the cam and the rods t^2 being bent to rest against the under side of the cam, substantially as set forth.

24. The trough A', combined with the alternately-reciprocating fingers *t t'* and the opening and closing dropping-cups *f f*, arranged to operate substantially as and for the purposes set forth.

25. The cam T, formed with the toe *a*, and the rods t^3 t^3, having fingers *t t'* and arranged to bear upon the upper and lower edges of the cam T, in combination with the spring-actuated rods *v v*, having cups *f f* and pins *v' v'*, arranged to come against the cam T, whereby this cam operates both the fingers *t t'* and the cups *f f*, substantially as described.



26. The tray C, formed of the two separate parts *c' c²*, arranged adjustably upon the rod c^4 and frame c^3, substantially as and for the purposes set forth.

27. The parts *c' c²*, hinged upon the rod c^4 and formed with the pins *n n*, in combination with the plate N', formed with the diverging slots *n' n'*, which act as cams for opening and closing the parts *c' c²*, substantially as and for the purposes set forth.

28. The tray C, composed of the parts *c' c²* and frame c^3, hinged upon rod c^4, the parts *c' c²* being provided with the pins *n n*, in combination with the stationary plate N', having the diagonal slots *n' n'* formed in it, substantially as and for the purposes set forth.

29. The bars a^6 a^3, tied together by the cross-piece F and carrying the feed-rollers *a a*, and adapted to be moved to and from the platform E, in combination with the sectional tray C and plate N', the plate being formed with the diagonal slots *n' n'*, in which the pins *n n* move, substantially as and for the purposes set forth.

398,016. COMBINED LATCH AND LOCK. GEORGE WERRELL, Chicago, Ill. Filed Aug. 19, 1887. Serial No. 247,349. (Model.)

Claim.—1. The combination of a bolt, a lever-dog for holding the bolt in its outermost position of projection, a catch-piece for holding the lever-dog out of engagement with the bolt, and a trip-lever connected with the bolt and provided with a projection to engage the catch-piece, substantially as described.

2. The combination of a bolt, a lever-dog for holding the bolt in its outermost position of projection, a catch-piece for holding the lever-dog out of engagement with the bolt, a trip-lever connected with the bolt and provided with a projection to engage the catch-piece, and a follower for operating the bolt, said follower having a projection for engaging the lever-dog to lift it out of engagement with the bolt, substantially as described.

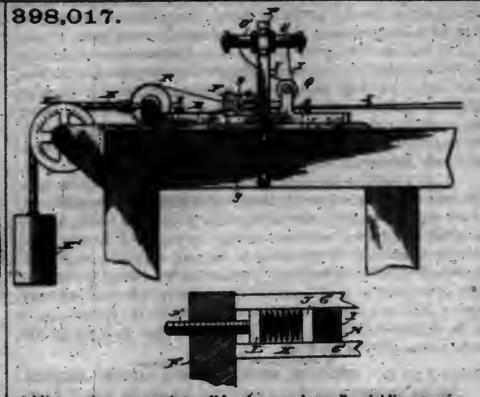
3. The combination of a bolt and a lever-dog for holding the bolt in its outermost position of projection, a catch-piece for holding the lever-dog out of engagement with the bolt, a trip-lever connected with the bolt and provided with a projection to engage the catch-piece, a follower for operating the bolt, said follower having a projection for engaging the lever-dog to lift it out of engagement with the bolt, and a tumbler and a tumbler-plate engaging said follower, substantially as described.

4. The combination of the bolt A, the sliding trip-lever G, having the slot *g'*, the pivot g^2, having an extension or projection working within the slot *g'* and against its projection g^2, the catch-piece F, having the lug f^3, the spring lever-dog E, and the projection *a* or its equivalent on the bolt A, substantially as and for the purpose described.

5. The combination of the bolt A, having the projection *a* thereon, the sliding trip-lever G and its spring *g* and slot, *g'*, a pivot, g^2, secured to the casing H, with its other end forming a projection within the said slot, the dog catch-piece F, having a spring, *f*, and lug f^3, the lever-dog E and its spring *e*, and means for reciprocating the bolt A, substantially as and for the purpose described.

6. The combination of the bolt A, having the anti-friction roller a^3, the projection *a*, and spring *a'*, the trip-lever G, pivoted to the bolt and provided with a slot, *g'*, enlarged at its rear end, the pivot g^2, and the lever-dog E, working thereon, the spring *e*, the extension of the pivot g^2 projecting within the slot *g'* of lever G, the catch-piece F, having a spring, *f*, and lug f^3, the cranked follower D, and means for operating said follower, substantially as and for the purpose described.

7. The combination of the spring-actuated bolt A, having a projection, *a*, thereon, a sliding lever, G, pivoted at its rear end to the bolt A, having a slot in its middle portion and notched or otherwise provided with a catch at its upper front end, a dog catch-piece, F, having a lug, f^3, at its upper end and a catch part at its lower end, a lever-dog, E, a cranked follower, D, and means for operating the same, substantially as and for the purpose described.



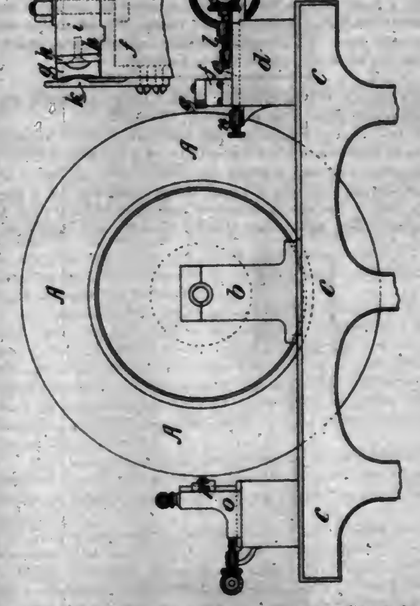
398,017. WARP-TENSION-REGULATING DEVICE FOR LOOMS. JOHN L. ALDRIDGE, Syracuse, N. Y., assignor to E. C. STEARNS & Co., same place. Filed Dec. 21, 1887. Serial No. 258,542. (No model.)

Claim.—1. The combination, with the casing open at the front and rear for the passage of the threads, of parallel plates mounted in said casing at right angles to its length, a spring pressing the plates together, a set-screw extending through the end of the casing, and a bearing block or plate between the inner end of said screw and the outer end of the spring, substantially as set forth.

2. The combination, with a casing having carriages or slides at its ends and ways therefor, of tension-plates within the casing at right angles to its length, and means for pressing the plates together, substantially as set forth.

3. The combination, with the loom-frame, of the longitudinally-

398,017.



yielding casing mounted to slide thereon, laterally-yielding tension-plates within said casing, a spring pressing said plates together, and a weight exerting rearward strain on said casing, substantially as set forth.

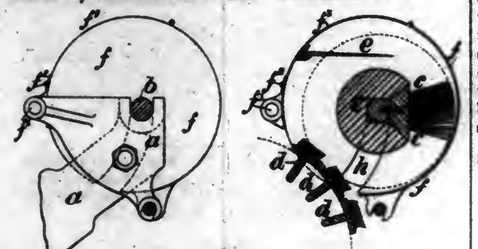
4. The combination, with the loom-frame, its spool or bobbin supports and guide-rollers, of the sliding casing mounted on the said frame parallel with the rollers, tension-plates in said casing, means for pressing the plates together, and a weight exerting rearward strain on said casing, substantially as set forth.

5. The combination, with the loom-frame, of the sliding casing mounted thereon and provided with laterally-yielding tension-plates, a spiral spring within the casing and pressing the plates together, a set-screw extending through the end of the casing and regulating the tension of the spring, and a weight exerting rearward strain on the said casing, substantially as set forth.

398,018. APPARATUS FOR TRUING BARS FOR CARDING-ENGINE FLATS. GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed Feb. 22, 1888. Serial No. 264,974. (No model.) Patented in England Apr. 20, 1886, No. 5,462.

Claim.—1. In an apparatus for acting upon carding-engine flat-bars to form or finish the curved surfaces which slide upon the flexible bends or curved guides, two revolving grinding-surfaces, the radius from the axis of motion to the grinding-surfaces corresponding with the radius of the flexible bends or curved guides of the carding-engine, in combination with a bar-carriage for holding the flat-bar and con-

nected feed-screws for moving it toward the grinders to obtain uniformity at the two ends of the bar, substantially as set forth.



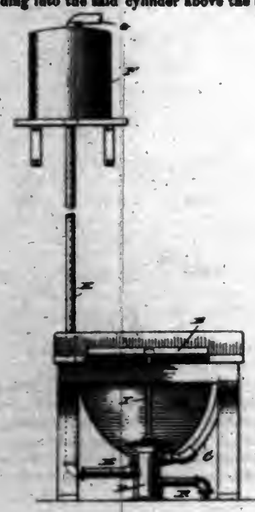
2. In a machine for forming the curved surfaces or working-faces on the two ends of a carding-engine flat-bar, two circular grinders fixed upon one shaft, each grinder being constructed by attaching grinding blocks or plates to revolable disks or carriers and by turning the projecting edges of such blocks or plates to make the periphery of the grinder correspond in curvature with the bends or guides upon which the flats are to travel, substantially as set forth.

3. In a machine for grinding or cutting the curved surfaces upon the ends of carding-engine flat-bars, the back-rest A, having the indicated angular position, the bar-carriage *f*, the two carriages *e e*, mounted in slides and coupled together by means of the screws *l l*, the cross-shaft and bevel-gearing *m*, and the adjustable stops *n*, in combination with two revolving grinders having about the same radius as the bend or guide upon which the flats are to slide, and fixed upon a shaft at a distance apart corresponding to the distance apart of the two curved surfaces which are to be formed upon the flat-bar ends, substantially as set forth.

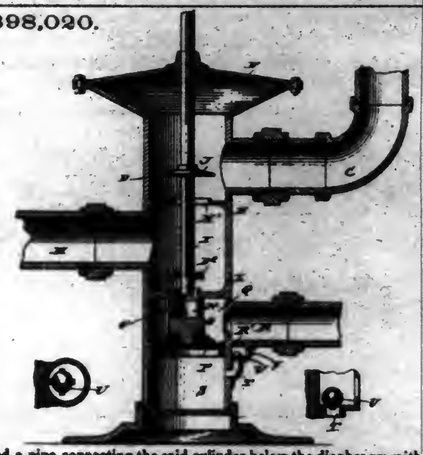
398,019. STRIPPING MECHANISM FOR CARDING-ENGINES.

GEORGE AINSWORTH and ELIJAH AINSWORTH, Manchester, County of Lancaster, England. Filed Mar. 16, 1888. Serial No. 267,284. (No model.) Patented in England May 15, 1883, No. 2,452.

Brief.—A shaft mounted to rotate in brackets on the framing carries a brush which at each revolution sweeps across the flat at that time in range. Fibers removed from the flats are delivered by the brush to hackles mounted within the casing, so that they can be turned away from the brush to remove accumulations of fiber.



Claim.—The combination of the side framing of a carding-engine, brackets *a*, fixed thereon, and the shaft mounted to revolve in the brackets and carrying a brush, *c*, with a casing, *f*, hinged at one side to expose the brush, and a hinged door to the casing carrying hackles *e* to clear the brush, all substantially as described.

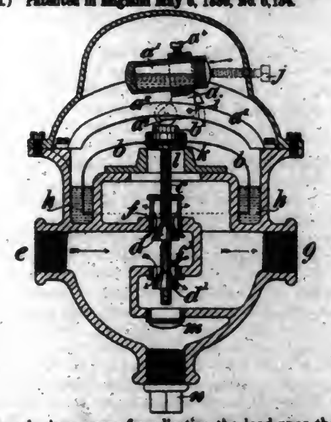


398,020. WATER-CLOSET.

JOHN J. RALLS, Jacksonville, Fla. Filed Oct. 30, 1888. Serial No. 289,514. (No model.)

Claim.—1. In a water-closet, the combination, with a cylinder and a valve-seat formed in the said cylinder, of a rod held to slide in the said cylinder through the said valve-seat, a valve adapted to be seated on the said valve-seat and operated on by the said rod, a diaphragm held in the said cylinder and supporting the said valve, a supply-pipe leading into the said cylinder above the said diaphragm,

398,020.



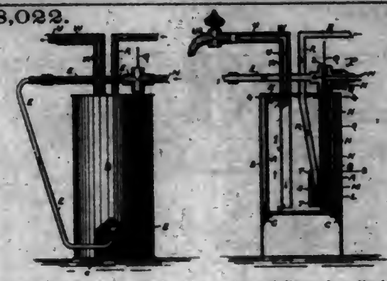
and a pipe connecting the said cylinder below the diaphragm with the said supply-pipe, substantially as shown and described.

2. In a water-closet, the combination, with a cylinder and a valve-seat formed in the said cylinder, of a rod adapted to slide in the said cylinder through the said valve-seat, a valve adapted to be seated on the said valve-seat and operated on by the said rod, a diaphragm arranged in the said cylinder below the valve-seat and supporting the said valve, a supply-pipe leading into the said cylinder above the said diaphragm, and having a branch, T, which extends down and connects with the cylinder below the valve, and has a grooved valve-seat, a ball-valve held in the said pipe, and a reservoir connected with the said cylinder above the valve-seat, as shown and described.

398,021. GAS-REGULATOR.

JAMES HARDLEY, Oldham, County of Lancaster, England. Filed June 25, 1888. Serial No. 278,089. (No model.) Patented in England May 6, 1886, No. 6,134.

Claim.—1. As a means for adjusting the load upon the bell of a gas-regulator, the lever *a*, having in the horizontal arm a^3 a wheel, a^5, resting upon the bell *b*, and a tubular chamber, *a'*, screwed into the vertical arm *a* and charged with mercury or fluid, the said part *a'* being adjustable in the arm by turning the said part in the direction for screwing or unscrewing, substantially as set forth.



2. In a gas-regulator, the lever $a\ a^3$, mounted upon a fulcrum, *i*, provided with a wheel, a^5, and with an adjustable tube, *a'*, containing mercury, in combination with the bell *b*, the spindle *c*, the valves *d d'*, and the valve-seatings *f f'*, substantially as set forth.

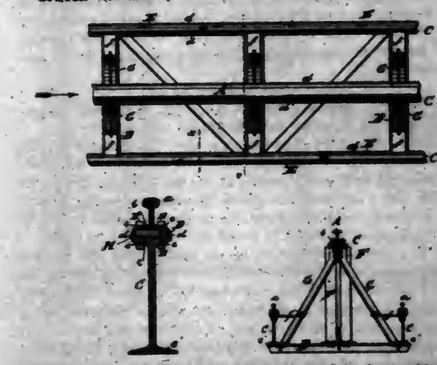
398,022. APPARATUS FOR HEATING WATER.

ROBERT P. BARNSDALL, Boston, Mass., assignor, by direct and mesne assignments, of part to Rufus H. Spalding, same place, and John C. Ballard, Cambridge, Mass. Filed Feb. 18, 1888. Serial No. 264,530. (No model.)

Claim.—1. The combination of boiler A, gas-burner D, to heat boiler, pipe E, to supply gas to burner, and pipe H, branching from pipe E and leading into water of boiler, and at its lower portion adapted to contain mercury and along its height divided into two separate gas-passages at their lower ends both open to mercurial chamber L and at their upper ends open to opposite end portions of gas-pipe E, and between their ends having a supplemental communicating gas-passage,

398,022.

a, located above mercurial chamber, substantially as described, for the purpose specified.



2. The combination of boiler A, gas-burner to heat boiler, pipe E, to supply gas to burner, pipe H, branching from pipe E and leading into water of boiler, and at its lower portion adapted to contain mercury and along its height divided into two separate gas-passages at their lower ends both open to mercurial chamber L and at their upper ends open to opposite end portions of gas-pipe E, and between their ends having a supplemental communicating gas-passage, *a*, located above mercurial chamber, and a plunger, Q, stationary in mercurial chamber and extended to outside of chamber, to be raised and lowered from the outside thereof, substantially as described, for the purpose specified.

3. The combination of boiler A, gas-burner to heat boiler, pipe E, to supply gas to burner, pipe H, branching from pipe E and leading into the water of boiler, and at its lower portion adapted to contain mercury and along its height divided into two separate gas-passages, and at their lower ends both open to mercury of pipe H, and at their upper ends open to the opposite end portions of gas-pipe E, and between their ends having a supplemental communicating gas-passage, *a*, located above the mercurial chamber, and a water-supply pipe, R, entering boiler and arranged to discharge against walls of mercurial chamber of pipe H, substantially as described, for the purposes specified.

4. The combination of boiler A, gas-burner to heat boiler, pipe E, to supply gas to burner, pipe H, branching from pipe E and leading into the water of boiler, and at its lower portion adapted to contain mercury and along its height divided into two separate gas-passages at their lower ends both open to mercurial chamber L and at their upper ends open to opposite end portions of gas-pipe E, and between their ends having a supplemental communicating gas-passage, *a*, located above the mercurial chamber, a water-supply pipe, R, entering boiler and arranged to discharge against walls of mercurial chamber of pipe H, and a shell, T, surrounding water-supply pipe at its discharge N and open to the water of the boiler, substantially as described, for the purposes specified.

398,023. RAIL-SUPPORT FOR ELEVATED ROADS.

FRANCIS A. BARTHOLOMEW, Bloomfield, N. J. Filed Nov. 3, 1887. Serial No. 254,141. (No model.)

Claim.—1. In a rail-support for elevated roads, the combination of a stringer-beam having the edges *d* of its top flange, *c*, turned up, forming between them a groove or recess, H, with the rail *a*, having foot *b* confined within the said recess, a bed, D, being interposed between the rail-foot and the bottom of the recess, and the rail-foot *b* and top flange, *c*, being secured together, substantially as hereinbefore set forth.

2. As a rail-support for elevated railroads, a stringer consisting of a web-beam, C, having bottom flange, *c'*, resting on the structure, and head or top flange, *c*, provided with a continuous groove or recess, H, for the reception of the rail-foot, substantially as specified.

3. In a center-rail elevated railroad, the combination of the central and side stringers, C, consisting of T-beams provided with recesses or grooves H for the reception of the rail-foot, the side stringers having bottom flange, *c'*, with the supporting cross-beams B and uprights F, and with the inclined braces G, bolted to the web of the central stringer, and the braces *f*, connecting the said inclined braces to the webs of the side-rail stringers, substantially as hereinbefore set forth.

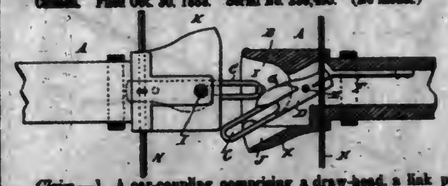
398,024. LINIMENT.

DAVID BATES, Bonham, Tex. Filed Dec. 19, 1888. Serial No. 294,602. (No specimens.)

Claim.—The liniment herein described, consisting of linseed-oil, turpentine, sulphuric acid, oil of winter-green, oil of osage-orange, tincture of button-snake root, and tincture of wild indigo, in about the proportions described.

398,025. INSULATOR.

WARREN C. BROWN, Tarrytown, N. Y. Filed Dec. 28, 1888. Serial No. 294,892. (No model.)



Claim.—1. An insulator formed of the two halves A B, bored axially and adapted to receive the screw *d*, one half being furnished with the recess *f* and the other half being provided with a projection, *g*, fitted to the recess and adapted to shut off leakage from the wire to the screw, substantially as specified.

2. As an improved article of manufacture, an insulator formed of the halves A B, provided with the semicircular grooves *c*, the part B being provided with a recess, *f*, and the part A having a projection, *g*, which extends beyond the screw-hole *c*, substantially as specified.

398,026. CAR-COUPLING.

SAMUEL BYERS, Toronto, Ontario, Canada. Filed Oct. 30, 1888. Serial No. 289,495. (No model.)

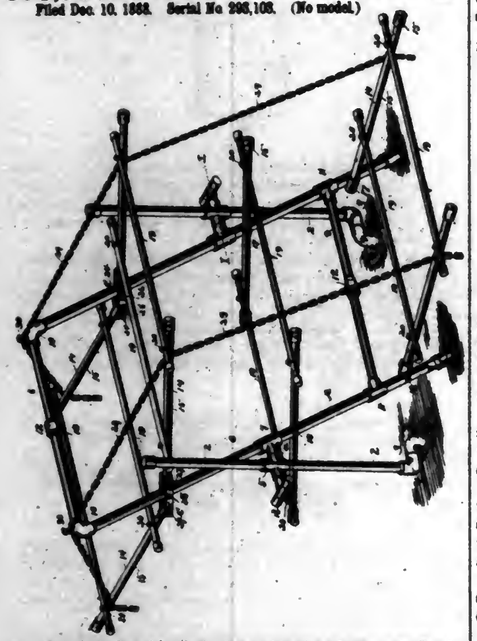
Claim.—1. A car-coupling comprising a draw-head, a link pivoted in the said draw-head in the middle of the draw-head opening, and a curved plate secured vertically on one side of the said link and extending essentially the height of the draw-head opening, substantially as shown and described.

2. A car-coupling comprising a draw-head, a link pivoted in the said draw-head in the middle of the draw-head opening, a curved plate secured vertically on one side of the said link and extending throughout the height of the draw-head opening, a flange formed on the upper end of the said curved plate, and a pin held to slide in the draw-head and adapted to be supported on the said flange, substantially as shown and described.

3. A car-coupling comprising a draw-head, a link pivoted in the said draw-head in the middle of the draw-head opening, a curved plate secured vertically on one side of the said link and extending throughout the height of the draw-head opening, a flange formed on the upper end of the said curved plate, a pin held to slide in the draw-head and adapted to be supported on the said flange, and a spring or weight for holding the coupling-link in a normal position, substantially as shown and described.

4. In a car-coupling, the link pivoted in the draw-head and provided on one side with a curved plate extending vertically essentially the height of the draw-head opening, substantially as shown and described.

5. In a car-coupling, the combination, with a draw-head, of a link pivoted horizontally in the said draw-head, a curved plate secured vertically on one side of the link and extending throughout the height of the draw-head opening, and a spring for holding the said link in a normal position out of line with the axis of the draw-head, substantially as shown and described.



6. In a car-coupling, the combination, with a draw-head provided on one side with an offset having an interior recess, of a link pivoted in the said draw-head and mounted to swing horizontally, a curved plate secured vertically on one side of the said link and extending throughout the height of the draw-head opening, a flange formed on

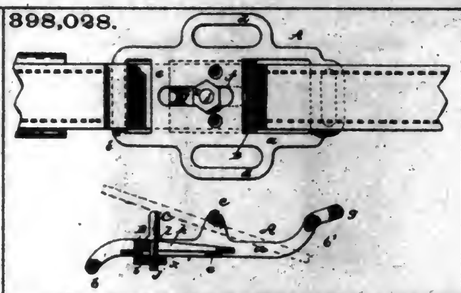
the upper end of the said curved plate to support the coupling-pin, and a spring for holding the said link in a normal position, substantially as shown and described.

7. In a car-coupling, the combination, with a draw-head provided on one side with an offset having an interior recess, of a link pivoted in the said draw-head and mounted to swing horizontally, a curved plate secured vertically on one side of the said link and extending throughout the height of the draw-head opening, a flange formed on the upper end of the said curved plate to support the coupling-pin, and a rod connected with the inner end of the said link to swing the same horizontally, said rod extending through the said draw-head to the sides of the car, substantially as shown and described.

8. In a car-coupling, the combination, with a draw-head, of a link pivoted in the said draw-head and mounted to swing horizontally, and a coupling-pin held in the said draw-head and adapted to pass through the said link to hold the same in line with the longitudinal axis of the draw-head, substantially as shown and described.

398,027. SHOW-RACK. BENJAMIN G. CAMLER, Cleveland, Ohio.
Filed Dec. 10, 1888. Serial No. 293,103. (No model.)

Claim.—1. In a show-rack, the combination of two vertically-pivoted uprights, 2 2, each having a bend or crank, 3, slides 5 5, arranged on said uprights, and a main frame, A, pivoted on said slides 5 5, substantially as and for the purposes specified.

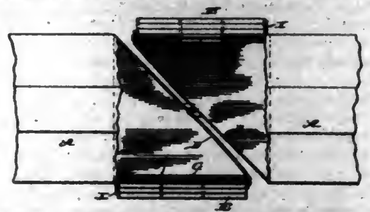


2. In a show-rack, the combination of two vertically-pivoted uprights, 2 2, each provided with a bend or crank, 3, slides 5 5, and main frame A, pivoted on said slides, said main frame having the adjustable cross-bars 8 and 9, substantially as and for the purposes specified.

3. In a show-rack, the combination, with pivoted adjustable uprights, of a main frame pivoted thereon, said main frame having side bars, 6 6, cross-bars 8 and 9, which connect the side bars, and turnbuckles 12, for adjusting the cross-bar, substantially as and for the purposes specified.

4. In a show-rack, the combination of two vertically-pivoted uprights, 2 2, each provided with a crank or bend, 3, slides 5 5, arranged on said uprights, side bars, 6 6, pivoted on the slides, adjustable cross-bars 8 and 9, which connect the side bars, and shelf-bars 14 14, pivoted on the side bars, substantially as and for the purposes specified.

5. In a show-rack, the combination, with the main-frame bars 6, of clamp-plates 24 24, pivoted on said main-frame bars, two sets of shelf-bars, 14, pivoted on the clamp-plates 24, and guys 29, substantially as and for the purposes specified.



398,028. BUCKLE. GEORGE P. COLE, Johnstown, N. Y. Filed Aug. 18, 1888. Serial No. 283,067. (No model.)

Claim.—1. The combination, with a buckle-body, A, provided with the slotted web *e*, of the slotted wedge B, and the buckle-tongue C, having the shank *j* inserted in the slots of the said wedge and web, substantially as shown and described.

2. The combination, with the buckle-body A, having its end curved in opposite directions and provided with the slotted web *e*, substantially as described, of the slotted wedge B, provided with a stud, *i*, and the buckle-tongue C, having the shank *j*, and furnished with the shoulder *l* and nut *k*, substantially as shown and described.

398,029. RAILWAY-CAR. WILLIAM L. COVEL, Micol, Miss. Filed Sept. 17, 1888. Serial No. 285,662. (No model.)

Claim.—1. A car or locomotive having at its end a three-sided platform made at its base or side next the car-body of the full width of such body, having one side formed in line with the side of such body, and its other side or edge inclined to the direction of motion and extended from side to side the full width of the car, substantially as set forth.

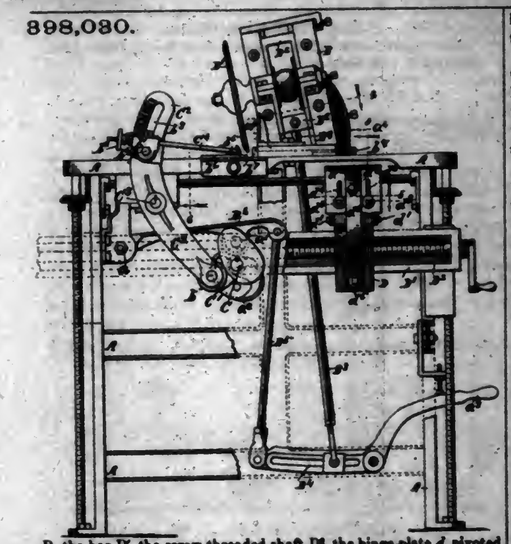
2. A car having a triangular platform and provided at the wide side thereof with steps adjustably connected with such platform, whereby they may be turned down for use as steps or up to serve as a guard-rail for the platform, substantially as set forth.

3. A car-platform combined with steps hinged to the side thereof, whereby they may be turned up or down at will, a spring engaging said steps and adapted to assist in elevating the same, and a fastening whereby the steps may be secured in elevated position, substantially as set forth.

4. A car having its end platform and the roof overhanging the same formed with surfaces or bearings at an angle inclined to the direction of motion, substantially as set forth.

5. The car having at its end a platform and an overhanging roof formed with angles inclined to the direction of motion, steps hinged to the wide side edge of the platform, whereby it may be turned up or down, the spring for assisting in elevating the steps, and a fastening for securing the steps elevated, all substantially as and for the purposes specified.

398,030. SAW-SHARPENING MACHINE. MILO COVEL, Chicago, Ill. Filed Oct. 18, 1888. Serial No. 288,454. (No model.)

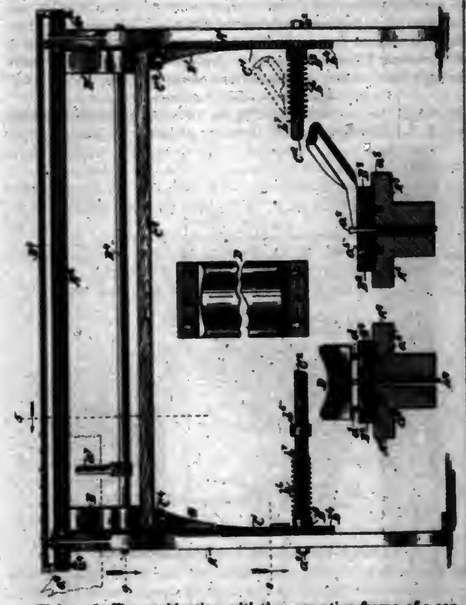


Claim.—1. In a saw-sharpening machine, the combination, with the supporting-frame, of the head-piece B, the bracket a^4, said head-piece being pivoted to said bracket at one side and provided in the other side with a segmental slot, and an adjusting-bolt passing through said slot, whereby said head-piece may be given a greater or less degree of inclination, substantially as and for the purpose set forth.

2. In a saw-sharpening machine, the combination, with the cam C, rigidly mounted on the driving-shaft, of a curved feed-arm having a roller journaled in the lower end, which has frictional contact with said cam, and provided in the upper end with an elongated slot, a feed-finger secured to said arm and adjustable in said slot, a rock-shaft upon which said feed-arm is rigidly mounted, and a spring coiled on said rock-shaft, whereby the lower end of said feed-arm is normally held in contact with the cam C and the feed-finger brought into engagement with the teeth of the saw in regular order of succession, substantially as and for the purpose set forth.

3. In a saw-sharpening machine, the combination, with a feed-finger, of the bracket a^4, the adjustable stop b^3, and the adjusting-bolt b^2, having a screw-threaded engagement with said stop, substantially as and for the purpose set forth.

4. In a saw-sharpening machine, the combination of the bracket



398,030.

D, the bar D', the screw-threaded shaft D^2, the hinge-plate *d*, pivoted at its lower end to said bracket, the clamping-plate d^3, provided with elongated slots and adjustably secured to said hinge-plate, and the spring d^5, substantially as and for the purpose set forth.

5. In a saw-sharpening machine, the combination, with the bracket D, of the cam locking-lever D^3, pivoted to said bracket, the back plate, d^6, and the spring *g*, whereby the saw is locked against a back movement only, substantially as set forth.

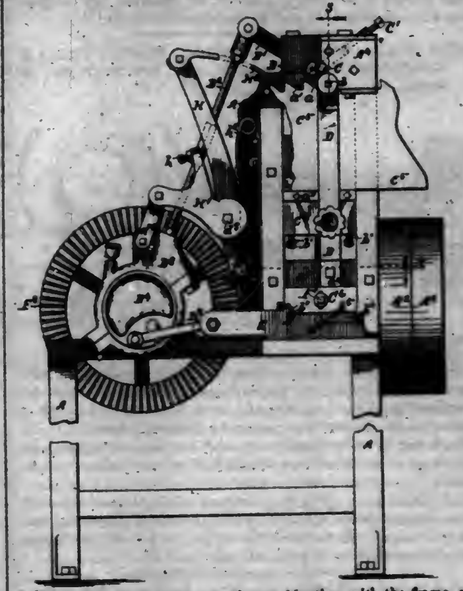
398,031. DEVICE FOR HOLDING AND DRESSING SAWS. MILO COVEL, Chicago, Ill. Filed Oct. 18, 1888. Serial No. 288,455. (No model.)

Claim.—1. The combination, with the supporting-frame, of a cap-plate rigidly mounted on one side of the frame, the vertical levers pivoted at their lower ends to said frame, a cam-shaft journaled in both said levers and frame, a second cap-plate rigidly mounted on the upper ends of said levers, and the clamping-bars mounted on the top of the respective cap-plates, whereby the movement of the cam-shaft throws the clamp into or out of a clamping position, substantially as and for the purpose set forth.

2. In a device of the character described, the combination, with the cap-plates and the clamping-bars, of the bolts a^4, whereby said bars may be sprung or forced upward at the ends, substantially as and for the purpose set forth.

3. In a device of the character described, the combination, with the supporting-frame, of the rack-bars notched in the upper end and having a vertical movement, a rock-shaft journaled in the frame, and the pinions mounted on the rock-shaft and engaging with the lower toothed end of said rack-bars, substantially as and for the purpose set forth.

4. The combination, with the rack-bars and the rock-shaft, of the pinions mounted on the latter, and the springs coiled on the respective ends of said shaft, whereby the rack-bars are automatically forced upward when the hand clamping-screws are relaxed, substantially as and for the purpose set forth.



5. The combination, with the frame having openings b^3 in the upper part, of the rack-bars, and provided on their upper ends with guide-lugs which fit into said openings, the guide-brackets b^4 b^5, and the hand-screws C^4, substantially as and for the purpose set forth.

6. Jointly with the clamping device herein shown and described, the supplementary hand-gage tool consisting of the plate D, provided in each corner with an adjustable screw-bolt, *d*, substantially as and for the purpose set forth.

7. Jointly with the clamping device herein shown and described, the supplementary hand-tool consisting of the plate D', grooved in the under side and provided with ledges d^1, and the screws d^4 for clamping the file in place, substantially as and for the purpose set forth.

8. Jointly with the clamping device herein shown and described, the supplementary hand-tool D^2, designed to hold a three-cornered file and consisting of the side plate, d^6, the top plate, d^7, grooved to receive one corner of the file, and the bottom or clamping plate, d^8, and screws for adjustably securing said plate, whereby a three-cornered file may be held to bring the cutting-face against the side of the saw-teeth at an oblique angle, as set forth.

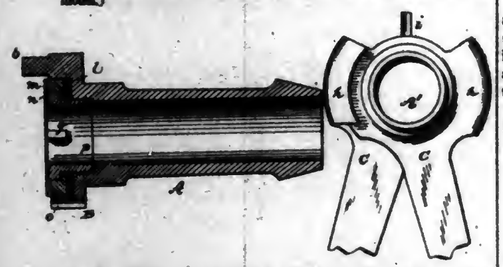
398,032. SAW-SWAGING MACHINE. MILO COVEL, Chicago, Ill. Filed Oct. 18, 1888. Serial No. 288,456. (No model.)

Claim.—1. In a saw-swage, the combination, with the frame, of the head-block, the rocking or rolling die inserted in said head-block, the link connected at the inner end to said die, the connecting-rod pivoted to the outer end of said link, the eccentric-strap, in which the lower end of the connecting-rod is inserted, the cam or crank wheel, and the counter-shaft upon which the same is mounted, whereby the required motion is transmitted to the roller-die, substantially as and for the purpose set forth.

2. In a saw-swage, the combination, with the frame, of the head-block supported thereon, the rocking or roller die inserted horizontally in said head-block and provided with a recess in the line of the saw, the adjustable die-point seated in said recess, the stationary die passing diagonally through said head-block, and the screw-bolt having a threaded engagement with the rear end of said stationary die, whereby the same may be adjusted with reference to the roller-die, and the die-point inserted therein, substantially as and for the purpose set forth.

3. In a saw-swage, the combination, with the frame, of the vertical guides bolted thereto, a cross-head moving between said guides and provided with a seat-rest for a saw, the saw-clamping bars secured to and moving with the cross-head, a cross-bar having beveled shoulders on the under side, as described, and arranged between said guides below the cross-head, the plate c^4, bolted to the cross-bar, the slide-bar E engaging with the under side of the cross-bar and having beveled shoulders, the connecting-rod D^3, the crank-wheel B^4, and the counter-shaft upon which the same is mounted, whereby a vertical movement is transmitted to the cross-head and the saw raised to bring the teeth in position to be operated upon by the swaging-dies once in each revolution of the crank-wheel, substantially as set forth.

4. In a saw-swage, the combination, with the head-block, of the saw-clamping bars having beveled upper ends, the spring-jaws rigidly secured at one end, the opposite beveled ends bearing loosely against the outer beveled surfaces of the clamping-bars, and the adjusting-screws inserted through the head-block and having contact with said jaws, substantially as and for the purpose set forth.



5. In a saw-swage, the combination, with the cross-head C^3 and the cross-bar C^3, of the adjusting screw-bolts b' b', inserted in the under side of said cross-head and adapted to rest on the upwardly-projecting flange a^3, forming a part of said cross-bar, substantially as and for the purpose set forth.

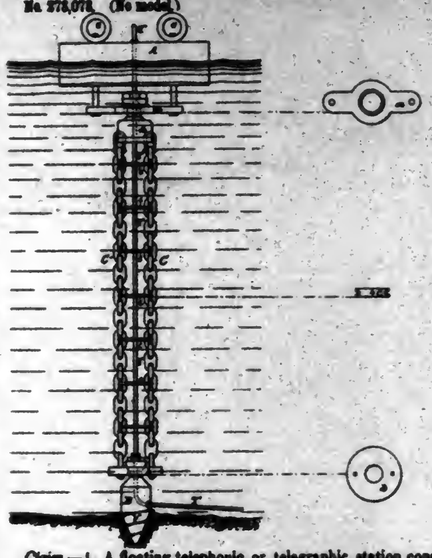
6. In a saw-swage, the combination, with the frame, of the cross-head, the cross-bar C^3, the vertical screw-shaft F, the pinion-wheel d, the horizontal shaft F', and the pinion d', whereby the saw may be raised by hand for the purpose of securing the proper adjustment of the same relative to the swaging-dies, substantially as and for the purpose set forth.

7. In a saw-swage, the combination of the feed-lever H, the bell-crank lever H', the eccentric-strap B^2, the link a^3, and the feed-finger H^2, whereby the saw-teeth are automatically presented to the swaging-dies in regular order of succession, substantially as set forth.

8. In a saw-swage, the combination of the feed-lever, the feed-finger pivoted to the upper end thereof, the bell-crank, and the gage-bolts h h', substantially as and for the purpose set forth.

398,033. PIPE-COUPLING FOR CAR-BRAKES. WILLIAM M. DARROW, Salem, N. Y. Filed May 21, 1888. Serial No. 274,584. (No model.)

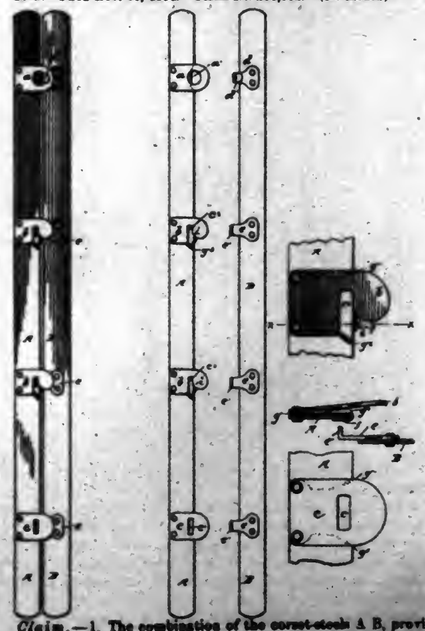
Claim.—1. In a pipe-coupling for cars, the combination, with the sleeves A A', provided with the flanges B, having studs b, notches c, and seat m, of the removable cam-levers C, each provided with an aperture, a beveled ear, g, and inclined and inwardly-turned lip h, the said ear and lip being opposite each other and adapted to engage the lip and ear of the other lever, substantially as herein shown and described.



2. In a pipe-coupling, the combination, with a sleeve internally screw-threaded at one end, of the packing l, the seat m, provided with the rabbet n, and the threaded thimble p, provided with the flanged end o, substantially as herein shown and described.

398,034. OX-SHOE. JOHN DEBBLE, Southington, Conn., assignor to the Scranton Forging Company, Scranton, Pa. Filed Sept. 27, 1888. Serial No. 286,515. (No model.)

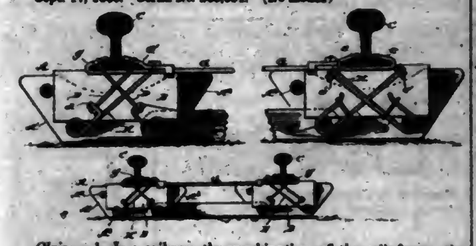
Claim.—As a new article of manufacture, the herein-described ox-shoe, having at the junction of the toe and body portions on the inside the web 7, and the shoulder 5 a short distance from the edge of said web, while the other parts of the shoe are of ordinary form, substantially as described, and for the purpose specified.



398,035. FLOATING TELEGRAPH-STATION. URBAIN DIEULOUARD, Tréguier, Côtes-du-Nord, France. Filed June 25, 1888. Serial No. 278,078. (No model.)

Claim.—1. A floating telephonic or telegraphic station consisting of a buoy and anchoring-shoe, chains connecting the anchoring-shoe and buoy, distance-pieces connecting the chains with each other at intervals, and a cable passing down through the center of the buoy, the distance-pieces and the anchoring-shoe forming the axis about which these parts may turn without danger of entanglement, substantially as herein described.

2. A floating telephonic or telegraphic station consisting of a buoy, an anchoring-shoe, and a chain having connecting-disks a and b, and universal joints between the buoy and disk a and between the anchoring-shoe and disk b, to enable the parts to turn and oscillate freely in all directions without entangling or fouling the cable T, which passes through their centers, substantially as herein set forth.



398,036. CORSET-FASTENING. WILLIAM M. DUCKER, New York, N. Y. Filed Nov. 16, 1888. Serial No. 290,992. (No model.)

Claim.—1. The combination of the corset-steels A B, provided with the eye a and hook d catch, at one extremity, and the closed slot c and engaging-piece e catch, at the other extremity, and having between such catches one or more catches consisting of an engaging part, e, and spring-piece b, having an open slot, c^3, a rounded cut-away part, i, a guide-plate, g, with turned-under part f, shoulder g', and downwardly-flaring shoulder g^3, adapted to permit the engaging part e to be withdrawn by a downward and outward movement, substantially as described and shown.

2. The corset-fastening described, consisting of the spring catch-piece b, provided with the open slot c^3, and having a rounded edge, i, a supporting guide-piece, g, provided with a turned-under portion, f, the upturned supporting part g', and outturned supporting part g^3, flaring away from the rounded edge i, in combination with the engaging part e and catch d, adapted to enter between the guide-piece g and spring-piece b, to engage in the slot c^3, and to be disengaged by being drawn downward and outward, substantially as described as shown.

398,037. RAILWAY. ROBERT P. FARISH, SCIOTO, M. MEX. Filed Sept. 17, 1888. Serial No. 285,651. (No model.)

Claim.—1. In a railway, the combination of the crib-frame, the rail seat or seats therein, the rails on said seats, and the anchor-rods passed through openings in and secured to the base of the rail at the opposite sides of the latter, and extended thence and secured to the lower portion of the crib-frame, substantially as set forth.

2. In a railway, the combination of the rail, the crib-frame having lower or base connecting-rods, and the anchor-rods connected at one end with the rail at the opposite sides thereof, and extended thence and connected with the base-rods, substantially as set forth.

3. In a railway, the combination, with the crib-frame and the rails, of the connecting-rods connected with the rail at the opposite sides of same and extended diagonally downward and inward, substantially as and for the purposes set forth.

4. In a railway, the combination of the crib-frame having base connecting-rods A^3 and the rail seat or seats in said frame, the rail and the anchor-rods extended diagonally between and connected with the base connecting-rods and the rail, substantially as set forth.

5. In a railway, the combination of the crib-frame, the rail seat or seats, the cross-bar G, having hook g, the plate G', and the rod H, all constructed and arranged substantially as and for the purposes specified.

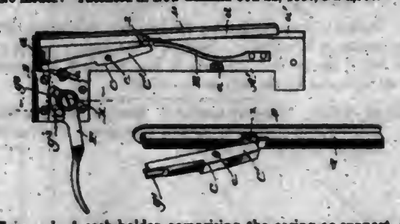
398,038. MACHINE FOR FINISHING DECORATIVE NAILS. HENRY P. PERIN, Waterbury, Conn., assignor to the American Ring Company, same place. Filed Aug. 4, 1888. Serial No. 281,927. (No model.)

Claim.—1. The combination, with the gate B and block C, of a slotted frame, c, a pivoted guide-plate, b, a spring, b', and a finger for raising the plate b, substantially as and for the purposes set forth.

2. The combination, in a machine for forming decorative nails, with the head-block E, of the slotted plate 7, the die N, connected therewith, and bolts 8, for securing said plate 7 adjustably to the head-block E, substantially as set forth.

3. The combination, in a machine for forming decorative nails, with the head-block E, of the slotted plate 7, the die N, connected therewith, and bolts 8, for securing said plate 7 adjustably to the head-stock E, and a projecting finger, 9, secured to the slotted plate 7, substantially as set forth.

4. The combination, in a machine for forming decorative nails, with the reciprocating gate B and the block C, of the die N and matrix M, the slide-block f'' within the matrix M, the slide-rod f within the block C, and mechanism, substantially as specified, for imparting an endwise movement to the slide-block and slide-rod, whereby the blank cut by the die and matrix and struck up is pushed out of the matrix, substantially as set forth.



5. The combination, with the reciprocating gate B and dovetailed block C and the matrix M, of a vertical bar pivoted to the block C, a projecting finger for moving said vertical bar, and a block or rod moving through the block C and through the matrix M, whereby the blank is pushed out of the matrix M, substantially as set forth.

6. The combination, with the reciprocating gate B and dovetailed block C and the matrix M, of a vertical bar pivoted to the block C, a projecting finger for moving said vertical bar, and a block or rod moving through the block C and through the matrix M, whereby the blank is pushed out of the matrix M, and a pivoted plate adapted to set across the opening in the matrix M, so that when the blank is pushed out of said matrix said plate insures its vertical fall, substantially as set forth.

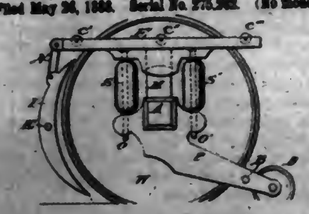
7. The combination, with the reciprocated gate B and the dovetailed block C and the matrix M, of the stud c on the back of the block C, the vertical bar d, pivoted to the stud c, the spring c, the adjustable screw-bolt h, the projecting finger-bar i, the slide-rod f and slide-block f', and the pivoted guide-plate b, substantially as and for the purposes set forth.

8. The combination, with the reciprocated gate B and dovetailed block C and the matrices C and M, of the slotted frame c, pivoted guide-plate b and spring b', and the vertical guide-bars k, substantially as and for the purposes set forth.

398,039. SASH-HOLDER. HENRY A. PLATMAN and JAMES REED, Southbrook, New Zealand. Filed June 20, 1888. Serial No. 278,588. (No model.) Patented in New Zealand Oct. 22, 1887, No. 2,597.

Claim.—1. A sash-holder comprising the casing or support, the friction-piece, the lever pivoted to the casing and supporting the friction-piece on one of its ends, and the spring engaging the friction-piece, substantially as set forth.

2. The combination, in a sash-holder, with the casing and a lever pivoted thereto, of the friction-piece pivotally suspended at a point midway between its ends on the said lever, whereby said piece may fulcrum at one end against the casing, and the spring engaging said friction-piece, substantially as set forth.



3. The combination, with the casing, of the friction-piece arranged to fulcrum at one end against said casing, a spring whereby to force the opposite end of said piece outward, and a retractor connected with said friction-piece between its ends, whereby it may be drawn in opposition to the action of its spring, substantially as set forth.

4. In a sash-holder, the combination of the casing having side plates, the friction-piece having on its inner side a narrow rib fitting between the said side plates, a spring engaging said friction-piece, and a retractor connected therewith, substantially as set forth.

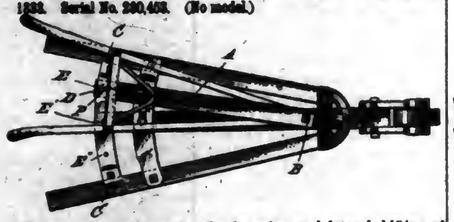
5. A sash-holder comprising the casing formed with inner and outer side plates, and having the outer edge of the outer plate extended, forming a guard, and having the top or crown plate fitted on said side plates, the friction-piece, the spring engaging the same, and the retractor, substantially as set forth.

6. The combination, in a sash-holder, of the casing, the friction-piece, the spring engaging said piece, the lever C, connected at its lower end with the friction-piece, the handle-lever, and the rod connecting said handle-lever with the lever C, all substantially as and for the purposes specified.

398,040. STREET-CAR TRUCK. JOHN D. GRACE, New Orleans, La. Filed May 24, 1888. Serial No. 275,262. (No model.)

Claim.—1. In combination with an axle-box, the inwardly-curved shaft P, provided with the seats for the springs S S', and jointed at J, substantially as described herein.

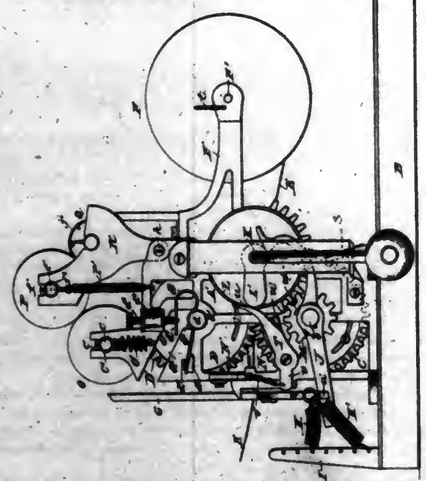
2. In combination with an axle-box, the inwardly-curved shaft P, provided with the seats for the springs S S', substantially as and for the purpose set forth.



3. In combination with an axle-box, the straight and rigid shaft P, provided with the seats for the springs S S', and with wheel D, all substantially as described.

4. In combination with an axle-box, the straight shaft P, provided with the seats for the springs S S', and with wheel D, and said shaft jointed at J, substantially as described.

5. The frame herein described, consisting of the ends F F', containing rollers or blocks d' d'', and forming also a support for brake-blocks I, substantially as described.

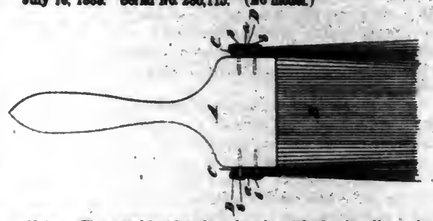


6. The bar M, in combination with the shaft P, substantially as and for the purpose set forth.

398,041. CULTIVATOR. FRED R. GRISWOLD, Naples, N. Y., assignor of one-half to Lucien R. Munsell, same place. Filed July 19, 1888. Serial No. 280,463. (No model.)

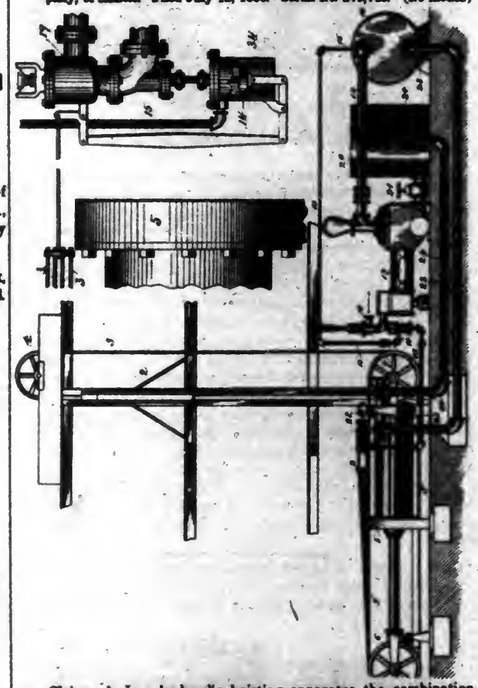
Claim.—An appliance for the fastening and lateral shifting of the handles of a cultivator, consisting of the piece or handle-beam A, the bolt B, the arc C C', the plate D, and the pin P, all substantially as set forth, and for the purposes specified.

398,042. PRINTING-MACHINE. HENRY H. HARRISON, New York, N. Y., assignor to Aaron R. Harrison, same place. Filed Jan. 20, 1888. Serial No. 261,349. (No model.)



Claim.—1. In a printing-machine, the standards A A', having the open bearings d' and diagonal slots d^3, reaching to the same, in combination with the type-roller D, lower roller, C, gudgeons d, springs d^2, pivoted to the standards and arranged to rest upon the gudgeons d, and the screws d^3, held in studs attached to the standards and adapted to hold the springs d^2, substantially as described.

2. In a printing-machine, the standards A A', formed with a rearwardly-projecting arm having sleeve F^4, containing rod F^5, spring F^6, and small rod F^8, attached to the rod F^5 and reaching to the outside of the machine, in combination with the disk g', placed upon the rod F^8, and the cord F^9, recessed at g, and the stud s, secured to the arm of the opposite standard A, substantially as described.

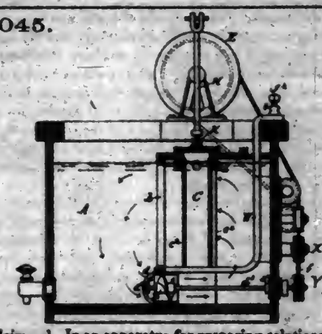


3. In a printing-machine, the lower roller, C, and gudgeon b thereof, in combination with the pinion M, placed on said gudgeon, the projection w^2, formed on said pinion, the pawl T, formed with the arm w and toe w', the wheel L, cam L', and the crank K, substantially as and for the purposes set forth.

398,043. BRUSH. HARVEY W. HASEY, New York, N. Y. Filed July 16, 1888. Serial No. 280,115. (No model.)

Claim.—The combination, in a brush, with the handle or head and the bristles attached thereto, of a cap, disk, or filler, against which the bristles abut, surrounding the handle or head, and having a multiplicity of recesses in its under face for receiving the butts of a part of said bristles, substantially as specified, and for the purpose set forth.

398,044. VARIABLE-PRESSURE HYDRAULIC ELEVATOR. THADDEUS W. HERRMANN, Chicago, Ill., assignor to the Crane Elevator Company, of Illinois. Filed July 12, 1888. Serial No. 279,740. (No model.)

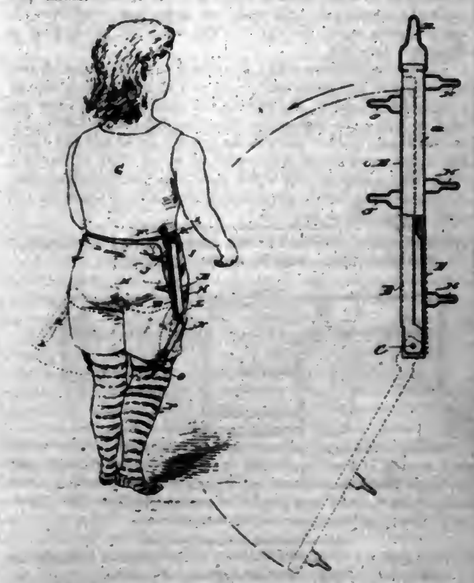


Claim.—1. In a hydraulic hoisting apparatus, the combination of a tank or reservoir for containing the water-supply, a steam-pump pumping therefrom direct to the main cylinder, a valve controlling said pump, a piston exposed on one side to the pressure from the main cylinder and on the other to pressure produced by tension of the lifting-cables, said piston being so connected to said valve that the pressure from the main cylinder tends to close and the pressure produced by the lifting-cables tends to open said valve, and a valve controlled by the operator and adapted to admit water to the main cylinder from the pump or to permit the water to escape from the main cylinder to said tank, substantially as described.

2. The combination, with a control-valve, as 19, operated by a piston, 14, exposed on one side to pressure from the main cylinder and on the other side to pressure produced by the tension of the lifting-cables, of a regulating-spring, 28, and a piston, 27, the pressure of said spring being opposed by fluid-pressure from the main cylinder, as and for the purpose set forth.

398,045. APPARATUS FOR BLEACHING BY ELECTROLYSIS. EUGÈNE HERMITE, EDWARD J. PATTERSON, and CHARLES F. COOPER, London, England. Filed Oct. 26, 1887. Serial No. 253,474. (No model.) Patented in England Nov. 12, 1886, No. 14,673; in France Dec. 15, 1886, No. 180,201; in Belgium Mar. 3, 1887, No. 76,560, and in Spain May 5, 1887, No. 10,747.

398,045.



Claim.—1. In an apparatus for preparing solutions for bleaching by electrolysis, the combination of a vessel or tank with a partition dividing it into two compartments, a group of electrodes on one side of the partition, and a propeller to maintain a circulation from one compartment to the other and through the group of electrodes.

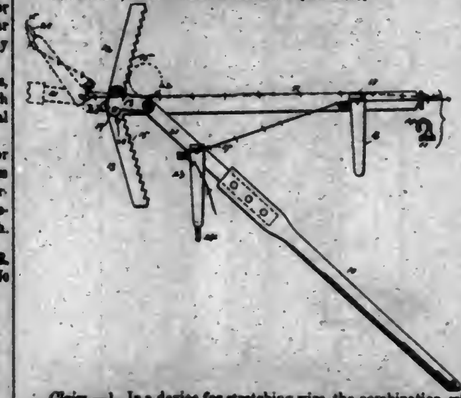
2. The tank and its partition having a tubular opening at its lower end and the two compartments communicating at the upper part of the partition, in combination with a propeller in said tubular opening and electrodes on one side of the partition, all substantially as described.

3. The combination of the plate K, carrying one set of electrodes, with a plate, *m*, carrying the other set of electrodes, and through which the electrodes of the plate K pass, and the insulating material between the plates, substantially as described.

4. A bleaching apparatus comprising an electrolyzing vessel or tank containing electrodes with scrapers to remove the deposits from the negative electrodes, a bleaching-compartment, and means to circulate the liquid and freed deposits to the bleaching-point and to return the solution to the electrodes, as and for the purpose set forth.

398,046. GARMENT FASTENER AND SUPPORT. CHARLES B. HOLLIS, Pittsfield, Mass. Filed Nov. 10, 1883. Serial No. 290,495. (No model.)

Claim.—1. In a garment-fastener, two levers pivoted together at their lower ends, the forward lever having a suspension device at its upper end, and both levers having fastenings or attaching devices whereby they may be secured on the drawers along the edges of the side openings thereof, and means for holding the levers in their closed positions, substantially as set forth.



2. A combined garment-fastener and stocking-support consisting in two levers pivoted together at their lower ends and there provided with a depending stocking-support, a suspension device at the upper end of the forward lever, a spring holding the levers in their closed position, and means for securing the front and rear levers to the drawers along the front and rear edges, respectively, of their side openings, substantially as set forth.

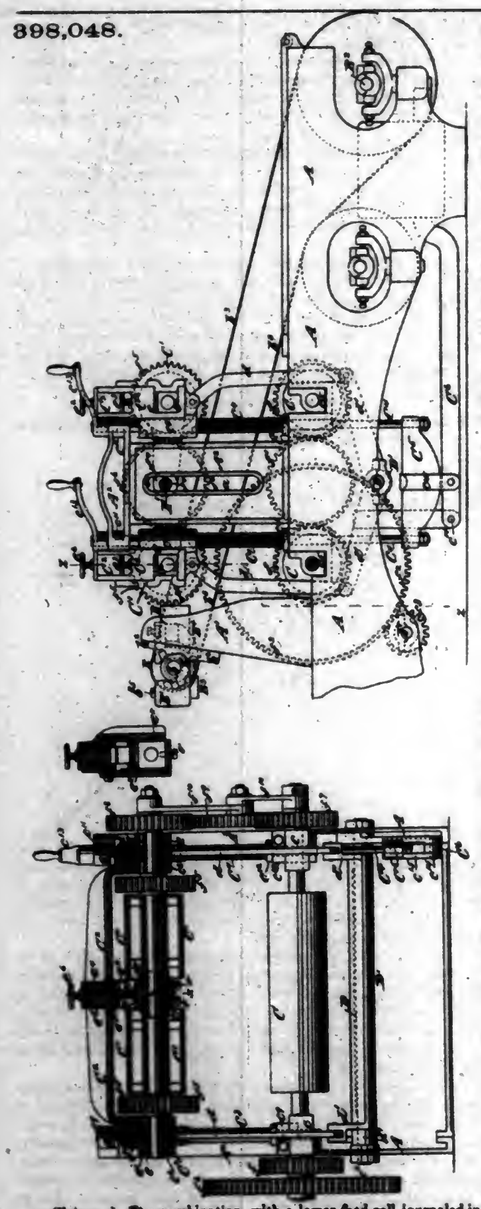
3. A garment fastener and supporter comprising a jointed pair of levers carrying a spring and adapted to be supported from the waist, and loops extending from the backs of the said levers on opposite sides and adapted to be fastened to the front part and seat of the drawers, substantially as shown and described.

4. A garment fastener and supporter comprising a jointed pair of levers carrying a spring, a loop held on the upper end of one of the said levers to support the device from the waist, and loops extending from the backs of the said levers on opposite sides and adapted to be secured to the front part and seat of the drawers, substantially as shown and described.

5. A garment fastener and supporter comprising a jointed pair of levers carrying a spring, a loop held on the upper end of one of the said levers to support the device from the waist, and loops extending from the backs of the said levers on opposite sides and adapted to be secured to the front part and seat of the drawers, and an elastic band held on the lower end of one of the levers and carrying at each end a loop adapted to be fastened to the stocking, substantially as shown and described.

398,047. WIRE-STRETCHER. GEORGE R. HUGHES, Savoy, Tex. Filed Oct. 1, 1888. Serial No. 286,906. (No model.)

Claim.—1. In a device for stretching wire, the combination, with an essentially T-shaped body having the members of the head inclined in direction of the straight member and provided with a series of teeth, of a lever pivoted to the straight member of the body contiguous to the head and clamping-jaws pivoted upon the said lever, substantially as shown and described.



2. In a device for stretching wire, the combination, with an essentially T-shaped body having the members of the head inclined in direction of the straight member and provided with a series of teeth, and a hook formed at the extremity of the straight member, of a lever pivoted to the straight member of the body contiguous to the head and clamping-jaws pivoted upon the said lever, substantially as shown and described.

3. In a device for stretching wire, the combination, with an essentially T-shaped body having the members of the head inclined in direction of the straight member and toothed upon the inner edge, and the said straight member provided with a hook at the extremity, of a short lever having clamping-jaws pivoted upon the straight member of the body near the hook, a long lever also pivoted to the straight member of the body contiguous to the head, and a second short lever provided with a clamping-jaw at one extremity and a hook at the other pivoted upon the said long lever, all combined to operate substantially as shown and described.

4. In a device for stretching wire, the combination, with an essentially T-shaped body having the members of the head toothed upon the inner edge and inclined in direction of the extremity of the straight member, and provided near the straight member with an aperture, and having a hook integral with the extremity of said straight member, of a short lever pivoted to the body contiguous to the hook and provided with clamping-jaws, a plate adjustably attached to the body, a long lever pivoted to the straight member of the body by the same pivot as the adjustable plate, and a second short lever provided with clamping-jaws at one end pivoted upon the said long lever, all arranged to operate substantially as shown and described.

398,048. WOOD-PLANING MACHINE. ALFRED B. HUTCHINSON and HENRY F. ANTHONISEN, Brooklyn, N. Y., assignor to the Glen Cove Machine Company, (Limited,) same place. Filed Jan. 30, 1888. Serial No. 262,206. (No model.)

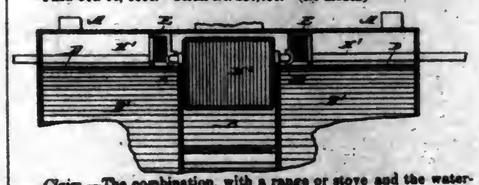
398,048.

Claim.—1. The combination, with a lower feed-roll, journaled in stationary bearings, of an upper roll composed of two sections arranged end for end, an upper roll-frame in which both sections of the upper rolls are journaled at each of their ends, said frame comprising sockets at the ends thereof and made integral therewith, one of said sockets forming a nut, two vertical rods, one at each side of the machine, and one of which is a screw engaging said nut, a crank for rotating said screw so as to bodily raise and lower the roll-frame and the upper roll-sections journaled therein, journal-boxes for the upper roll-sections supported wholly in said frame and capable of a limited vertical movement therein, said journal-boxes being acted upon by springs to press them downwardly in the frame, substantially as specified.

2. The combination, with the lower roll, C, and the upper roll-section, C', of the upper roll-frame, C^2, the boxes for the roll-sections having a limited vertical movement in said frame, the springs c^4, whereby the outer boxes are held down, and the springs c^5, and a saddle whereby the two inner boxes are held down, substantially as herein described.

3. The combination, with two pairs of upper and lower rolls, the lower rolls being journaled in stationary bearings, and the upper rolls being each composed of two sections, of an upper roll-frame for the sections of each roll, and boxes for the roll-sections having a limited vertical movement in said frame, a shaft intermediate between the upper rolls and geared with the two sections of each upper roll, and journaled in bearings projecting from one of the roll-frames, gearing connecting the lower rolls of the two pairs, and expansion-gearing connecting one of said lower rolls with the said intermediate shaft, substantially as herein described.

4. The combination, with the lower feed-roll journaled in stationary bearings, of an upper feed-roll composed of two sections arranged end for end, an upper feed-roll frame in which both sections of the upper roll are journaled at each of their ends, said frame comprising sockets c^6, made integral therewith and at the ends thereof, one of said sockets forming a nut, two vertical rods, one upon each side of the machine, extending through said sockets, one of said rods being a screw and engaging a screw-thread in its coacting socket, a crank whereby said screw-rod may be moved up and down in order to bodily raise and lower the frame and the upper feed-roll section, a rock-shaft having arms connected by rods with the ends of said upper roll-frame, a weight applied to said rods, and boxes for the upper roll-section having a limited vertical movement in said frame, and which are acted upon by springs to press them down in the frame, substantially as specified.

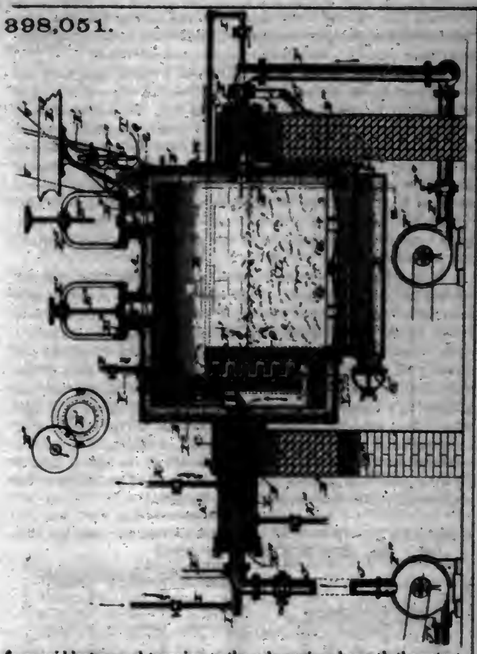


398,049. PRINTER'S BRUSH. JOSEPH C. ISRAEL, New York, N. Y. Filed July 9, 1888. Serial No. 278,406. (No model.)

Claim.—1. The combination, with a brush, of a liquid-receptacle secured to the back thereof and formed with an opening in its bottom, a valve-plate secured to one end of a fulcrumed operating-rod and arranged to close said opening, a spring at the opposite end of said rod, and a capped tube held to the said spring and to the valve-rod and projecting above the cover of the receptacle, substantially as shown and described.

2. The combination, with a brush, of a liquid-receptacle secured to the back of said brush and formed with an opening in its bottom, a valve-plate located at said opening and provided with a softer material, as cork, on its under side, a fulcrumed operating-rod secured at one end to said plate, a spring at the opposite end of said rod, a tube held to the upper end of said spring and to the valve-rod, and provided with a washer or collar of soft material, as cork, below the cover of the receptacle, and a screw-cap on the said tube above the said cover, substantially as described.

398,050. STOVE OR RANGE. HENRY E. JAMES, New York, N. Y. Filed Oct. 10, 1888. Serial No. 287,799. (No model.)



Claim.—The combination, with a range or stove and the water-back thereof, of a grating located at each side of the grate between the upper oven-plate and the top of the stove, and provided with a concavity in the rear edge adapted to embrace the pipes of the water-back, substantially as shown and described.

398,051. GAS-GENERATOR. JOSEPH JORDAN, Bridgeport, Pa. Filed Nov. 14, 1888. Serial No. 290,781. (No model.)

Claim.—1. A gas-generator consisting of a horizontal fire-brick-lined retort provided with hollow trunnions set in bearings, an air-entrance pipe opening into one of said trunnions, a branch air-pipe leading from said last-named trunnion to the ash-receiver beneath the retort, a gas-exit main or pipe inserted into the hollow trunnion, an automatic rocking mechanism consisting of a shaft provided with a worm, fast and loose pulleys on said shaft, and a belt-shifter and pivoted bars, and a rack with which the worm engages, all operating substantially as described.

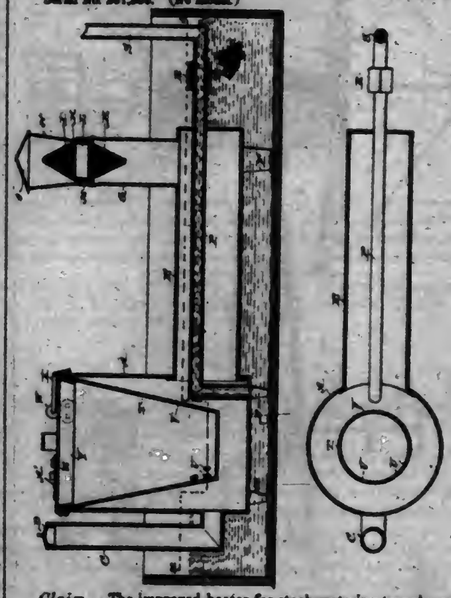
2. A gas-generator consisting of a horizontal fire-brick-lined retort provided with hollow trunnions set in bearings, an air-entrance pipe opening into one of said trunnions, a branch air-pipe leading

398,051.

from said last-named trunnion to the ash-receiver beneath the retort, a gas-exit main or pipe inserted into the other hollow trunnion, an automatic rocking mechanism consisting of a rack provided with adjustable lugs, a shaft having a worm mounted upon it, pivoted bars and belt-shifter, and fast and loose pulleys mounted on said shaft, substantially as described.

3. A gas-generator consisting of a horizontal fire-brick-lined retort provided with hollow trunnions set in bearings, whereby it is adapted to be rocked, an air-entrance pipe opening into one of said trunnions, a branch air-pipe leading from said trunnion to the ash-receiver beneath the retort, a gas-exit main or pipe inserted into the other hollow trunnion, and an ash-receiver with its grate-bars set beneath and attached to said retort, whereby the ash-receiver moves with it, substantially as described.

4. A gas-generator consisting of a horizontal fire-brick-lined retort provided with hollow trunnions set in bearings, whereby it is adapted to be rocked, air-entrance pipe opening into one of said trunnions, a branch air-pipe leading from said last-named trunnion to the ash-receiver beneath the retort, a gas-exit main or pipe inserted into the other hollow trunnion, a steam-pipe entering through one of the trunnions to inject steam into the retort, and an ash-receiver and grate-bars set beneath and attached to said retort, whereby the ash-receiver moves with it, substantially as described.



5. A gas-generator consisting of a horizontal fire-brick-lined retort provided with hollow trunnions set in bearings, whereby it is adapted to be rocked, an air-entrance pipe opening into one of said trunnions and passing to the ash-receiver beneath the retort, a gas-exit main or pipe inserted into the other hollow trunnion, an ash-receiver with its grate-bars set beneath said retort and attached to it, a tortuous fixing-chamber set within the shell of the retort, and an oil-injection pipe, substantially as described.

6. A gas-generator consisting of a horizontal fire-brick-lined retort provided with hollow trunnions set in bearings, whereby it is adapted to be rocked, an air-entrance pipe opening into one of said trunnions and connected with the ash-receiver beneath the retort, a gas-exit main or pipe inserted into the other hollow trunnion, an ash-receiver with its grate-bars set beneath and attached to said retort, a steam pipe entering through the exit-trunnion of the retort into the interior of the latter, whereby the steam is superheated, said pipe thence passing out of the retort, leading around into the entrance-trunnion of the retort to inject steam into the latter, that portion of said pipe which is within the retort being protected by a wall from direct contact with the fuel, substantially as described.

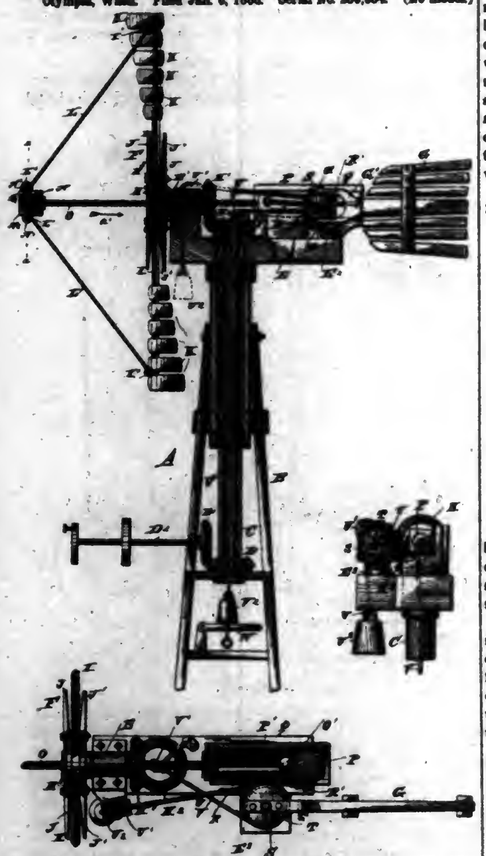
7. A gas-generator consisting of a horizontal fire-brick-lined retort provided with hollow trunnions set in bearings, whereby it is adapted to be rocked, an air-entrance pipe opening into one of said trunnions and connected with the ash-receiver beneath the retort, a gas-exit main or pipe inserted into the other hollow trunnion, an ash-receiver provided with grate-bars set beneath said retort and attached to it, a steam-pipe entering through the exit-trunnion of the retort into the interior of the latter, where it is formed into a coil, whereby the steam is superheated, said pipe thence passing out of the retort around to and into the entrance-trunnion of the retort to inject steam into the interior of the latter, that portion of said pipe which is in the retort being protected by a wall from direct contact with the fuel, substantially as described.

8. A gas-generator consisting of a horizontal fire-brick-lined retort provided with hollow trunnions set in bearings, whereby it is adapted to be rocked, an air-entrance pipe opening into one of said trunnions, a branch air-pipe leading from said trunnion to the ash-receiver beneath the retort, a gas-exit main or pipe inserted into the other hollow trunnion, which latter is elongated and provided with a water-chamber formed by a shell enveloping the trunnion and leaving a space between it and the said trunnion, the said space being supplied with water by a pipe, as shown, the water being carried off by another pipe, whereby the products of combustion are cooled, and an ash-receiver provided with grate-bars set beneath said retort and attached to it, whereby it moves with the retort, substantially as described.

398,052. HEATER FOR STOCK-WATERING TROUGHS. HENRY A. KEEP and JOHN KEEP, Greensborough Bend, Vt. Filed Mar. 31, 1888. Serial No. 267,960. (No model.)

Claim.—The improved heater for stock-watering troughs, consisting of the vertical cylindrical vessel A, the vertical flue C, and the horizontal flue E, communicating therewith at diametrically-opposite points near the bottom thereof, and the smoke-flue leading upward from the end of the flue E, the fire-box removably supported in the vessel A and having diametrically-opposite openings in its sides near its lower end, and adapted to be turned so as to bring said openings into or out of line with the flue E, and the pipe P, having one end extending through the bottom of the vessel A, thence extending vertically upward to near the fire-box, and thence horizontally through the flue E and projecting through the end of the same, as specified.

398,053. SECURING DIAMONDS IN CUTTING-TOOLS. HUGO KELLER, New York, N. Y., assignor to Henry A. Parr, same place. Filed Apr. 26, 1888. Serial No. 271,911. (No model.)



Claim.—1. That improvement in the art of setting diamonds in

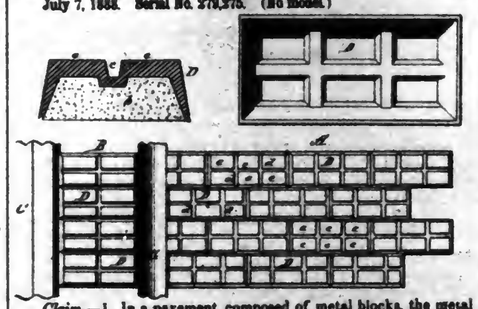
cutting-tools which consists in longitudinally dividing the cutting-edge of the tool, forming registering recesses in the contiguous faces of the sections, inserting the diamonds in said recesses, and brazing the said contiguous faces, substantially as shown and described.

2. The method herein described of setting diamonds in cutting-tools, which consists in providing the body of the tool A at its cutting-edge with a longitudinal rectangular recess, B, and a clamping-plate, B', adapted to fit said recess, said clamping-plate B' and the vertical wall of the recess being provided with registering hemispherical recesses D, formed at a slight distance from the lower edge of the tool A, said recesses forming sockets to receive the stones, said stones being retained in said sockets by means of the clamping-plate B being detachably secured to the body of the tool, substantially as shown and described.

398,054. WINDMILL. FRANKLIN B. KENDALL, Tumwater, Wash., assignor to himself, George Gelbach, same place, and Royal S. Western, Olympia, Wash. Filed Jan. 6, 1888. Serial No. 259,854. (No model.)

Claim.—1. In a windmill, the combination, with a wind-wheel provided with spokes carrying blades, of rods connected with said spokes, a sliding rod connected with said rods, and a vane connected with said sliding rod, substantially as shown and described.

2. In a windmill, the combination, with inclined rods connected with the spokes of the wind-wheel, of a sliding rod connected with the said inclined rods and passing through the shaft of the wind-wheel, a drum connected by ropes with the said sliding rod, and a vane held on the said drum, substantially as shown and described.

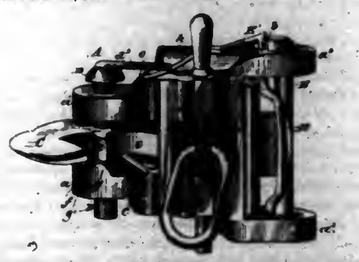


3. In a windmill, the combination, with a wind-wheel consisting of a hollow shaft supporting spokes carrying blades, of spokes having inclined faces and held in the front and rear of said wind-wheel spokes, rods secured to the outer ends of said wind-wheel spokes and extending in front of the wind-wheel in an inclined position, a block in which the inner ends of said rods are secured, and a rod carrying said block and passing through said hollow shaft, being connected with the tail-vane, substantially as shown and described.

4. In a windmill, the combination, with a sliding rod, of ropes connected with the said sliding rod, a drum on which said ropes are wound, a vane secured to the said drum and turning with the same, and a second set of ropes connected with said drum and carrying counterbalance-weights, substantially as shown and described.

5. In a windmill, the combination, with a hollow main shaft and a frame turning on the same, of a wind-wheel having a hollow shaft mounted on the said frame and connected with the said main shaft, rods connected with the upper ends of the spokes of said wind-wheel, a block in which the inner ends of said rods are fastened, a sliding rod carrying the said block and passing through the hollow shaft of the wind-wheel, a slide held on the inner end of said sliding rod and mounted in a suitable guide, ropes connected with the ends of said slide, a drum mounted on a vertical shaft and carrying the said ropes, and a counterbalanced vane held on said drum, substantially as shown and described.

6. In a windmill, the combination, with a hollow main shaft and a frame turning on the same, of a wind-wheel having a hollow shaft mounted on said frame and connected with said main shaft, rods connected with the upper ends of the spokes of the said wind-wheel, a block on which the inner ends of said rods are fastened, a sliding rod carrying the said block and passing through the hollow shaft of the wind-wheel, a slide held on the inner end of said sliding rod and mounted in a suitable guide, ropes connected with the ends of said slide, a drum mounted on the vertical shaft and carrying said ropes, a counterbalanced vane held on said drum, counterbalance-weights connected with said drum, and spokes secured to the hollow shaft of the wind-wheel and adapted to limit the bending of the spokes of the wind-wheel, substantially as shown and described.



398,055. PAVEMENT. JOHANN B. KNOCHE, San José, Cal. Filed July 7, 1888. Serial No. 279,275. (No model.)

Claim.—1. In a pavement composed of metal blocks, the metal blocks D, of shell-like construction, open at their base but having closed checkered or grooved tops and tapering downwardly-diverging sides of diminishing thickness toward their bases, substantially as specified.

2. In a street or road having a carriage-way, A, gutter B, and sidewalk C, the carriage-way and gutter pavements each composed of metal shell-like blocks D, constructed as described, and metal flanged supports G, extending from the gutter-blocks up to the tops of the adjacent carriage-way blocks and arranged to bear against the sides of the latter and to brace them and the gutter-blocks, essentially as shown and described.

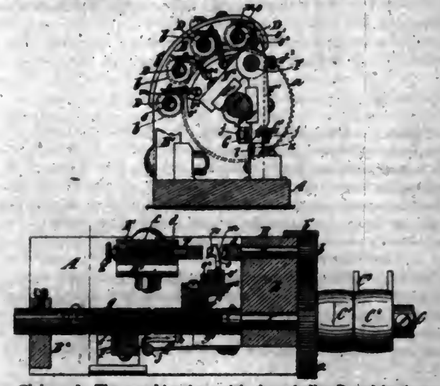
398,056. CAR-COUPLING. EPHRAIM H. B. KNOWLTON, Watertown, Dak., assignor of three-fourths to Arthur C. Mellette, John J. Owsley, Sr., and Otis E. Dewey, same place. Filed Feb. 2, 1888. Renewed Dec. 20, 1888. Serial No. 294,247. (No model.)

Claim.—1. The car-coupling having its draw-head provided with a recess in its one side and with a vertical bead or rib in its other side, and its coupling-hook provided with an arm standing in alignment with said recess, substantially as specified.

2. The car-coupling having its coupling-hook provided at its inner pivoted end with an arm struck by the opposite draw-head, and which hook is also provided with a stud arranged adjacently to said arm and adapted to be acted upon by the uncoupling contrivance, substantially as set forth.

3. In a car-coupling, the draw-head having the pivot-pin and the coupling-hook riding upward and laterally upon said pivot-pin and provided with a stud upon its under side and a stud at its inner end, one stud riding upon and resting in a recessed elevation of the draw-head, while the other stud is struck or acted upon by an uncoupling contrivance, substantially as set forth.

4. The car-coupling comprising the draw-head provided at one side with a coupling-hook having a stud intermediately of its beak and armed end, the opposite side of said draw-head having an uncoupling bail-shaped contrivance, substantially as set forth.



5. In a car-coupling, the draw-head having at its one side a recess, and at one side of said recess an elevation, and the coupling-hook having at its inner pivoted end an arm about at a right angle to its body and a stud upon its under side, substantially as set forth.

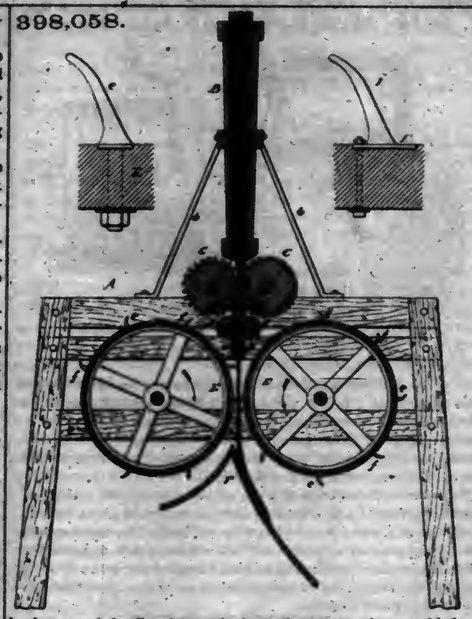
6. In a car-coupling, the draw-head having at its one side a recess, and at one side of said recess an elevation provided in its upper surface with a recess, and the coupling-hook locked to its pivot-pin and provided with a stud upon its under side and at its inner pivoted end with an arm about at a right angle to its body, and with a stud facing said arm, substantially as specified.

7. In a car-coupling, the draw-head having at its one side a recess and at one side of said recess an elevation provided in its upper surface with a recess, and a coupling-hook provided at its inner pivoted end with an arm and a stud, and also upon its under side with a stud, said draw-head having at its opposite side a coupling-pin and an uncoupling contrivance or cranked rod, substantially as specified.

398,057. MACHINE FOR WINDING SEWING-MACHINE BOBBINS, &c. WILLIAM R. LANEHAR, Brooklyn, N. Y., assignor to the Willimantic Linen Company, Willimantic, Conn. Filed Feb. 7, 1884. Serial No. 120,068. (No model.)

Brief.—The object of the invention is to produce a simple and compact machine for winding several bobbins at once.

Claim.—1. The combination, with the spindles D and back-centers E, arranged in the arc of a circle, of the spindle-driving shaft C, concentric with said arc and provided with right and left hand threads *g g'*, gearing for driving said spindles from said shaft, the traverse-rod F, with its arms F' F², and their nuts *f f'*, engaging with said threads on the said driving-shaft, and guides, one for each spindle, all carried by the single traverse-rod, substantially as herein described.



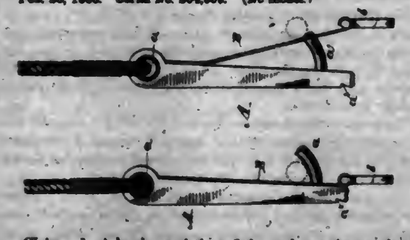
2. The combination, with the spindles and back-centers D E, arranged in the arc of a circle, of the concentric right and left hand threaded driving-shaft, the traverse-rod F, and its arms F' F², having nuts *f f'*, engaging each respectively with one of the threads of the driving-shaft, thread-guides, one for each spindle, all carried by the one traverse-rod, the projection *h*, having cam-surfaces *i i'*, and a tongue, *k*, all carried by one of the arms of the traverse-rod, the springs G G', and the stationary cam or abutment *l*, all substantially as herein described.

398,058. ROTARY BRAKE. PAUL LANGUAMMER, New Orleans, La. Filed Feb. 10, 1888. Serial No. 263,605. (No model.)

Claim.—1. In a machine for extracting fibers, the combination of a pair of rotary crushing-rolls, a pair of rotary holding-rolls, a pair of rapidly-revolving cylinders provided with rows of teeth having rounded-off points and alternating scraper bars or blades having rounded-off edges, and guide-boxes located between the crushing and holding rolls and between the latter and the scraping-cylinders, substantially as set forth.

2. In a machine for extracting fibers, the combination of a tapering feed box or hopper, a pair of rotary crushing-rolls, a pair of rotary holding-rolls, a pair of rotary cylinders having rows of teeth

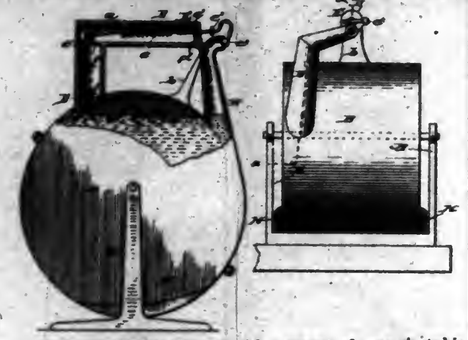
398,058.



having rounded-off points and alternating scraper bars or blades having rounded-off edges, guide-boxes interposed between the feeding and holding rolls and between the latter and the cylinders, and an inclined conducting-plate for the fibers, substantially as set forth.

398,059. BRAKE-HOSE COUPLING. EDWIN A. LELAND, Brooklyn, N. Y., assignor to Leonard Richardson, same place. Filed Oct. 18, 1888. Serial No. 288,474. (No model.)

Claim.—In a brake-hose coupling, two separable and similar members, each having a semi-cylindrical exterior shell, 5, inclosing a cylindrical section, 6, having its open end part way between the extremity of said shell and a shoulder, 5ª, formed by removing the exterior to leave the half-shell, each member being also provided with a lug, 17, having a beveled end extending over the shoulder 5ª and a cam-surface, 18, plug-valves 12, opening and closing the air and steam passages in the parts, levers 15, mounted on the stems of said valves 12 and having weights 16 and cam projections 18ª, and chains or similar connections 21, uniting the free ends of said levers to the car-platforms, said chains being of such length as to draw taut as the cars separate before the hose-pipes are drawn straight, the whole being constructed and combined substantially as described.



398,060. HOOK. ANDREW M. LEWELLEN, Rosendale, Mo. Filed Feb. 20, 1888. Serial No. 264,669. (No model.)

Claim.—1. A hook consisting of the main portion or shank, the projection forming the hook, and the spring attached to the shank extending beyond and embracing the projection, the said spring being arranged, substantially as described, to be in the rear of and bear upon any object to which the hook is attached.

2. A hook comprising a shank, a projection therefrom serving as a hook, and a spring arranged contiguous to the projection and provided with a loop attached to the free end of the spring, designed to engage the end of the shank, substantially as described

398,061. LIQUID-HOLDING VESSEL. STEWART R. MACK, Moulton, Iowa. Filed Mar. 23, 1888. Serial No. 268,215. (No model.)

Claim.—1. The combination, with a support, of a can pivoted in said support and provided with a hollow handle communicating with the can, and an upwardly and rearwardly projecting spout having its end in alignment with the handle, a valve for closing the spout, and a second valve for establishing or closing communication between the handle and can, substantially as described.

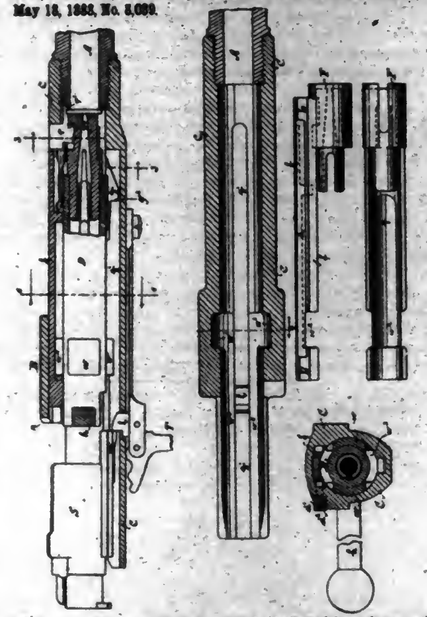
2. The combination, with a support, of a can pivoted in said support and provided with a hollow handle communicating with the can, and a spout at one side carved upward and inward in alignment with the handle, a spring secured to the inside of the handle and provided with a valve, and a spring-rod secured to said spring and projecting through the handle and carrying a valve on its end, substantially as herein shown and described.

398,062. WOOD-BLOCK FLOORING OR PAVING. MALCOLM MACLEOD, Philadelphia, Pa. Filed Nov. 30, 1888. Serial No. 292,211. (No specimens.)

Claim.—1. The combination of wooden blocks B B' B'' B''' B^{IV}, secured laterally one to another by double-shanked nails M, which latter are provided with middle flanges or rims, concrete substratum A, mastic E, intermediate between the concrete and the said blocks, anchor-iron clip L, embedded in and surrounded by the concrete, screw K, passing through block B''' and engaging in a screw-threaded hole in anchor-clip L, and grooves F F in the lower faces of the blocks to engage with the mastic, substantially as described.

2. The combination of wooden blocks B B' B'' B''' B^{IV}, secured laterally one to another by double-shanked nails M, which latter are provided with middle flanges or rims, concrete substratum A, mastic E, intermediate between the concrete and the said blocks, anchor-iron clip L, embedded and surrounded by the concrete, screw K, passing through block B''' and engaging in a screw-threaded hole in anchor-clip L, grooves F F in the lower faces of the blocks to engage with the mastic, and opposite <-shaped grooves G G, the lower edges of which are separated to receive the mastic to bind the blocks to the latter, substantially as described.

3. The combination of wooden blocks B B' B'' B''' B^{IV}, concrete substratum A, intermediate layer of mastic, E, double-shanked nails M, to unite the blocks laterally one with the other, and serrated bar D, passing through wooden block B'', through the mastic, and into the concrete, with which it engages, and is held fast by its serrations, substantially as described.



4. The combination of wooden blocks B B' B'' B''' B^{IV}, concrete substratum A, and intermediate layer of mastic, E, the said blocks being provided with saw-grooves F F upon their lower surfaces, as shown, to engage them with the mastic, substantially as described.

5. The combination of wooden blocks B B' B'' B''' B^{IV}, united laterally by double-shanked middle flanged or rimmed nails M, concrete substratum A, and intermediate mastic, E, substantially as described.

6. The combination of wooden blocks B B' B'' B''' B^{IV}, concrete substratum A, intermediate mastic, E, metallic anchor-clip L, embedded in and surrounded by the mastic, and screw K, passing through one of said wooden blocks and engaging in a screw-threaded hole in the said clip, substantially as described.

7. The combination of wooden blocks B B' B'' B''' B^{IV}, substratum A, intermediate mastic, E, and screw D, passing through one of said blocks and the mastic and engaging beneath with the substratum to hold the blocks down, substantially as described.

398,063. BREECH-LOADING FIRE-ARM. PAUL MAUSER, Oberndorf-on-the-Neckar, Würtemberg, Germany, assignor to the Waffenfabrik Mauser, same place. Filed June 27, 1888. Serial No. 278,321. (No model.) Patented in Belgium Mar. 8, 1888, No. 80,962; in Italy Mar. 31, 1888, No. 23,906/479; in England Apr. 9, 1888, No. 5,244, and in Spain May 16, 1888, No. 8,089.

Claim.—1. The combination, with the bolt and breech-case, the latter formed with the bridge over the rear portion of the bolt and with a longitudinal guideway extending beneath said bridge, of the bolt-head made in a separate piece from the bolt and swiveled thereto, so that it is moved longitudinally with the bolt, but does not partake of the oscillatory movement thereof, and a guide-plate arranged over the bolt and beneath said bridge, movable longitudinally in said guideway, and fastened to the bolt-head, whereby it derives longitudinal motion from the latter and prevents oscillatory movement thereof.

2. The combination, with the breech-case formed with a longitudinal guideway and the bolt formed with a recoil projection, of a guide-plate arranged over the bolt in said guideway and having a recess into which said projection enters as the bolt is oscillated to unlock it.

3. The combination, with the bolt having a recoil projection, of the breech-case having a recess entered by said recoil projection when the bolt is in the locked position and a guide-plate mounted to slide longitudinally and having a recess entered by said recoil projection when the bolt is in the unlocked position.

4. The combination, with the bolt and its locking-lever, of the breech-case formed with a bridge over the rear portion of the bolt, and having an inclined face, *n*, at the rear of this bridge in position to be engaged by the locking-lever while the latter is being turned up to unlock the bolt, and thereby to draw back the bolt sufficiently to start the extraction of the cartridge-shell.

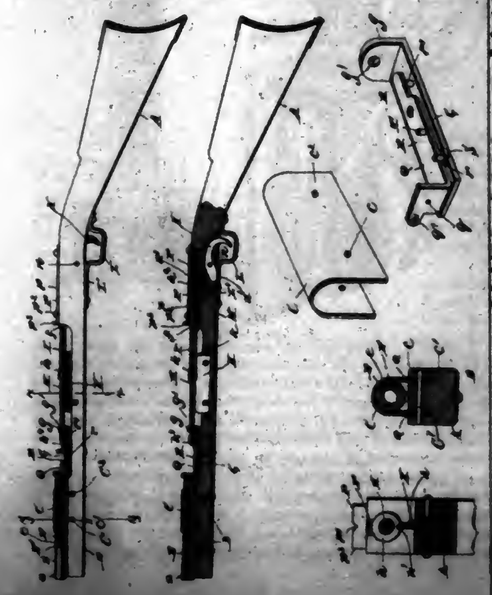
5. The combination, with the bolt and the longitudinally-sliding guide-plate connected to and moving with it, of the reciprocal stops for limiting the rearward movement of the bolt, consisting of a shoulder on said guide-plate and a stop-tooth or projection stationary relatively to the breech-case in the path of said shoulder.

6. The combination, with the breech-case and the bolt, of a longitudinally-sliding guide-plate connected to the bolt to be moved thereby, and formed with a groove, *a*, terminating in a shoulder, *b*, and a stop-tooth, *d*, arranged in said groove and mounted on a lever, *d'*, pivoted to the breech-case.

7. The combination, with an oscillatory bolt and a bolt-head restrained from oscillation, of an ejector consisting of a sliding piece working in a longitudinal guideway in the bolt-head and projecting beneath the same, the breech-case having a longitudinal groove in which said projecting portion moves when the bolt is retracted, and a stop projecting into said groove for arresting said ejector.

8. The combination, with an oscillatory bolt and a bolt-head restrained from oscillation, of an ejector consisting of a slide-piece mounted in a longitudinal guideway in said bolt-head and having a rearward shoulder, and a trigger-beak arranged in position relatively to said shoulder to be encountered thereby and arrest the ejector during the retractile movement of the bolt.

398,064. CARTRIDGE-EJECTOR FOR BREECH-LOADING FIRE ARMS. PAUL MAUSER, Oberndorf-on-the-Neckar, Würtemberg, Germany, assignor to the Waffenfabrik Mauser, same place. Filed July 2, 1888. Serial No. 278,759. (No model.) Patented in Belgium Mar. 8, 1888, No. 80,963; in Italy Mar. 31, 1888, No. 23,905/473; in England Apr. 17, 1888, No. 5,709, and in Spain June 12, 1888, No. 8,054.



Claim.—1. The combination, with the breech case and bolt, of the bolt-head formed with a recess in one side, and an ejector consisting of a bar arranged to slide longitudinally in a groove in the breech-case and having a ledge entering said recess, an ejector-pin fixed to said ledge and sliding in a hole in the bolt-head, a spring in said recess pressing backwardly against said ledge, and a stop for limiting the rearward movement of the ejector.

2. The combination, with the breech case and bolt, of the bolt-head formed with a recess in its side, an ejector consisting of a bar arranged to slide longitudinally in a groove in the breech-case and having a ledge entering said recess, and bored out on the front side to form a cup, an ejector-pin in said recess working through a hole in the front of the bolt-head and fastened to said ledge, and a spring confined within said recess in the bored-out portion of said ledge, with a stop for limiting the backward movement of the ejector.

3. The combination, with the bolt, of the breech-case having a longitudinal groove on one side, an ejector-bar arranged to slide in said groove and formed with a groove on its outer side terminating in a shoulder, a stop projecting from the breech-case into said groove for limiting the rearward movement of the bar, an ejector-pin fastened to said bar, and a spring for retracting said pin.

4. The combination, with the bolt, of the breech-case having a longitudinal groove on one side, an ejector-bar arranged to slide in said groove and formed with a groove on its outer side terminating in a shoulder, a stop consisting of a lever pivoted to the exterior of the breech-case, and formed with a tooth projecting through a slot in the side of the breech-case and entering said groove in the bar, and a spring pressing against said lever and holding it normally with said stop entering said groove, an ejector-pin fastened to said bar, and a spring for retracting said pin.

398,065. BREECH-LOADING GUN. WILLIAM C. MAYNARD, Mount Pleasant, Mich. Filed Aug. 1, 1888. Serial No. 281,859. (No model.)

Claim.—1. In a rifle, the combination, with the stock, of the barrel arranged thereon, the clasp or sleeve passing over the barrel and secured at its edges in the stock, and the set-screws passing vertically up through the stock and bearing against the lower side of the barrel to clamp it firmly in the clasp or sleeve, substantially as and for the purpose specified.

2. In a rifle, the combination of the stock, with the barrel, the clasp or sleeve C, passing over the barrel and inserted at its edges in parallel grooves in the stock, the transverse pin passing through registering apertures in the stock and the front end of the clasp or sleeve, the screws engaging apertures in the rear ends of the clasp or sleeve, and the set-screws bearing against the under side of the barrel at its front and rear ends, respectively, to hold the same firmly clamped in the clasp or sleeve, substantially as specified.

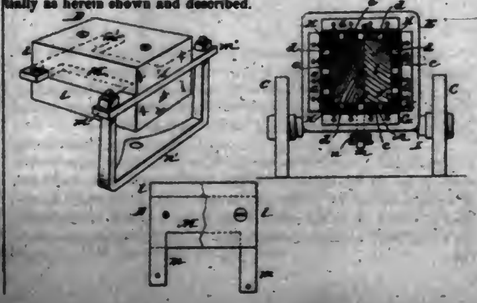
3. In a rifle, the combination, with the stock, the barrel thereon, and the spring-actuated firing-rod provided with a groove, h^2, of the trigger-guard provided with an extension or arm, L', the engaging-pin connected to the free end of the said extension or arm and adapted to normally engage the groove h^2 in the firing-rod, and the trigger provided with an arm, *x'*, bearing on the said extension or arm and adapted when operated to depress the same and release the firing-rod, substantially as specified.

4. In a rifle, the combination, with the barrel having an open breech, of the firing-rod provided with an actuating-spring, and a knob or handle, *h*, on the rod provided with a notch operating on a guiding-web, K, substantially as specified.

5. In a rifle, the combination, with the stock having the bearings *f* and *g'*, of the firing-rod mounted in the said bearings and provided with the knob or handle *h*, the spring coiled on the firing-rod between the bearing *f* and the knob or handle, and the guiding-web attached to the stock under the firing-rod and fitting at its upper edge in a notch in the under side of the said knob or handle, substantially as and for the purpose specified.

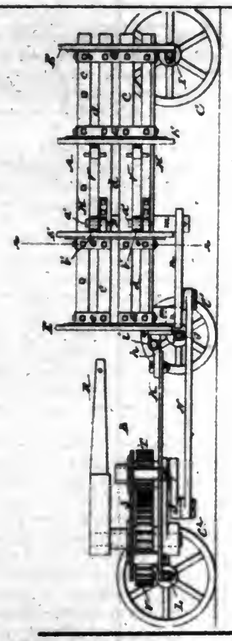
6. In a rifle, the combination, with the breech-guard covering the breech of the barrel and the firing-rod, of the safety-pin connected to the breech-guard and adapted when the breech is opened to assume a position between the breech and the end of the firing-rod, substantially as specified.

7. In a rifle, the combination, with the barrel and the firing-rod, of the breech-guard adapted to close the breech of the barrel, and having a pivoted plate, R, provided with a vertical safety-pin, T, adapted to assume a position between the firing-rod and the breech when the guard is removed from the breech, substantially as and for the purpose specified.



8. In a rifle, the combination, with a barrel having an open breech, of the breech-guard having a pivoted plate, R, adapted to cover the breech of the barrel, and a friction-spring located under the said pivot-plate to hold the guard from accidental movement, substantially as specified.

9. In a rifle, the combination, with the breech-guard having a pivoted plate, R, provided with a safety-pin, T, of the stud *r*, arranged in the path of the front end of the plate and adapted to stop the same when the breech is closed, and the tail or projection on the rear end of the plate adapted to strike a stud, *r'*, when the breech is open, substantially as and for the purpose specified.



398,066. HAY-PRESS. MICHAEL MCCARTY, Montrose, Colo. Filed May 9, 1888. Serial No. 273,301. (No model.)

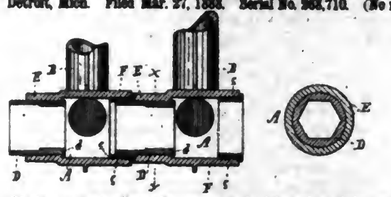
Claim.—1. In a hay-press, a plunger consisting of two sections, a bar arranged between the said sections and provided with arms adapted to project through the press-box, and a connecting bar or rod for the arms outside of the press-box, substantially as herein shown and described.

2. In a hay-press, the combination, with the press-box A, having a slotted bottom, of the plunger D, provided with the arms *m*, projecting through the slot of the bottom of the press-box, the bar *n*, connecting the arms of the plunger, the connecting rod or bar N, the crank S, the pinion T, the spur-wheel U, and the sweep R, substantially as herein shown and described.

398,066.

398,067. SIGNALING DEVICE FOR RAILWAY-TRAINS. MICHAEL MCCORMICK and FREDERICK FARISH, Toronto, Ontario, Canada, assignors of one-third to Michael Donnelley, same place. Filed May 21, 1888. Serial No. 274,557. (No model.)

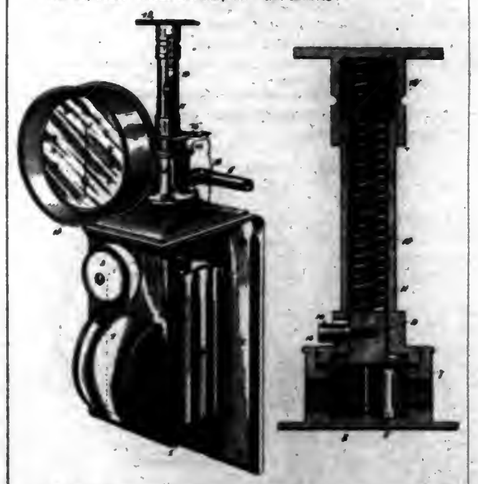
Claim.—1. A signal placed at some conspicuous point on a railway-car, in combination with a chain having detachable connection with another car and connected with the signal-board of said signal, a hook connected with one end of said chain, and a weight carried by said hook, substantially as and for the purpose specified.



2. A box, A, fixed in some conspicuous part of a car, and having a signal-board, C, fixed to its hinged door E, in combination with a chain, G, having detachable connection with another car, and one end of which is connected to the signal-board C and its other end to the head of a hook, L, on the shank of which the weight K is suspended, the whole being arranged substantially as and for the purpose specified.

3. A box, A, fixed in some conspicuous part of a car, and having a signal-board, C, fixed to its hinged door E, on which the weight F is attached, in combination with a chain, G, having detachable connection with another car, and one end of which is connected to the door C and its other end connected to the head of a hook, L, on the shank of which the weight K is suspended, the whole being arranged substantially as and for the purpose specified.

4. A box, A, fixed in some conspicuous part of a car, and having a signal-board, C, fixed to its hinged weighted door E, and a door, E', hinged to the door E, in combination with the chain G, having detachable connection with another car, and one end of which is connected to the door C and its other end connected to the head of a hook, L, on the shank of which the weight K is suspended, the whole being arranged substantially as and for the purpose specified.

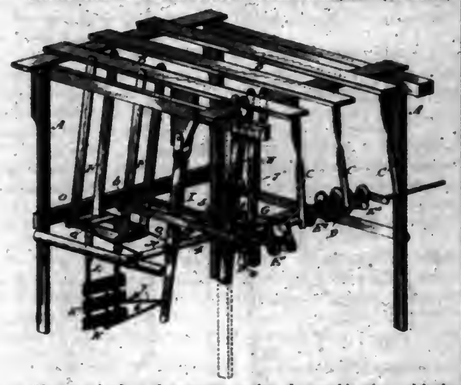


5. A box, A, fixed in some conspicuous part of a car, and having a lamp, D, suspended from it, and a hinged portion, E', of the door E, in combination with a chain, G, having detachable connection with another car, and one end of which is connected to an inner projection on the door E and its other end connected to the head of a hook, L, on the shank of which the weight K is suspended, the whole being arranged substantially as and for the purpose specified.

398,068. COUPLING FOR PARALLEL PIPES. JAMES MCEWAN, Detroit, Mich. Filed Mar. 27, 1888. Serial No. 268,710. (No model.)

Claim.—A coupling-pipe connected with and at right angles to the main or circuit pipe, said coupling-pipe being screw-threaded interiorly on both ends but having the interior diameter at one end larger than at the other, combined with a bushing screw-threaded on the outside and on the inside, the interior diameter of the bushing being equal to the interior diameter at the smaller end of the coupling-pipe, and a nipple screw-threaded on its outside to fit the interior of said bushing and the smaller end of the coupling-pipe, substantially as and for the purposes described.

398,069. SAFETY-GAGE. AUGUSTUS F. NAGLE, Chicago, Ill. Filed Oct. 20, 1888. Serial No. 288,708. (No model.)

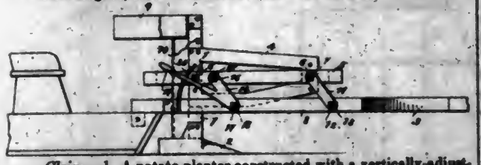


Claim.—1. In an electrical pressure-indicator, the combination, with the chamber 5 and the contact-arm 15, of the shell 11, the movable plug 9, provided with a contact-point, 14, a spring, 10, bearing upon the plug, a diaphragm, 7, mounted in the chamber 5 and adapted to actuate the plug, which is independent of the diaphragm, a pipe, 6, adapted to convey fluid to the chamber beneath the diaphragm, and electric connections, all arranged for operation substantially as shown.

2. In an electrical pressure-indicator the combination, with the chamber 5 and the contact-arm 15, of the shell 11, provided with a spring, 10, a diaphragm, 7, mounted in the chamber 5, a plug, 9, provided with a contact-point, 14, and resting upon the diaphragm, a stem, 8, adapted to support the diaphragm, and electrical connections,

3. In an electrical pressure-indicator, the combination, with the hollow shell 11 and the chamber 5 and diaphragm 7, of the movable plug 9, resting upon the latter and adapted to complete the circuit, a spring, 10, inserted into the shell and resting upon the plug to act in opposition to the pressure of the fluid, and an adjustable cap, 12, upon the end of the shell adapted to vary the tension of the spring.

4. The combination, with the chamber 5, provided with a diaphragm, 7, and a plug, 9, of the shell 11, provided with a spring, 10, and with a scale, 18, and a graduated adjustable cap, 12, secured to the shell 11 and adapted to vary the tension of the spring.

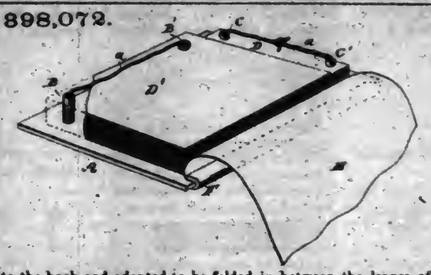


398,070. RIVER-POWER ENGINE. ADOLPHUS F. W. ESTHAMER, Detroit, Mich. Filed Dec. 16, 1887. Serial No. 258,081. (No model.)

Claim.—1. In a river-power engine, the combination, with the swinging frames F and L and the blades K and connecting-bar M, of a swinging arm, I, connections between said arm and the bar M, and connections between a motor-shaft and the swinging frames F, whereby a plane perpendicular surface is presented by the blades to receive the impulse of the current on the downstream movement of the said swinging frames, and the blades are feathered, so as to present only their edges to the current on the upstream movement thereof, substantially as described.

2. In a river-power engine, the combination, with the swinging frames F and L, the blades K, and connecting-bar M, of the swinging arms I, H, and J, connecting-rods 6 and 7 between said arms I and the bar M, the bar 5, connecting arms I and H, the bar G, connecting arms I and J, and pitman 4, connecting the swing-frames F with a motor-shaft, all substantially as described and set forth.

398,071. POTATO-PLANTER. JOHN R. CHILSON, Rockford, Wash. Filed Aug. 30, 1888. Serial No. 284,159. (No model.)



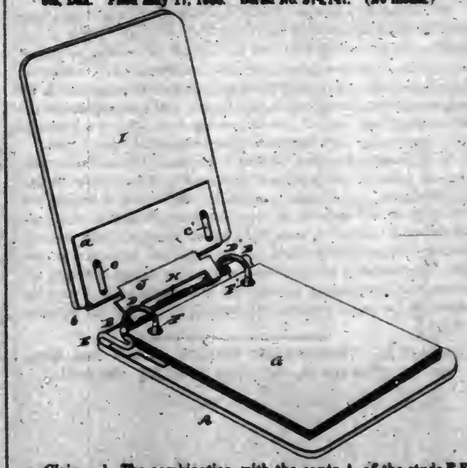
Claim.—1. A potato-planter constructed with a vertically-adjustable frame and standard mounted on the forked end piece of the pole of the machine, a seed-box and discharge-chute on the standard, a plow on the lower end of the standard adjacent to the lower end of the discharge-chute, and pivoted links connecting the vertically-adjustable frame with the forked end of pole, a curved toothed bar on the latter, and a lever on one of the links engaging the curved toothed bar, substantially as shown and described.

2. A potato-planter constructed with a vertically-adjustable standard, 1, extending between the arms 8 of the forked end of pole 5, a plow, 2, at its lower end, a seed-box, 9, at its upper end, with a discharge-chute, 10, and forwardly-projecting frames 4, having their lower portion projecting between the arms 8 of the forked end of a pole, 3, horizontal strips 5, bolted to standard 1 and frames 4, and connected by pivoted links 11 and 14 with arms 8, a curved toothed bar, 20, mounted on one of the arms 8, and a lever-handle, 19, on one of the links 14, engaging the toothed bar 20, substantially as shown and described.

398,072. DUPLICATING-TABLET. WILLIAM H. PARKER, Columbia, Dak. Filed May 17, 1888. Serial No. 274,146. (No model.)

Claim.—1. In a duplicating-tablet, the combination, with a back, of two books secured to the back by independent fastenings, with their leaves alternating with each other, and a carbon-paper secured

398,072.



to the back and adapted to be folded in between the leaves of the said books, substantially as described.

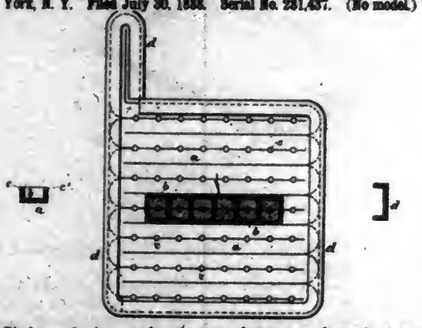
2. In a duplicating-tablet, the combination of the back A, provided with the tubes B B' C C, the books D D' on the said tubes, the strings *a*, passing through said tubes, and the carbon-paper E, secured to the back, substantially as described.

3. In a duplicating-tablet, the combination of the back A, provided with the tubes B B' C C, the strings *a*, the carbon-paper E, and the carbon-paper fastener F, substantially as specified.

398,073. TEMPORARY BINDER. WILLIAM H. PARKER, Columbia, Dak. Filed May 17, 1888. Serial No. 274,147. (No model.)

Claim.—1. The combination, with the cover A, of the studs F F' and the rock-shaft C, provided with the curved arms D D', substantially as specified.

2. The combination of the cover A, provided with the studs F F', the spring-actuated rock-shaft C, provided with the curved arms D D' and lever E, the cover I, and the link J, connecting the covers A I, substantially as specified.

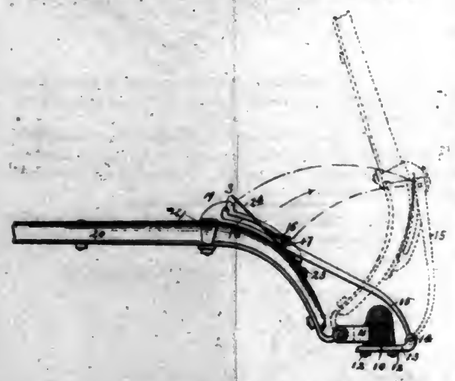


398,074. COMBINED CURB AND GUTTER. AUGUSTUS G. PARKHURST, Minneapolis, Minn. Filed Oct. 15, 1888. Serial No. 288,076. (No model.)

Claim.—1. A combined curb or gutter of artificial stone or cement, having its facing or exposed surface of harder and more durable material than its mass and fitted with the rear projections, 11 and 13, by means of which it is anchored and held in position by the surrounding and superincumbent earth.

2. In combination, the street-pavement 1, sidewalk 3, the combined curb and gutter 7, having the rear projections, 11 and 13, and a facing or outer surface, 17, composed of harder and more durable material than the mass of the structure.

398,075. SECONDARY BATTERY. JOHANNES T. PEDERSEN, New York, N. Y. Filed July 30, 1888. Serial No. 281,437. (No model.)

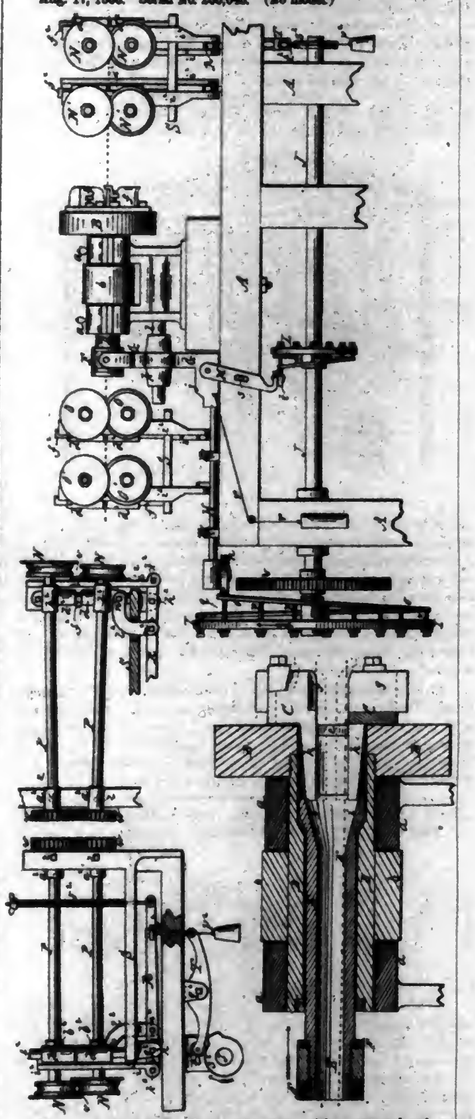


Claim.—1. A secondary-battery element or electrode formed from a strip or bar of rolled or cast lead bent upon itself to form a series of flattened horizontal convolutions, and having pockets or holes formed or pressed into or through the surface of said strip to contain the active material of the battery, and having grooves or openings through which access is obtained to the active element, substantially as set forth.

2. A secondary-battery element or electrode formed from a strip or bar of rolled or cast lead bent upon itself to form a series of flattened horizontal convolutions, and having pockets or holes formed or pressed into the surface of said strip to contain the active material of the battery, and having grooves or openings through which access is obtained to the active element, and a strip passing around the bent or convoluted ends of the strip or bar and confining the same to place, and forming a homogeneous plate, substantially as set forth.

3. A secondary-battery element or electrode formed from a strip or bar of rolled or cast lead bent upon itself to form a series of flattened horizontal convolutions, pockets or holes formed or pressed into or through one or more of the opposing surfaces of said strip, said pockets being adapted to receive the active element of the battery, there being cross-grooves which, when brought into opposition to each other, form openings through the surface of the convoluted strip, the pockets in said strip being also brought into opposition to connect the surfaces of the active material, substantially as and for the purposes set forth.

398,076. VEHICLE-SHAFT SUPPORT. JAMES A. PEEL, Springport, Ky. Filed Nov. 19, 1888. Serial No. 291,946. (No model.)



Claim.—1. The combination, with an arm arranged for pivotal connection with a vehicle running-gear and provided with a stud, of a plate arranged for connection with the shafts of said vehicle and formed with an L-shaped slot, the shorter slot being at the forward end of the longitudinally-extending slot and at an angle thereto to form a shoulder to engage said stud, substantially as described.

2. The combination, with an arm arranged for pivotal connection with a vehicle running-gear and provided with a stud, of a plate formed with an L-shaped slot and arranged for connection with the vehicle-shafts, and a spring carried by the plate and arranged to bear upon the arm, the arm-stud riding in the plate-slot, as and for the purpose specified.

3. The combination, with an arm arranged for pivotal connection with a vehicle running-gear and provided with a thumb-piece and a stud, of a plate arranged for connection with the vehicle-shafts and formed with an L-shaped slot in which the arm-stud rides, and a spring carried by the plate and arranged to bear against the arm, as and for the purpose stated.

398,077. LATHE. SANFORD A. PERRY, Rochester, N. Y. Filed Aug. 17, 1888. Serial No. 283,043. (No model.)

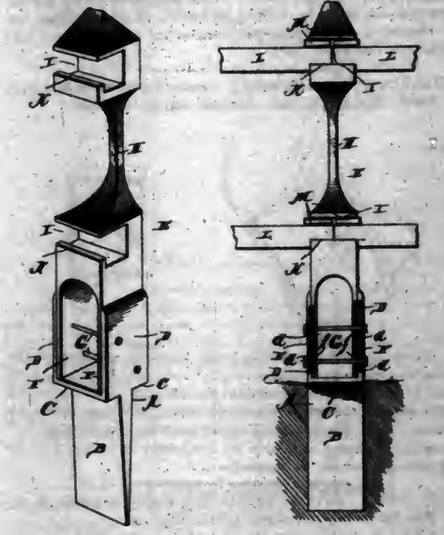
Claim.—1. In a lathe, the combination, with a cutter-head provided with a central hole for the passage of the article to be turned, of a set of knife-stocks pivoted to the face of the cutter-head and provided with guide-arms that extend inward through the hole and are operated upon by a mandrel to close the cutters to their work, as set forth.

2. In a lathe, the combination, with a cutter-head provided with a central hole for the passage of the article to be turned, of a set of knife-stocks pivoted to the head, a set of knives attached to said stocks and standing tangentially to the opening, and a set of gages attached to said stocks standing radially to the hole, as and for the purpose specified.

3. In a lathe, the combination of a cutter-head provided with a center hole, a set of knife-stocks carrying knives pivoted to said head and provided with guide-arms that extend into the hole, and a mandrel provided with a beveled end against which the guide-arms rest and by which they are operated, as herein shown and described.

4. The combination of the cutter-head B, mounted on a shaft and provided with the central hole, *c*, the set of knife-stocks C C, pivoted to the head and provided with the guide-arms *h h*, extending into the hole, the sliding mandrel E, provided with a beveled end that engages with the guide-arms, the lever G, connecting with the mandrel, the plunger H, connected with the lever, the cam *o*, for giving motion to the plunger, and the weighted cord *r*, for producing reaction on the lever, all operating in the manner and for the purpose specified.

5. In a lathe, the combination of the cutter-head provided with a central hole, a set of knife-stocks carrying knives and provided with guide-arms and pivoted to said cutter-head, a mandrel with a beveled end connecting with the guide-arms for operating the same, and feed-rollers for feeding the article to be turned through the cutter-head, as herein shown and described.



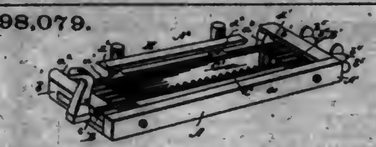
6. In a lathe, the combination of the grooved feeding-rollers N N, their shafts P P, boxes a^3 a^3, pivoted to their supports to allow the shafts to spread, the spindle f^3, sockets d^3 d^3, resting and sliding thereon, and the boxes b^3 b^3, pivoted to said sockets, as shown and described, and for the purpose specified.

7. In a lathe, the combination, with the shafts P P, carrying feed-rollers N N, of the spindle f^3, the sockets d^3 d^3, sliding thereon, the boxes b^3 b^3, pivoted to said sockets and supporting the shafts, the lever R, the link i^3, connecting the said lever with the upper box, and the link l^3, connecting said lever with the lower box, as shown and described, and for the purpose specified.

8. The combination, with the shafts P P, carrying feed-rollers N N, of the spindle f^3, the sockets d^3 d^3, sliding thereon, the boxes b^3 b^3, pivoted to said sockets, the lever R, the links i^3 and l^3, connecting said lever with the sockets, the lever T, connected with the lever R by link r^3, the cam s^3, and the reacting spring-rod o^3, as and for the purpose specified.

9. In a lathe, the combination, with the slide *j*, plunger H, and cam *o*, of the lever M, pivoted to the slide, the cam L, for operating the lever, and the weighted cord *r*, for producing reaction of the slide, as shown and described, and for the purpose specified.

398,078. FENCE-POST. ALBIN G. PETERSON, Arvada, Ia., assignor of one-half to Thomas J. Brooks, same place. Filed Nov. 21, 1888. Serial No. 291,419. (No model.)

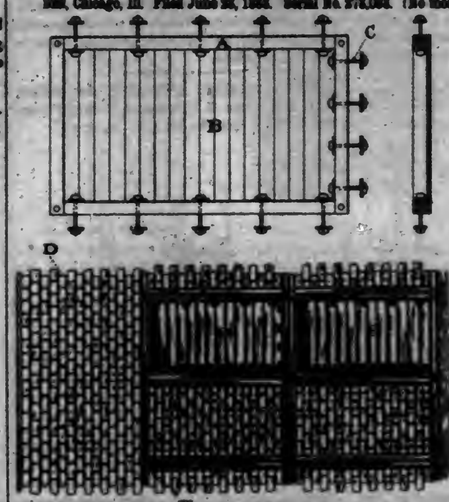


Claim.—In a fence-post, the combination, with the anchor secured in the ground and provided with the vertical ears D D at right angles to the line of the fence, of the upright provided with the depending parallel ears F F, fitting between the ears D D and provided with apertures *f f*, registering with apertures *d d* in the ears D D, and the bolts or screws engaging the said registering apertures, substantially as specified.

398,079. SAW. HERMILAS PETRY, Rockport, Mo. Filed July 20, 1887. Serial No. 245,030. (No model.)

Claim.—1. A saw-frame consisting of the parts A' A^2, the part A' being provided with grooved end pieces, *b b'*, and the part A^2 provided with flanges a^2, fitting in the grooves of the said end pieces, and saw-heads carried by the end pieces of the part A', one of the said heads being movable and the other stationary, substantially as herein shown and described.

398,079.



2. The combination, with a saw-frame consisting of the part A', provided with the grooved and slotted end pieces, *b b'*, and the part A^2, provided with the flanges a^2, of the saw-heads B B', the head B being rigidly secured to the end piece *b* of the part A', and the head B' having the shank fitting loosely in the slot of the end piece *b'*, and provided with means for movably supporting it in the said slot, whereby provision is made for adjusting the tension of the saws and locking the parts of the frame together, substantially as herein shown and described.

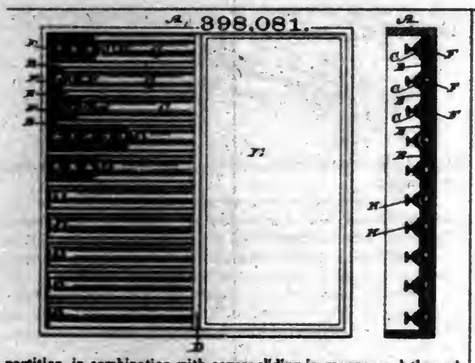
3. The combination, with the frame A, composed of the parts A' A^2 and having slotted end pieces, *b b'*, of the saw-heads B B', provided with a series of slits, b^2, the head B being rigidly secured to the end piece *b*, and the head B' having its shank fitting loosely in the slot of the end piece *b'* and provided with the screw-threaded rods b^4 and the nuts b^5 on the said rods, substantially as herein shown and described.

4. The combination, with a saw-frame having apertures in one of its side bars, of the gage E, provided with shanks adjustably secured in the apertures of the said side bar, substantially as herein shown and described.

398,080. DEVICE FOR PROTECTING SHORES. JOSEPH M. REARDEN, Chicago, Ill. Filed June 26, 1888. Serial No. 278,093. (No model.)

Claim.—1. A device for protecting shores, constructed of a series of cribs made of a stout and durable substance, firmly bolted together and filled with rubble-stones grouted and cemented so as to form one solid mass, substantially in the manner herein set forth.

2. A device for protecting shores, built and constructed of a series of cribs made of a stout and durable substance, firmly bolted together and filled with rubble-stones or other similar substance grouted and cemented so as to form one solid mass, substantially as herein described, as a foundation for and in combination with a rubble-stone or other pavement, substantially as described.



398,081. POOL-REGISTER. HOWARD R. ROBBINS, Sacramento, Cal. Filed Oct. 15, 1888. Serial No. 288,142. (No model.)

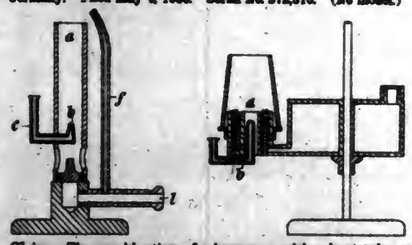
Claim.—1. A pool-registering device consisting of a case having horizontal channels with balls fixed permanently therein to one-half their length, slides traveling in guides, so as to conceal or expose the balls, and an inclosed or uncovered chamber into which the slides run when the balls are exposed, substantially as herein described.

2. A registering device for ball-pool, consisting of a case having channels, within half of which balls are fixed, slides traveling in guides over said channels, and having numbered disks fixed to them, substantially as herein described.

3. A case having a vertical central partition, horizontal channels extending across the case and containing balls upon one side of the

398,081.

partition, in combination with covers sliding in grooves and through the central partition, and having numbered disks or knobs upon them, substantially as herein described.



398,082. COCOANUT COMPOUND. LEOPOLD SCHEPP, New York, N. Y. Filed Dec. 15, 1888. Serial No. 293,718. (No specimens.)

Claim.—The herein-described food compound in dry and granulated form, consisting of cocoanut, sugar, tapioca, baked corn, cream of tartar, gelatine, salt, and a flavoring extract, the ingredients being in the proportions substantially as set forth.

398,083. COCOANUT COMPOUND. LEOPOLD SCHEPP, New York, N. Y. Filed Dec. 15, 1888. Serial No. 293,720. (No specimens.)

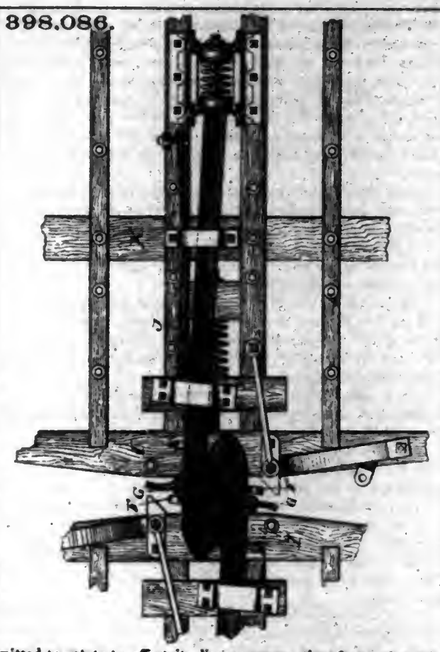
Claim.—The herein-described food compound in dry and granulated form, consisting of cocoanut, sugar, kiln-dried starch, gelatine, a flavoring extract, cream of tartar, and salt, the ingredients being in the proportion substantially as set forth.

398,084. MAGNESIUM LIGHTING APPARATUS FOR TAKING PHOTOGRAPHIC PICTURES. JOHN W. C. G. SCHIRN, Breslau, Prussia, Germany. Filed May 4, 1883. Serial No. 272,816. (No model.)

Claim.—The combination of a burner, *a*, with a bent tube entering said burner and adapted for the reception of the magnesium, and with an air-blast pipe, substantially as specified.

398,085. SUPPOSITORY. HIRAM SCHEELE, New York, N. Y. Filed Dec. 20, 1888. Serial No. 294,326. (No specimens.)

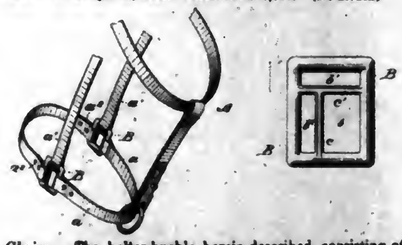
Brief.—To prevent exudation of glycerine from glycerine-soap suppositories, dips the molded suppository in a concentrated solution of soap, thus forming a shell of soap which prevents oozing.



Claim.—A suppository composed of a mixture of glycerine and a concentrated soap solution and of a protective layer or coating of soap, substantially as set forth.

398,086. CAR-COUPLING. CHARLES A. SCHROTER, Chicago, Ill. Filed Aug. 17, 1888. Serial No. 283,051. (No model.)

Claim.—1. In automatic car-couplings, the combination of a coupling-head having an oblique face or engaging-surface, and a rotating hook arranged therein and held in a fixed position while in engagement with an opposing hook and permitted to rotate to effect its disengagement therefrom, substantially as described.



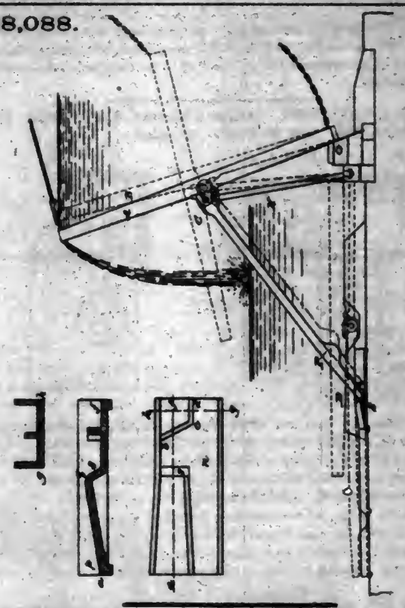
2. In automatic car-couplings, the combination of a coupling-head having an oblique face or engaging-surface having a recess therein rounded or curved at its forward portion and a rotating hook rounded or curved at its forward portion and fitted to the recess and held in a fixed position while in engagement with an opposing hook and permitted to rotate to effect its disengagement therefrom, substantially as described.

398,086.

3. In automatic car-couplings, the combination of a coupling-head having an oblique face or engaging-surface, a rotating hook arranged therein and held in a fixed position while in engagement with an opposing hook, and permitted to rotate to effect its disengagement therefrom, and means for holding the hook in its fixed position and for releasing it therefrom for engagement and disengagement, substantially as described.

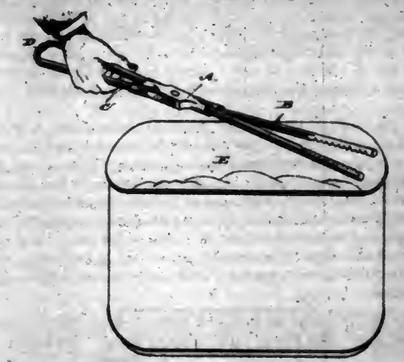
398,087. HALTER-SQUARE. CHRISTIAN C. SCHWANER, Winterset, Iowa. Filed Apr. 16, 1888. Serial No. 270,833. (No model.)

Claim.—The halter-buckle herein described, consisting of the rectangular frame B, having rectangular openings *b b' b²*, formed by means of a cross-bar, *c'*, connected to the side walls of the frame, and a vertical bar, *c*, connected to the lower wall of said frame and to the cross-bar *c'*, said opening *b* being double the size of the openings *b' b²*, whereby it is adapted to receive the chain-strap and a bridle-bit attachment, substantially as specified.



398,088. MOVABLE DAM. ADDISON M. SCOTT, Charleston, W. Va. Filed May 3, 1888. Serial No. 272,733. (No model.)

Claim.—1. An improved heurter having a seat or bearing for the lower end of the prop, and provided in advance of said seat with a guide or deflector arranged for engagement by the prop as the latter is moved upstream or forward from its seat, substantially as set forth.



2. An improved heurter having a seat or bearing for the prop, and provided in advance of said seat with a guide or deflector curved or inclined forward and laterally, such guide or deflector being arranged for engagement by the prop as the latter is moved upstream and forward from its seat, substantially as set forth.
